COAL AGE

The World's Accepted Authority on Coal Mining

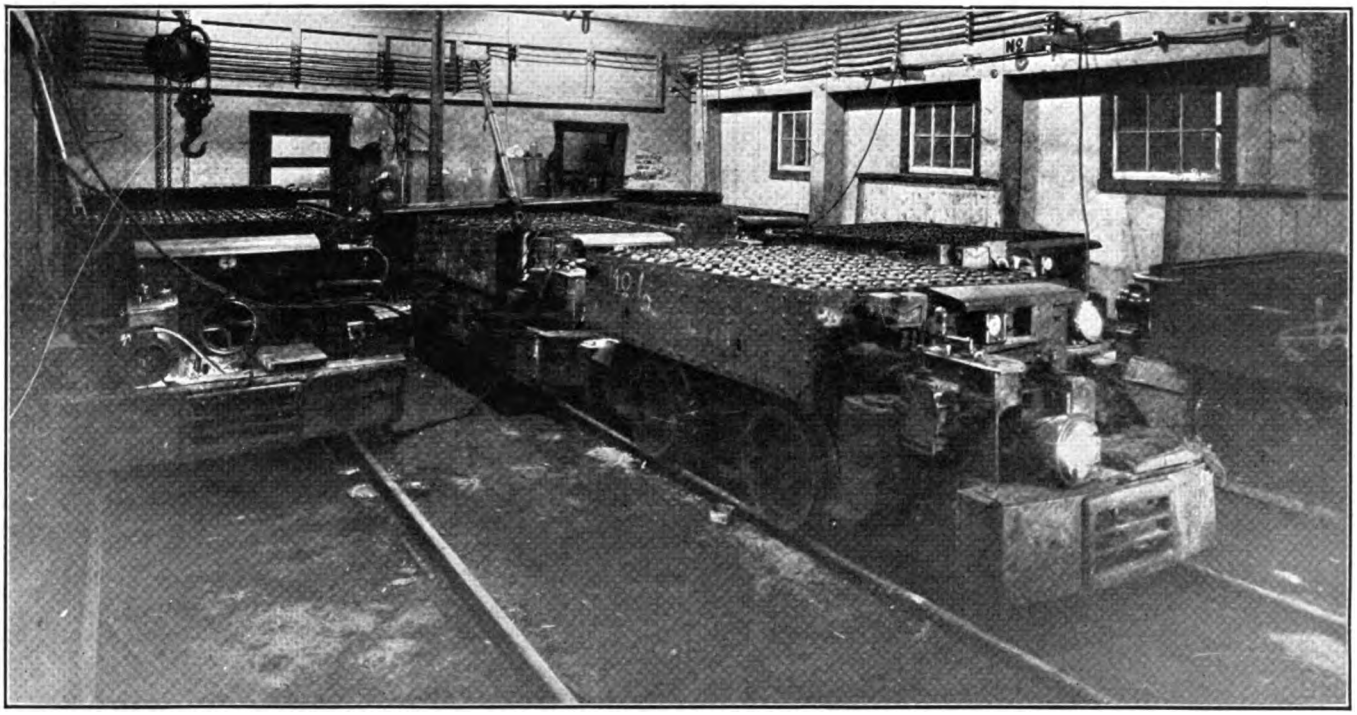
McGraw-Hill Co., Inc. **January 7, 1926** 20 Cents per Copy

HYATT
ROLLER BEARINGS

EASY running mine cars, equipped with Hyatt roller bearings, haul more coal per day.

They consume less power.

They require less lubricant and less lubricating labor.



They operate for years without bearing repairs or replacements.

Hyatt bearings are a real factor in lowering the cost per ton of coal produced.

Our Bulletin No. 390 contains some interesting information on mine haulage. Write for a copy.

Interior of charging barn at Rossmore Mine, formerly Logan Mining Company, West Virginia, but now owned by West Virginia Coal & Coke Co., where are six of twenty-five motors equipped with Exide-Ironclad Batteries.

Taking their daily charge

They fill up fast, these Exide-Ironclad Batteries, but their need is small

SO efficient in the charging barn is the Exide-Ironclad that its need for current is small.

If there's no time for a leisurely charge, you can crowd current into this battery fast. Its monthly charging cost is comparatively low, for it needs surprisingly little current.

Outside the charging barn the Exide-Ironclad is an efficient battery too. It hustles the coal along at a good speed, right up to the end of the shift. Few are the grades that can stump it, even with a heavy trip; for the Exide-Ironclad always carries a reserve of power that can be delivered in a flood if needed.

Repairs are almost unknown, for the Exide-Ironclad is rugged—built for mining work. Its life is long and its first cost reasonable. Hundreds of leading coal mines have cut their haulage costs with this battery. You should know more about it. Send for a free copy of our booklet, Form 1791, "Facts for Consideration in *Selecting a Battery* for Locomotive Service." It is worth reading.

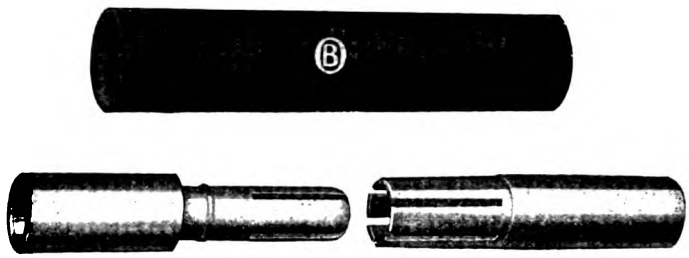
"Cooling with Coal"



THE CONSTANT search for new consuming outlets for coal turns up the entirely workable idea of cooling theaters, business offices, factories and even homes in hot weather by refrigerating plants run by electricity that is generated by coal. Most people will be surprised at the rapid advance in this line made recently. R. Dawson Hall, engineering editor of *Coal Age*, tells an interesting story about it in next week's issue.

MOVING PICTURE HOUSES are leading the movement at the present moment. Few such theaters of consequence are built these days without a refrigeration plant run in connection with the ventilation system. The initial cost of installation for a theater seating 4,000 or 5,000 people may run from $60,000 to $100,000 but operating charges usually are low—the daily average is estimated at 1.5c. per seat—and both are absorbed usually within two years by increased summer patronage. One theater in Chicago has the operating cost down to less than one cent per seat.

THE MOVEMENT is not particularly new. The offices of a New York banking house were "cooled with coal" as long ago as 1907 and various restaurants and one or two hotels in the country followed suit. Today more projects are under way. The thing is just beginning to prove its worth. What the future will bring forth of course remains to be seen, but engineers of vision look forward to a day when we will no more think of enduring the indoor stifling heat of summer than we now would tolerate unheated houses in winter. As this movement advances, coal consumption increases. The mining man, therefore, is deeply interested.

New CABLE CONNECTOR

This new O-B Cable Connector is for motor and armature leads on mine locomotives, for cable connection to trolley poles, or for cable leads to any stationary or portable motor.

It takes the place of a permanent connection that might otherwise be used, yet has the advantage that it can be quickly disconnected.

The two phosphor bronze terminals are soldered onto the cable ends. Insulation is trimmed back just far enough so that the distance between ends of the insulation is slightly less than the length of the tight-fitting rubber sleeve. When terminals are snapped together, with the rubber sleeve in place over the joint, a continuous and tight rubber-insulated joint is formed, requiring no taping.

Write for complete details.

Three Sides to the Coal Labor Dispute

THE NEWSPAPERS in describing the strike agreement negotiations in New York, referred to "the miners' most insistent demand, the check-off." This illustrates an inexactness of thought and consequent phraseology which should be noted. The check-off is not the insistent demand of the miners: it is the insistent demand of the organized miners' union—that is to say, of the leaders thereof. No miner ever desired to make a national issue to force his employer to abstract his union dues from his pay envelope before handing it over to him, on the plea that he was too indifferent or weak or too unfavorable to the union, to pay his dues, once he got the money in his jeans. The demand for the check-off is not the demand of the miner against the operator, but the demand of the union officials against the miner. It is an indictment of the miner as unintelligent and incapable of handling his own funds; and is a survival of the importation of cheap foreign labor in the coal industry, of a type that needed to be brow beaten by union leaders and employers alike, and forcibly aligned into a union they did not understand, and which they did not have the intelligence and independence to support, or to disapprove.

Indeed, there has been three parties, not two, to the whole anthracite strike—the operators, the union, and the miners. The strike organizers can have had no illusions that they were to bring about a net financial gain to the miners any more than to the operators; they must have known that the money lost to both sides would never be recovered in any readjustment. What they hoped for was a gain to the union as the price paid by the irretrievable economic loss to the industry, sustained by both the real laboring factors in the strategy—the operating miner and the working miner.

Leisure More Fatal Than Labor

IN THE January issue of the *Employees' Magazine*, of the Union Pacific Coal Co., it is stated that in the year just past there were four fatal accidents in the company's Wyoming mines and one in its mine at Tono, Wash. In contrast with this record six employees of the Wyoming mines of the company were killed in automobile accidents, one employee was murdered and one committed suicide. Twice as many met their deaths by accident, therefore, in their non-working time as lost their lives in the mine. Furthermore, in the "wide open spaces" of southern Wyoming, where, by the way, the roads, though mostly of dirt, are excellent, there is less excuse for accident than in crowded cities. Apparently bootleg liquor was a cause of some, at least, of these fatalities.

There were thirteen fatalities in the company's mines in 1921, eight in 1922, sixteen in 1923, nine in 1924, and only five in 1925. Thus the automobile did its part to compensate for the increased safety of the Union Pacific Coal Co.'s mines.

But the company desires a further measure of safety. "Candor," says E. C. McAuliffe, the president of the company, "compels the statement that the death of at least two men could have been foreseen and avoided. They both died because of our failure as managers to see that the 30-in. track clearance recently adopted in our Book of Standards was maintained."

Speaking about responsibility for accidents, he says that he "has a deep and abiding belief that less than ten per cent of the mine fatalities which occur can be charged wholly to the victim." There is much to be said in regard to this contributory negligence of the employer. The employee is sometimes only partly to blame, though that part may be 90 per cent of the whole. The rest of the fault is that of the employer who has not made it sufficiently difficult for the employee to injure himself by carelessness.

The accidents due to lack of clearance seem to be of that character. The two from falls of roof, according to Mr. McAuliffe, were not, and the one from failure to wait twenty minutes on a shot can only be placed on the management by holding that the men were insufficiently instructed.

In the intermingling causes that result in an accident the operator does well to beware lest he find he has a part, however small. It often takes a half dozen contributing causes to make an accident.

We Extend Our Service

THE WIDER AND CLOSER a publishing house can make its contacts with the industries it serves, the more valuable that service becomes. This was an actuating influence moving the McGraw-Hill Co., Inc. to purchase the Keystone annual catalogs which have been standard reference and data books in the coal and metal mining industries for years. Full announcement of this purchase is made in the news pages at the end of this issue.

Coal mining men on the one hand and equipment manufacturers on the other who read *Coal Age* are well aware of their own community of interest. Each one profits most who makes best use of the opportunities the other offers. Educational work correlating the efforts of both has always been considered by this magazine to be an important part of its educational task. Therefore it is eminently fitting that the publishers of *Coal Age* should extend these correlating activities, issuing not only the magazine but also the most complete reference books of the industry.

CONTROL OF RAILROADS SUGGESTS and, in a sense, demands control of motor trucks, buses and similar carriers. The regulation of coal makes reasonable the control of oil, coke and other substitutes. Thus from one stepping stone to another we advance to socialism.

The Markle Plan

IF THE TEST of an acceptable solution of the anthracite labor deadlock is to be the public interest, the program proposed by Alvan Markle, chairman of the joint wage conference, at New York last week merits earnest and sympathetic consideration. In brief, that program would encompass: (1) A truce providing for an immediate resumption of mining at the 1923-25 scale while the machinery for permanent peace was being geared for action; (2) a long-term agreement, with flexible wages, and a bar against strikes or lockouts; and, (3) impartial determination of the economic facts upon which wages should be based. It would preserve to both employer and employee the fullest opportunity for self-determination of all issues and invoke outside aid only after the resources of conciliation and direct negotiation had been exhausted.

An early resumption of mining—if it carries with it the assurance of permanent peace—is clearly in the public interest. A long-term agreement meets the expressed desires of both operators and miners. Where they differ is on the question of rigid wage scales. With neither side disposed to respect the factual statements of the other, impartial determination of the basic data seems the proper course. Indeed, if such determination did nothing more than dissipate the mutual suspicion entertained by miners and operators and the public distrust of both sides, it would be well worth the cost. That an agreement reached without the intervention of an outside agency is preferable to the parties directly concerned and promotes harmonious labor relationships is too obvious for comment.

But four months of inactivity have demonstrated that such an agreement within reasonable time limits is not always possible. The Markle program and every other plan suggested since the first break in negotiations last summer recognize this. In meeting this contingency, however, we fear that a laudable spirit of compromise has led the author of the Markle plan to concede too much to the sensitiveness of the union spokesmen. Mr. Markle would create a fact-finding commission of nine with membership equally divided between the miners, the operators and the public. Upon the representatives of the last-named group would devolve the task of initiating a report and recommendations, but this group would vote only in the event that the representatives of the operators and the miners failed to agree. In that event, the public representatives would vote on disputed points with the other six and a majority vote of the nine would decide the issues.

Mr. Markle has said to the miners that this is not arbitration, but an extension of the plan of operation of the Anthracite Board of Conciliation, with three umpires instead of one. It is easy to understand the chairman's reluctance to damn his project with a description so hateful to the miners. Nevertheless, we think that Mr. Lewis and his associates are correct when they describe it as arbitration under another name. The plan loses none of its force by boldly stating what it is. Sooner or later the union will have to revert to its earlier position when it was a staunch advocate of arbitration. We might just as well face the facts now as later. Sugar-coating the pill will deceive no one: neither will it speed acceptance.

There is, however, a real objection to the plan as proposed. The *modus operandi* outlined promises to be more provocative of dissension than of harmony. In the first instance, the public representatives submit a report to their fellow-commissioners. If it could be assumed that this report would be approved by both operators and miners, all would be well. The reasonable assumption, alas, points to a contrary conclusion. In the end, the deciding vote rests with the public group, but that vote is cast only after opinion of the contending parties has become frozen. Bitterness, doubt and suspicion are encouraged and the defeated side is more convinced of the justice of its cause than if it had never gone on formal record.

Fortunately this defect is not irremediable. Since the public group must control, why not divorce it entirely from the preliminary negotiations? Why commit it in advance to views or conclusions it may wish to modify in the light of further discussion or argument? Let it appoint the investigating corps if miners and operators cannot agree upon the agency or agencies, and then retire from the scene until such time as operators' and miners' representatives admit their inability to reach an agreement. Then let the operators and miners submit statements showing the facts and the recommendations upon which they agree, with supporting documents, and the points in dispute. This done, exclude the representatives of both sides from participation in the deliberations of the public group and let the public group alone sit in judgment and decide the questions by a majority vote of its own membership.

In this way, the public group would have the benefit of all the technical knowledge and advice of both operators and miners. But, acting independently in reaching its decision, its conclusions would be more readily accepted by both sides and would carry more weight with the public at large. After all, when we reach the arbitration stage, we are approaching something so akin to a judicial determination that in certain fields resort to arbitration precludes an appeal to the courts. Representatives of the miners and the operators have as much right to be members of the arbitration board as plaintiff and defendant would have to mount the bench and vote with the judge in a court of law.

Coal Mines Help to Build Highways

LARGE COAL LAND holdings increase the expenses of the holders and the cost of coal, but they help to pay the taxes for maintaining roads and schools. Without such help the public roads would exhibit slow improvement. The public should remember that such expenses, figured either as liquid charges or as a fixed value in the land held, while adding first or last to the cost of coal, bring the motorist speedy transportation. But here, again, the mine owner is sometimes condemned for charging back what he has been obliged to pay. But surely the public would not have him assessed for the building of roads in parts distant from his towns and tipples and yet prevent him from recovering the expenditure, as a charge on coal, in land sales or in royalties.

PITILESS PUBLICITY—The Mine Workers are asking that inquiries be made into the financial affairs of the coal companies. As W. W. Inglis has pointed out, we already have the Coal Commission's thick report. Company books were ransacked to obtain this data. The important omission is facts about the check-off. Will the union furnish this interesting information?

Anthracite Company Takes Another Big Step Toward True Modernization

Much Less Fuel Is Needed to Supply Electrical Energy to Motors than Steam for Direct Users—Additions to Nanticoke Plant Make Glen Alden Capacity 50,000 Kva.

By C. R. Seem
Electrical Engineer, Glen Alden Coal Co., Scranton, Pa.

ALTHOUGH the Glen Alden Coal Co., generates all its own power, it burned under its boilers in 1924 for all steam raising purposes only 776,548 tons of anthracite, or a quantity equal to but 7.8 per cent of its tonnage shipped to market.

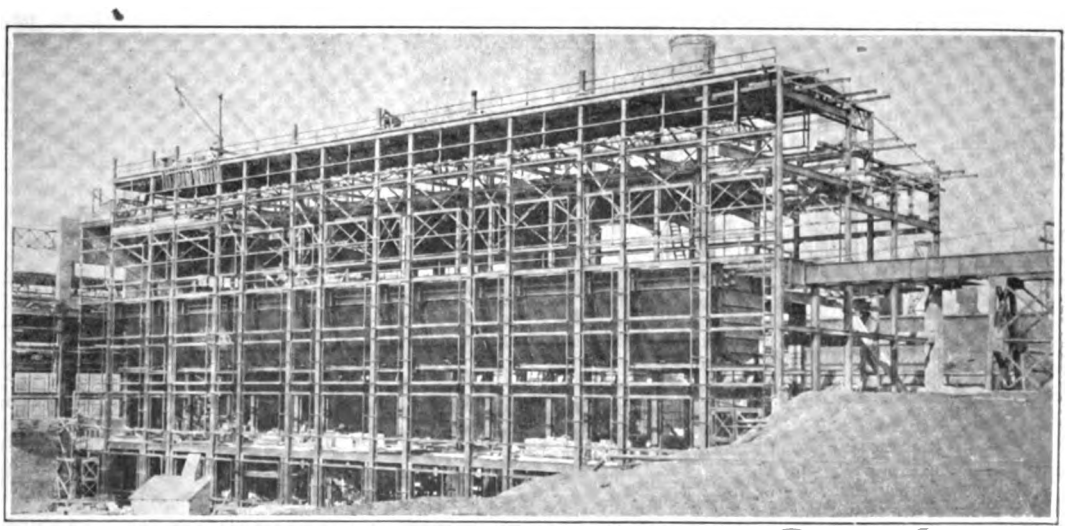
The company is highly electrified because records comparing the relative efficiency of steam and electric drives have impelled the use of electricity. The quantity of steam required to generate electrical energy for motors is, in most instances, less than one third that necessary to drive steam-operated equipment.

The fuel used in the company's electric power plants and auxiliary plants at several collieries was of the lowest grade. The total tonnage consumed by the company, besides generating electrical energy, raised steam to supply direct power applications not yet electrified and heated the collieries.

About 31 per cent of the coal was barley No. 1 and 69 per cent was barley No. 2. Of this tonnage 318,873 tons, or 3.2 per cent of the quantity sold was used to generate electrical energy and 457,675 tons to raise steam for all other purposes. Only barley No. 2 was used in the electric plants.

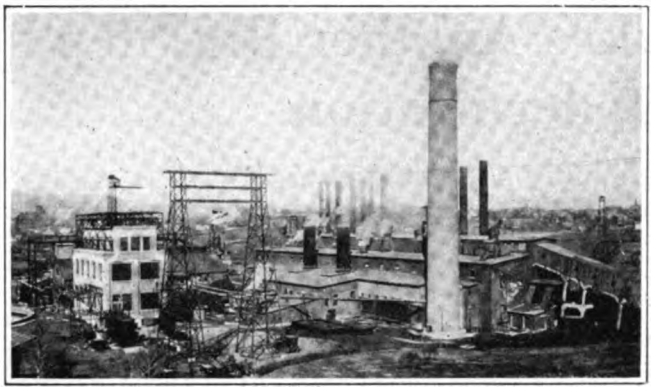
From this fuel energy was obtained for a connected electric motor load of 140,000 hp., a steam power load of 38,500 i.hp. for steam engines, steam pumps, etc., and an additional load for heating purposes.

Estimated from steam-flow meter records obtained on certain machines, indicator card tests made on others and computed foot-pounds of work done by still others, such as hoisting and pumping units, 185,000,000 hp.-hr. of work was done at the shafts of the drivers. The collection of these data revealed a startling fact regarding the comparative efficiency of steam and electric drives. It was found that for every horsepower-hour of work done at the shaft of a steam engine an average of 76 lb. of steam was required at the boiler house; whereas, for the same work done by an electric motor only a 29-lb. average was necessary.



Examination of the flow charts on many large steam engines shows quite clearly a reason for this important difference in steam requirements. These records revealed the fact that stationary mine steam engines even though operated only 8 hr. a day, use as much steam in the other 16 hr. as in the eight while running. The reason for this is that high line losses due to condensation and leaks in joints, traps, throttles, etc., go on continuously and hardly can be avoided even on well kept steam systems. It is difficult to keep every engine and steam line leakless. Also, it is often necessary to leave the throttle of a steam engine slightly open to keep the engine warm and free from condensate. Fortunately, such leaks cannot exist on electric power lines and motors.

Furthermore, the average steam hoisting engine, when in operation, uses about 50 lb. of steam per horsepower-hour, and most pumps use more than 75 lb. These figures are based upon records taken at the machine and disregard the line losses which are always considerable. As compared with this, a modern turbo-electric plant, such as is reasonably possible for a mining operation, produces a horsepower-hour of energy for each 10 to 15 lb. of steam consumed. These data alone show a difference in steam consumption well worth considering. Obviously, when the line losses of a steam-operated mine are compared with the distribution losses of an electrified plant this difference in steam consumption becomes much greater.



To get a more accurate idea of the savings effected by electrification, other factors also must be considered.

Big Plant Under Construction

This addition to the Nanticoke power plant, which is already the largest coal company-owned electric generating station, will accommodate fourteen boilers for about 50,000 kva. in generator capacity. Five boilers are now being installed for a new 15,000-kva. turbo-generator.

Digitized by Google

A Pioneer Electric Plant in the Upper Anthracite Field

The problem of supplying cooling water at the Hampton plant was solved by using mine water. Now the plant and operations of the company have grown to the point where additional generating capacity can be more advantageously placed at Nanticoke.

The ordinary mine boiler plant is not handled by skilled operators or provided with modern steam-raising equipment. Furthermore, it is merely another detail in the many duties incumbent upon a mine superintendent or foreman and he cannot be expected to give it expert attention. Isolated mine boiler plants are rarely, if ever, equipped to burn the small-size fuel which can be used in modernized plants, therefore it will be found that they use large quantities of fuel which could be sold. Often they use coal which is much larger than is generally believed. In emergencies—occasions which arise and persist for long periods in winter—it is the general practice to take fuel that would otherwise go to market and use it at the mines.

Power plant improvements which are continually going on have already made it possible for the economic utilization of fuel which is too fine to be shipped to market by the ordinary methods now used. In fact, it has been proved both practical and successful to generate steam from pulverized anthracite.

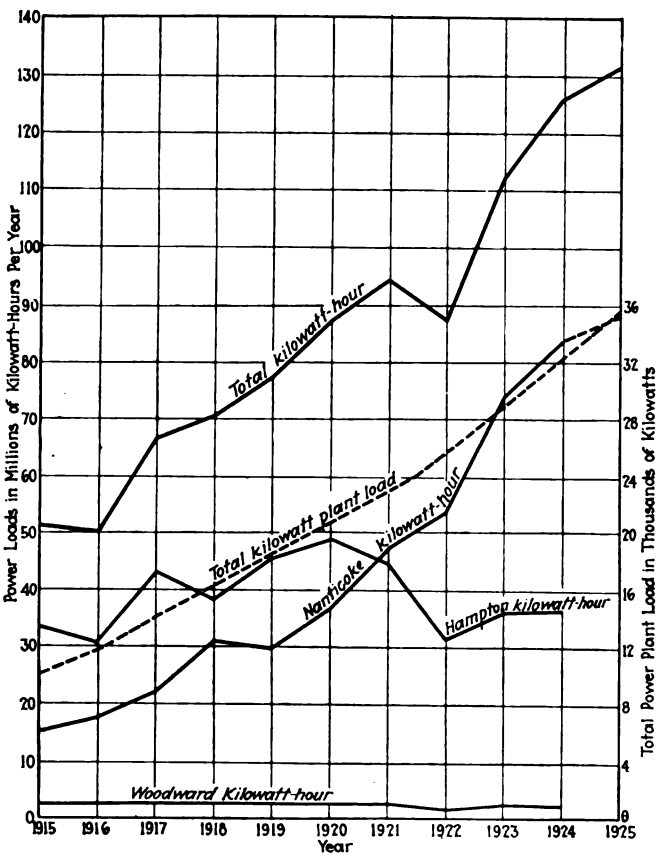
Therefore, for the double purpose of releasing for market all possible saleable coal and to eliminate the large power losses incident to isolated boiler plants, the Glen Alden Coal Co. for years has carried on a plan of electrification which is still unfinished.

At present the company has four turbine plants, briefly described as follows:

The oldest plant is a 11,000-kw. station located at Hampton. This plant has reached its economic limit. Mine water is used for cooling purposes. The total available flow is barely enough. Physically the plant cannot be redesigned or enlarged without expense that is now unwarranted.

At the Woodward mine near Wilkes-Barre a 1,000-kw. low-pressure turbine is operated. This machine uses exhaust steam from the various hoists and fans at this colliery.

At Storrs, in the Providence section of Scranton, a 2,500-kva. machine was installed a few years ago to use the surplus steam available from a good boiler plant which had formerly supplied the breaker and mine pumps with steam before the colliery was electrified.



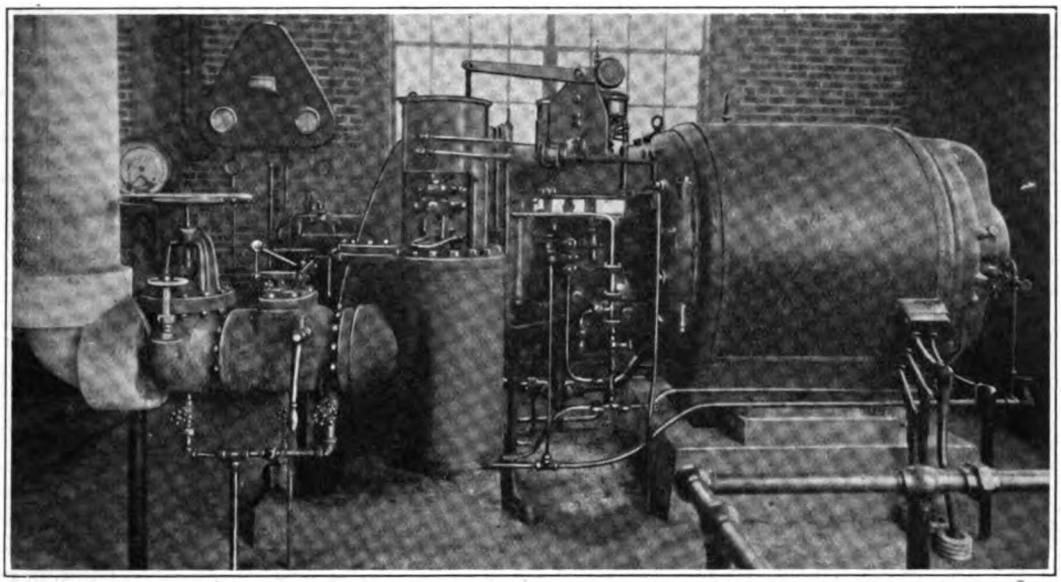
The fourth electric plant is near Nanticoke, Pa. This station is probably the largest and most modern industrial plant wholly devoted to supplying an industrial load. The first machines installed there and put in service in 1902, were three 500-kw. vertical turbines supplied by three 303-hp., hand-fired boilers. The steam pressure was 150 lb. gage, 150 to 200 deg. superheat. Barley No. 1 coal was burned. The water rate of these machines was 27 lb. per kilowatt-hour.

By 1905 five of these machines had been installed. In 1911 it was decided to install two 5,000-kva. turbo-alternators, an up-to-date turbine room including switching compartments and a new boiler plant of twenty 303-hp. boilers. The last of these boilers was installed in 1918. In 1916 all the hand-fired boilers then in service were changed to stoker-fired units, the stack height was increased from 100 ft. to 125 ft. and the plant redesigned to accommodate these changes.

In 1918 a 10,000-kva., 13,000-volt, 150-lb. gage, 150-deg. superheat machine was installed in addition to the two 5,000-kva. units. No additional boilers were put in then because it was impracticable to enlarge the boiler plant.

In 1921 the five 500-kw. vertical turbo-generators were scrapped. At that time sufficient information was available to estimate the continued demand for electrical energy. By studying the growth curve reproduced with this article it could be seen that by 1926 the company would be in urgent need of another large generator.

After the 10,000-kva. turbine was installed in 1918 it was felt that any future additions would have to be made with a view toward taking advantage of everything that well established practices dictated. However, inasmuch as the company did not care to do any pioneering work in this direction, it decided to use 275 lb. steam pressure at 150 deg. superheat with the next unit. Consequently, about a year ago, a 15,000-kva. turbo-generator with two points of stage bleeding was purchased to operate under these conditions. To sup-



Load Curves Show Rapid Progress of Electrification

Year by year the load curve of the Nanticoke plant has shown a steady increase; so also has the total load curve of the company. During the past decade the yearly load has increased 80,000,000 kw.-hr., at an average rate of 8,000,000 kw.-hr. per year. In this same period the total kilowatt demand has nearly reached 36,000 kw.

Digitized by Google

Balances Feed Water Temperature

The governor of this 500-kva. house turbine is influenced by the load on the large turbines in such a manner that sufficient exhaust is always available to maintain the boiler-feed water at 210 deg.

ply steam for this turbine five 6,675 sq ft., Stirling boilers equipped with 3,237 sq.ft. of economizer surface were purchased.

To house this equipment an addition is being built to the power house suitable for fourteen boilers although only five will be installed now for the new turbine. A new tunnel 44 ft. below ground level has been built to the river to carry intake and discharge pipes to insure full water supply at minimum river elevations. The intake water enters through a screen house in which are located three motor-driven traveling chain screens of the vertical type. Trash is removed by high-pressure nozzles squirting warm water through the screen, thus in cold weather but little difficulty will be experienced. This refuse material is then carried away in troughs. The condensing water flows into a sump and provision is made for pumping into the old section of the plant in emergencies as well as to the new 15,000-kva. machine and for two other turbines which may be installed later.

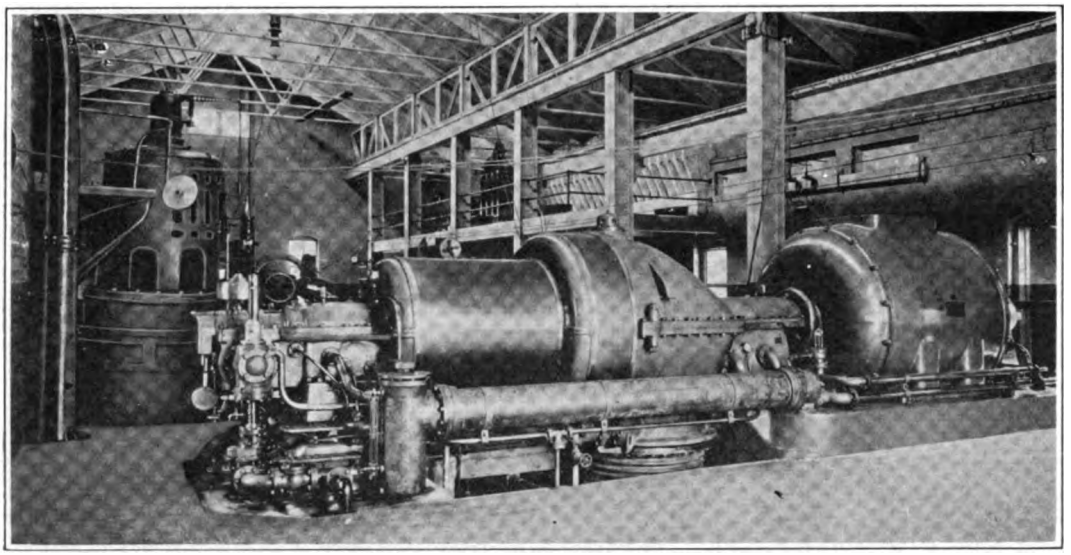
For the present equipment in the plant the feed water is heated in an open-type heater, sufficient exhaust being taken from various auxiliaries to raise the temperature of the water to 200 deg. To make up the difference between 200 and 210 deg. and to take care of variations in demand, a non-condensing, 500-kw. house turbine is floated on the house bus. Its governor is connected to a relay, which in turn is connected to a thermocouple in the stack exhaust of the heater. In this manner the house turbine supplies just enough steam to raise the feed water to 210 deg.

Coal handling at this plant is quite simple. All fuel is shipped from the various collieries over the D., L. & W. R.R. The boiler house is so situated that the supply track enters the plant over the bunkers on a grade of 1½ per cent. In warm weather cars are run directly over the bunkers and emptied into the hoppers through cast-iron gratings which prevent not only foreign material entering the hoppers but serve as a safeguard for the men.

In winter the coal is frozen when it arrives and the cars must stand over the hoppers awhile before they are unloaded. As the cars are in an upper section of the boiler plant this makes an ideal thawing house. The heat of the boilers combined with live steam, which is used under ordinary winter conditions, is sufficient to loosen the coal. In severe weather it is necessary to use auxiliary thawing lines on the cars before they are placed over the hoppers. Some of the cars are often so badly frozen that 3 to 4 hr. of heating are necessary to loosen the coal.

The new plant will accommodate five cars at one time as does the old plant. The bunkers will hold five tons per foot of length or a total of 1,000 tons. The company expects to burn 340 tons in 24 hr., but the ultimate consumption in the new plant alone will be between 800 and 1,000 tons per day. All cars are moved by means of a locomotive, but in emergencies a motor-driven winch can pull the cars in or out of the plant.

There will be two somewhat similar methods of ash disposal at this plant. In the old plant the boilers are set at ground level and the ash pockets are of sufficient capacity to hold the ash produced in about 6 hr. of normal run. This, however, is not a serious factor for the gates on the ash hoppers open directly into a flushing trough, which empties into a deep concrete tank outside the plant.



Water Aids in Moving Ashes

In these hoppers spray water continuously cools the ash so as to keep down the dust and quench all hot material that may come over the ends of the stokers. One man empties the hoppers for the twenty boilers. During the process of emptying the hoppers, high-pressure water is used to assist the movement of ashes into the trough. This is necessary as there is very little pitch to the bottom of the hoppers. After leaving the hoppers the ashes travel to the center of the plant through the flushing trough and, turning at right angles, flow outside into the main ash tank. This tank has sufficient storage for 24 hr. The water level is held constant by means of an overflow pipe.

The ash itself is taken out of the tank with a 1½-yd. grab bucket by means of a revolving, stiff-leg derrick. It is dumped into 3-yd., side-dumping, 36-in. gage cars and hauled to the ash bank by means of a 7-ton electric locomotive.

In the new plant the boilers will be set 15 ft. from the ground. Underneath each boiler double-gate, oil-operated hoppers are already installed. The locomotive and ash cars will be run directly beneath the ash gates and the cooled ashes will be dumped into the cars and

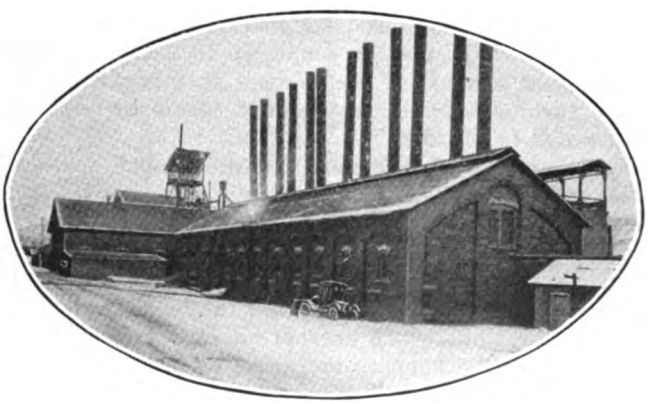
Old Types Are Replaced

The Glen Alden Coal Co. generated its own power when vertical turbines were the most modern units of the day. On the left-hand side of the picture stands one of the old vertical turbo-generators originally installed at the Hampton power house. Always keeping pace with new developments, the company is now installing a 15,000-kva. unit which has two stages of bleeding.

removed to the bank. Under the tracks and leading to the main ashpit of the old plant, is a cast-iron lined, concrete, flushing trough. Over this and under the tracks is a cast-iron grating. All of the spillage and splash from the cars falls into the trough and is washed to the main pit. Likewise, if for any reason the ash cannot be dumped into the cars it will be possible to drop it directly on the grating from which it will fall into the sloping sides of the trough and then be washed to the main pit.

The gates on these hoppers are water-tight, measure 5x4 ft. and are operated by oil cylinders. Oil pressures are maintained by a special pump and a duplicate unit is provided for emergencies. The use of oil under high pressure insures a positive movement of the gate and while the gates move quickly there is no slamming or rebound. With the use of oil there is no fear of winter freezing and higher pressures can be used more successfully than with water systems. This is important as the doors to the ash tunnel must be open to permit the locomotive to place the cars.



The company expects this system to work cheaply and efficiently. One man is employed for dumping the hoppers in both plants. One man handles the ash bucket derrick and one man the locomotive and ash cars. On the ash bank two men are required to dump cars; they also move track and keep things in operation there. One extra man will be employed on the eleven o'clock shift to empty the pockets and to render any necessary help. This makes a total of six ash men for the whole boiler plant which will have a total capacity of about 11,000 hp. All ash will be handled during the day shift.

Electricity is generated at four different voltages. The larger and newer turbines, the 15,000 and 10,000-kva. units, generate energy at 13,200-volt pressure; the two old 5,000-kva. machines generate at 4,150 volts. The longer and heavier feeders go directly from the 13,200-volt bus to their various transformers or directly to the collieries. For some of the collieries, particularly those which are situated near the generating plant, the distribution lines lead directly from the 4,150-volt machine bus. The plant originally generated all energy at 4,150 volts pressure. The 500-kva. house turbine generates 440-volt energy. This goes directly into the 440-volt house buses. Direct current for excitation, also for charging storage batteries and emergency lighting service is made at 125 volts.

The 4,150-volt bus and the 13,200-volt bus are connected together through three 2,500-kva. transformers separated by means of disconnecting switches and an oil circuit breaker.

To supply current for the power house system there are two 440-volt buses, one being supplied through a transformer bank connected to the 13,200-volt bus and the other by a similar bank connected to the 4,150-volt bus. The house turbine can feed directly into either of these 440-volt buses, which may also be tied together by operation of interconnecting switches. This gives a flexible and reliable means of supplying current to the plant auxiliaries.

The circuit breakers for the 13,200-volt machines are being located close to the machines just below the main floor. Leads are run from these switches to the buses in the switch gallery; feeder switches are also located nearby. Plans are being made to rearrange the buses so that in case of accident or inspection a regular service switch can be disconnected and worked upon. Power for the operation of these switches and the main board will be supplied by a storage battery. In case of failure of the battery circuit, emergency service can be obtained from the excitation system. The control board is located on the main turbine room floor and is handled by the engineer in charge of this section of the plant.

Power for Two Mines Generated Here

This plant supplies the larger part of the energy consumed by Jerome Mines Nos. 1 and 2 operated by the Hillman Coal & Coke Co. at Jerome, Pa. The capacity of the plant, which burns crushed picking-table refuse from the C-Prime seam, is 800 kw. In addition, a normal load of 600 kw. of purchased power at 2,200 volts is conducted to underground substations where it is converted into direct current. When this plant was built in 1904 a plentiful supply of stone was available for its construction.

Poor Drainage Ruins Concrete Shaft Linings*

Survey in Pennsylvania Shows 30 of 106 Failed Though Cement Was Good—Freezing and Thawing of Leakage Destroy Walls—Remedies Are Suggested

By Newell G. Alford
Pittsburgh, Pa.

THE NEED for adequate drainage behind concrete linings of coal mine shafts seems apparent from a survey of installations in western and central Pennsylvania. Thirty of the 106 concrete shaft linings studied were distinct failures and in every case insufficient drainage was the outstanding difficulty. The results of the survey suggest improvements in concrete lining practice.

Twenty-two years have now elapsed since the first mine shaft in America to be lined throughout with concrete was completed at Gary, W. Va., in 1903. The practice of thus lining shafts rapidly spread until by 1915 it had become practically universal not only for coal mines but iron mines as well.

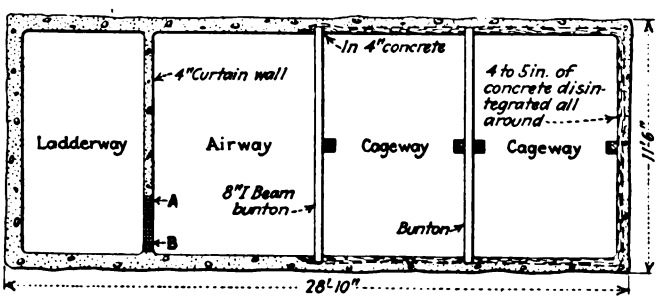
In 1921 failure of two concrete linings at western Pennsylvania mines led to the survey covered in this paper. This study was confined to the central and western districts with no organized effort to extend it beyond the state boundary. No decided lining failures have yet been reported outside of this region.

In all but six cases of the 30 failures studied these linings gave trouble within two years after installation. No fault can be found with the cement because good grades were used in all instances. In 17 of the failures the aggregates were approved sand and gravel; in the remainder they were either gravel and crushed sandstone, gravel and crushed limestone and sandrock, slag and sand, or simply crushed sandstone.

In nine cases the workmanship was reported as being either "fair" or "bad." These terms, however, are so relative in their significance that they mean little. If the work was not of the best the blame should, doubtless, be shared by the coal company and should not be borne entirely by the contractor. Lining a shaft involves the chuting of the wet concrete into the forms through conveyor pipes of either rigid or flexible design with a consequent doubt as to whether the cement is thoroughly mixed with the other ingredients when the material finally comes to rest. Not infrequently disproportionate quantities of the cement are floated to the surface of the batch. This uncertainty with numerous others can easily result in controversy that should be anticipated by properly drawn specifications.

In all of the failures, lack of sufficient drainage was a principal cause. Leakage was estimated at anywhere from a mere seepage to 50 gal. per minute. Severe temperature changes with alternate freezing and thawing of the water that penetrated the concrete destroyed the surface of the lining. After the face had scaled off, a disintegrated mass was invariably found beneath.

Undoubtedly the greatest problem involved in successfully lining a shaft is the determination of the drainage required. One or two holes were drilled outside a few of the linings that failed without carrying away the water. These linings, however, were not supplied either with bleeder pipes or water rings, which experience shows are essential to the successful handling of water where its pressure is great enough to effect penetration of the lining. Where grout was used to permanently seal off water it was nowhere reported as successful. This indicates that it should only be used as an aid to sinking.



In many of the successful linings no drainage of any kind was supplied and the success of these linings to date can only be attributed to the dryness of the strata which they penetrate.

One company with 18 concrete linings has, within the past year, drilled from one to three holes outside the shafts to carry water to the bottom and to stop penetration of the concrete. After these linings had thus been rendered dry, their faulty sections were repaired. So far the result has been satisfactory but the work has yet to pass through the season of greatest temperature variation, which, at the same time, furnishes the largest quantities of water. This company has one shaft in which three such linings were built within nine years.

Good concreting practice demands that the mixture should be as dense as possible. Uniform density can best be maintained by checking the mix volume with actual weights at sufficient intervals to avoid erroneous volume measurement caused by the swelling of damp sand.

During at least the first 48 hr. of setting, the concrete should be protected entirely from contact with shaft water. The cost of this protection in some cases will be high, depending chiefly on the quantity of water in the strata penetrated and to a much lesser degree on the ingenuity of both the designing engineer and the contractor.

A typical failure, designated as Shaft No. 9 in the accompanying table, is an intake airway that was sunk and lined in 1915. The drawing shown with this article

Shaft Section Showing Disintegration of Curtain Wall

This rectangular shaft contains four compartments, yet it is crossed by only one curtain wall, of reinforced concrete 4-in. thick. Unquestionably disintegration of the lining resulted from alternate freezing and thawing of ground water penetrating the shaft walls. Strangely enough, the curtain wall, not subject to direct contact with this water, in places suffered complete disintegration from *A* to *B*, only the reinforcing being left.

*Abstract of paper entitled "Failure of Concrete Shaft Linings at Pennsylvania Bituminous Coal Mines," presented before a meeting of the Engineers Society of Western Pennsylvania, Nov. 24, 1925.

Digitized by Google

is a section of this shaft. It represents an especially difficult condition in that the shaft sinking was practically dry with water pressure developing later on.

In the lining mixture a standard grade of Portland cement was combined with Allegheny River sand and gravel in the proportions of 1:2½:5. Aggregates from the Allegheny River were chosen because they are freer from foreign matter than are those dredged from the Monongahela River. No water-proofing was used. No grouting was done, and no water rings installed. The concrete was rammed tight in a workmanlike manner.

The curtain wall, which was 4 in. thick and reinforced with vertical wires on about 15-in. centers, was composed of a mixture of 1:2:3 with the same cement and aggregates as the lining.

The shaft, which is about 215 ft. deep, penetrates rock only, and while it was being sunk practically no water was encountered. Soon after the shaft was completed, the lining became wet near the surface and a drill hole was put down behind the shaft to relieve water pressure.

In the spring of 1922, after the last thaw, the surface of the lining began to scale off in small sections about an eighth of an inch thick. Little additional disintegration took place until the winter of 1922-1923. Alternate freezing and thawing during that season continued the process of scaling and when spring came the disintegration had taken off as much as 4 to 5 in. from the face of the lining opposite the cage ways, as shown on the drawing. The curtain wall from *A* to *B* was destroyed entirely, nothing being left of it except the bare reinforcing.

Disintegration of the concrete began about 45 ft. below the surface and continued to the bottom of the shaft. In many places the lining had completely fallen away from the ends of the steel buntons that held the guides and in several instances the buntons were loose at the ends and supported altogether by the guides. In places the shaft lining had entirely fallen out, showing the rock. In many places also the concrete had a soft, rotten appearance and was easily dug out with a pick. In one or two cases where an exceedingly small stream of water percolated through the concrete, there were deposits of white, mushy material that looked very much like lime.

In cold weather the ice around the lining frequently required trimming with picks so that the cages could have clearance. At the ends of the airway section the lining was intact and the surface of the concrete was apparently perfect. Fifty thousand cubic feet of air per minute, about one-fourth of the total intake for the mine, enters this shaft. The concrete lining was recently replaced with one built of brick.

Data covering the 30 linings that failed are set forth in the accompanying table.

A study of the conditions in both the successful linings and those that failed prompts the conclusion that concrete lining practice may be improved by careful attention to the following details:

(1) By providing sufficient drainage behind the lining to relieve natural water pressure from

NOTES:—Shaft No. 9 described in text. Concrete replaced with brick lining in November, 1925. Shaft No. 12, concrete replaced with brick lining in October, 1925. Shaft No. 14 relined with concrete in 1924. Shafts Nos. 18 and 19, concrete mixed thin on surface and poured through 6-in. pipe to the forms. Cement scaled off surface with honey-combed condition found in body of the concrete. Water pressure doubtless separated cement from slag aggregate despite bleeder pipes inserted to relieve pressure. Shaft No. 20, an excess of water was used but mix was well spaded. Shaft No. 23 was relined in 1921 and 2-in. drain lines employed. In 1923 drain lines became choked and shaft became wet. Two boreholes were then sunk outside of lining, thus draining water to the bottom. Shaft is now dry. Shaft No. 25, drill holes were sunk outside of lining in 1924. Shaft No. 26, water worked through concrete followed by freezing and disintegration. Lining was replaced in 1923 with 1:2:4 concrete mixed with Medusa water-proofing powder. Rings were cut in old concrete and strata where water flowed; 2-in. pipe conducts water to bottom. Shaft is now practically dry. Shaft No. 28, piers at shaft bottom were replaced and part of lining resurfaced in 1921.

Digitized by Google

the rock strata and prevent water from penetrating the concrete.

(2) By using a mixture that is uniform, and as dense as possible, with complete protection from contact with both shaft and surface water until setting is complete.

(3) By pouring the mixture into the forms with equipment that does not require the use of water beyond what is needed for proper mixing.

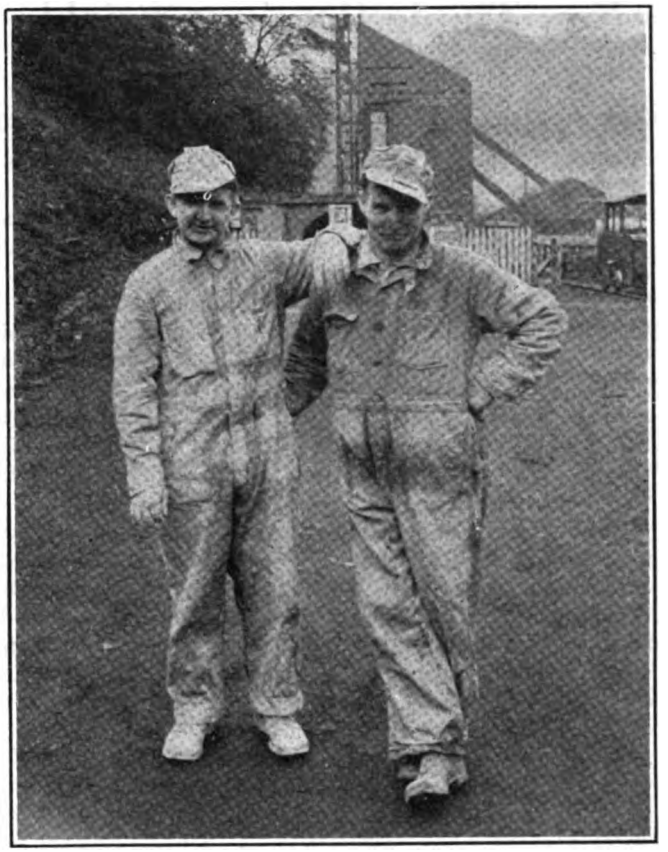
(4) By making closure joints homogeneous with the rest of the lining.

(5) By using grout only as an aid to sinking and not for permanently keeping ground water from contact with the lining.

(6) By more rigid inspection.

It is proposed to continue this study of concrete shaft linings in Pennsylvania and other states as well.

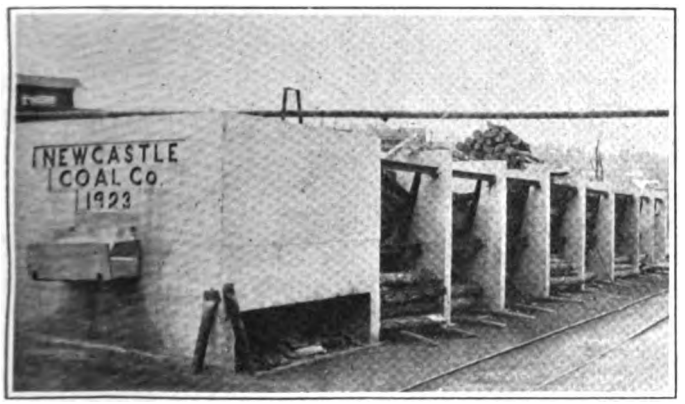
Storage Rack Reduces Rot in Mine Timber Piles



Untreated ties, posts, and capboards have, at best, a short life in the average mine. Proper timber storage such as is provided at the New Castle Coal Co. mine, New Castle, Ala., help to increase it. When the usual method of storing this material is followed, it is not uncommon for posts near the bottom of the pile to lay undisturbed until they rot completely or until they have deteriorated to a point where, after hauling into the mine and perhaps setting, it is discovered that they are unfit for use. In the latter case there is a double loss; the post itself, and the labor expended in taking it into the mine and setting.

The concrete-and-steel timber rack at New Castle eliminates this loss of timbers lying at the bottom of the pile. The rack resembles the self feeders now used in some sections of the country for fattening hogs. As can be see in the illustrations, old boiler flues are used to form the front and back ends of the bins so that the whole pile of contained posts moves progressively toward the opening near the bottom at the front where the timbers are taken out.

Eight Bins for Ties and Posts



In addition to a bin for capboards, eight other compartments are provided; one for room ties, one for entry ties, and six for posts. The stock of posts consists of the following lengths: 4 ft. 8 in., 5 ft., 5½ ft., 6 ft., 6½ ft., and 7 ft. The respective compartments are of lengths corresponding to those of the posts.

The rack is located close to the mouth of the slope, and a track has been built alongside so that the timbers can be loaded directly into the mine cars. Having the various lengths of posts in separate bins lessens the mistakes in filling orders for timbers of any specified length. The rack adds neatness to the appearance of the timber yard.

Shades of T. R.! More Nature Fakers!

These clownish lads are not really "white coal" miners, though they are right out of a mine after a full shift. Instead they are Harry Camp (left) and Fireboss Jimmy Simpson, the rock dust twins at the Harmar mine of the Consumers Coal Co., Harmarville, Pa. When this picture was taken they had just finished distributing 116 80-lb. sacks of pulverized stone in their 6-hr. turn below.

Front and Back Views of Rack That Adds to Life of Mine Timber

At the left is the front of the New Castle storage plant. In the foreground is the bin containing the supply of capboards. The eight other compartments are of lengths corresponding to the ties and posts which are standard for the New Castle mine. Taking posts from the bottom of the pile insures against deterioration that might be caused by long storage close to the ground.

The rear of the racks is to be seen in the picture at the right. Wagons delivering the timber are driven along this side of the rack. Each length of post is put into the bin of corresponding length. Old boiler flues were used to shape the end of the bins so as to make the posts feed progressively toward the opening.

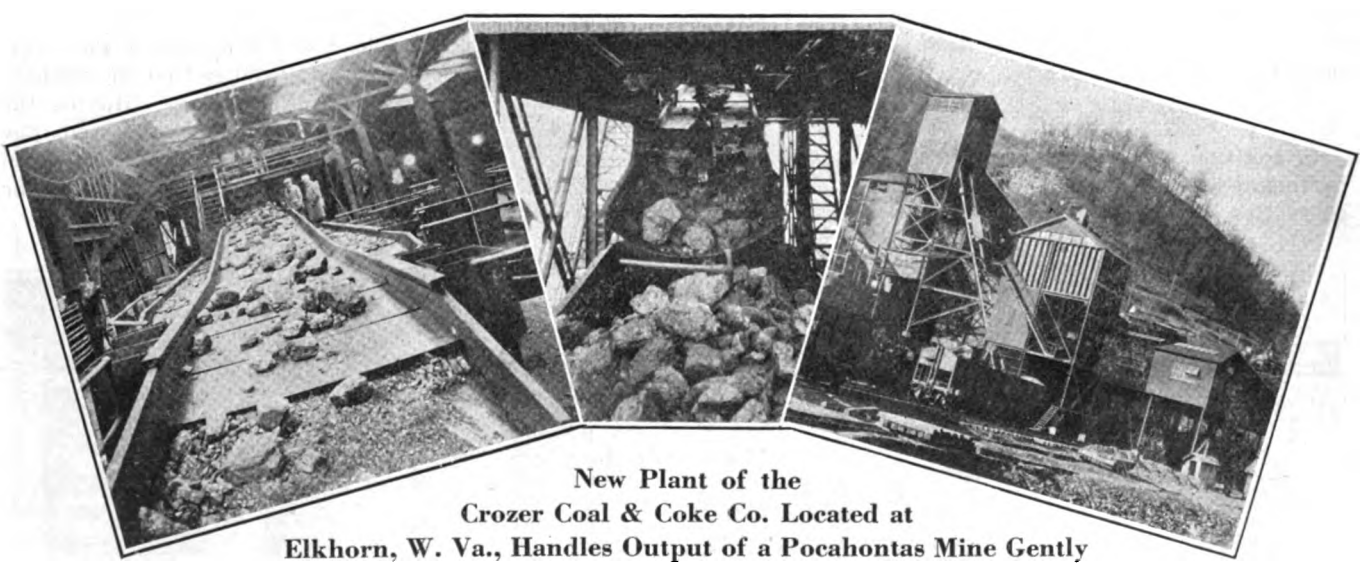
New Tipple Prepares Friable West Virginia Coal

Larger Sizes Picked Separately—All Grades May Be Reunited or Shipped Alone—Bradford Breaker Salvages Coal

A 3,000-TON PLANT for the preparation of bituminous coal at Elkhorn, W. Va., on the main line on the Norfolk & Western Ry. was recently completed for the Crozer Coal & Coke Co. This installation is particularly interesting in that it is intended to treat with as little degradation as possible the friable Pocahontas coal produced in this region. It is by no means an experiment, however. About five years ago the engineers responsible for its construction designed and built the preparation equipment serving the Pageton mine of the same company.

When it was decided that a new plant should be built at Elkhorn, it was deemed advisable to embody in its construction the type of equipment that had proved its utility at Pageton. Certain details have been added, however, so that the new tipple can prepare five different sizes of coal loading them on four tracks. This was accomplished by providing a pea coal bin of 220 tons capacity spanning the nut-coal track. Thus both pea and nut sizes are loaded upon the one track.

The quick-return, oscillating picking table installed in this plant is of large capacity and so arranged as to segregate the lump and nut coals, delivering each to separate picking spaces thus affording ample opportunity for removing the impurities. This is accomplished by using a "wing" type of screen which permits not only separate picking of the various sizes but their recombination after screening and cleaning. Thus either picked nut and egg coal can be made or these sizes can be combined with the others when picked run-of-mine is to be shipped to satisfy a fastidious market.



In the accompanying illustrations, one photograph shows this feature, how the lump coal proceeds in the middle compartment by itself and is separately picked, while on the side wings the nut and egg coals receive separate treatment by the pickers, after which these various sizes are recombined to form a picked run-of-mine. In this view the coal is moving toward the camera.

Bone with good coal adhering to it, and slate or rock are picked out and disposed of separately through chutes leading to a two-compartment conveyor which delivers these materials into a large, duplex hopper, automatically feeding to a double compartment skip. This in turn elevates these products to a Bradford breaker and a rock disposal bin, respectively. The breaker salvages the good coal from the bone and rock and returns it to the screens for sizing into nut, pea and slack. This relieves the pickers of considerable labor, enables the plant to handle a larger daily tonnage and saves good coal that otherwise would go to the rock and slate disposal dump. These economies justify its cost.

USE SHAKING LOADING BOOMS

For carefully loading the lump, egg and nut coals after screening, picking and rescreening, shaking loading booms are employed. These consist of two reciprocating sections balanced against each other. The upper sections are provided with liberal rescreen areas so that any degradation made in the process of picking on the table is finally removed just before going to the railroad car.

The central illustration shows the lump coal boom loading down close to the coal in the car. The booms in this tipple deposit their loads in the cars with a minimum of drop and breakage. The mechanical simplicity of these devices also renders them highly efficient and popular. Screenings from them are delivered to the conveyor handling bone pickings and eventually

New Plant of the Crozer Coal & Coke Co. Located at Elkhorn, W. Va., Handles Output of a Pocahontas Mine Gently

At the left is shown the combined screen and picking table. First the coal passes over screens where the various sizes are separated. The smaller coals then travel along the wings where they are separately picked. Near the discharge end of the table the smaller sizes may be either reunited with the lump for shipment as picked run-of-mine or each size may be loaded separately.

The lump loading boom is illustrated in action in the center photograph. This inclined chute shakes back and forth longitudinally. Its inclination is below the critical angle so that the coal refuses to slide except when the trough is oscillated. Chutes of this kind place the coal in the cars gently and with small breakage. In this installation the upper end of the chute carries degradation screens so that the product is placed on the car in excellent condition.

The Elkhorn tipple is at the right. At first sight this installation does not appear appreciably different from others—it is in its details, however, that that differentiation becomes apparent. Five sizes of coal may here be loaded on four tracks. This is made possible by a pea-coal bin of 220 tons capacity to which this size is delivered and from which it may be loaded either direct to car or passed to it by way of a shaking loading chute. Note the two-compartment skip which is here shown approaching the dumping point. This elevates the slate and rock to the refuse bin and the intergrown coal and rock to a breaker that salvages the coal.

Digitized by Google

find their way to the screenings car on the slack track.

For removing pea coal from the 1-in. and smaller size an electrically vibrated screen is placed beneath the picking table between the nut and slack tracks. The fine material from this unit is delivered to a belt conveyor which elevates it to proper height for loading into the slack car. The pea coal or oversize from this electrically vibrated screen is elevated to the pea bin from which it can be loaded into railroad cars by either of two methods. The first is intended for emergencies only and is by means of a gravity loading chute on which this material is rescreened to remove any fines that may have been made during its passage through the pea coal bin. The second is by way of the boom ordinarily used for the nut coal. To send this material by this route a special gate and chute delivers it from the pea bin to the rear end of the upper section of the shaking nut boom. By this means the pea coal is mechanically rescreened over this device and is "boom loaded" so that it satisfies the most particular markets.

An up-track view of the plant accompanying this article shows the pea bin as well as the two-compartment skip for elevating the rock pickings to the refuse bin and bone pickings and rescreenings to the breaker. As previously explained, the salvaged coal from the bone pickings together with the rescreenings from all the sizes is returned to the main screen and eventually finds its way to the nut, pea and slack coal cars.

The operation of this skip equipment is automatic in every respect. It is automatically loaded, started, stopped, emptied, and reversed, and requires no attention from the plant attendant. The electric controller employed for this service is provided with an oil dash pot and is fully inclosed within a steel cabinet. It is unfailing in operation and permits the continuous ascent and descent of the skip. The illustration shows it approaching the dumping position.

Plant Well Lighted and Fireproof

This plant is of heavy construction throughout, is lighted with a generous number of windows and skylights and is covered with corrugated asbestos-protected metal. All units of the equipment are separately motor driven with remote control for starting and stopping.

All drives are protected by guards for the safety of the workmen. The layout of the machinery and the size of the tipple provides ample room for the pickers and other workers while the equipment is running, and the arrangement is such that all machinery is accessible for its proper care and operation.

The results obtained at this preparator so far as the loading of clean, carefully sized coal containing a minimum of degradation is concerned as well as its economy in operation and maintenance, warranted this company in recently contracting with the Roberts & Schaefer Co. designer and builder of this plant for a similar but larger capacity installation for its Upland (W. Va.) mine.

International Explosion Tests Prove U. S. and British Coals Alike

There is but slight difference in the behavior of standard American and British coals when subjected to identical tests to determine the quantity of stone dust which must be mixed with coal dust in order that the mixture shall be incapable of propagating flame when raised as a cloud in the air. This was determined by co-operative tests conducted at Pittsburgh, Pa., by the U. S. Bureau of Mines and by the Safety in Mines Research Board at the British Experimental Station at Eskmeals, Cumberland, England. The importance of this finding is that it should render available for direct application to each nation's problem of mine danger the results of the other's experiments.

Mining engineers have no doubt been puzzled heretofore by the apparently different conclusions arrived at by the explosions in mines committee of the British Home Office and the Bureau of Mines of the United States regarding the quantity of rock dust which must be mixed with coal dust in order that the mixture shall be incapable of propagating flame when raised as a cloud in the air.

The British experiments have been confined almost entirely to dust from the Altofts Silkstone coal. The American experiments have dealt with a wide diversity of coals. But recently each government has tested imported samples of the other's coal dust. The results obtained form the basis of a report just issued by the Mines Department of Great Britain under the terms of the arrangement for co-operative research made between the Safety in Mines Research Board and the U. S. Bureau of Mines. Copies of this report, known as Safety in Mines Research Board Paper No. 13, "Stone dust as a preventive of coal dust explosions. Comparative tests," by G. S. Rice and R. V. Wheeler, may be obtained from H. M. Stationery Office at Adastral House, Kingsway, London, W. C., 2, at a price of 3d. net, plus the cost of foreign postage.

Explosibility of Ammonium Compounds—An investigation of the properties of ammonium nitrate that influence its safety in storage, handling, and use, is being conducted by the U. S. Bureau of Mines, in co-operation with the National Research Council. The investigation during the previous fiscal year had shown that ammonium nitrate was not combustible; supports the combustion of oxidizable materials; is not readily detonated by fire or heat, but can be detonated by a No. 8 detonator alone and by boosters of various explosives. The detonation is aided by increased confinement and greater density of the ammonium nitrate. During the past fiscal year the effect of temperature on the sensitiveness of ammonium nitrate and the rate of detonation of ammonium nitrate at different temperatures was determined. It was shown that ammonium nitrate is more sensitive to detonation at the higher temperatures, and that its rate of detonation was greater at the high temperatures.

As part of the program in the study of the explosibility of ammonium compounds, an investigation has been conducted on the explosibility of urea nitrate at the request of the Fixed Nitrogen Research Laboratory. The Bureau's interest in this material is in its possible use as an explosive or a component of explosives. An investigation, therefore, was made to determine whether it was in fact an explosive. The preliminary tests showing that urea nitrate is readily detonated by a No. 8 electric detonator, the investigation was then extended to determine the physical properties of urea nitrate as an explosive.

Union Pacific Coal Co.'s Code of Standards—IV*

Safety Standards (Continued)

7. Working panels shall be sectionalized by dusting and dust barriers as shown in Fig. 18.

8. In any place where complete protection is not afforded by the foregoing, additional districts shall be established which shall be sectionalized by dust barriers in a manner similar to the foregoing and subject to the approval of the safety engineer.

9. Areas worked by the room-and-pillar method off entries shall be sectionalized in the manner shown in Fig. 19.

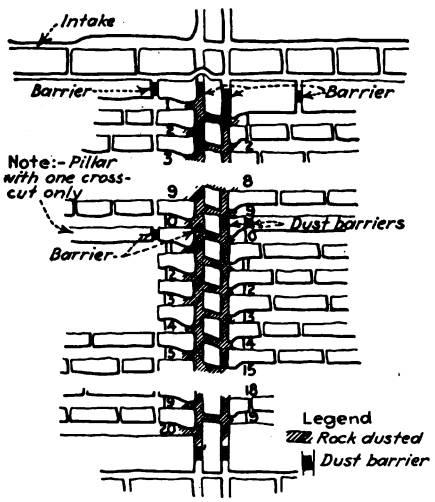

Fig. 18—Protection of a Panel Slope

Rock-dusted travelways supplemented with barriers separate the workings so that not more than twenty rooms are included in one section.

10. Slopes, panels, entries, haulageways and traveling ways shall be rock dusted in a manner prescribed by and subject to the approval of the safety engineer, which, however, shall be in a manner now or hereafter approved by the U. S. Bureau of Mines and the state mining inspector.

11. All bugdust (machine cuttings) must be loaded out before the place is shot. Bugdust shall be thoroughly wetted down before loading.

12. Cutterbars of all mining machines must be equipped with hose and water.

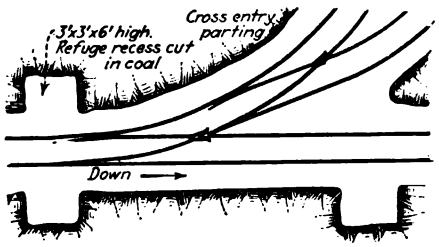

Fig. 20—Refuge Holes Along Haulageway

Recesses are cut in the ribs of the gangway at switch points on main slopes to provide a refuge place for rope riders and others.

13. Water lines shall be extended to all working faces.

14. Working places will be thoroughly sprinkled by the miner for a distance of 50 ft. from face before shooting, otherwise the place will not be shot.

15. No persons except those duly authorized by the mine foreman shall be permitted to ride on any empty or loaded trips.

16. Rope runners shall see that on trips devoted to the hoisting or lowering of men that no one is permitted to ride unless he is seated. Over-crowding of man trips or riding the "hitchings" of man trips is absolutely prohibited. Persons boarding or getting off man trips while in motion subject themselves to discharge.

17. Sec. 4,454, Wyoming Compiled Statutes.—" . . . And such train of cars known as a man trip shall not be run at a greater speed than 5 m.p.h. When tools are carried on man trips they shall be carried in a separate car provided for that purpose and it shall be a violation of the law for any miner or other person to carry his tools except as herein provided."

18. Safety manholes shall be located every 50 ft. on all main haulageways and slopes.

19. Man or refuge holes at entry switches on main haulage slopes will be arranged as shown in Fig. 20. Manholes shall also be provided at all heading switch positions upon which haulage is mechanically operated.

20. At crossings of all regular traveling ways and locomotive haulage roads, and on partings, the trolley wire shall be protected by a guard which shall be supported in the manner shown in Fig. 21.

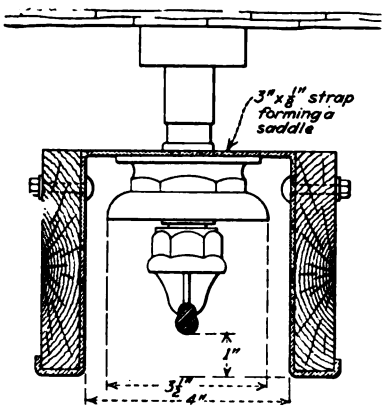

Fig. 21—Trolley Wires Are Guarded

This method of protecting trolley wires is used where a travelway crosses under a trolley and also at partings.

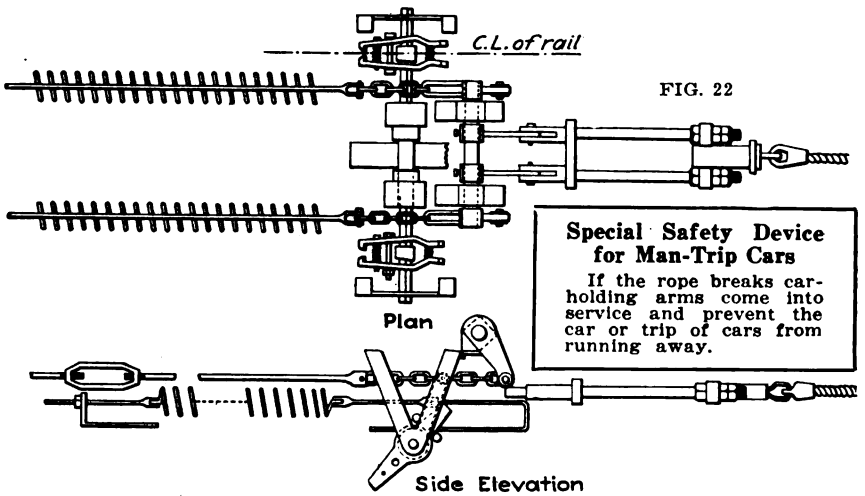

FIG. 22

Special Safety Device for Man-Trip Cars

If the rope breaks car-holding arms come into service and prevent the car or trip of cars from running away.

21. At all mines where man trips are handled by hoists on slopes, the man trip shall be provided with a safety device which will prevent the trip from running away in the event of breakage of the hoisting cable, or the trip becoming uncoupled. These devices shall conform to Fig. 22, details of which may be obtained from Drawing P-126, on file in the chief engineer's office.

22. All slopes including panel slopes being driven to the dip in development shall be protected by a safety switch which shall conform to Fig. 23.

23. At the slope entrance to each mine there shall be installed a safety

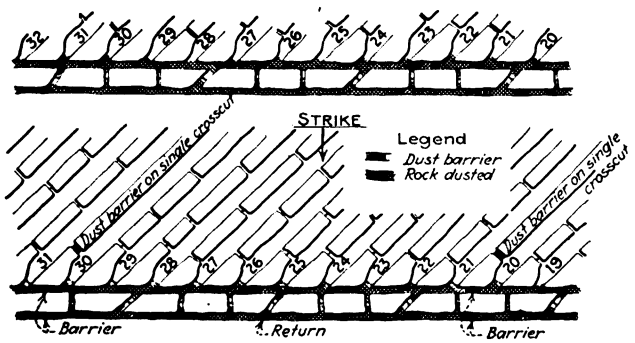

FIG. 19

A Protecting System

In mines where operations are carried on by the room-and-pillar method, dust barriers are placed every ten rooms apart. Room pillars at these points are cut by one crosscut only and a barrier is placed therein.

*This is the fourth of a series of articles giving the Code of Standards put into effect by the Union Pacific Coal Co., at its operations in Wyoming. The first three articles appeared in the issues of Dec. 10, 17 and 24, and the remainder of the code will be published in future issues in this form that permits of easy filing.

Digitized by Google

block that shall conform in plan to Fig. 24.

24. The stop block for empty cars at the knuckle shall be according to Fig. 25.

25. First aid material shall be kept at all panel hoists. In headings worked by the room and pillar method, there shall be at least one complete first aid outfit, located at some central point.

26. The locations of all first aid outfits shall be designated by the presence of a blue light.

27. It shall be the duty of the mine foreman to see that first aid outfits are kept supplied with all necessary material and that this shall be in good condition at all times.

28. In addition to first aid supplies at the indicated stations in the mine, all foremen, assistant foremen, fire bosses, motormen, rope runners and trained first-aid men shall carry approved pocket first aid packets at all times while in and about the mines.

29. Provision for the care of injured persons shall be made in accordance with the wage agreement as follows:

"There shall be at each mine sufficient blankets, oil, bandages, cots, etc., readily available to properly care for and convey injured persons to their homes or the hospital after an accident; said equipment to be kept in a dry place. Rooms suitable for the care of injured persons shall be provided at each mine by the company. Suitable ambulance service shall be furnished for all mining districts . . ."

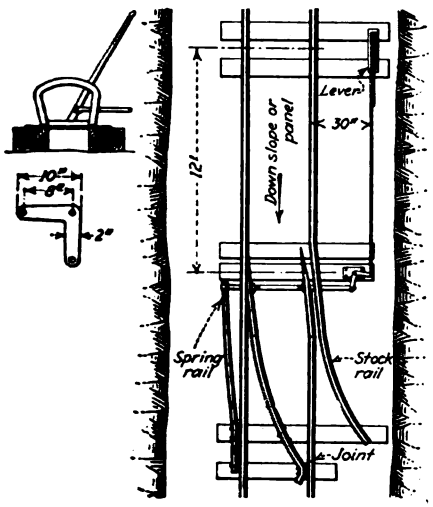
30. All mechanical haulage shall be provided with efficient head and tail lights.

Wyoming Compiled Statutes.—"Each locomotive employed in underground haulage in a coal mine shall be equipped with an efficient gong and with an efficient headlight, both of which shall be maintained in good operating condition. Motormen must use the headlight and gong in a way to effectively warn persons of danger. When mine cars are lowered on slopes, or when pushed by a locomotive underground, an efficient trip light, maintained in working order and kept lighted, shall be carried on the front end of the forward car in a position where it may be plainly seen by persons ahead of same. When loaded or empty mine car trips are being pulled by locomotives or animal power through entries or haulageways an efficient trip light, maintained in working order and kept lighted, shall be carried on the rear end of the last car at all times. A marker board, with an area of not less than one foot square, painted white and kept clean for visibility, may be substituted for the trip light on trips which are being pulled by locomotive or animal power; provided, however, that this section shall not apply to the gathering of cars or to any hauling of cars in a mine except on slopes and main entries."

(NOTE: No trip marker other than a red electric light will be permitted or used in the mines of the Union Pacific Coal Co. The same to be carried on the inby end of all slope trips.)

Sec. 2—"Any person or corporation violating any of the provisions of this act shall be deemed guilty of a misdemeanor and be subject to a fine of not more than $200."

31. Wherever a traveling way crosses a main haulageway, there shall be installed gates that will swing inward and away from the haulageway. These gates shall be provided with springs or weights, which will make them positive in closing. (See Fig. 26.) Gate locations shall be designated by the safety engineer.



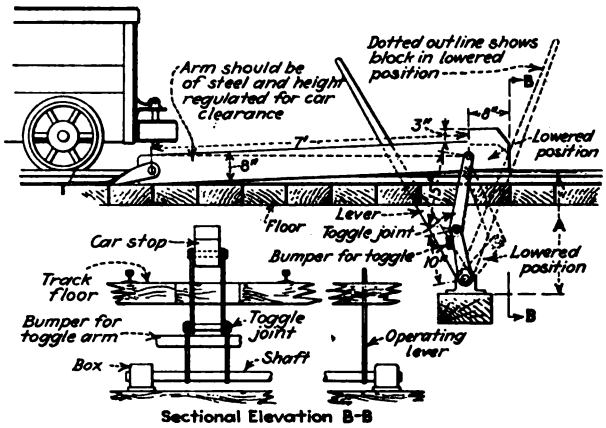


Fig. 23—Derail Switches for Slopes

Normally this derail device stands in such a position that a car coming down the grade is prevented from passing this point. Whenever a car or trip of cars is to descend the grade, the switch lever must be held so that the straight track can be used.

FIG. 25

Stop Block for Empty Cars

A lever-operated bumper block arranged so that a car may either be stopped or permitted to pass through is constructed as shown in the above illustration. The movement of the stopping block may be increased by shortening the distance *A*.

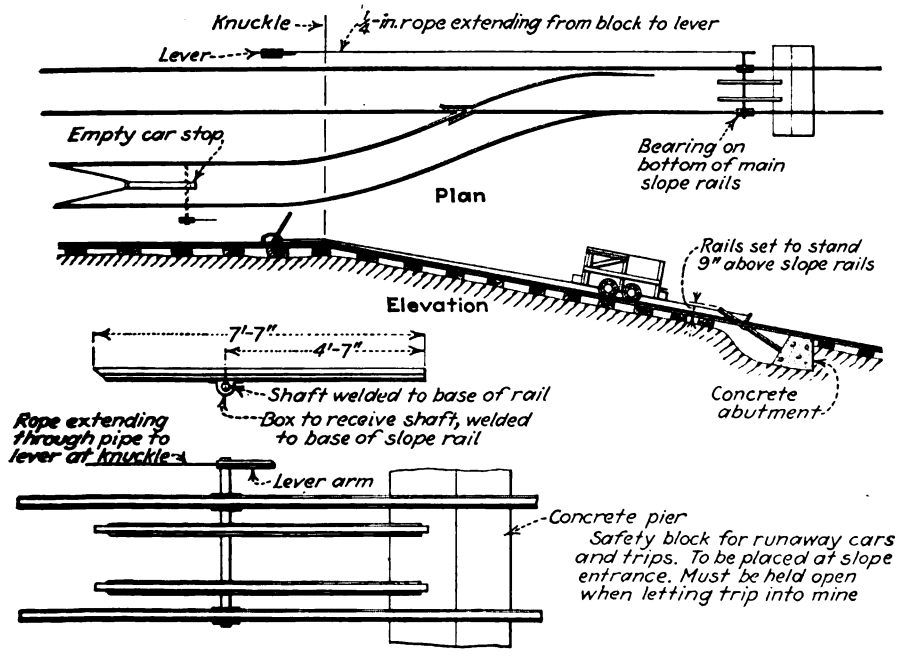

Fig. 24—Safety Block Checks Runaway Slope Trips

Slope entrances are protected so that runaway cars or trips cannot enter the mine. A control lever at the knuckle operates a safety stop located between the rails on the graded section leading to the inside workings.

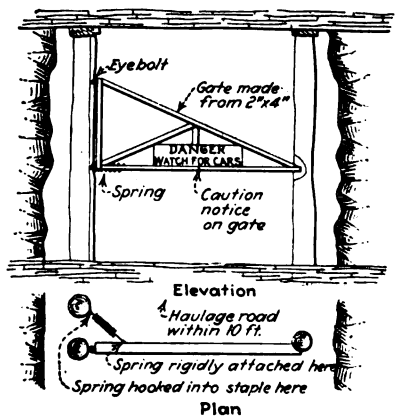

Fig. 26—Danger Warnings

When travelways enter upon or cross main haulage roads, gates which swing away from the main road are provided. These gates are hung either so that they close of their own weight or are assisted by a spring.

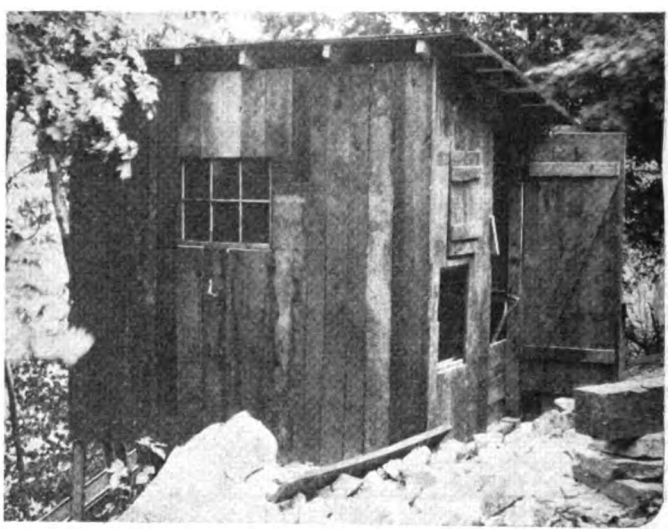
Tennessee Mine Saves $1.75 Per Ton on Sand

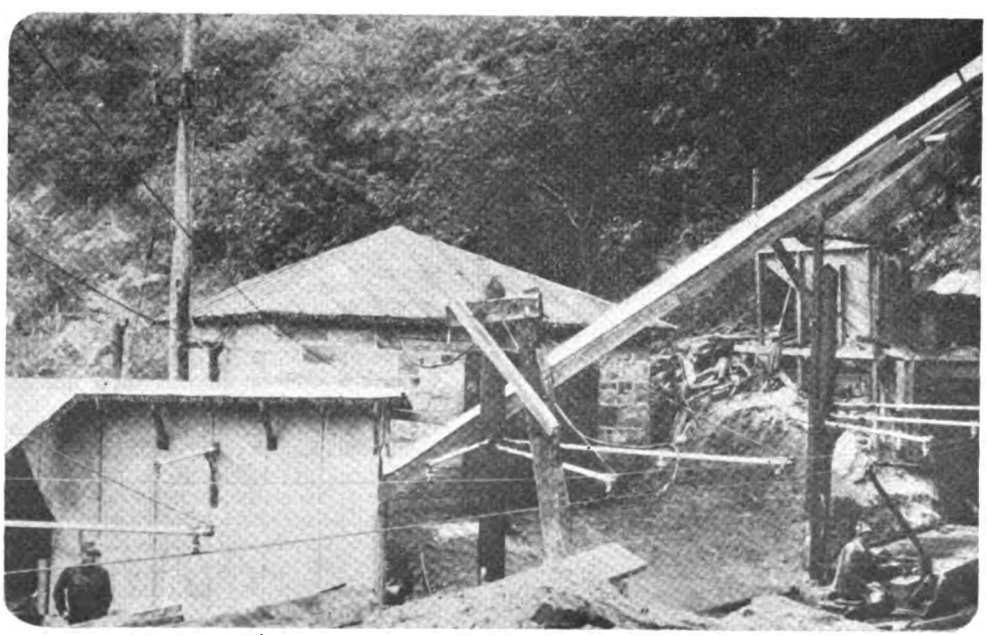
For Locomotives, Crushed Sandstone Proves a Substitute for River Sand — Suitable Stone Quarried Near Drift Mouth

An ideal abrasive material for applying on mine rails to prevent slipping of electric locomotives would be one which is an electrical conductor, one in which the particles would not be crushed by the weight, and one which would have a low cost delivered to the locomotive.

When the material is applied sparingly, which it should be for the best effect against slipping, the conductivity is an unimportant factor. For that reason, and because of the abundant and widely distributed supply of Nature's ready-made material; plain sand as found in the rivers is the abrasive used on a large per cent of the mine locomotives. However, even washed river sand may have a camparatively high cost when delivered to the sand house at the mine.



At the New Caryville Coal Co., Caryville, Tenn., river sand cost $2 per ton f.o.b. mine, and $3 per ton by the time it was put into the sand house. Labor of unloading from the railroad car, hauling up a 6,000-ft. monitor plane, and shoveling into the sand house near the drift mouth made up the extra dollar. Aside from the high cost of the river sand, the trouble and inconvenience of handling it were, in themselves, reason enough for turning to a substitute made from a seam of sandstone which outcrops about 40 ft. above the main drift mouth. It was found that this served the purpose practically as well as the river product, so it is now used exclusively.



The rock is easy to quarry, requiring little shooting. It is hauled by wheelbarrow about 75 ft. to the crusher house which is a small building, about 6x10 ft., located at the head of a chute leading down to the sand house.

The crusher is driven by a 20-hp. motor. The product from the crusher decends by gravity through the chute to the sand house where it is screened, dried if necessary, and delivered to the locomotives. G. W. Pickle, superintendent of the New Caryville mine, states that the sand costs about $1.25 per ton as compared to the three-dollar cost of the sand formerly used.

The use of crushed, local sandstone on locomotives has been tried at a number of mines, but in many of these instances has been given up because of the sand being too fine or mixed with too much binder. No doubt. however, many mines of this country are using crushed sandstone, instead of purchased sand.

Obtaining Locomotive Sand Cheaply at Home

The illustration at the top shows a part of the sandstone seam from which the new Caryville Coal Co. obtains rock for making sand for locomotives. The 2-ft. stratum at the bottom of this quarry which outcrops about 40 ft. above the main drift mouth of the company's mine, is far superior to the rock above for this purpose. The building shown immediately below, houses the crusher, a "Tarvin Pulverizer" driven by a 20-hp. motor. The stone is broken with a sledge into 6- to 8-in. lumps before it is fed to the pulverizer. From the crusher, a chute conveys the sand to the sand house, shown in the illustration at the left. The sand obtained in this manner costs $1.25 per ton delivered in the sand house as compared with a cost of $3 per ton for river sand.

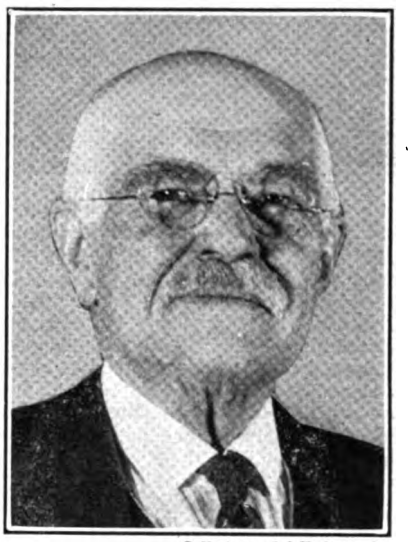
News Of the Industry

Hard-Coal Miners and Operators Resume Joint Wage Conferences; New York Labor Makes Peace Plea

The anthracite joint wage conferences were resumed at the Union League Club, New York City, on Tuesday of this week, with both sides professing to be in a receptive mood, but with neither operators nor miners giving any indication that they had receded from the positions held when the conference recessed over the holidays on Dec. 31. In the interval between the two sessions, however, outside pressure to reach an agreement has been increasing. This, the optimists believe, may be effective enough to hold the conference together until a new contract is signed. The nearest approach to a confirmation of this view was the fact that the joint sessions were still continuing at the time this issue of *Coal Age* went to press. That—and nothing more.



Outside pressure to end the strike has been coming from several forces. On the eve of the conference this week business interests of the Scranton region telegraphed representatives of both the miners and operators that "public patience has reached the breaking point" and that the public "would impose its penalty upon those who contribute to a continuation of the situation with its deplorable inhumanities." Members of the Scranton Ministerial Association met with John L. Lewis, president of the United Mine Workers, in New York on Jan. 5 to present anew "the moral and humane aspects" of the situation. The Rev. J. J. Curran of Wilkes-Barre also appeared upon the scene. Metropolitan editorial criticism of the refusal of the union to accept arbitration has been growing more severe.

A plea for a settlement from an unexpected source was made public Monday when John Sullivan, president of the Central Trades and Labor Council of New York, appealed to Governor Smith and Mayor Walker to use their good offices in promoting a speedy and amicable adjustment of the controversy which was endangering the comfort and the health of "750,000 organized workers" in the city.

The negotiations reopened at the Union League Club on Dec. 29 started out with all the ear-marks of an endurance contest. The two subcommittees, which had not met since Aug. 4 at Atlantic City, entered into joint conference early in the afternoon and continued the session until nearly midnight. That program was repeated the next two days. By New Year's Eve the contestants were ready to call the struggle a draw and adjourned over the holiday and the week-end although both sides had expressed a determination to sit through earlier in the week.

Notwithstanding the optimistic statement made at the end of the second day's meeting that "a contract can and should be negotiated at this conference," it was the general opinion of those following the parleys that a break was imminent and that only the New Year's recess forestalled an open rupture. Fundamentally both operators and miners had held to their original positions. If there was any concession on the part of either side from the stand taken at the opening of the joint conferences last summer, the public was not let in on the secret.

The Markle plan, submitted by the chairman of the conference, served to emphasize this point. The miners attacked it as arbitration in a new guise. Chairman Markle voiced the opinion that his proposal merely called for an enlargement of existing machinery for settling disputes and that in lieu of the one umpire provided for in the Board of Conciliation setup, he was

Alvan Markle

Chairman of the joint conference of anthracite operators and miners in session at the Union League Club, New York City. Mr. Markle's peace plan, printed in *Coal Age*, Dec. 31, has been the subject of much discussion since both sides resumed negotiations to settle the strike.

Real Earnings of Contract Miners In Anthracite Fields—IV

(SHIPMAN COAL CO.)

Are contract miners in the anthracite fields underpaid?

John L. Lewis, international president of the United Mine Workers, insists that they are. He has repeatedly drawn upon the reports of the Coal Commission, with their misleading figures basing earnings upon the number of starts made, to support his assertion. In a statement published in the Sept. 15 issue of the *United Mine Workers' Journal*, Mr. Lewis declared that the average was $1,700 per year, from which "there must be deducted over $200" for supplies.

Check of actual payrolls, however, tells a far different story.

For example, the Glenbrook colliery of the Shipman Coal Co. worked 282 days in 1924 and employed an average of 145 contract miners. Of this number, less than one-third worked regularly enough to appear on each of the 24 semi-monthly payrolls. Of the number so working eight men averaged $4,836.75 *net*. The lowest paid man received $1,603.58.

The average earnings by $100 groups for the 46 contract miners covered by the statistics were as follows:

Miners	Average Annual Earnings	Miners	Average Annual Earnings
8.....	$4,836.75	5.....	$2,248.42
2.....	3,273.94	4.....	2,149.81
1.....	2,942.27	2.....	2,071.69
1.....	2,867.97	2.....	1,935.16
4.....	2,651.71	1.....	1,896.78
5.....	2,553.76	1.....	1,797.76
4.....	2,419.73	1.....	1,603.58
5.....	2,365.13		

The average earnings for the entire group of 46 men were $2,806.20. Only five men, it will be noted, earned less than $2,000 and nearly 20 per cent of the group earned over $3,000.

At this colliery the unskilled labor rate is 58c. per hour. This, it is asserted, is practically double the prevailing rate in other industries.

Union Representatives at Hard-Coal Parley

Mine worker members of joint conference about to leave hotel in New York for Union League Club, where negotiation sessions are being held. Left to right: Ellis Searles, editor *United Mine Workers' Journal*; C. J. Golden, president, District 9; Andrew Mattey, president, District 7; Thomas Kennedy, secretary-treasurer of the international union; John L. Lewis, international president; Philip Murray, international vice-president.

suggesting three. This explanation, however, failed to move Mr. Lewis and his associates, who reiterated that they were willing to have a third party interpret a contract once negotiated, but were adamant in their opposition to any plan which permitted a third party to write the original contract.

Union spokesmen, however, showed enough interest in the Markle program to seek further light on how it would work. Reviving one of the arguments urged at Atlantic City, they inquired whether freight rates would come within the scope of the inquiry of the Markle plan commission. The chairman said "no." Then they wanted to know whether the commission could fix selling prices. To this the answer was made that such action would be clearly illegal and was not contemplated in the plan.

Both operators and miners agreed upon the desirability of a long-term agreement. Where they split was on the question of wage revisions. The miners demanded that any wage rates written into a new contract continue throughout the life of the agreement. The operators, with the effects of the Jacksonville agreement known, insisted that any long-term contract incorporate within itself provisions for periodic revisions of the wage rates should economic conditions justify such readjustments.

The last word on the situation up to the New Year's adjournment was contained in the following official statement issued late Dec. 31:

At today's session of the conference the operators presented further arguments for a long-term contract, assuring continuity of production with some form of arbitration to prevent possible deadlocks. The operators stated that they do not seek wage reductions but believe it necessary to provide for adjustment that economic conditions may require in the future. They said their purpose is to avoid suspension of production and that they are willing to adopt any means that will secure this result.

The miners asserted that the provision of the Pinchot plan for a board of investigation and award would afford the operators the protection which they say they need.

The operators suggested a modification of the Markle plan so that after investigation the board, in case of disagreement, would make recommendations to the joint conference within 30 days. If, following these recommendations, no agreement was reached within the succeeding 30 days, the board would decide the matters in dispute. The operators claim that this would probably make arbitration unnecessary, believing that the recommendations would dispose of the matter.

The miners claim that in the final analysis this proposition provides for arbitration, as does the Markle plan. On this ground they object to both proposals. The miners offer to write two-and-a-half or five-year contract upon definite terms for either period, and no arbitration.

Representatives of the operators and miners have since Tuesday tried diligently to find a basis of adjustment of their differences. Both sides have sincerely applied themselves to this task.

Questions have arisen which require more analysis than is possible in the conference. For this reason the conference has agreed to recess until Tuesday, Jan. 5.

No Distribution Census Yet

No appropriation for a census of distribution will be asked at this time, Secretary Hoover has announced. Until there is abundant proof that such figures are desired there is no chance of obtaining a vote of funds, he feels.

It took five years of sustained effort to get the census of manufacturers. A census of distribution, however, is just as important as a census of production, Mr. Hoover believes.

Pittsburgh Coal Co. Opens Worden Mine

Operations have been resumed at the Worden Mine of the Pittsburgh Coal Co., located near McKeesport, Pa. Work recommenced Jan. 4 under the provisions of the 1917 wage scale. This is the sixth operation in the Pittsburgh district that the company has reopened in recent months, all under the terms of the 1917 agreement. Preparations have been under way for several weeks to start work at this mine.

Renew Attack on Lake Rates

Reopening of the question of the competitive adjustment of rates from mines in the Appalachian region to the Great Lakes for transshipment to the Northwest has been asked in petitions filed with the Interstate Commerce Commission a few days ago. This action was taken by the Pittsburgh Coal Producers' Association and the Pittsburgh Vein Operators' Association of Ohio, complainants in the Lake Cargo Coal cases dismissed by the Commission last summer.

In that proceeding complainants attacked the relative adjustment to the lakes, contending that the rates from the Pennsylvania and Ohio fields were unreasonable *per se* and unjustly discriminatory against that traffic when compared with rates in effect from southern West Virginia and eastern Kentucky mines to the lakes. The examiners who heard the testimony in the case filed a tentative opinion recommending reductions in the rates from the Ohio and Pennsylvania fields complaining and a number of other readjustments in competitive differentials. The Commission, however, disregarded these recommendations and dismissed the case.

This decision was recently referred to in unfavorable terms by Senator Reed of Pennsylvania in his attack upon the failure of the administration to give the Keystone State representation on the Commission. Governor Pinchot several weeks ago urged a reopening of the case and promised state aid to the protesting operators.

Attempt to Blow Up Western Maryland Ry. Bridge Wrecks High-Tension Pole

A pre-holiday demonstration against non-union coal operators in northern West Virginia was marked by an attempt to destroy the bridge across the West Fork River at Bingamon on Dec. 23. A piece of flying iron snapped the pole shown above, which is on the far side of the river. The bridge was damaged to the extent of about $5,000, but repairs were completed and service was restored by Dec. 28.

Adoption of Arbitration In Hard-Coal Peace Is Hope of Federal Officials

By Paul Wooton
Washington Correspondent of *Coal Age*

Representatives of the public, both on Capitol Hill and in the executive departments, for the most part seem to be of the opinion that the anthracite operators should agree to no truce or permanent settlement that does not recognize the principle of voluntary arbitration of all matters under controversy. It is felt that neither the public interest nor the long-time interest of the industry itself would be served by a quick settlement, which doubtless could be reached were the operators willing to waive the principle of arbitration. To resume work at the status quo would mean, many believe, that the four months' travail would go for naught.

It is recognized that the operators are in a strong position and never before have had such an opportunity to provide for continuity of production.

There is an ill-disguised eagerness on the part of the miners and their friends for a quick settlement. President Green, of the American Federation of Labor, predicts a prompt return to work. His forecast is hailed as a promise by the White House spokesman. The utterance suggests that there is a feeling of discomfort at Federation headquarters in connection with this strike. That it proved to be unpopular is thought not to be surprising to Mr. Green.

The weakening of the mine workers is attributed to the failure of the settlement plan proposed by Governor Pinchot to attract public support and to the realization that little could be expected from the special session of the Pennsylvania Legislature.

Back of these immediate causes has been the remarkable defense put up in the anthracite-consuming area. Even the recent low temperatures failed to reveal any disposition to beg for mercy. Ample evidence has reached Washington that this demonstration of ability to meet the situation without an appeal for federal help has excited the admiration of the entire country. Much of the credit for this accomplishment is being given the leadership in the campaign for the use of substitutes. Success could not have been attained, it is pointed out, had not the people been directed effectively and their determination kept up by frequent communications emanating from those directing the campaign.

One of the most recent statements of the Emergency Fuel Administration of Massachusetts is cited as typical of many well selected messages calculated to put the people on their mettle. In this statement the full administration pointed out that "there is no coal situation outside of the Northeast." Attention was called to St. Louis, which formerly was a regular customer of the anthracite industry and took 500,000 tons of its product each year. Last year St. Louis bought only 40,000 tons of anthracite because "the people have learned to burn soft coal, which is costing them one-half the price they were paying for anthracite."

The attention the people have given to such doctrine is one of the reasons why it is regarded in Washington as so necessary for the anthracite operators to insist upon a plan that will guarantee against interruption of production. It is believed to be the only course that will protect the industry's $800,000,000 investment, its $2,000,000,000 annual turnover and its payroll on which 155,000 names appear.

There is a disposition in Washington also to give generous credit to the foreign language priests for the part they have played in preparing the way for settlement. It was they who revealed to the union leaders that their men, particularly those in the Wyoming region, were ready to go back to work. None would be surprised to learn that the priests went even further and told the union leaders that they themselves would advise the men to go back unless steps were taken at once to reopen peace negotiations. Under present conditions it is probable that the men would be more inclined to take the advice of the priests than to follow the union leaders.

Despite published reports to the contrary, it was stated on Dec. 31 at the Interstate and Foreign Commerce Committee of the House that no arrangements had been made for an inquiry into the anthracite situation. Representative Treadway, who is urging such action, admits that he has been unable to obtain any promise as to what will be done, but that he fully expects that hearings on his two bills will be accorded promptly.

T. M. Dodson

Has resigned as vice-president of the Pittsburgh Coal Co. in charge of operations. Mr. Dodson, who went to Pittsburgh several months ago, will return to Bethlehem, Pa., to his own company, the Weston Dodson Company. He will retain a connection with the Pittsburgh Coal Co., however, as a consulting engineer.

Trade Commission Segregates Trial Examiners

Trial examiners of the Federal Trade Commission have been made an independent division and are to be designated hereafter by the chief of that division, according to a statement recently released by the commission. The preparation of all stipulations in settlement of applications for complaint also has been placed in this division.

This change does not mean an increase in personnel or duties, but only the assignment of those related duties where they logically belong. Every one of the duties specified or contemplated to be performed by this new division is now performed by someone in the several departments. Under this new order of things better efficiency will be acquired and the trial examiner's staff will function more economically.

Heretofore the trial examiners who presided at the hearings in the taking of testimony were designated by the examining division which investigated the cases. Some criticism has been made that the division which investigated and recommended complaint should not select the trial examiner to try it.

Johnstown Celtic Glee Club that Sang at the Coal Mining Institute of America Dinner

The men in this choral club are all employees of the Bethlehem Mines Corp. at Johnstown, Pa., and work in and around the coal mines. Back row, left to right: P. Hughes, trackman; R. Tremain, foreman; H. W. Plotts, foreman; D. Lees, miner; W. Regittko, clerk; C. Ellis, salesman; C. L. Strayer, inspector; W. T. Roberts, miner. Center row: T. Griffith, miner; E. Jones, salesman; E. Dodd, miner; D. A. Lewis, supply clerk; B. Hughes, repairman; E. Roberts, miner; T. L. Jones, machinist; J. Thomas, foreman. Front row: E. C. Roberts, miner; D. Jones, miner; W. E. Ellis, foreman; Prof. J. L. Jones, clerk; Miss Annie Hughes, stenographer; B. E. Henderson, manager; H. B. Mishler, transportation; E. Ellis, clerk, and J. Jones, miner. The fine appearance of the glee club, almost every man attired in a dinner coat, attracted almost as much attention as the excellence of their music.

162 Die in November From Mine Accidents; Ratio to Output Higher

Accidents at coal mines in the United States in November, 1925, resulted in the loss of 162 lives, according to information received from state mine inspectors by the U. S. Bureau of Mines. Three of the fatalities occurred at anthracite mines in Pennsylvania; the remaining 159 were at bituminous mines throughout the country. As the output of bituminous coal in November was 50,780,000 tons, the fatality rate for the month, for the bituminous industry, was 3.13 per million tons, as compared with 2.63 in the preceding month and 2.85 for November a year ago. The anthracite rate for November last year was 7.72; no corresponding rate is available for November, 1925, because of the stoppage of work at the mines.

The November fatalities brought the total number of deaths at all coal mines during the first eleven months of the present year to 1,934 as compared with 2,203 during the same period last year. The accident cost of the coal, as represented by deaths per million tons, was 3.64 as against 4.25 last year. For bituminous mines alone the 11-month rate was 3.27 as compared with 3.99 for the first 11 months of 1924; for anthracite mines alone the rate was 6.40, including dredge coal produced since the strike, as compared with 5.65 during the same 11 months last year.

An explosion at Madisonville, Ky., on Nov. 13, in which five lives were lost, brought the total number of major disasters during the first 11 months of 1925 to 11 with an aggregate loss of 204 lives. During the corresponding months last year 9 similar disasters occurred with a loss of 452 lives. The per-million-ton death rate, based exclusively on major disasters, was 0.38 for January-November, 1925, compared with 0.87 for those months in 1924.

An examination of the causes of the accidents in 1925 shows a slight reduction, as compared with 1924, in the per-million-ton death rates from falls of roof and coal, haulage, and explosives, and a marked reduction for explosions of gas and coal dust. The rate from electricity remained unchanged. The comparative rates per million tons were:

	Jan.-Nov., 1924	Jan.-Nov., 1925
All causes	4.251	3.635
Falls of roof and coal	1.835	1.791
Haulage	.608	.592
Gas or dust explosions	1.009	.528
Explosives	.179	.163
Electricity	.143	.143

Mexican Mine Blast Kills 42

The bodies of forty-two victims had been recovered on Dec. 31 from a Mexican National Ry. coal mine at Palau, State of Coahuila, where an explosion occurred Dec. 26.

A score of miners were injured and it is believed that more victims are in the mine. The blast is believed to have been caused by the breaking of a miner's safety lamp, which ignited gas. Palau is about eighty-five miles from Eagle Pass, Texas.

West Virginia Coal Output 101,943,765 Tons in 1925

Production of 101,943,765 tons of coal in West Virginia in 1924 established a new high record for the state, according to statistics compiled by R. M. Lambie, chief of the West Virginia Department of Mines. Owing to a change made in the mining laws by the Legislature last spring the calendar year is now used in compiling production statistics instead of the fiscal year, and this will simplify and expedite the collection of data.

McDowell County, as usual, led with an output of 17,860,908 tons, closely followed by Logan County, with shipments of 17,659,307 tons.

The Island Creek Coal Co., of Logan County, was the largest individual producing company in the state, having an output of 4,951,399 tons, or more than a fourth of the entire output of the Logan district. The Consolidation Coal Co. ranked second, with 4,131,477 tons. Nine companies in the state produced over one million tons each, and ten companies produced more than 25 per cent of the state's entire tonnage.

The companies producing more than one million tons each besides the Island Creek and the Consolidation companies, were the United States Coal & Coke Co., Pocahontas Coal Co., West Virginia Coal & Coke Co., Kingston Pocahontas Coal Co., New River & Pocahontas Consolidated Coal Co., Elm Grove Mining Co. and the Bethlehem Mines Corporation.

Coal-Mine Fatalities During November, 1925, by Causes and States

Government Wins Case on Commandeered Coal

The United States Government won its case in the second trial of the suit of the White Oak Coal Co. against the government for money claimed to be due for coal commandeered for the use of the navy during the world war. Judge George W. McClintic on Dec. 11 directed a jury in the U. S. District Court for the southern district of West Virginia to bring in a verdict for the defendant. About a year ago the plaintiff was awarded a judgment for $790,000, which was appealed to the Circuit Court of Appeals at Richmond.

Approximately 210,000 tons was supplied by the company and the government is said to have fixed the price at $3.08 per ton. It was contended by the plaintiffs that the price continued to rise before the order was filled until at one time it reached $16.50 per ton.

The government contended that it had a contract at the price made, though the coal was purchased on a commandeering order. It was the contention of the coal company that it had the right under the terms of the order to protect the price and to make claim for the difference. The White Oak Coal Co. was the sales agency for fifteen coal mines in Raleigh and Fayette counties, West Virginia.

Locomotive Fuel Cost Drops Slightly in October

The average cost of coal used by Class 1 railroads in locomotives in transportation train service during October, 1925, was a little below similar figures for September, according to a report by the Bureau of Coal Economics of the National Coal Association, based on figures released by the Interstate Commerce Commission.

The average cost of this coal, which includes any freight charges paid on it by the consuming railroads, is as follows: Eastern district, $2.65 per net ton; Southern district, $2.19; Western district, $2.99; entire United States, $2.66. These figures are 2c. below the average for September in the Eastern district; no change in the Southern district; 1c. lower in the Western district, and 1c. lower for the entire country.

When comparison is made with the averages for October, 1924, a decrease of 24c. appears in the Eastern district; 15c. in the Southern district; 16c. in the Western district, and 20c. in the United States as a whole. Thus the Class 1 railroads of the United States saved nearly $2,000,000 in locomotive coal costs because of the decline in cost since the previous October.

The New York Public Service Commission has approved a new rate of the New York Central (East) on coke, coke breeze and coke dust from Buffalo, East Buffalo and Harriet to Leroy and Stafford of $1.39, a reduction of 13c. per net ton, effective Jan. 19, 1926.

By special permission of the commission a new rate of the Schoharie Valley R.R. has been approved on coke in either direction between Schoharie and Schoharie Junction, 60c. per net ton, effective Dec. 17.

Wolfe Resigns Secretaryship

Officers of the Winding Gulf Operators Association, with offices at Beckley, W. Va., on Dec. 30 announced the acceptance of the resignation of George Wolfe as secretary, which was tendered some months ago. The identity of Mr. Wolfe's successor has not been made public. Mr. Wolfe has been the secretary of this association for the past six years and in leaving Beckley and Raleigh County he is bringing to a close thirty years of activity in the smokeless coal fields of southern West Virginia. Mr. Wolfe's acquaintance and knowledge of the smokeless industry of West Virginia is wide and he has long been considered an authority on coal matters in this section. Accompanied by Mrs. Wolfe he left for a vacation in the South. "I am out of coal entirely," said Mr. Wolfe, "and have not a cent invested in the industry. I consider coal a good thing to stay out of for a while. I have under consideration several propositions which I may take up later, but none of these is directly or indirectly connected with the coal business."

Mistrial in Coronado Case

A mistrial resulted in the third trial of the Coronado Coal Co.'s $2,200,000 anti-trust suit against district 21, United Mine Workers (Arkansas), local unions and individuals, when the jury at Fort Smith, Ark., failed to reach an agreement late in December. After 72 hours of deliberation the jury reported that it was still in a deadlock and was discharged. Judge Frank A. Youmans probably will reset the case for trial. After eleven years and three months in the federal courts the case is again on the docket for trial before a jury.

Three juries have heard the testimony. The first, in 1917, brought in a verdict for the plaintiffs for $20,000 actual damages. That judgment was reversed by the Supreme Court of the United States on the grounds that a conspiracy to restrain interstate commerce had not been proved.

Pattison & Bowns in Deal

Full control of Pattison & Bowns, Inc., New York City, coal distributors, was acquired Dec. 28, by the United States Distributing Corporation, through the purchase of a one-fourth interest from Burns Brothers. The corporation had previously owned three-fourths of Pattison & Bowns, Inc., which is the distributor in the East for the anthracite output of the Pennsylvania Coal Co. and the Hillside Coal & Iron Co., both owned by the Erie R.R.

Coal River Company Forms Sales Organization

A coal sales corporation known as the Fuel Distributors, Inc., through which the entire production of mines of the Coal River Collieries Co. will be sold, in addition to heavy tonnages from other fields, was organized last week, according to an announcement Dec. 31 from the office of J. T. Dunigan, Huntington, W. Va., president of the collieries company, which is controlled by the Brotherhood of Locomotive Engineers.

The new concern, which started operation Jan. 2, began business with a contracted tonnage of almost 2,000,000 and expects to swell this to 3,000,000 tons during the first year, establishing an annual business of more than $5,000,000. The headquarters will be maintained in the Brotherhood of Locomotive Engineers' Bank Building in Cleveland with a branch office at Huntington.

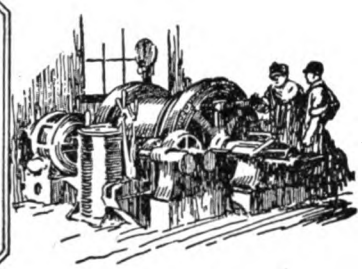
Fuel Distributors, Inc., organized under the laws of Delaware and capitalized at $200,000, fully subscribed, completed its organization at a meeting in Cleveland Dec. 29, when Fred L. Smith was elected to the presidency; Walter Myers, vice-president; G. G. Hoffman, secretary-treasurer, and Harry E. Moran, Charles Lindquist, W. E. Dunigan and Mr. Huffman, directors, with Mr. Smith as chairman of the board.

Miners Indorse Pinchot Call For Special Session

Christ J. Golden, president of District 9 United Mine Workers, said that the miners are 100 per cent back of Governor Pinchot in his call for a special session of the Legislature on Jan. 13.

In a statement he said the anthracite operators are trying to put the American miner in a "state of poverty," the same position the English miners find themselves in today.

If Governor Pinchot succeeds in putting the coal industry under the Public Service Commission, Golden said, the profits of the operators and their business methods will be exposed to the public.



C. C. & B. Sale Is Completed

Purchase by the Massachusetts Gas Companies of the old firm of Castner, Curran & Bullitt, Inc., of New York City, as well as a number of important mines in the smokeless coal fields of West Virginia—reported in the Nov. 26 issue of *Coal Age*—has been confirmed by the stockholders of Castner, Curran & Bullitt. The transfer was completed on Jan. 2, and the entire issue of stock was taken over by the New England interests. Castner, Curran & Bullitt were the pioneers in marketing smokeless coal, having shipped the first car of Pocahontas to market in 1882. Since then they have been leaders in the distribution of this coal. Lemuel Burrows, long the head of the company, retires from the presidency on the transfer of stock to the new owners, but it is understood that the rest of the personnel of the old organization will remain.

Practical Pointers For Electrical And Mechanical Men

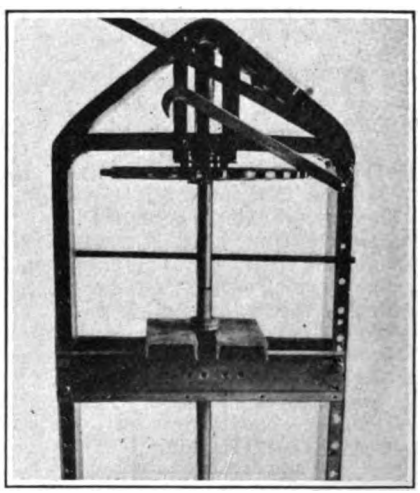
Hammer Used to Surface Arc-Welded Locomotive Tires

Repairing worn locomotive tires by filling is practiced at comparatively few mines, and is accomplished by means of an arc welder. With this method it is not considered practical to put the tires back in service without smoothing the welded surface, so in most cases they are ground or turned to the desired finish.

Turning of the larger tires requires a lathe of size seldom included in the shop equipment of a small mine. A method of handling which does not require a lathe is followed at the Nuttallburg (W. Va.) operation of the Fordson Coal Co.

At this mine, C. J. Southard, chief electrician, utilizes one end of the wheel press as part of a rack to hold the truck while filling the tires. The truck is supported by centers in the end of the axle. This brings the tires to a convenient height and leaves them free to be turned by hand as the welding progresses. At the top is fitted an adjustable surface gage which aids in filling to the correct diameter and helps to detect high or low spots.

Mild-steel electrodes ¼ in. in diameter are used for filling. The bead is laid on crosswise and when the last layer is applied each row is hammered vigorously, before it cools, to smooth the surface. This hammering adds materially to the time of welding the tire but probably takes less time than would be required to turn it in a lathe. Hammering makes the welded surface smooth enough so that the locomotive does not ride rough, and so no decrease is noticeable in tractive power.



Filling Tires by Electric Welding at a Fordson Mine

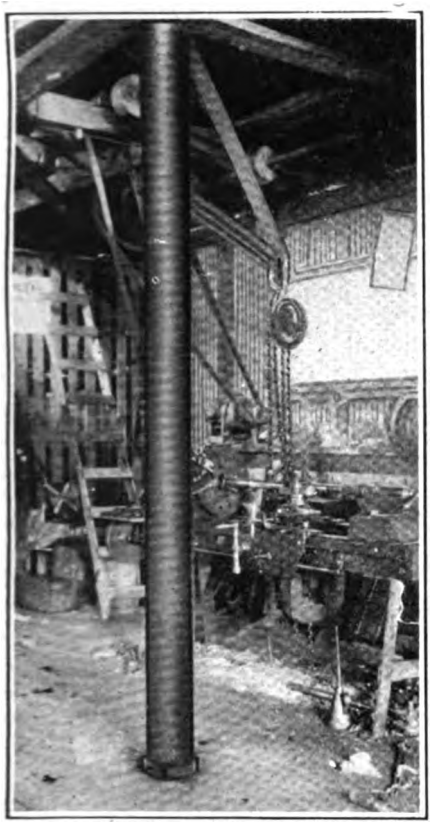
By means of a home-made attachment, C. J. Southard utilizes one end of the wheel press as a welding rack. The adjustable surface gage at the top aids in obtaining a true surface. Each cross row of the last layer of metal is hammered flat before it cools. This method of surfacing the arc-welded tires proves efficient.

Small Capacity Press Is Handy Shop Tool

By use of a press, work such as must often be done on armature shafts is accomplished in less time and with more certain results than if accomplished with a hammer or sledge. When a shop is equipped with a wheel press of 100 to 200 ton capacity this machine usually serves for handling the lighter work also. But at some mines where there is little heavy work to do no press of any kind is provided even though it would pay to have a small one.

An Improvement Over Hammering

This home-made press proves convenient for work such as renewing armature shafts.



V. D. Picklesimer, foreman of the Thealka, Ky., shop of the North East Coal Co., contributes the accompanying photograph of a home-made, hand-operated press which is used successfully for light work. The hand wheel at the top once served as a sprocket on a chain-driven machine. Fastened at the center of the wheel is a threaded steel bushing through which the movable plunger operates. A hook-shaped pawl fastened near the pivot of a long lever arm is used to ratchet the wheel around when the pressure required is such as to make it difficult to be turned directly by hand. The hook engages the teeth of the sprocket.

The one-piece main frame of the press is made from a 6-in. channel. This is braced at the top so as to withstand successfully any ordinary pressure required. The two cross-beams which form the back-stop are adjustable through a distance of several feet. When the photograph was taken the machine was being used to press a collar on a short piece of shafting.

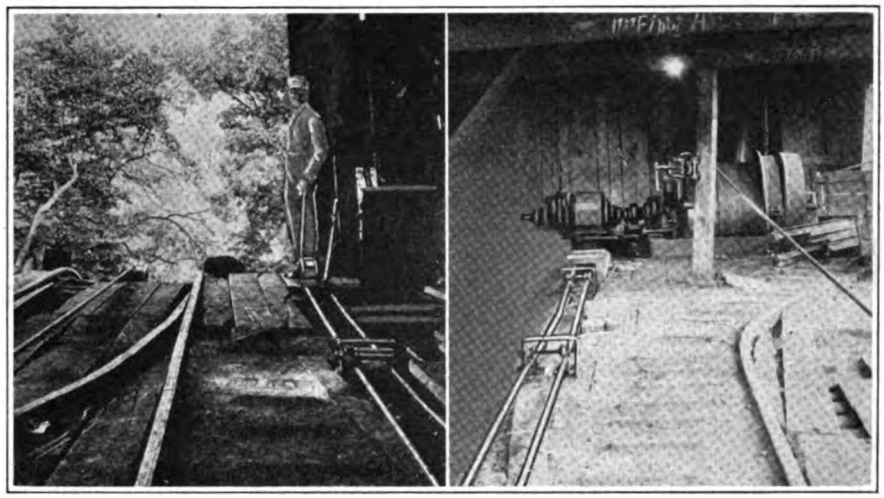
Home-Made Revolving Crane Aids Men in Mine Shop

To the list of mechanical stunts for lightening the work of handling heavy objects about coal mine shops M. S. Suffridge, master mechanic, Ajax Coal Mining Co., near Hazard, Ky., adds a home-made revolving jib crane which can be swung in a complete circle. It is shown in the accompanying illustration and consists of an 8-in. round oak post the ends of which are 1½-in. iron pins. A horizontal beam consisting of a 30-lb. rail is strapped to the post at one end and suspended from a 4½x½-in. iron strap to the post at the other. The beam is 5 ft. long. From it is hung a 1½-ton chain block which, together with the swinging beam, has lifted one end of a 6-ton locomotive.



Handles Material Easily

This tackle-block beam, now in service in a mine shop near Hazard, Ky., lifts heavy equipment at any point within its circle of operations.

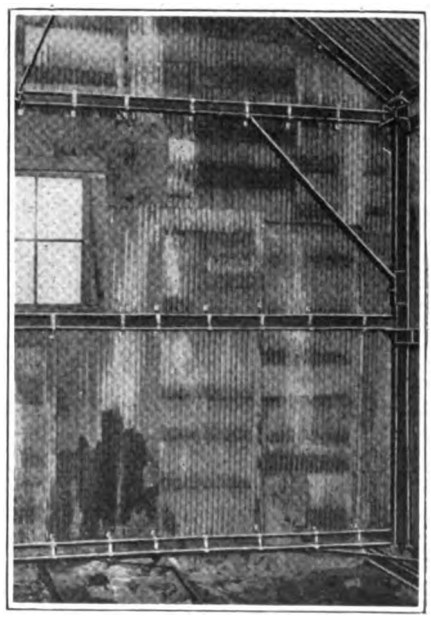
Mine Borrows Switch Control Idea from Railroads

The scheme used by railroads for remote mechanical control of track switches by long connecting rods which ride between rollers has been applied to the control of the friction clutch and brake on a hoist at the top of an incline at the Elsie No. 2 mine of the Consolidated Fuel Co., Elsiecoal, Ky. Photographs of both ends of the installation are reproduced here showing the 40-ft. connecting rods which are made of 1-in. pipe.

Remote Control Makes Operation of This Inclined Hoist Safer

The operator, standing at the top of the slope where his view is unobstructed, can meet emergencies quickly in the same way that the railroad signal towerman controls the distant switches and signals which respond to the levers at his hands.

The hoist is set back from the point where the incline track breaks to the horizontal and in the clear of the curve, as shown in one of the accompanying illustrations. The incline is steep and rises about 600 ft. For this reason it is dangerous to locate the mechanical and electrical controls at the hoist out of sight of the incline. By borrowing the switch tower idea from the railroads the Consolidated Fuel Co. has found a way to put all the control devices, mechanical and electrical, at the brink of the hill. From this point the operator has a view of the incline and can act quickly and without signals in an emergency.



Worn Rails Make Good Frame For Motor Barn

The practice of using rail instead of the more suitable and lighter shapes of material in structural work is seldom commendable from an engineering standpoint. When, however, second-hand rail of little more than scrap value is available, its use may be economical.

Utilization of waste material in such a way represents true saving, since it means turning a comparatively worthless product to a useful end. The mine is an excellent place for the practice of this kind of economy, because, as a rule, an abundance of scrap material is there available.

The entire frame of the 20x80-ft. motor barn of the Southern Mining Co., at Balkan, Ky., was made from old rail. In fact, practically all of the material came from the scrap pile. A few windows and the galvanized straps and bolts for securing the siding made up the only new material purchased for the job. The corrugated metal had seen previous service on an old motor barn, and sand house.

The building has such a neat appearance, inside and out, that, except for the uneven discolorations on the siding, there is little to suggest that it was built from scrap material. G. L. Birch, chief electrician of the Balkan mine, designed the frame and erected the structure with his "gang."

Scrap Pile Yielded this Frame

Except for the one strap-iron brace all of the framing seen in this picture of the back corner of a motor barn is of old rail. Very little new material was used in the construction of the building.

Problems In Underground Management

High Frequency and Low Voltage Make Face Illumination Safe*

By Edward Hughes
Cumberland, B. C.

Illumination of coal mine workings presents difficulties not usually encountered in other industrial undertakings. The danger from explosion attendant upon the use of any sort of lighting, particularly high intensity illumination in the presence of coal dust or methane has in most instances prevented the use of effective lighting under ground. In electrified mines, hoist rooms, pumprooms, partings and the like are electrically illuminated to a limited extent.

Within a mine where coal dust or methane are liable to be encountered, the illumination is ordinarily obtained from small units giving at best only two or three candle power. Higher labor efficiency unquestionably could be realized if better lighting could be obtained in a safe manner. This higher efficiency would entail quicker extraction, safer working conditions and cleaner coal.

The problem of obtaining better and safer illumination at the face has been attacked from several angles. The most promising of these appears to be that suggested by Professor Thornton, who has carried out a series of experiments to demonstrate the advisability of employing for this purpose alternating currents of higher frequencies than are now used for power transmission. The standard frequencies now used at coal mines are 25 and 60 cycles per second. In the course of his experiments Professor Thornton has developed several graphs showing the ignition points of various mixtures of methane and air at given voltages and amperages of both direct and alternating current. Some of these are presented herewith. Figs. 1, 2 and 3 show the ignition points of methane and air at various voltages for direct and alternating currents, also the effect of raising and lowering the frequencies of alternation upon the ignition point at a given potential. Fig. 4 shows the variation of time between maximum and minimum voltage of three frequencies of alternating currents.

It might be well at this point to call attention to the fact that an alternating current does not draw as long an arc for a given voltage and current value as does a direct current. Direct current is an electrical flow which does not vary in potential or polarity, while an alternating current is one that varies periodically at a predetermined rate from zero to maximum voltage in a positive direction, then descends to zero, passes to a negative direction, attains a maximum voltage and then ascends to zero again, commencing the cycle anew in a positive direction. The number of complete cycles per second establishes the frequency of the particular current under observation. When a direct current is broken from any cause, an arc is formed and as the voltage has a tendency to increase rather than diminish on most power lines at the moment of breaking, the arc tends to draw out rather than to cease sharply. Particularly is this the case on circuits using 200 volts or more.

As the arc is elongated the positive side of the circuit tends to heat rapidly thus aiding the prolongation. When an alternating-current circuit

*Abstract of paper entitled "A Safe Method for Lighting the Working Faces of Coal Mines by Electricity," read before a meeting of the Vancouver Island Branch of the Canadian Institute of Mining and Metallurgy.

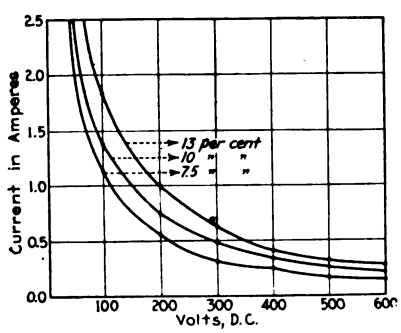

Fig. 1—Least Igniting Currents of Methane-Air Mixtures

This shows the smallest amperages of direct current that will ignite various percentage mixtures of methane and air at voltages up to 600. As might be expected small current volumes at high potential are as effective in igniting gas as much larger amperages at lower voltages.

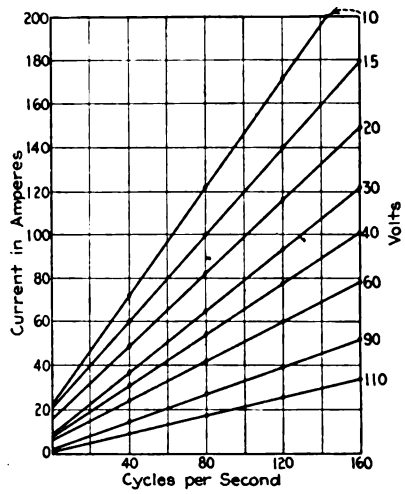

Fig. 2—Methane Ignition with Alternating Current

This reveals the high amperages that are necessary to ignite gas with current of low potential, also the increase in current volume necessary for ignition at high frequencies. With current of a given voltage the amperage necessary for ignition is almost directly proportional to the number of cycles per second.

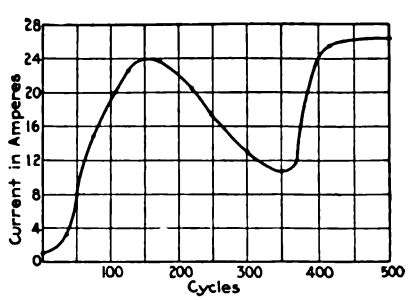

Fig. 3—Influence of Frequency on Ignition

This graph shows the effect of holding the potential constant at 200 volts but varying the frequency from 0 to 500 cycles per second. A pronounced hollow or low point occurs in this graph at a frequency of 350 cycles.

Digitized by Google

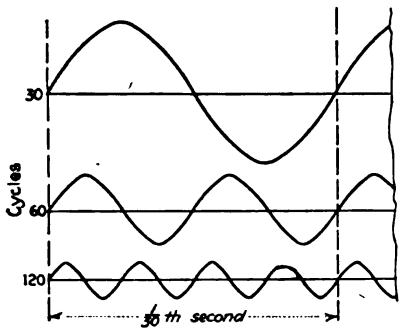

Fig. 4—Relation Between Cycles and Potential Changes

Direct current is a continuous flow in one direction at uniform potential. With alternating current the potential and consequently the direction of current flow changes direction twice during each cycle or the total number of reversals per second will be twice the number of cycles.

is broken the polarity of the ends of this circuit will vary with the frequency of the generator or source of energy supplying the current, and since the potential reaches zero and the polarity changes twice during each cycle it becomes evident why a shorter arc will be drawn than is the case with a direct current.

Company rules and state laws governing the use of electricity in coal mines allow its employment for signaling at potentials not exceeding 25 volts in either direct or alternating current, and the wires may be extended to the coal face. To obtain a source of adequate illumination it will only be necessary to use alternating current at a frequency of 150 cycles per second at 8 or 10 volts potential to energize lamps of any candle power that may be deemed sufficient by the operators.

Explains Necessary Current Volume

An illustration of the current volume necessary to energize a 21 cp. 8-volt mazda lamp such as is used on automobiles might aid in understanding this point. A 21 cp. lamp burning one-half watt per candle power would require 10½ watts. This divided by 8 volts would equal 1 5/16 amp. Referring to Fig. 1, it is found that it would require a current of 200 amp. at a potential of 10 volts to ignite a mixture of air and methane. If choke coils were placed in the lamp circuit so as to limit its possible capacity to 10 amp. it will be seen that a safety factor of 2,000 per cent would be established for ignition by electric sparking.

If the generator were designed to supply ten 21-cp. lamps a choke coil might be placed in the main circuit or the self induction of the generator could be so designed as to limit its output to 50 amp. which would afford a safety factor of 500 per cent. The voltage being low the insulation of the wiring could be of a nature that would be comparatively cheap such as a weatherproof and slow-burning covering, although some kinds of slow-burning insulation are liable to damage from acid water.

One detail in any scheme of this kind is highly important, namely, the lamp fixture. This should be so designed as to be capable of withstanding mechanical abuse, also of being easily placed in any convenient position. It has been suggested that the present miner's safety lamp be designed to hold two bulbs, one of which might be operated from the present type of storage battery, the other being energized by means of a length of flexible cord. This latter might well terminate in a plug connection, which could be plugged in to a source of high frequency current at convenient points. The objection to any method of this kind would be the necessity of the miner having to drag the connecting cord around with him as he moved from place to place.

Describes Another Method

Another, and probably a feasible method, would be to install a suitable generator in any convenient position, run the necessary wiring to such places as might be desired, as many plug outlets being placed in the circuit as might be necessary. From these points, extension cord with cab tire insulation could be run to lamp fixtures capable of being hung on a nail or stuck in the timbers as might prove most convenient. The miner could be supplied with his standard safety lamp to enable him to enter and leave the workings or move about outside his room, as occasion might demand.

The generator supplying current to such lamps would be of special design and could be arranged for either an air- or electric-motor drive, and could be placed a suitable distance from the face. Of course, steam engine drive could be used if this were desired. Such a generator could be designed to operate with permanent magnets so as to embody no moving conductors in its construction, thus eliminating collector rings, brushes and exciters. A combined motor-generator set designed to deliver 100 watts or 200 cp. of lighting capacity would weigh about 100 lb. and therefore could be shifted easily from point to point as occasion might demand. Such units could be built with dustproof ball or roller bearings.

To sum up, it would appear that high frequency alternating current might be obtained by the use of a low cost motor-generator set. This could be built to energize 20- to 30-cp. lamps in mechanically strong fixtures capable of being placed in any desired position. Current could be either plugged in or connections made permanently as the operator might see fit. Such a current supply affords a method of mine illumination that is safe for both miner and operator, whether the danger of explosion or fire be from mixtures of air and methane or air and coal dust. The whole system would be free from costly installation and operation charges.

Wooden Box Helps Advance Heading Rapidly

Advancing an entry at the rate of 709 ft. per month, by hand loading, is no easy task. This average was maintained for three consecutive months at the No. 2 mine of the Sudduth Fuel Co., at Huddy, Ky. The mine is in the Pond Creek seam, and the coal averages 51 in. in thickness. The main heading, the one advanced so rapidly, consists of three parallel entries. Driving had to be stopped every 300 ft. and a cross entry turned off on a 150-ft. radius curve.

Undercutting was done with a shortwall machine having a 7½-ft. cutterbar. Four, and sometimes five, cuts per entry, were made each 24 hr. Entries were driven 15 ft. wide and ventilation of the face was effected by a blower and wind-pipe. An interesting feature was the use of a wooden box rather than canvas. This was made up in 16-ft. sections fitted with sleeve or muff joints. The sides were formed of four ⅞x12-in. boards, giving the box an inside cross-sectional area of 100 sq.in. The lumber used cost approximately $40 per M., making the material cost for each section around $2. T. H. Huddy, general manager of the company, states that for this work the wood boxing proved to be economical and highly satisfactory. The 16-ft. sections are easy to handle and require no hangers or supports, but are laid directly on the bottom.

Book Reviews

Toured the States Checking Machine Loader

Convincing proof of the progress in mechanical loading in coal mines is furnished in "Bulletin 17, Coal Mining Investigations," published by the Carnegie Institute of Technology, Pittsburgh, Pa., which includes "Mechanical Loading in Coal Mines," by F. E. Cash, mining engineer, U. S. Bureau of Mines and E. H. Johnson, research fellow, Carnegie Institute of Technology. The speed with which this bulletin has been produced is one of its most valuable attributes, for, with a development which moves along as rapidly as mechanical loading of coal, the would-be authors who have hot-footed it round the country from Dan to Beersheba, or shall we say, from the Dodge Slope in Scranton, Pa., to the Sublet mine near Kemmerer, Wyo., find when they get back that to cover the ground satisfactorily they ought to be making another round.

It is interesting to note how complete this record is. The reader can get a good idea of about all that has been done in the United States. Not all the mines, it is true, have been visited that have mechanical loaders, but almost all kinds of devices have been covered. We note that the Paris Purity Coal Co.'s installation in Arkansas is omitted as is also the activities of the Montevallo Coal Co. in Alabama. The Phelps-Dodge Corporation, in Dawson, N. M., is not covered and at Sublet, Wyo., there are two kinds of conveyors now beside the one listed.

Inspection Reveals Value

But what a valuable symposium this book is can only be judged by its inspection. It not only describes all the devices giving their heights, lengths, widths, gages, power required, gathering system, types of conveyors, propelling mechanism, speed and crew but in many cases it gives time studies and plans of the mine workings. It also publishes a cost analysis of operation with average loading machines of the portable car-loading type and with scrapers and conveyors in thin beds. Assuming a machine cost delivered of $15,000 and machine labor at $8.14, $4.00 and $6.50 per day respectively, the cost of loading by a portable car loader is given as 40.3c., 27.0c. and 34.6c. respectively, making a saving over handloading costs of 39.7c., 8.0c. and 20.4c. respectively. Scraper equipment is recorded as costing $5,100 delivered, and with machine labor at $7.50, $4.00 and $5.50 per day the cost of loading is placed at 59.7c., 38.3c. and 48.2c. per ton respectively giving a respective saving of 40.3c., 11.7c. and 27.8c.

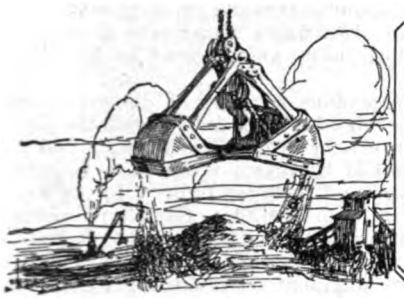
The industry is greatly indebted to F. E. Cash and E. H. Johnson, to the Advisory Board for the Co-operative Mining Courses of the Carnegie Institute of Technology and to the U. S. Bureau of Mines for the preparation of this little volume. It contains 113 pp., is 6x9 in. in size and sells for $1.

Mainsprings of Men

Poincare, says a recent Parisian epigram, knows everything, everything, and understands nothing, but Briand knows nothing, nothing, and understands everything. Something, such as has been said of Briand, might be said of Whiting Williams, author of a recent book entitled "Mainsprings of Men." The reviewer has made no count, but if there are a half dozen figures in the book he will be surprised.

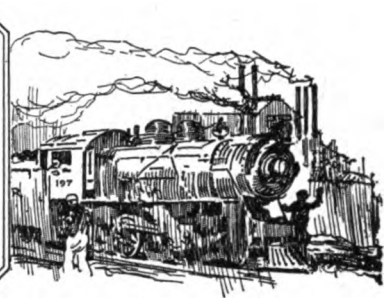
Mr. Williams has traveled far and wide and worked entirely incognito and unsuspected in all manner of industrial plants, including many coal mines, and in many countries. He knows the mind of the worker and can quote his very words. He can cause the reader to see the worker's point of view. Perhaps the reader could dispense with this book altogether if he could look into his own heart and impulses and judge of other men's "mainsprings" by his own. But that he cannot do without some intelligent explorer like Whiting Williams to show him the way.

Mr. Williams' first chapter is on the immediate need of the laboring man for his pay envelope, a need so pressing that he is not interested in delayed bonuses, thrift and group insurance. These attract only the men who are better paid and are able for that reason to look ahead.



Then follow two chapters on working conditions and caste. Those capitalists who have worked their way up will recall that every time they rose, the honor of the better job was as large an item as the increased pay and that often the status, even without authority, of the job is so important as to make men seek it even at a decreased rate of remuneration. The undesirability of the job usually determines the class of men in it and so tends to make the caste distinction the more obvious. When the wage rate is changed relatively the caste alignment is revised, and dissatisfaction results. But danger and hard labor in a job is not a deterrent but rather a source of vainglory. The cry, "You ain't got 'guts' enough for this job" shows the attitude of the worker to this feature of his work.

The Superiority of the Miner



"In a Welsh coal town," says Mr. Williams, "the 'colliers' as they came down the street at the end of a shift were always grimier than those who only helped those experts by shoveling, not coal, but mud or rock. So because the colliers were immediately more important than laborers, one way we had of showing our importance on the street was to get as black as possible. That, however, did not keep every coal worker in the town from figuring, along with all the other miners in Christendom, that he was superior to any ordinary factory hand because as a miner he was in the habit of taking a daily bath!"

The "Worker and His Organizer" and "The Worker and His Employer," "The Wish for Worth" and other like chapters follow. At the end of each chapter are "Problems" for solution based on the foregoing considerations; problems such as all employers must solve frequently, but they don't involve figures quite so much as principles. After all, wages are not the sole consideration in economic production; the will to work, the ability and readiness to co-operate are often as big a factor as the wage scale. Mutual regard in industry is as fateful as rates of pay. The worker's mind is more important than his body. How he thinks, what he thinks, why he thinks when he thinks is the subject of "Mainsprings of Men." The book has 311 pages, 5½x8¼-in. and is published by Charles Scribner Sons, Fifth Ave., New York City. The price is $1.50.

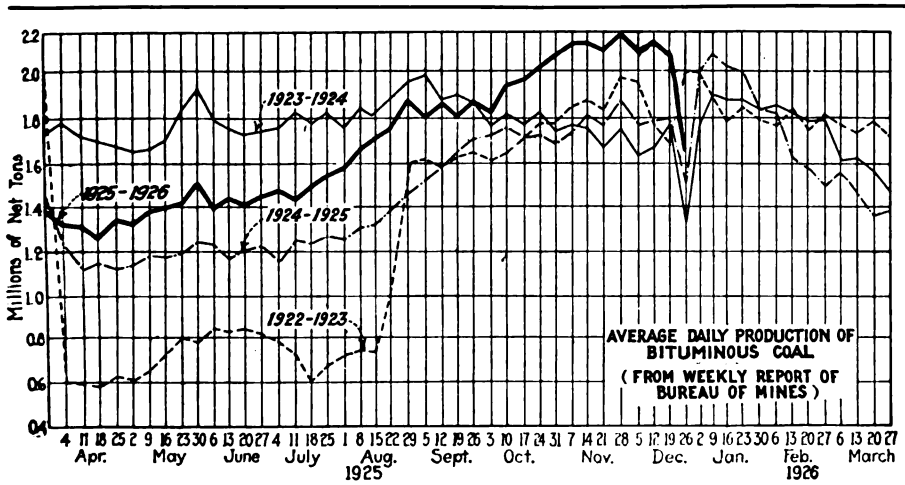
Production And the Market

Unwonted Holiday Activity Marks Coal Trade As Anthracite Peace Parley Drags

Tradition as well as such seasonal influences as the Christmas holiday lull and pre-inventory hesitancy have affected the coal market more or less during the last week, as in the corresponding period of years past. These influences have been offset to a certain extent, however, by the anthracite suspension, but most of all by the appearance of real winter weather over a broad expanse of territory—the first cold snap of any consequence thus far this season, reaching sub-zero levels in some localities. Domestic demand has picked up notably in response to the mercury's dip and steam consumers in many instances have discarded the waiting game and replenished waning stocks to be on the safe side.

Curtailment of production by reason of low running time during the last two weeks has had a strengthening tendency, but the heavy volume of output in previous weeks since October gave ample assurance that there would be no dearth of supplies. As a matter of fact "no bills" had become uncomfortably plentiful in many sections, and the cleaning up of tracks cluttered with unordered coal was a job of no mean proportions. The net result has been a firmer tone in prices without any markedly buoyant characteristics. As a rule, steadiness continues to be more marked in Eastern markets, the outstanding weak spot being New England, where steam grades have slumped again, despite the help of seasonable weather. As this is generally attributed to the belief that the end of the anthracite strike is near, there is a likelihood that consumers will soon begin to show more interest if negotiations tend to be prolonged.

As prospects for general business are considered favorable, industrial operations, car loadings and pig iron production being at high levels, and plenty of cold weather is likely before the winter ends, the coal trade outlook is good.



Belief that the anthracite difficulty was about to be settled caused a number of cancellations of orders for anthracite substitutes, but the appearance of cold weather and a realization that hard coal would not be flowing freely for quite awhile even if the strike was settled quickly—which is not at all certain—brought a flood of renewals, and at advanced prices in many instances. Coke continues to be most in demand as a substitute, and many in the trade are of the belief that it will hold many new customers when the strike ends.

Output in 1925 Over 500,000,000 Tons

Production of bituminous coal during the week ended Dec. 26 is estimated by the Bureau of Mines at 8,452,000 net tons, a decline of 4,237,000 tons from the total for the preceding week but 912,000 tons more than was produced in the corresponding week of last year. Total output for the calendar year 1925 to Dec. 26 is 514,827,000 net tons, compared with 473,208,000 tons in the same period of 1924. Anthracite production during the week ended Dec. 26 totaled about 32,000 net tons, as against 55,000 tons in the preceding week. Hard-coal output for the calendar year to Dec. 26 is about 62,119,000 net tons, compared with 89,320,000 tons up to the same date a year ago.

Coal Age Index of spot prices of bituminous coal stood on Jan. 4 at 181, the corresponding price being $2.19, compared with 178 and $2.16 on Dec. 28.

Dumpings of coal at Hampton Roads during the week ended Dec. 31 underwent the usual holiday slump, the total being 355,126 net tons, compared with 446,093 tons in the preceding week.

Estimates of Production

(Net Tons)

BITUMINOUS

	1924	1925
Dec. 12 (a)	10,873,000	12,908,000

Midwest Demand Responds to Cold Snap

About a week of very cold weather has created a tremendous difference in the Midwest market. This has made itself felt in a brisk demand for all grades of coal and at better prices.

The domestic market was the first to be affected, as two or three days of below zero weather taxed the bins of retailers to the utmost and a lot of them saw their reserve piles dwindling at an alarming rate of speed; consequently they placed orders for renewed supplies and for immediate shipment. Those who were actually cleaned out of coal were paying a premium to the producers and wholesalers for car numbers. The demand for southern Illinois and central Illinois coals has been very good indeed. Most operators find themselves heavily booked on lump coal, comfortably supplied with orders for egg, and fairly well booked on their 3x2-in. small egg. In Indiana the condition is about the same.

West Virginia high volatile and eastern Kentucky coals moving into the Middle West are being absorbed rapidly, with additional orders being placed daily. Prices are firm to rising, and the market, generally speaking, is good. Smokeless coals from West Virginia have reacted some and prices have gone up a little, but they are a long way from the $5 and $6 levels they attained six or eight weeks ago when most of the smokeless coal was diverted to the East.

There is no great fuss about anthracite as those who have burned up their supply are now using either coke or smokeless, or a combination of both, and appear to be quite satisfied.

In the face of the tremendous tonnage of domestic coal that is being produced this week, it is remarkable that prices on steam coals have held firm. This is explained by the fact that a great deal of the extra steam coal is being used for heating purposes and it takes quite a lot of coal to heat large factories in zero weather. Operators anticipate that if the cold weather lasts another week or so steam coal prices will slip, but the buying public are placing orders heavily for future shipment on present price levels.

Demand for domestic sizes has been unusually good in the Carterville field. Egg is in greater request than lump as a rule, but the nut sizes are slow and steam coal is heavy, which is unusual around the holidays. Railroad coal has been fair at the shaft mines, car supplies good, and working time from four to six days a week for the mines that are working. The strip mines have good working time; railroad tonnage shows improvement and prices seem to be better.

In the Duquoin and Jackson County field there is no change—the mines are working four to six days a week; railroad tonnage is light; no change in prices but the smaller sizes remain unbilled. In the Mount Olive field domestic has been moving well, but steam is slow; the only

Coal Age Index of Spot Prices of Bituminous Coal F.O.B. Mines

	1926	1925		
	Jan. 4	Dec. 28	Dec. 21	Jan. 5
Index	181	178	179	172
Weighted average price	$2.19	$2.16	$2.17	$2.08

This diagram shows the relative, not the actual, prices on fourteen coals, representative of nearly 90 per cent of the bituminous output of the United States, weighted first with respect to the proportions each of slack, prepared and run-of-mine normally shipped, and second, with respect to the tonnage of each normally produced. The average thus obtained was compared with the average for the twelve months ended June, 1914, as 100, after the manner adopted in the report on "Prices of Coal and Coke; 1913-1918," published by the Geological Survey and the War Industries Board.

thing that saved this field was railroad tonnage, which came in the last few days in the month quite heavily and cleaned up everything. The prevailing price on this coal for domestic sizes is $2.75 both city and country.

In the Standard field there was an increase of about 10c. a ton for a day or two on domestic sizes and then they slipped back. At present there is a surplus of all other sizes than 6-in. lump and there is no unusual demand for this size. All mines are carrying "no bills." Railroad tonnage shows some improvement, there are plenty of cars and the mines are getting from three to five days per week.

Zero weather at St. Louis put the retail business on the map for a few days to finish up the year. All sizes moved, principally middle grade, and Standard is in fair demand. Orders for high grade have not been as numerous and there has been no unusual call for anthracite; smokeless showed some activity and coke is moving fairly well.

Country domestic business is unusually good on middle-grade coals. There is some activity in the country on coke. Country steam is fairly good and city steam in carloads is a little slow, but is expected to show improvement soon.

Wagonload steam is good and continues to show gains. No change in prices.

Tracks Cleared in Kentucky

In Kentucky there has been a heavy demand for car numbers, due to zero temperature, which brought about heavy demand for coal from retailers and for heavier firing for heating purposes.

With light production over the holidays in eastern Kentucky and strong demand for all sizes, coal on track has been in good movement and producers have been putting coal in transit more freely on prospect. Western Kentucky took advantage of an opportunity to increase tonnage over the week. River coal has been shut out of the markets by heavy ice in the Ohio River.

Inventory work is nearly completed and improved demand for industrial coal is expected soon. Railroad consumption is heavy; utilities are consuming a lot of fuel and cement plants are working at full spead. Prices are no better on steam or small prepared sizes, but block coals are stronger by 25c. a ton or so in eastern Kentucky, and a trifle stronger in western. Except for special coals, eastern Kentucky prices are: Block, $2.75@$3.25; lump and egg, $2@$2.25; nut, $1.75@$2; mine-run, $1.40@$1.75; screenings, $1.10@$1.35. Western Kentucky block, $1.85@$2.15; lump and egg, $1.75@$2; nut, $1.35@$1.50; mine-run, $1.25@$1.50; screenings, 80c.@$1.10.

Northwestern Trade Spurts

Coal dock operators at Duluth-Superior experienced a burst of activity last week as a result of a spell of sub-zero weather. Retailers were flooded with orders. The docks had comparatively moderate orders for prompt shipment but soon got batches of orders for later delivery.

December coal shipments are estimated at around 28,000 cars, compared with 27,411 cars in November and 29,615 cars in December last year. Increased movement is looked for in January as a result of the heavy accumulations of orders on dock operators' books and expectations that larger consumers and dealers will be in the market to replenish supplies that have been running low.

Cold weather and the knowledge that supplies on the docks are running low contributed to a rush for anthracite by domestic consumers late last week. From the present outlook stocks will be about cleaned up within three weeks. Supplies of bituminous coals on commercial docks are estimated at around 4,890,000 tons, so that no apprehensions are felt regarding the possibility of a shortage before spring. Quotations are unchanged for both anthracite and bituminous coals.

There has been no change whatever during the last week in the fuel situation in Milwaukee. Demand fluctuates with the mercury, and consumers are uncomplainingly facing the colder weeks of the winter now closely ahead. There is plenty of coke and Pocahontas and the better grades of bituminous coal, and there will be no hardship in this section except such as accompanies all wintry weather among the poor.

Arctic temperatures touching considerably below zero in the Twin Cities served to increase domestic and other heating-plant consumption of coal materially while it lasted. The severe weather endured but four or five days, but it did give a sudden increase to retail demand.

Steam coal demand has been better as long as the severe weather threatened to cut down deliveries as well as to augment demand. But supplies have been too good and the severe weather too short to do more than give passing help.

Southwest Trade Sensitive to Weather

The first zero weather of the season in the Southwest last week relieved the congestion of 234 "no-bill" cars on Kansas tracks, for the Southwestern market throughout the year has been unusually responsive to climatic changes. With the rising of the thermometer in the middle of the week orders again began to fall off and the surplus situation threatened to revert to its former condition. Arkansas, while not confronted with the surplus of Kansas, because a much smaller proportion of its mines are in operation, is having greater difficulty moving what it does produce, and many mines are working only two or three days a week.

During the past week there was a slight improvement in the Colorado domestic trade, which is attributed to the material change in the weather conditions. The increase is expected to continue, as the stocks on hand are getting very low, and it is not unlikely that if the cold weather continues the mines will be working to full capacity in order to supply the demand. Several operators are booked into the middle of January and are unable to take on any additional orders at this time.

There has been no change in the prices and in all probability present quotations will continue until April 1. There is ample labor supply and no interruptions from a transportation standpoint.

Demand for coal for heating purposes is quieter in Utah now than for years at this season. The weather has

Digitized by Google

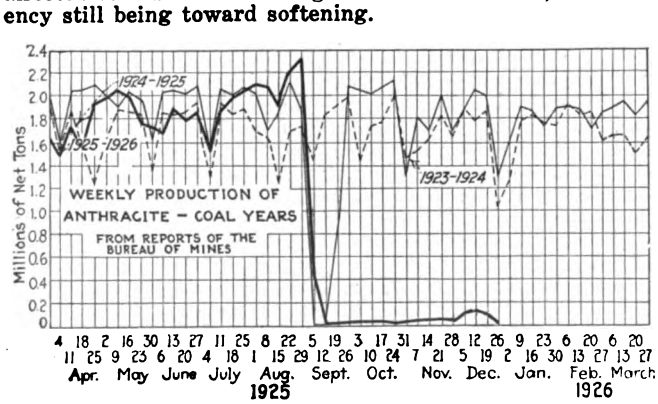
been spring-like of late and consumers are buying only from hand to mouth. Domestic lump continues to be the most popular grade for residences. Industrial demand continues fairly steady with the metal industry and the railroads the best customers. The sugar manufacturing "campaign" is practically over and the sugar companies are no longer in the market for coal. Prices remain as firm as ever, and the labor situation is all that could be desired from the standpoint of the operator.

Cold Snap Lightens Holidays at Cincinnati

At Cincinnati cold weather that hit both ways served to enliven what otherwise would have been a dull season caused by the holidays. Already a fall in production has been shown through the American Railway Association's report for the Cincinnati district, where last week 12,044 cars passed from the south to the north side of the Ohio River, a decrease of 1,818 cars from the week previous, but 2,514 more than in the corresponding week of last year.

The anthracite conference also acted as a control to keep the market from running away with itself once the surplus and distress cars were cleaned up. Rises in price, it follows, were close to a semblance of normal. West Virginia high volatile lump advanced to $2.75@$3. Southeastern Kentucky, which had been holding out for $3 as its December price but which had dropped to $2.75 and lower for block, recovered, and at this writing some wholesalers are asking $3.25. Egg recovered to its first of the month range and all lines of mine-run went on the same basis, steam and gas being quoted $1.50@$1.75. Inventory time, which always plays hob with the slack piles, caused a slight recession there.

In smokeless the advances made last week on nut, egg and lump were maintained. Mine-run is firm but screenings slid off 10c.@15c. Production both in the Pocahontas and New River fields, coupled with the domestic demand, has straightened things out for the low-volatile producers.



Zero weather froze the Ohio River on Dec. 27 and put a quietus to river movement. Retail business enters the year with practically the same price level that has been maintained for months. On smokeless lump quotations are $9@$9.50; mine-run, $6@$6.50; bituminous lump, $6.25@$7; slack, $4.50.

A drop in temperature has stimulated the domestic trade at Columbus to a marked extent. Dealers have cleaned up stocks to a large extent and distress coal has disappeared from the Columbus market, as well as from Detroit and Toledo, and better prices are obtained for the supply which is available. Retailers have been holding prices steady. Pocahontas users are now coming into the market better.

In the steam trade, buying is still for present needs as reserves are still good and large users are not disposed to increase them. One of the unexplained features is the weakness of screenings, which had been holding up fairly well. Practically no consignment steam grades are on the market and the usual mine prices are being obtained.

Output in the southern Ohio field is estimated at about 25 per cent of capacity, with the Pomeroy Bend field producing the lion's share. Preparations are being made to place additional mines in operation, however, and a better run is expected in January.

The only ripple in the eastern Ohio coal trade during the past week or so has been the increased activity of retailers due to the cold snap and heavy snowfall, which resulted in a rush of orders. However, prices have been in no wise affected so far as domestic grades are concerned, the tendency still being toward softening.

In the steam trade, inactivity has been the controlling feature during the holidays, due to many industrial plants being practically closed down or running such short time as to seriously curtail coal consumption. Spot prices on slack and nut-and-slack are 10c. lower than a week ago, and the market is slow to absorb the fuel being offered.

Depression Less Heavy at Pittsburgh

The Pittsburgh market shows a larger turnover, with more consumption and more production, but the relation between production and consumption is unfavorable to trading. There is a slight accumulation of steam coal on track. Demand for domestic coal has been much heavier in the past fortnight, but domestic coal is not a large enough proportion of the total business to make much difference in the general showing that the market is in poor shape. Prices are the same all along the line as formerly, except that while steam slack in general has been $1.40@$1.50, Panhandle slack is now strictly $1.50, with slack from some other parts of the district readily obtainable at $1.40.

The Buffalo bituminous trade is awaiting the possibilities of the next few days with much interest. That the resumption of anthracite mining is going to get the present trade to rights is shown by the fact that while Pocahontas egg now sells here for $12 at the curb, dealers say that they hope to be able to hold that trade against anthracite by selling it for $9. The regular bituminous shippers rather dread a return to mining, for it is expected to hurt that business more or less. Bituminous shippers declare that they are selling coal for exactly the same prices that it brought last summer.

New England Steam Trade Dips Again

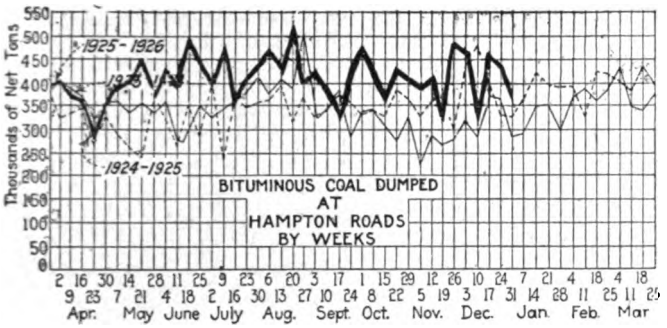
Demand for steam coal has taken another slump in New England. While the weather has been more seasonable the trade has been much influenced by the impending anthracite settlement, and should negotiations be further protracted it is quite likely that the average consumer will be more interested than he professes to be today. For screened bituminous the inquiry from retail dealers is still reasonably good, but for run-of-mine there is only a scattering market.

At Hampton Roads there is perhaps less accumulation than a week ago, owing to the holidays, but spot prices are soft, even for the best grades. No. 1 Pocahontas and New River are quoted at $4.75 down to $4.50 per gross ton f.o.b. vessels, but most of the coal dumped is being applied on contract.

On cars Boston and Providence for inland delivery the smokeless coals range from $6 per gross ton up to $6.40@$6.50, depending upon the situation of the shipper and the tonnage involved. Consumers, especially the industrial users, know that the aggregate of steam coal above ground is relatively very large and they will not be stampeded for the present.

There continues moderate request for substitutes for anthracite. A considerable proportion of the householders in search of fuel are insisting upon something better than run-of-mine bituminous, and various kinds of coke as well as Welsh anthracite and Welsh ovoids, a form of briquet, apparently are in more favor. Steamer cargoes from Welsh and other ports are arriving day by day and, in all, the January arrivals are likely to be heavy.

Prepared smokeless coal is being freely offered at $4.25@$4.75 per net ton at the mines, while low volatiles from Pennsylvania, also in domestic sizes, are commanding $5.25@$5.55, owing to the through rate differential in their favor.



New York Trade Holds to Even Grade

Snow storms which interrupted mining and movement of soft coal in central Pennsylvania late last week did not interfere with receipts in the New York market to such an extent as to cause any uneasiness, but less coal was coming forward, some shippers receiving less than half their usual daily shipments. Mine-run movement sustained the local market, for, in addition to the industrial consumption, a fair volume is moving into residences and other buildings where anthracite formerly was used.

The taking of inventory did not appear to have as much effect on buying as in previous years when buyers usually held off until after New Year's Day.

The market for sized bituminous coal from central Pennsylvania is not particularly brisk, but a fair amount of New River and Pocahontas coals is coming into the market on the basis of $4@$4.75.

Digitized by Google

At Philadelphia the bituminous market is still quiet, but there are signs of a pick-up. Concerns that suspended purchases on account of inventory are coming back for regular shipments, and this in conjunction with the drop in production due to the holidays has imparted a touch of firmness to the situation. Offsetting this is the possible end of the anthracite suspension. There has been a fair increase of steam buying by retailers who cater to steam trade, as they have exhausted their anthracite stocks, but even these buyers are quite cautious.

Contract customers are slow to come in for renewals, feeling that by waiting until the end of the anthracite troubles they may be able to close a better bargain. A good volume of rail fuel is moving, but with no special inquiries abroad. Tide movement continues ordinary, with only a couple of clearances recently.

The Baltimore soft-coal market, which had been gradually stiffening for a week, tightened up on prepared sizes with a bang when the cold spell swept the East last week. Quotations for low-volatile lump went up to $4 a net ton; egg and nut were quoted variously from $4.25 to $4.50, and mine-run around $2.25. Industrial coals also were in more brisk demand. Pool 71, quoted quite freely a week ago at $2.15, was bringing generally around $2.25@$2.35, while good Pool 9 coals were generally quoted around $2.15. There was little change in lower grade steam coals or gas coals, either for spot delivery or on contract. The export situation is simply one of absolute stoppage.

At Birmingham the slump in buying ordinarily following the Christmas holidays is not pronounced. Inquiries are good and new business is being booked right along for commercial coal. Consumers are not pressing deliveries as strongly as they were several weeks prior to the holidays and the volume of sales is not quite so large, but otherwise the status of the market is sound and the outlook promising. Bunker trade has suffered little if any setback, inquiry being good, but requirements are not being placed without some delay and effort.

Cold weather has given stimulus to the domestic market, and inquiry and booking have been good for the week. Some grades and sizes have been sold up several weeks ahead and demand has been sufficient to provide an outlet for current production of even the lower and medium qualities for the time being. There has been no change in quotations.

Coke is very active and there is a good market for all grades. Spot foundry is still holding at $6@$6.50; contract, six months and under, around $5.75@$6 per ton; gas coke, $6@$6.50. Egg is quoted $5.25 and nut $4.75@$5 per ton ovens.

Peace Parley Causes Substitutes to Wobble

Failure of the anthracite operation and miners to iron out their differences last week caused much uneasiness and disappointment at New York. Optimism was rampant earlier in the week, as it was thought a settlement would be reached and that hard coal would soon be flowing into the market.

The market for substitutes, which had been active, became dull and wholesale dealers received many cancellations of orders, some of which had been placed at lower than current market prices. When the conference recessed without reaching any conclusion buyers who endeavored to reinstate cancelled orders found prices higher.

So positive were some wholesale dealers that a settlement would be reached that they discussed opening prices at the mines for independent coals.

With the exception of some No. 1 buckwheat held by speculators the wholesale market is cleaned up of anthracite. Coal users are not without fuel, however. There are some domestic sizes of hard coal in retail yards and plenty of coke and soft coal, besides a fair volume of Welsh and German fuels.

As a substitute coke has the inside track and it is expected to continue to hold a part of its present clientele after the anthracite market becomes active. Byproduct coke is well sold up, nut sizes being held at around $9.40 at the ovens, with beehive product fluctuating between $7 and $9.

The peace conference is exerting a strong influence upon the Philadelphia trade. Retailers, facing an active demand for fuel, do not know how to order substitutes to meet this demand, being fearful if the strike ends that they will have coke and bituminous coal on their hands. The cold wave created such a strong demand for fuel that the supplies of coke, the fuel in best demand, have been about cleaned up. Prices have jumped $1 to $2.50 a ton. What little coke is available is of the beehive variety, as all byproduct concerns are sold up for a couple of weeks.

There is a feeling in the Baltimore hard-coal trade that the end of the anthracite strike is approaching, but retailers are not encouraging customers in the belief that an adequate hard coal supply will be had within a month, even under most favorable conditions. It will take considerable time to get hard coal moving again and to restock yards here to a point where they can begin to supply anthracite demands. Soft coal is being pushed meantime, and the public is not only learning how to burn prepared sizes but is taking quite kindly to mine-run in many cases.

The trade at Buffalo is watching with increased interest for the outcome of the peace conference. Some of the wholesalers have run out of buckwheat anthracite and say they cannot get any more. It has been put up in price a little when sold by the independents, but the regular companies kept their old price to the end, selling it as low as $6.85 at the curb. One concern is still delivering its byproduct coke to the curb for $9.50, while others are charging $12. Nobody knows what the coke people will do when anthracite again is in competition, so the trade is getting what it can out of it and the producer is taking it all.

Connellsville Coke Market Turns Calm

Since the top of the Connellsville coke market was reached during Christmas week the market was very quiet for about a week and prices began to yield rather sharply. Standard blast-furnace coke, run-of-oven, which had gone up to $6, but with scarcely any turnover at that figure, is now, say, $4.50@$4.75. Prepared coke, which had gotten up to $8 and more for some grades, is around $5.50@$6.50, but quite irregular.

There is no blast-furnace demand, as some blast furnaces bought prompt lots well before Christmas, to tide over any curtailment that might occur in shipments. Contracting was all done before the latest rise. There may be a few uncovered inquiries, but these would be chiefly among furnaces thinking of starting, and such furnaces can now wait a little while to get their coke at a fair price. One furnace, which had a contract with a byproduct plant through December, is reported to be banking.

The trade in Pittsburgh figures that even if the anthracite strike is settled soon the resumption of mining will take time and that there will be demand for Connellsville coke in the East for about a month after the settlement is signed. This coke, however, will have to go at a moderate price, say $4 to $5 or perhaps $5.50 for prepared coke, according to quality.

The *Courier* reports coke production in the Connellsville and lower Connellsville regions in the week ended Dec. 26 at 95,800 tons by the furnace ovens, a decrease of 28,400 tons, and 95,290 tons by the merchant ovens, a decrease of 7,110 tons, making a total of 191,090 tons, a decrease of 35,510 tons.

Foreign Market And Export News

Stiffening of Tone in British Coal Market With Revival of Demand

Revival of demand for coal has placed the British market in a firm position. The low prices are stimulating fresh inquiries and steady bookings are now running well into the new year. Most collieries are fully sold for the next week, many being unable to accept further commitments. A number of pits are reopening on the strength of the subsidy and larger demand, though eighty-five large mines remain idle. The Swedish State Railways are inquiring for 30,000 tons of Admiralty large for January-March delivery. Employment is at the highest level since June. Monmouthshire coals are enjoying a good business and prices are a shade better. Coke holds steady on a fairly good home demand.

The Newcastle-on-Tyne coal trade continues to show a firm, quiet tone until well into January, but the sellers' firmness for sticking out for current quotations is rather checking actual business beyond. The chief inquiry for the past week has been for gas coals, and the major proportion of interest has been shown in such qualities. Steam coals have been rather erratic, becoming somewhat too plentiful for prompt movement at times, but on the whole maintaining a firm front. Coking coals and bunkers are quite firmly held, and the coke market is very much stronger, the falling off in values of a fortnight ago having been only a temporary phase. Patent and beehive sorts are very steady, but the firmest section is gas coke, which is in good demand for both export and home.

Production by British coal mines during the week ended Dec. 19, according to a special cable to *Coal Age*, totaled 5,555,000 gross tons, compared with an output of 5,430,000 tons in the preceding week.

Belgian Industrial Grades Dull

The situation of the Belgian coal market, particularly for industrial grades, is dull, even in the Liége district, where, however, there now is much industrial activity.

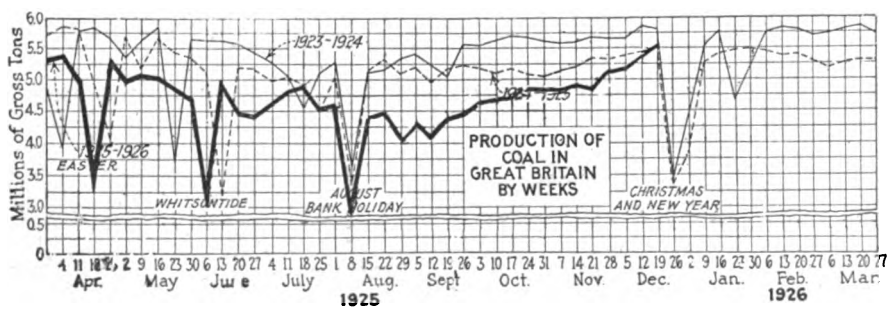
In domestic grades, anthracite coals, as well as nuts and small cobbles of half-bituminous, quarter-bituminous and lean coals, remain scarce, but the other sized coals are much easier.

The joint wage commission will meet again in a few days to consider the recent 5 per cent increase of wages. Nearly all the collieries are opposed to this increase being maintained, as they deem it unjustified by present conditions in the trade. The slight increase in demand for Belgian coals noticed a few days ago was due to fears of a general strike of the Belgian miners. Meanwhile, competition is keen on the part of French, British, German and Dutch coals.

No change is reported in the situation of coke and briquets except that stocks are increasing again.

Market Listless and Weak At Hampton Roads

Business at Hampton Roads last week continued dull, with the market weak. Practically all mines serving this section shut down, to remain closed until Jan. 4, but it had little effect on the market.



The cold wave apparently did little to stimulate trade, and affected the railroads and those mines that were in operation only slightly. Shipping has been suffering somewhat from bad weather, and the bunker trade consequently has been light.

Strong Demand for All Grades In French Market

The French coal market remains satisfactory. A good volume of orders, for both industrial and house coals, was received by the mines of the Nord and Pas-de-Calais in December, but those for house coals are more pressing and available supplies are becoming scarcer.

Because of the increase in taxes (the advance of 50 per cent of the "royalty" tax alone will add 30,000,000 fr. per annum to the bill of costs of the French collieries), it is probable that prices will be raised as of Jan. 1, when higher rail transportation rates go into effect.

Depreciation of French currency compared with that of Great Britain and Belgium places French coals on such a low price level that there is a good export demand from Belgium, Switzerland and Italy. The Sarre coal field is getting its share of this business through an agreement with the mines of the Nord and Pas-de-Calais.

During November the O. H. S. received from the Ruhr 732,100 tons of indemnity fuel, including 491,100 tons of coal, 210,700 tons of coke, 30,300 tons of lignite briquets. During the past fourteen days of December the O.R.C.A. received from the Ruhr 113,448 tons of coke.

News Items From Field and Trade

ALABAMA

Major developments which will have a marked effect on coal production during 1926 include the Crockard No. 5 Mine of the Woodward Iron Co., near Mulga, a shaft opening which is being driven 500 ft. into a large virgin field of Pratt coal. This mine is being developed with a view of being the largest source of fuel supply for the Woodward company. The Yolande Coal & Coke Co. will have its Connellsville Mine, in Tuscaloosa County, in operation soon. This operation has been rehabilitated at a cost of about $300,000 after being idle about fifteen years. The Black Diamond Coal Mining Co. is building a washery and other plant facilities at Johns, in the Blue Creek field, and will be producing coal there from an old development at an early date. The seven drift openings being developed by Moss & McCormack in Fayette County will be producing coal for shipment during the early part of the year, as will also the new slope of the Brookside-Pratt Mining Co. at its Warrior River plant.

COLORADO

At a meeting of the board of directors of the Colorado Fuel & Iron Co. at Denver, Dec. 30, J. B. Marks was elected vice-president in charge of sales, traffic and purchases. Mr. Marks will continue his present duties as assistant to the president.

ILLINOIS

A. N. Poli, operator of the Greenfield Coal Co., of Greenfield, for the past four years, has sold his lease and improvements to Joseph Dubinick and James O'Brien of Virden. Mr. Poli has accepted a position as Superintendent of the mining department of the Carrollton Clay Corporation, of Carrollton.

INDIANA

Five non-union miners were kidnaped from the Buckskin Mines of the Bosse Coal Co., near Evansville, Jan. 2 by a crowd of nearly 300 men, officials of the mine were informed. John Lenn, mine superintendent, said he did not know where the men had been taken. The mine has been closed eighteen months as the result of a wage disagreement, Lenn said. The men who reported for work were to make repairs preparatory to reopening the shaft.

The Indiana Coke & Gas Co., Terre Haute, has plans under way for the construction of additions to its gas works, including a new byproduct plant for the production of sulphate of ammonia, estimated to cost close to $100,000 with machinery. A new battery of coke ovens and auxiliary equipment will be installed at a cost approximating $400,000.

KENTUCKY

Representative Robsion, of Kentucky, recently introduced a bill in Congress to establish a mine rescue station at Pineville, in the heart of the southeastern Kentucky coal fields, where there has long been need of such service.

G. M. Shoemaker, formerly in the operating department of the Harlan Coal Co., Louisville, stationed at the mines, is now sales manager at the main office at Louisville.

C. D. Glass, head of the Pacific Coal Mining Co., western Kentucky, has moved his office from Louisville to the mines, near Central City, as he spends practically all his time at the mines.

At Madisonville, the West Kentucky Coal Co. and its subsidiary the Kentucky Block Coal Co., which filed joint suits against the Grapevine Coal Co., for $159,000, for coal alleged to have been removed from properties of the companies by the Grapevine concern, have reached an agreement. Settlement was made out of court and the case dismissed.

It was reported from Maysville, late in December that the coal towing boat "J. H. Donald," valued at $80,000 was burned to the water's edge at Ripley, near Maysville.

Emmett O'Neal, head of the Emmett O'Neal Coal Co. and the Process Fuel Co., Louisville, recently was elected vice-president of the Bankers Bond Co., Louisville, a concern which handles insured bonds. O'Neal in November was defeated by a small majority for the office of sheriff of Jefferson County.

Frank D. Rash, former president of the St. Bernard Mining Co. and later vice-president of the West Kentucky Coal Co., has been elected president of the Inland Waterways Co., Louisville, and the Frankfort Elevator Co., and will have charge of their river boats, barges, etc., and development of traffic, terminals, etc. The company handles coal, iron, oil and other products on the Ohio River from Pittsburgh to Louisville principally, as well as below. Mr. Rash is a graduate of the Massachusetts Institute of Technology, coal operator, served a year as head of the American Legion, Kentucky division, and is president of the Western Kentucky Coal Operators' Association, the operators refusing his resignation a short time ago, when he felt that a man who had left the coal trade shouldn't hold the office.

R. R. Webster has returned to Weeksbury and is again chief electrician and master mechanic of the Kentucky operations of the Elkhorn Piney Coal Mining Co. He resigned a position with the Dupont Engineering Co., at the new nitrogen-fixation plant near Charleston, W. Va., to go back to mining work.

More coal has been found in the Parksville community and a company, known as the Parksville Coal Co., with about twenty members, has been formed to develop the product. The latest coal found is a 3-ft. seam discovered on the Allnut place, near the L. & N. R.R. The coal is first class and is being used. The property of W. S. Aldridge contains a 6-ft. seam and it is believed much coal is in the knobs around Parksville. J. Adams of Parksville organized the company to make further investigations and mine the coal if a sufficient quantity is found.

MASSACHUSETTS

The Boston & Maine R.R. is about to build a plant capable of transferring 6,000 tons of coal in an 8-hr. shift from vessels to cars at its Mystic wharf in Boston. The cost will be about $450,000. The yard will have storage capacity for 150,000 tons of coal.

OHIO

An inquest held on Dec. 28 absolved the Cambria Collieries Co. from all blame for the fire in the company's Webb mine which resulted in the death of nine miners. The cause of the fire was not determined, according to an announcement by Coroner Clyde Hardesty, of Bellaire, and State Mine Inspector Jerome Watson.

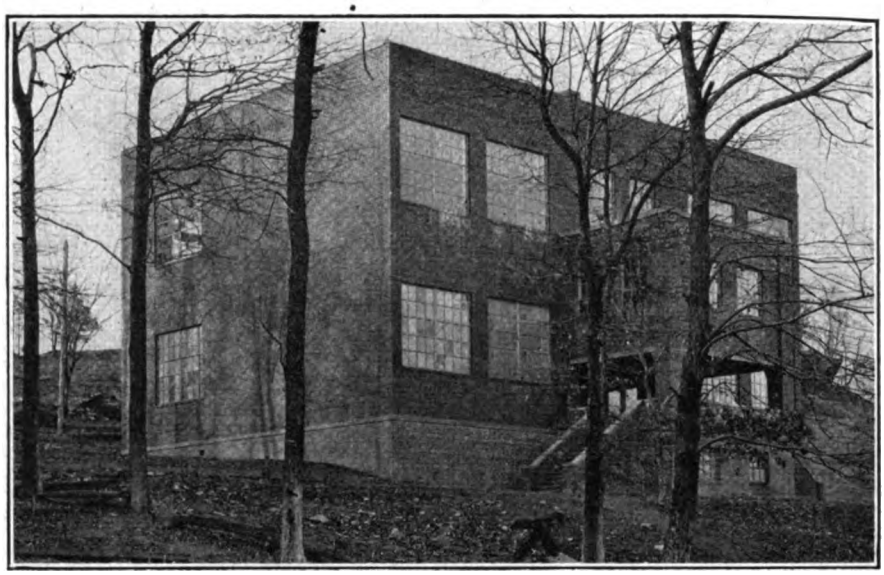
Bids received Dec. 23 by the Columbus Board of Purchase for 15,000 tons of Hocking nut, pea and slack for the Municipal Light plant, were as follows: Hamilton Coal Co., Columbus, $1.25; Hatton, Brown & Co., Inc., Columbus, $1.25; Jay Miller Coal Co., Columbus, $1.25; W. S. Harman Coal Co., Columbus, $1.28, all f.o.b. mines. For 8,500 tons of Hocking nut, pea and slack for the Scioto River Pumping Station, the bids were: Hamilton Coal Co., $1.25; Hatton, Brown & Co., Inc., $1.25; Jay Miller Coal Co., $1.25. For 3,000 tons

Digitized by Google

of Hocking nut, pea and slack for the garbage disposal plant: Hamilton Coal Co., $1.25; Hatton, Brown & Co., $1.25; Jay Miller Coal Co., $1.25; W. S. Harman Coal Co., $1.28. For 600 tons of West Virginia nut, pea and slack: Hatton, Brown & Co., $1.25; W. S. Harman Coal Co., $1.25.

The Stalter-Essex Coal Co. is planning an increase in production from Mine No. 5, in the Pomeroy Bend field, which really is a double tipple serving former mines No. 1 and No. 5. When the tipple was burned eight months ago the company decided to erect a double tipple to serve the two properties. Mine No. 7 also is being operated to capacity, total production from the two mines being 1,800 tons daily. By Feb. 1 this will be increased to 2,200 tons daily. The mines are operated on the 1917 scale basis and little trouble of consequence since the burning of the tipples has occurred in that region.

A meeting of the stockholders of the Hazelton Coal Co., which has a mine at Long Run, in the Hocking Valley section, has been called for Jan. 30 for the purpose of dissolving the corporation. The mine has been completely worked out and the property will be abandoned.



Mine managers, superintendents and others in the production end of the seventeen mines controlled by the Southern Coal & Coke Co., in southeastern Kentucky and northeastern Tennessee mingled with the sales and directing forces in a two day "round-up" held Dec. 28-29 in Cincinnati. E. L. Mahan, president, and John Callahan, general manager, were the chief speakers at meetings that were held for better preparation, better production and better selling methods. The annual dinner was the social event which took place on Mondoy evening.

Aften ten years spent in Cincinnati representing his father's company, the Hutchinson Coal Co., and his own project the Central Fuel Co., B. Lee Hutchinson has moved to Chicago, where he will be located as general Western sales manager for the West Virginia Coal & Coke Co. Mr. Hutchinson and his brother Brooks were the moving spirits last year in the consolidation of their interests the Main Island Creek Coal Co. and other properties into the old line corporation, the West Virginia Coal & Coke Co.

S. R. Jennings, whose properties played a large part in the consolidation recently effected by S. Bascom Slemp of a $9,750,000 company under a Virginia charter, was in Cincinnati recently and said that the general sales offices would be continued there under the direction of W. S. Denham, who has been marketing the Jennings product for several years from offices in the Dixie Terminal Building.

PENNSYLVANIA

Frozen rivers in the Pittsburgh district in the severe cold spell last week caused much inconvenience to consumers of coal and coke, who are dependent on this method of transportation. Fuel was being diverted to the railroads, and one large company was forced to go into the open market and purchase a lot of coke as a result.

A Modern Educational Building in West Virginia

This high school building at Glen White, W. Va., is an example of the progressive development by the E. E. White Coal Co. This building has all the advantages of the modern city school and it also has an abundance of light and fresh air.

Effective Jan. 1, James T. Garbine, coal freight agent of the Pennsylvania R.R. at Philadelphia, became coal freight traffic manager at Pittsburgh, succeeding H. G. Clevenger, who died recently. Carter H. Lippincott, coal freight agent at Pittsburgh, was made coal freight agent at Philadelphia, and Samuel A. Lattimer, chief clerk to the coal traffic manager at Pittsburgh, was appointed coal freight agent at Pittsburgh.

A reward of $5,000 for the recovery of the $48,000 payroll loot obtained by bandits when they held up messengers and guards at mine No. 3 of the Pittsburgh Terminal Coal Corporation at Mollenauer, near Pittsburgh, Dec. 24, has been offered by the company. Isaiah L. Gump, an employee of the company, was slain by the bandits in the holdup.

According to figures compiled by the State Forestry Department the Pittsburgh Terminal Coal Corp. during the first nine months of 1925 mined 2,923,000 tons of coal and used 8,812,804 board feet of lumber. The largest single item was posts, of which 738,000 were used or 6,500,000 board feet. Mine ties were the next largest item, 1,660,000 board feet being used during the nine-month period. Other items were caps, 285,000 ft.; railroad ties, 60,310 ft.; brattice, 77,000 ft. The use of wooden mine rails was discontinued Sept. 1, but up to that time 230,000 board feet was used for this purpose. In the mines of the Clearfield Bituminous Coal Corp. it is estimated, 4.5 board feet of lumber was required for each ton of coal mined.

The Corrado Coal & Coke Co., of Connellsville is putting into operation more plants as a result of the increasing demand for coke. The works at Adelaide are the latest to be put in operation with 100 ovens burning, the coal being shipped from the Vanderbilt mine. The Clarissa mines are furnishing coal for 150 ovens at the Clarissa works, near Vanderbilt. Fort Hill has 40 ovens running. Vanderbilt and Shamrock are furnishing the coal for Fort Hill.

During the Christmas holiday period State Treasurer Samuel S. Lewis came to the aid of the financial institutions of the anthracite and the bituminous regions of Pennsylvania by depositing in them $5,000,000 of state funds. The money was placed in the regular depositories of the Commonwealth and the coal regions were chosen, he said, because of conditions there owing to the strike in the hard-coal counties and continued subnormal conditions in the soft-coal section.

WEST VIRGINIA

Coal production in the 12½ counties of northern West Virginia in 1925 is estimated at 25,604,740 net tons, according to compilations by George S. Brackett, head of the Brackett Statistical Organization. The coal production in the region is the heaviest since 1923, when 27,758,050 net tons was mined. In 1924 the output was 19,909,000 net tons.

The work of rock-dusting Rachel mine of the Bertha-Consumers Co. at Downs, near Fairmont, was completed recently, according to E. Frank Miller, general superintendent.

The Bingamon bridge of the Western Maryland Ry., which had two shoes of the structure blown out by nitroglycerine Dec. 23, has been repaired and transportation has been resumed.

A new coal loading record for the Fairmont region was made recently by Paul Dobele, a 37-year-old French miner, at the Dakota mine of the Bethlehem Mines Corporation. He

Digitized by Google

mined 538 tons, or an average of 45 tons a day, in a 12-day period. His biggest day totaled 51 tons in eight hours, which was in addition to drilling the necessary holes for the coal shooters to do their work. Some time ago a negro miner loaded 400 tons in 12 days.

The Smoke Eaters' Society, composed of 225 men, who have been baptized by smoke of mine fires, subjected to noxious and poisonous gases following explosions in which effort was made to rescue entombed miners, and adepts of the self-contained breathing apparatus, will meet in Morgantown next June. The Smoke Eaters were organized at the Leisenring (Pa.) plant of the H. C. Frick Coke Co. 18 months ago, and now has veteran mine-rescue men of several states banded together.

For the first time the men employed in the state's industries excelled those employed in the coal mines this year, according to a recent survey. The report shows that 100,000 men were at work in the coal mines of the state this year as compared with 113,814 men in the industries of the state.

Fairmont region ranked fifth among the lake-coal shipping fields in the country during the 1925 season up to Nov. 1, according to figures of the Ore & Coal Exchange of Cleveland. The region shipped 1,173,352 net tons. The Kanawha, Logan, Kenova-Thacker field led with 8,286,113 tons shipped and eastern Kentucky was second with 5,766,838 tons; the Pocahontas-New River third with 3,029,616 tons and Pittsburgh (Pa.) fourth with 1,923,591 tons. The No. 8 Ohio fields were sixth with 1,122,981 tons. Mines in the Panhandle section shipped 713,420 tons up to Nov. 1. The Fairmont total includes the tonnage on both the Baltimore & Ohio and Monongahela railroads.

An analysis of smokeless production for the month of October brings to light the fact that at the end of ten months of 1925 production was 5,799,230 tons in excess of shipments for the corresponding period of 1924. It had reached a total of 37,518,307 tons, making it certain that the output for the entire year would be approximately 44,000,000 tons. This will be 6,000,000 tons in excess of last year's production. The increase in October alone was 430,051 tons over that for October, 1924.

Probably 50 per cent of the Dakota mine of the Bethlehem Mines Corporation was rock-dusted up to the early part of last week, according to N. A. Emslie, division superintendent. Four coats of rock dust will be applied. The rock-dusting is done at night in order to hasten the work and not interfere with the usual mining activities.

O. W. Evans, general manager of the Lynchburg Coal & Coke Co. and the Eureka Coal & Coke Co., operating in the Pocahontas district, succeeded W. A. Wilson as general superintendent of the fuel mines of the Norfolk & Western Ry. Co., Jan. 1. Mr. Wilson recently moved to Florida. Mr. Evans will have general charge of the Howard Collieries at Chattaroy, Pond Creek Colliery, at South Williamson and Vulcan Colliery at Vulcan. All of these mines are being operated by the railway company as a cource of fuel supply and ship approximately one million tons of coal per year.

Work on the electrification of the Virginian Ry. from Elmore, to Roanoke, Va., 134 miles, will be resumed. The line was completed as far as Princeton, a distance of 36 miles, when Gibbs & Hill, the contracting company, was ordered to suspend operations temporarily. When the project is completed eastern coal shipments will be brought to Roanoke for classification and weighing instead of to Princeton, as is now the case. Operation of electric locomotives between Elmore and Princeton began Sept. 21.

The will of the late Dr. C. B. Lee, of Glen Jean, head of several coal companies in the Loop Creek section of Fayette County, which has been probated in the county clerk's office, disposes of an estate amounting to about half a million dollars.

W. H. Green, of the W. H. Green Coal Co. which completed the mining of coal at Adrian, last summer, has purchased the plant of the Greenmar Coal Co. at Strader on the Charleston division of the Baltimore & Ohio R.R. Mr. Green will operate the mine as an individual as soon as the lease can be transferred. H. B. Martin, president of the Greenmar company, will for the time being retire from active mining operations and devote his entire time to the coal brokerage business. Mr. Green at one time was interested in the Greenmar company.

All employees and officials of the E. E. White Coal Co. attended a farewell banquet at Glen White, Dec. 29, to E. E. White, the retiring president. The affair was not only a tribute to the retiring president but also was a welcoming to the new owners of the property, the Massachusetts Gas Co., of Boston.

After investigating the $40,000 fire which destroyed the tipple of the West Virginia - Pittsburgh Coal Co. near Wellsburgh, deputy fire marshals and state police say that the fire was of incendiary origin. Lon Scott, who had been discharged by the company several days prior to the fire, is being held by the authorities. The company is rebuilding the tipple.

The Detroit Mining Co. is loading coal at its mine on the Little Coal River branch of the Chesapeake & Ohio Ry., after several months of preparation. The Detroit Mining Co. is a subsidiary of the Essex Mining Co. which about six months ago began operating its mines in the Pomeroy field on a non-union basis. Interests in control of the Essex and the Detroit companies heretofore have operated only in the Pomeroy and Hocking fields of Ohio. The Detroit company has 3,200 acres of coal in one block in the Little Coal River section. This coal is in the Winifrede vein and is 5½ ft. thick. As the seam is 500 ft. up the mountain a button conveyor is employed. The mine is electrically equipped for cutting and haulage. Automatic mine doors have been installed and loading machines will be used. Next spring the company plans to open another mine in this vicinity. R. T. West will be general superintendent at the mines in southern West Virginia as well as over those in Ohio.

Five union miners are in jail at Philippi, awaiting trial on the charge of having violated an injunction issued to eight coal companies of the Bear Valley mining region by Judge Warren B. Kittle of Barbour County. It was alleged the men trespassed on coal company premises and "dogged" non-union workmen. The injunction order was issued to the Brown Coal Co., Blocky Pittsburgh Coal Co., Cambria Coal Co., Greer Gas Coal Co., Tressler Coal Co., Bear Valley Coal Co. and the Bear Mountain Coal Co., all of which are operating on a non-union basis.

WYOMING

M. O. Carlson, who has been superintendent of the Blazon Coal Co. at Blazon during the past year, has been transferred to Rains, Utah, to serve in similar capacity at that point, being succeeded by James Hackett, who has been working in the Rock Springs district of late. Mr. Hackett, who took over the superintendency at Blazon, is well known in the local district, having been employed by the Kemmerer Coal Co. for several years.

CANADA

A communication received by the Ontario government from Sir Henry Thornton, president of the Canadian National Rys., states that within two weeks from Dec. 29 the remainder of the Alberta coal which the railway agreed to haul to Ontario would be moved. The original agreement was to transport 25,000 tons. Some 18,000 tons of this allotment had been delivered when the movement was stopped to make way for the grain shipment.

Importation of bituminous coal into Canada continued to rise in October, amounting to 1,347,965 gross tons which was the largest in any month since March, 1924. Imports of anthracite decreased still further, and the quantity imported in the month was only 149,371 tons. The decrease was, however, in importation from the United States, shipments from Great Britain increased and amounted to almost 60 per cent of the month's total.

Production of coke in Canada during November totaled 156,182 tons, a decrease of 3 per cent as compared with the October output of 161,414 tons. Coke produced in the Eastern provinces rose to 60,089 tons from the 56,714 tons produced in October, the output of the Western provinces of 19,220 tons was about the same as in October, while the Ontario production of 76,873 showed a drop of 10 per cent. The consumption of Canadian coal for coke-making remained about the same as in the preceding month at 84,190 tons, but imported coal had declined to 153,033 tons from 163,660 tons in October. Producers of pig iron being the principal users of coke, a decline of 7 per cent in pig iron production in November led to a drop in the coke output,

McGraw-Hill Company Buys Keystone Catalogs

The McGraw-Hill Co., Inc., has bought the Keystone Consolidated Publishing Co., of Pittsburgh, Pa., and thereby acquires the *Keystone Mining Catalog*, the *Coal Catalog*, the mining and quarrying directories and the list services published and conducted by the Keystone company.

There is thus brought into one organization the outstanding publishing interests serving the mining field—the McGraw-Hill Co., with its magazines, *Coal Age* and *Engineering and Mining Journal-Press*, and the Keystone company with its catalogs, directories and lists. *Coal Age* and *Engineering and Mining Journal-Press* have served the mining industries for more than two generations and the purchase of the Keystone property will enable them to broaden and intensify that service and assist, even more than in the past, in the solution of the problems of these industries. At the same time there is offered to the manufacturers who make the machinery, tools and supplies with which the industry does its work, a co-ordinated advertising service, consisting of educational and creative advertising in the magazines, efficient catalog distribution through the Keystone catalogs and direct-by-mail effort through the list service.

The Keystone catalogs, published annually, are condensed and consolidated catalogs of manufacturers selling to the mining and quarrying fields and give in convenient form the essential facts regarding the machinery and supplies made by these manufacturers. There are two editions, one for coal mining, the other for the metallic and non-metallic mining and quarrying fields. Both editions, besides the condensed manufacturers' catalogs, contain extensive information regarding mining and quarrying methods and serve as handbooks of mining and quarrying practice.

The *Coal Catalog* is a handbook of the coal seams and coal mines of the country, giving the geology of the seams, the analysis and characteristics of the coal taken from them, and the advertisements of companies mining and selling coal. It forms an indispensable guide to economy in buying coal for fuel or processing purposes.

The Keystone company also publishes directories of the mining and quarrying fields and furnishes a list-addressing service for mailing circulars and other advertising matter for manufacturers.

The catalogs in no sense replace or interfere with the educational function of *Coal Age* and *Engineering and Mining Journal-Press*. Each volume furnishes the mining man in convenient form, information that would otherwise have to be sought in a file of individual manufacturers' catalogs, inconvenient to keep and seldom complete. The Keystone catalogs, by bringing the essential data together in condensed form and thoroughly indexed make it instantly available.

That the Keystone service has been sound is attested by the growth and present size of the catalogs. The coal mining edition, in its last issue, contains 1,204 pages; the metal-quarry edition, 928 pages; the *Coal Catalog*, 1,293 pages. All of the volumes are of 9 x 12-in. page size.

From the standpoint of the manufacturer selling to the mining fields, the concentration of *Coal Age*, *Engineering and Mining Journal-Press*, the Keystone catalogs, the Keystone directories and the list service under one management offers the opportunity to obtain from one organization a complete promotion and publicity plan, embracing educational and creative advertising, through the advertising pages of *Coal Age* and *Engineering and Mining Journal-Press*, reference advertising through the Keystone catalogs, and direct-by-mail list service through mailing lists kept up-to-date week by week and rendered highly efficient through the manifold and direct sources of information of the magazines and catalogs. Such list sources could not, on account of the high cost, be duplicated by the manufacturer. These lists, which must be obtained by McGraw-Hill for its magazines and for the Keystone directories, and must be kept up currently, will now be available to manufacturers for their circular mail work at a cost negligible compared with the cost of compiling and maintaining their own lists.

Joseph J. Vigneau, the founder of the Keystone company and until now its president, will continue in charge of the Keystone business for the McGraw-Hill Co. with offices in Pittsburgh, while Ralph C. Becker, hitherto vice-president of the Keystone company, will continue in charge of sales with headquarters in New York. Except for the retirement of Edward B. Day, New York representative, who leaves to devote his entire time to his company, the Hydrotator Co. of New York, there will be no changes in the staff of the Keystone organization, but the service of the organization will be augmented by all the editorial and advertising resources and strength of the McGraw-Hill Co. All communications should continue to be addressed to the Keystone Consolidated Publishing Co., 800 Penn Ave., Pittsburgh, Pa.

CANADA

(Continued from page 33)

but this was partly offset by increased demands for domestic use. Imports of coke in November declined to 81,609 tons from 94,213 tons in October, while exports fell 1 per cent to 2,432 tons. The apparent consumption was 235,359 tons, as compared with 251,475 tons in October.

A mass meeting of coal miners at Glace Bay, N. S., adopted a resolution, moved by Attorney General John C. Douglass of Nova Scotia, to the effect that the provincial government petition the federal administration for the purpose of obtaining a Canadian National Rys. coal contract for the British Empire Steel Corp., as a means of alleviating unemployment in collieries Nos. 2 and 4 in the Glace Bay area.

Obituary

M. S. Kemmerer, for many years head of the coal firm of Whitney & Kemmerer and widely known in the industry as a pioneer in the hard-coal producing field and the owner of important coal properties in Virginia, Wyoming and Colorado, died at Atlantic City, N. J., Dec. 29 at the age of 82. The firm of Whitney, McCreery & Kemmerer was organized in 1871, the name being changed to Whitney & Kemmerer when George McCreery retired on being elected City Treasurer of Philadelphia. Mr. Kemmerer became head of the firm about 20 yeras ago, when W. B. Whitney died. At first his interest was exclusively in hard coal, but he soon branched out and his interests spread to Virginia, Wyoming and Colorado, as well as to central and western Pennsylvania. He was one of the pioneers in the industry in Wyoming, the mining town of Kemmerer having been named after him.

Robert Drummond, M.P.P., 86, of Stellarton, N. S., died recently. He was regarded as an authority on coal mining in Nova Scotia and for many years was proprietor and editor of the *Maritime Mining Record*, published at Stellarton.

Edward J. Nied, prominent in the coal industry in Cambria and Somerset Counties, Pennsylvania, died at the home of his brother-in-law, Wilson W. Shaver, in Johnstown, Pa., on Dec. 26, aged 58 years. Mr. Nied was born in Danville, Pa. He came to Somerset County in 1897 as private secretary of Simon Krebs, pioneer coal operator, who established a coal mine at Listie. This was the first mine to be opened in Somerset County in the low-vein coal. Mr. Ried remained at Listie until 1904, when the Krebs operations were sold to the Somerset Coal Co., which later was merged with the Consolidation Coal Co. In 1904 Mr. Nied removed to Somerset and had charge of the payroll department of the Consolidation Coal Co., until 1913, when he was transferred to Jenkins, Ky., where he was superintendent of supplies. His health failed about a year ago.

Douglass B. Dunsmore, 77, a mine superintendent in central Pennsylvania for many years, died at the home of his son, James Dunsmore, in Portage, Cambria County, Dec. 30. He was a member of a family which was closely associated with the development of the coal industry in Pennsylvania. His health failed following an injury he sustained a year ago.

William Henry Sanford, prominent banker and coal operator and a director of the Cosgrove-Meehan Coal Co., of Johnstown, Pa., and Illinois, died in Philadelphia on Dec. 24, aged 74. Mr. Sanford was born in England, and was brought to America when an infant by his parents, who settled in Phillipsburg, Pa. When he grew to manhood he became cashier of the old Moshannon Bank. Thirty years ago he went to Patton, Cambria County, where he organized the First National Bank, with which he had been affiliated during the remainder of his life.

Traffic

Adjust Rates on Burlington

The Chicago, Burlington & Quincy R.R. will place in effect Jan. 12 a new schedule of rates on coal shipments from various Illinois coal fields to Burlington, Fort Madison and Keokuk, Iowa, as well as to points in that general vicinity. It had been shown to the Interstate Commerce Commission that freight rates to Burlington and adjacent points had been higher than to Galesburg, Aurora, Joliet and other industrial cities in Illinois.

Cut Coke Rate on N. Y. Central

The New York Public Service Commission has approved new rates of the New York Central (West) on coke, coke breeze, coke dust and coke screenings, from Buffalo and East Buffalo to Falconer and to Fredonia, $1.39 per net ton. This is a reduction and becomes effective Jan. 22, 1926.

Digitized by Google

Coming Meetings

Engineering Council. Annual meeting Jan. 13-15, at Washington, D. C.

The Engineers Society of Northeastern Pennsylvania. Annual banquet at Hotel Sterling, Wilkes-Barre, Pa., 6:30 p.m. Thursday, Jan. 21. Secretary, T. F. McKenna, Scranton, Pa.

Hazard Coal Operators' Exchange. Annual meeting Jan. 22, at Lexington, Ky. Secretary, J. E. Johnson, Lexington, Ky.

American Wood Preservers' Association. Annual meeting, Jan. 26-28, 1926, at Cleveland, Ohio. Secretary, B. J. Stocking, Chicago, Ill.

Coal Club of Philadelphia. Annual meeting, Jan. 28, 1926, at the Bellevue-Stratford Hotel, Philadelphia, Pa. Secretary, C. K. Scull, Philadelphia, Pa.

Northeast Kentucky Coal Association. Annual meeting, Jan. 28, 1926, at Ventura Hotel, Ashland, Ky. Secretary, C. J. Neekamp, Ashland, Ky.

American Institute of Electrical Engineers. Annual convention, Feb. 8-12, 1926, at Engineering Societies Bldg., New York City. Secretary, F. L. Hutchinson, 29 West 39th St., New York City.

American Institute of Mining and Metallurgical Engineers. Annual meeting, Feb. 15-17, 1926, at Engineering Societies' Building, New York City. Secretary, Dr. H. Foster Bain, 29 West 39th St., New York.

The Rocky Mountain Mining Institute. Winter meeting, Feb. 23-25, 1926, at Albany Hotel, Denver, Colo. Secretary, Benedict Shubart, Boston Building, Denver, Colo.

New Companies

The Powhatan Mining Co., Beechwood, Ohio, has been incorporated with a capital of 500 shares of stock, no par value designated, to mine and sell coal. Incorporators are: C. N. Fiscus, M. E. Balcom, H. M. Bruening, M. K. Appleby and J. Q. T. Ford.

The S. Doyel Coal Co., Henryetta, Okla., with a capital of $20,000, has been incorporated by M. A. Doyel and Hugh Kerr.

The Sandlick Coal Co., Whitesburg, Ky., capital $140,000, has been chartered by W. M. Pursifull, P. G. Gorman and James P. Lewis. The same general interests have operated other companies in the section and are well-known operators, Pursifull and Gorman having been in the section for years.

Among the new coal companies organized in West Virginia in October were the following: Queen Coal Co., of St. Albans, with a capital stock of $10,000; Hager Coal Co., of Logan, $75,000; Samples Coal Co., of Thurmond, $5,000; Elkland Mining Co. of Elkhurst, $50,000; Paul Logan Coal Co., of Huntington, $100,000; Superior Central Mining Co., of Charleston, $500,000 and Packs Smokeless Fuel Co., of Charleston, whose capital consists of 1,000 shares of no par value.

The Midland Number Four Mining Co. has been organized at Cass, Ind., with a capital stock of $75,000 to do a general mining and prospecting business. Of the capital stock one-third is common and the other preferred. The incorporators are Nelson Houpt, Bert Houpt and Lex Usrey.

The Captina Coal Co., of Bellaire, Ohio, has been incorporated with a capital of $20,000 to operate a mining business. The incorporators are J. F. O'Conner, Mary E. O'Connor, Thomas Long, Slater Long and M. L. Davis.

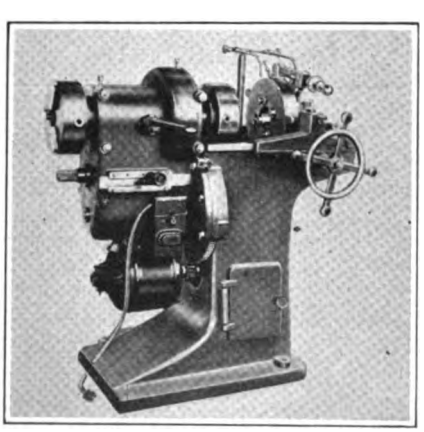
Trade Literature

The Rome Wire Co., Rome, N. Y., recently issued the third in its series of catalogs dealing with wire. This last one is on **Bare Wire** and contains useful data and tables regarding constructions, sizes, weights, current-carrying capacities, etc. The first two catalogs dealt with **Magnet Wire and Super Service Cord.**

Automatic Switching Equipment. General Electric Co., Schenectady, N. Y. Bulletin No. GEA-295. Pp. 23; 8 x 10½ in.; illustrated. Describes the application of this service to mining and industrial service, railway service, hydro-electric generators, central station service, etc.

New Equipment

Self-Contained Threader Can Be Made Portable



In order to meet the demand for a pipe and bolt threader that can be used either as a portable or production machine, the Chicago Pipe Threading Machinery Co., of Racine, Wis., has perfected and placed on the market the machine shown in the accompanying illustration. This is capable of threading pipe from ¼ in. to 2 in. in diameter or bolts from ½ in. to 1½ in. By the addition of a universal drive shaft it may be fitted to drive hand stocks of any size up to and including 12 in. in diameter.

Although this machine is designed to meet all the requirements of one for portable use it is also a production and precision threader. The motor driving it through direct gear connection is protected from all oil and chips as well as from the work being handled. An extension cord is provided, fitted with a plug that will fit any light socket, so that power may be drawn from any convenient point. Three speeds, which well cover the range of the machine, are obtained by means of sliding gears operated by a conveniently placed lever. A clutch for starting and stopping the machine is located on the spindle and gives perfect control without reference to the motor or gears.

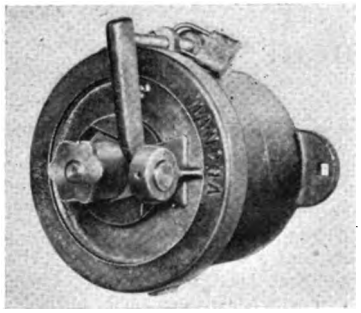
At the rear of the die head is placed the extra heavy cut-off attachment. All sliding parts are carefully machined and gibbed to compensate wear. Absence of vibration in this particular part saves many knives and other parts from breakage. The reaming tool is mounted on the cut-off block and is operated by turning the handle toward the center of the machine after the cut has been made. This is accomplished without changing the location of the die head.

In general design this machine is modern in every particular, yet presents a more or less radical departure from conventional practice. The pedestal base is fitted with both an oil reservoir and a tool cabinet where dies, wrenches and the like can be stored. The entire machine may be mounted on wheels when it is desired to use it as a portable unit.

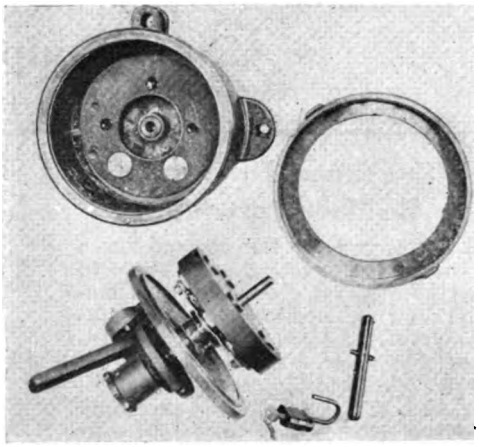
Charles Rasmussen and R. T. Ingalls, owners of the Wisconsin Machinery Co. of Racine, Wis., together with L. H. Taylor, formerly of the Greenfield Tap & Die Co., of Greenfield, Mass., and the Williams Tool Corp., of Erie, Pa., and Clifford Peterson of the Clifford Peterson Tool Co., of Chicago, are the incorporators and owners of the company manufacturing this new machine.

Side View of Semi-Portable Machine

This combined pipe and bolt threader represents a more or less radical departure from conventional design. It is a self-contained unit that may be mounted on wheels for ready transportation over short distances. The pedestal base contains both an oil reservoir and a tool cabinet where dies, wrenches and the like may be stored.



Triple Inclosed Fuse Keeps Locomotive in Operation



Adaptability to practice is the keynote in the design of a three-point, permissible fuse recently introduced by the Mancha Storage Battery Locomotive Co., of St. Louis, Mo. This fuse insures continuity of operation of a locomotive or power truck in a gaseous mine. Safety dictates that no current-carrying part shall be exposed in a gaseous portion of a mine. Formerly, when a fuse was blown, the locomotive had to be hauled to the bottom before it could be replaced. Equipped with this new device, the locomotive is instantly restored to service by simply operating a lever. A new fuse is thus placed in the circuit, while a third fuse is still in reserve. The blown fuse may be renewed when the locomotive reaches the barn. In addition to the continuous service which this device effects, it injects a further element of safety into storage battery locomotive operation. The fuse lever is located convenient to the motorman and may be thrown as a switch should the controller stick or an accident be imminent.

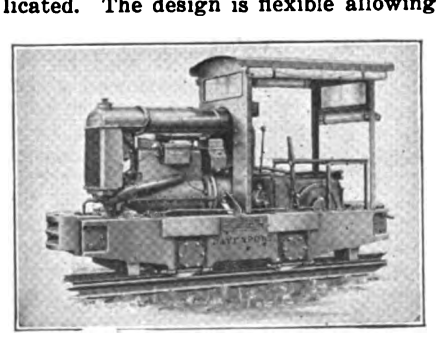
This three-point fuse has been approved by the Bureau of Mines and is standard equipment on all permissible locomotives and power trucks furnished by its manufacturer. The housing consists of three parts. First, there is a cylindrical shell of cast bronze, the upper face of which is accurately machined. The end of this shell is also threaded, the cover consisting of a cast bronze plate with raised faces on each side at the circumference. These faces are also machined, one to fit flush with the end of the shell, and the other to fit a similar face on the inside of the retainer ring. This latter is of cast bronze and is threaded inside. When it is in place, the housing presents a rugged exterior and forms an absolutely flame proof unit.

Two asbestos packed stuffing boxes in the bottom of the shell permit the leads to reach the terminal posts mounted on a fibre block. On this block are also located two laminated

Digitized by Google

Fuses Easily Changed

In case of a burnout fuses may be changed without opening the case. To accomplish this it is merely necessary to properly manipulate the lever and knob.



copper contacts, 90 deg. from each other. The working parts are carried on a stem which extends through a bushing in the cover and is supported at its lower end by a bushing forming an integral part of the shell casting. This stem carries a round, fibre block, on the top of which the fuse links are mounted. Four solid copper contacts placed at 90 deg. from each other protrude from its under side. These contacts are in series with one another through the three fuse links. The absence of the fourth link prevents a continuous circuit. In other words, when the external lever which operates the stem is in the closed position, only two adjacent solid contacts make connection with the two permanent, laminated contacts. There is, therefore, but one fuse in the circuit, the others being on open ends. The shift from one fuse to another is made by simply releasing the lever, which allows the stem to be withdrawn a short distance, next turning the stem through 90 deg. by means of the knob on the outside of the housing, and then closing the circuit again by throwing the lever. By means of a spring, opening of the circuit becomes instantaneous. This is highly desirable for breaking the circuit without drawing an arc, in case the device is used as a switch. The housing and all working parts on the inside are substantially lined and bushed with several thicknesses of mica so as to avoid all possibility of short circuits. Burned out fuses may be replaced in a moment's time, the only tool necessary to the accomplishment of this operation being a small wrench.

New 4-Ton "Gas" Locomotive Has Fordson Power Plant

A new 4-ton gasoline locomotive incorporating the Fordson engine and transmission parts recently was announced by the Davenport Locomotive Works, Davenport, Iowa. The dependability of the Fordson power plant with the advantages of using highly standardized engine and transmission parts for quick replacement and repair, help to fit this locomotive for all-around service in outdoor mine-track yards.

The design of the locomotive is simple, parts are accessible and the rugged, balanced construction found in the larger Davenports has been duplicated. The design is flexible allowing the use of a canopy cab, a fully inclosed steel cab, or the removal of the cab altogether. The operating levers are placed within easy reach at the right hand side of the cab and clear vision is provided in all directions.

The locomotive has a speed range of 3 to 14 m.p.h. and a maximum tractive power of 2,125 lb. Its operation is highly economical for it starts on gasoline and runs on kerosene.

Good for Outdoor Service

This new 4-ton gasoline locomotive using a Fordson engine, starts on gasoline runs on kerosene and is rugged enough for hard work.

Industrial Notes

The Link-Belt Co., of Chicago, announces the opening of a branch office in the First Wisconsin National Bank Bldg., Milwaukee, Wis., with R. C. Kendall in charge.

The electrical supply business carried on by the Western Electric Co. has been set apart from the telephone manufacturing business and incorporated under the name of Graybar Electric Co., with capital stock of $15,000,000, all owned by the Western Electric Co. This gives to the supply department a separate identity which is made necessary by its importance as the largest merchandiser of electrical apparatus and related equipment in the world. Since it came into existence in 1869 as the partnership of Gray & Barton, the name which it now resumes in modified form, the supply business has grown steadily until it now serves more than 35,000 customers through fifty-five distributing houses in important cities. Albert Lincoln Salt is president of the new company.

The Lapeer Trailer Corporation, manufacturers of automatic semi-trailers, announces the appointment of J. B. Beattie as Eastern sales manager, with headquarters in New York City. Mr. Beattie formerly was connected with the Autocar Co.

Association Activities

Directors of the **Cincinnati Coal Exchange** on Dec. 22 elected the following officers to serve for 1926: President, Nolan Mahan, General Coal Co.; Vice-President, John Glaser, Midland Coal Sales Co.; Secretary, Armour A. Sizer, Flat Top Fuel Co.; Treasurer, William Heitzman, Central Pocahontas Coal Co.

T. K. Maher, president of the Maher Collieries Co., (chairman), J. L. Good, of the National Coal Co., and Joseph Nelms, of the Ohio & Pennsylvania Coal Co., are members of a committee appointed by the **Pittsburgh Vein Operators' Association of Ohio** on trade extension. It is said that newspaper advertising will be used to help move Ohio coal.

Freight rates, recent court rulings and Interstate Commerce Commission decisions were freely discussed at the December meeting of directors of the **Central Pennsylvania Coal Producers' Association**, held in the headquarters in Altoona Dec. 15. The meeting was in charge of the president, B. M. Clark, of Indiana, the others present including M. J. Bracken, Rembrandt Peale, Sr.; J. W. Searles, C. Law Watkins, William Lamont, E. W. Robertson, S. J. Wills, J. R. Caseley, H. B. Scott, J. William Wetter, Rembrandt Peale, Jr., C. B. Maxwell, James McCook, A. M. Liveright, of Clearfield, solicitor for the association; Charles O'Neill, secretary, and W. A. Jones, statistician. Representatives of the National Coal Association also attended. Harry L. Gandy, executive secretary of the National Coal Association, gave much valuable information relative to the industry throughout the country and strongly appealed to the association to renew its membership in the national association. This matter was taken under advisement and a committee composed of B. M. Clark, Rembrandt Peale and Secretary Charles O'Neill was appointed to make a canvass of the members and make a report at the January meeting.

New

CABLE CONNECTOR

This new O-B Cable Connector is for motor and armature leads on mine locomotives, for cable connection to trolley poles, or for cable leads to any stationary or portable motor.

It takes the place of a permanent connection that might otherwise be used, yet has the advantage that it can be quickly disconnected.

The two phosphor bronze terminals are soldered onto the cable ends. Insulation is trimmed back just far enough so that the distance between ends of the insulation is slightly less than the length of the tight-fitting rubber sleeve. When terminals are snapped together, with the rubber sleeve in place over the joint, a continuous and tight rubber-insulated joint is formed, requiring no taping.

Write for complete details.

The Story of 1925

NEARLY EIGHT MILLION tons of coal loaded underground by machine—five million more by conveyor—many mines rehabilitated—the use of electric power expanded—more mine boiler plants equipped to burn low-grade fuel—the market for coal widened by new industrial demands—these are some of the high lights out of the 1925 story of coal that will be told in next week's issue of *Coal Age*.

THE ANNUAL REVIEW NUMBER will contain market reviews of the world and production statistics showing that the United States mines produced the satisfying total of 523,072,000 tons of bituminous coal and sold almost that much. It will show that 1925 was the "safest year in history," excepting only 1920 when the death rate per million tons was down to 3.45 as compared with last year's 3.68.

The issue will summarize and review many of the problems of both anthracite and bituminous coal producers and distributors, developing a great deal of interesting material that will go down in coal's history as a permanent part of the record.

Signs Favorable to the Coal Industry

DESPITE the welter of coal overproduction, despite the continued threat that economies will cause a further contraction in coal demands, despite the assurance that oil is going to make further inroads on the sea and, in places, for transportation by land, one can, nevertheless, see signs ahead that are reassuring for the coal industry. These signs include the activity of the public utilities, and the ousting of oil by coal in large steam-boiler and locomotive-boiler practice. Power companies, also, are organized for expansion, and are reaching out for new power uses, such as for better illumination.

The safety of highways, both for passengers and for vehicles, will be increased by better lighting, a development which is rapidly taking place. Furthermore, illumination is proving a great aid to merchandising. Stores which in earlier days were dimly lighted are now ablaze with high-candlepower lamps, and new electric signs add constantly to the demand for power. In factories, also, the value of illumination to safe operation and a better product is causing rapid increase of the demand for electric energy.

In modern dwelling houses, besides better lights, all kinds of equipment are being installed, to reduce the drudgery of housekeeping. Electric washers, sweepers, mangles and irons are being introduced; and even electrically cooled refrigerators and radiators. Farms are being equipped with electric feed cutters, separators, churns and milking devices. Electrically operated pumps are providing water under pressure, for domestic purposes; and perhaps we may look for the extensive use of electricity for the sprinkling of crops and for irrigation in times of drought; extending the practice already long in use in southern California and other semi-arid agricultural regions.

"Eventually—Why Not Now?"

UNION OFFICIALS who insist day after day that arbitration shall not be the solution of the anthracite deadlock give an exposition more remarkable for its pertinacity than its wisdom. The public that pays the final bill is plainly out of patience with the position of the mine workers and as plainly in sympathy with the stand of the operators. When we remember the century-old epidemic of "anthracite-phobia" and the easy appeal to passions and prejudices which the advocates of labor have time and again so successfully invoked against capital, the swing in the public attitude has a significance which should impress even the irreconciliables among the executives of the United Mine Workers of America.

Mr. Lewis, leading a forlorn hope with all the vigor of a victorious commander, speaks feelingly of the unwillingness of the miners to permit a third person to fix "their wages and decide what kind of food they shall eat, the clothes they shall wear" and other living conditions. It is an understandable unwillingness. But, if the mine workers are to escape this dictation, they must do one of two things. They must either surrender their conception of an inherent right to the jobs they have deserted, and make no protest against the employment of others in the places they have vacated, or offer an acceptable substitute for arbitration—a substitute which will protect the public's right to an uninterrupted supply of fuel. No one at this time seriously suggests the first surrender. The union, on the other hand, offers no peaceful substitute for arbitration.

Until Mr. Lewis and his associates prove wiser than the wisdom of ages and come forward with such a workable alternative, the public is going to believe that arbitration is the ideal solution. The public is going to be cold to demands for sympathetic consideration of claims which the union has declined to press before an impartial tribunal. The public is going to be suspicious of the merits of contentions which can be established only through inconvenience, discomfort, exhaustion and suffering. If union leaders persist in their determination to war on peace, the public may acquire a belligerency of its own.

Sooner or later—lacking that superwisdom—the union will have to reaccept the principle of arbitration. It has acknowledged as much in its adherence to the one-sided third party judgment incorporated in the discredited Pinchot plan. It has admitted it again in its Sunday attempt to foist the Governor's plan upon the country cloaked as a "revision" of the Markle plan. To prolong its opposition to bona fide, unrestricted arbitration in the desperate hope that something may happen to rescue the organization from its plight shows consideration neither for the public nor for its own loyal members who face want and privation.

Bigger Recovery by Shearing

DESPITE its demonstrated and potential merits, the shearing machine has not received the consideration which it deserves. It should be a material assistance in increasing the percentage of lump coal as it provides an additional free face for each shearing cut. Though this advantage obviously is partly or entirely lost by the increase in the quantity of bugdust yet two advantages remain that have no countervailing disadvantages.

One of these is that shearing prevents the undue shattering of the roof in shooting. Not only can the holes be more lightly loaded but the pressure created by the explosive acts horizontally as well as vertically and thereby damages both roof and coal less severely. Though by this means the roof is not protected as well as by the top cut of the turret machine the advantage is nevertheless appreciable, a fact which does not seem to be widely realized.

The last and probably the most important advantage of the shearing machine, is also not appreciated by many mine owners. It enables a more complete re-

Digitized by Google

covery of coal from mined-out areas by facilitating the lifting of that coal which lies below the kerf formed by an undercutting machine. This it does by channeling to the bottom of the seam, through the bench of coal which is left by the undercutter. Any man who has been a miner appreciates the difficulty with which many bottoms are lifted by pick and may even wink at the practice which is so prevalent, of abandoning the bottom coal when not forced by management to remove it.

The shearing machine is particularly beneficial in this respect in rolling seams. Under this condition the bar of the undercutting machine cannot be so nicely regulated as to stay on the bottom, with the result that some, and often much, coal is left under the cut. An almost imperceptible rise of the floor of the cut, or dip of the bottom, may cause a considerable thickness of unmined coal to be left on the floor of the mine. One of the largest producers in the country estimates a loss of coal in its mines of about one ton in thirty through the inability of the undercutting machine to cut on the bottom, and the failure of the efforts of the management to compel miners to lift coal which the machine over-rides. The shearing machine should stop this unprofitable waste of bottom coal, and at the same time improve roof conditions and perhaps increase the percentage of large sizes.

The Bureau of Mines Director In Spitzbergen

AN INTERESTING story of a difficult coal enterprise is interwoven with a glimpse of the personality of the new director of the Bureau of Mines in a bulletin sent out by the Bureau on Dec. 9. It goes without saying that this bulletin was issued without the knowledge and consent of the new director, who is winding up his personal affairs in Ottawa; the acting director, Dr. D. A. Lyon, assumes responsibility in a note accompanying the publication, indicating that it is in the spirit of good-will on his part that the entertaining document is sent out. Indeed, the document is not, strictly speaking, addressed to the public, but is specifically sent to the far-flung employees of the Bureau. The bulletin describes the picturesque mining adventure of Scott Turner as general manager for the Spitzbergen mines of the Longyear interests.

If there is anything in the theory that Nature tries to provide for the wants of humanity, then there would seem to be sense in placing abundant coal at Spitzbergen,—not very far from the North Pole, between latitudes 76 deg. and 82 deg. And to judge from the obstacles she has interposed to mining and shipping the coal, she seems to be doing her best to keep it there till Arctic inhabitants may need it.

The enterprise of J. M. Longyear, of Marquette, Mich., and Frederick Ayer, of Boston, in coal mining in Spitzbergen began in 1905. Due to the inclement situation of this considerable group of Arctic Islands, no nation has established unqualified sovereignty, so that the keeping of order was entirely a function of the operating company. Installation of equipment, mining, and the development of markets continued to 1911, at which time Mr. Turner became general manager, replacing the general manager who was resigning. Why he resigned becomes increasingly easy to imagine as the narrative proceeds. At that time (in 1911) the production was 26,000 tons.

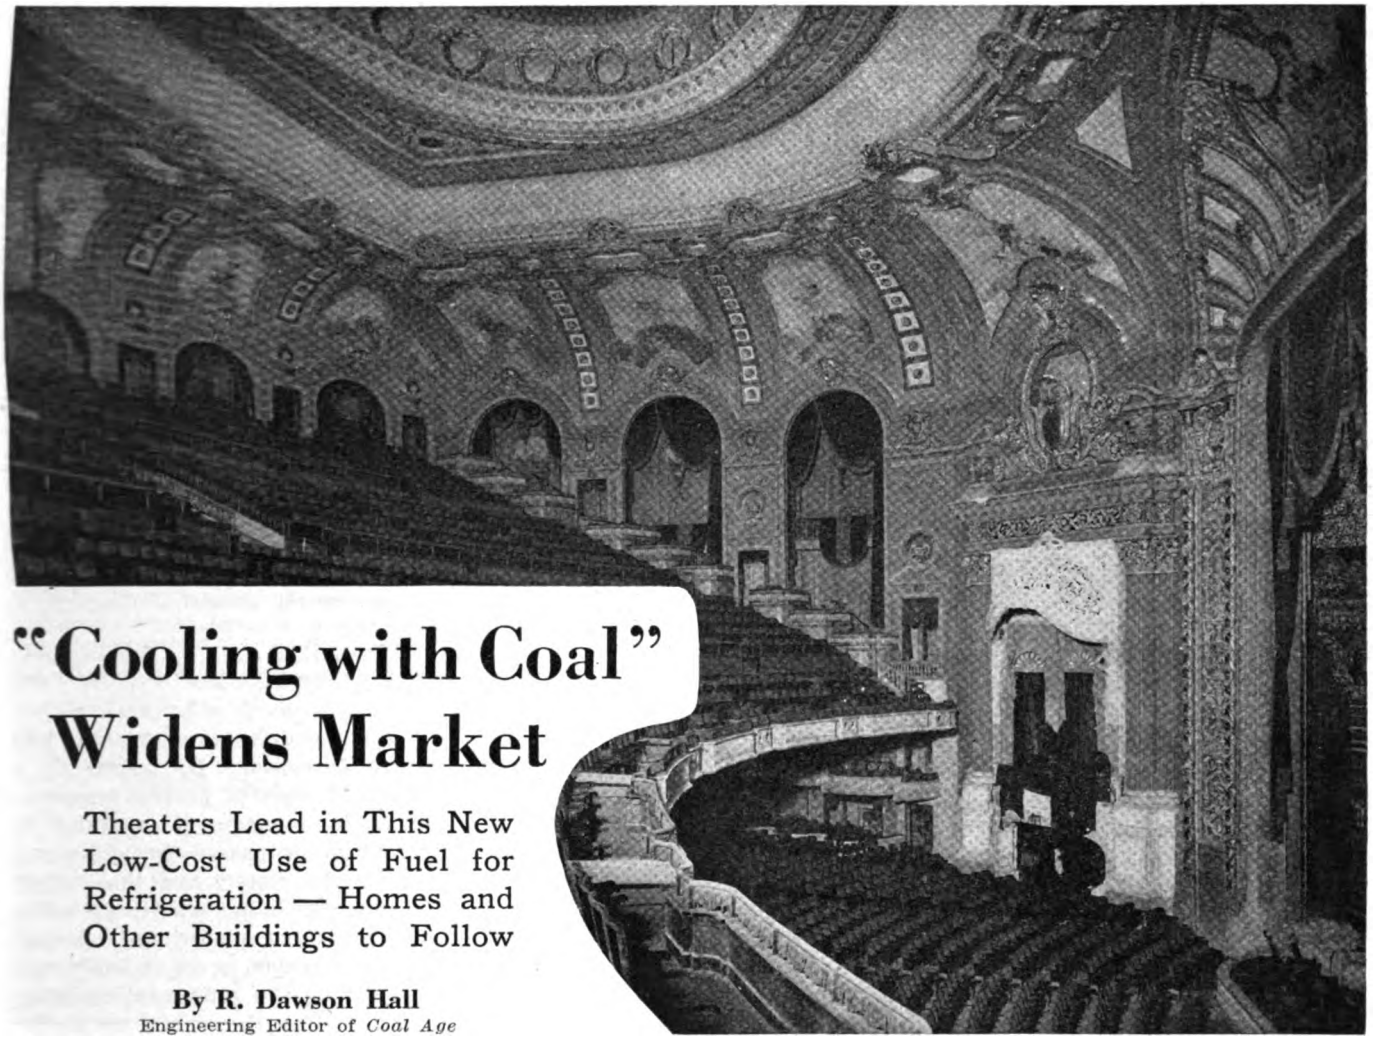
The problems with which Mr. Turner grappled courageously and, on the whole, successfully are interestingly detailed. These included Arctic climate, poor and unwilling labor, no government, inadequate shipping facilities, and the determination of markets. There is plenty of coal in Spitzbergen, it is clear: the problem is to get it out economically. A single seam investigated thoroughly showed bituminous coal amounting to 11,000,000 positive, 13,000,000 probable, and 43,000,000 possible tons. In 1913 the output of the mines had been brought up to near 38,000 tons.

The national sovereignty of the Islands is not yet determined, a conference of the powers in 1914 to decide this having broken up without coming to an agreement. The beginning of the war distracted attention from this question; and also changed all plans regarding the operation of the mines. In 1916 the rights of the American company (Ayer and Longyear) were sold to a Norwegian syndicate, and Mr. Turner ceased to have any part in the enterprise.

No Facts Withheld

ONE BITUMINOUS coal producer, the Union Pacific Coal Co., realizes that the truth told does less harm than all the surmises that follow the truth withheld. It has issued orders that if, owing to some untoward circumstance, it has an explosion in its mines and reporters throng around the plant they are to be received with all the courtesy possible under the circumstances and to be given a statement every three hours or oftener if need be. Many a wild story, many an unfortunate misrepresentation would be avoided if this practice, quite common in the railroad service, were followed. Of course, the company has undertaken with the utmost diligence to make its mines safe. It has workings which are models of safety in every way and a system of inspection that makes the prospect of a large loss of life unlikely, but should the unforeseen happen there will be full disclosure of the facts.

Improving Trite Advice



"TAKE an interest in your work," "Love your work" or something to this effect usually is included among the "five," "ten," or "fourteen" points of advice given to the young man going into the coal industry or any other field of activity. But does not this point of admonition have a rather hollow sound? The very words "love" and "interest" have to do with the inner feelings of an individual and are not voluntarily controlled.

Would it not be much better to tell the beginner that if he is not interested in his work, he should attempt to find out why; and remember that with increased knowledge and proficiency comes greater interest. This may offer to him a solution instead of discouragement.

Mine Ventilation

THE PRACTICE of ventilation suffers much from the popular notion that one aircourse should be as large, as smooth and unencumbered as another, whereas only where the volume of air to be transmitted is large need the aircourses be wide, high, with rounded lines and no interference. That is why particular solicitude should be felt for the passages that have to carry the full unsplit current.

"Cooling with Coal" Widens Market

Theaters Lead in This New Low-Cost Use of Fuel for Refrigeration — Homes and Other Buildings to Follow

By R. Dawson Hall
Engineering Editor of *Coal Age*

ECONOMY in the use of coal by railroads, public utilities, metallurgical plants, industries and domestic consumers has changed the steady progress in the production of that mineral so that now it is difficult to tell whether consumption is increasing or decreasing. What is more, the last word in economy has not been said. The railroads have made only a start in electrification. The public utilities have set standards which only a few are reaching. Metallurgical economies are still progressing and have not been universally adopted. More industries every year close down their inefficient power plants and turn to purchased power producing energy with economical equipment, and domestic consumers are trying out new composition roofing and sheathing boards that prevent leakage of air and loss of heat. The anxiety of the gas manufacturers to get into the heating business is causing them to advocate houses almost hermetically sealed because a leaky house takes so much heat that to warm it with gas would bankrupt the householder.

Operators must face the inevitable restriction in market due to economy. It cannot be stemmed. He would be exceedingly ill-advised and unpopular who would attempt it.

In the headpiece is shown the interior of the Chicago Theater. This great moving-picture house seating about 5,000 is cooled to 74 deg. in summer by a 300-ton plant, the daily operating charge of which is about 1c. per seat. This cost is approximately half a cent lower than that estimated for the average theater but even the average is low enough to have proved the "cool-with-coal" idea a profitable one. Increased theater patronage in hot weather repays not only the operating cost but also, within two or three years, the original investment charge.

However, there are always new uses for coal. One of these which has been almost unknown until today, but which has large possibilities for the future, is the cooling of the air in theaters, offices, factories, stores, restaurants, hotels, hospitals and homes by refrigeration plants the electric power for which is generated with coal. Sufficient advance has been made in the refrigeration of moving-picture houses to prove the case. There, summer patronage has been increased enough to more than offset the original plant investment and the daily operating cost which averages only 1.5c. per seat.

Among the other new uses for coal is the manufacture of what have been hitherto regarded as mere byproducts of its distillation, but at present it is questionable whether these can be sold at a price justifying such treatment. Where the coal is distilled, the gain is in the better fuel rather than in the byproducts. There are possibilities in coal distillation and gasification but even if pushed to present limits and even somewhat beyond them, they would add but little to the coal consumption. Hope from this course seems somewhat remote.

So the main solution is by the use of more coal for domestic heating and in developments in the use of power. There is quite a possibility that the average farmer and country laboring man might be induced by advertising to heat his house more completely and to use wood less in so doing. This advance would be in the direction of the use of coal of the larger sizes

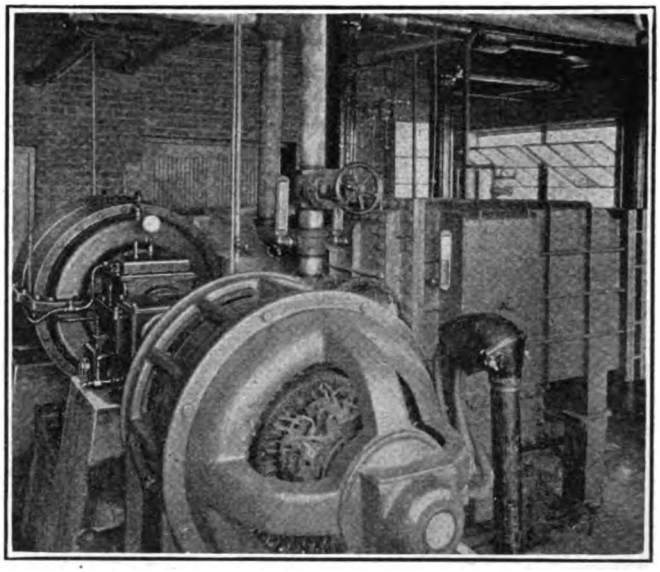
Digitized by Google

and the market would be likely to be badly unbalanced by that additional demand, for some farmers like to buy their coal when they can haul it in sleds and so are disposed to leave the work of hauling and therefore their buying till the winter.

At best, it is not a large use, and the operator, if he is going to use his strength to develop his market, must lay his stress on those opportunities which are largest. The biggest are those where the producer helps the consumer to get more business, thereby aiding the former to increase his sales. These opportunities are in the increased sale of electrical power.

Hitherto the public utility has not been a generous purchaser of coal. It has largely bought the smaller sizes of the product at cost below that of production, but that was because the quantity of coal desired was usually such that, unless he was buying the unsized low-volatile, there was plenty of slack available as the outcome of preparing screened sizes.

The economies of the public utility have enabled it to make this advantageous bargain. Had its demands been larger it would have had to crush some run of mine all the time, and it does part of the time even today. The utility, if it needs more coal, will have to pay a bigger price for all of it or will have to produce enough coal for the supply of its own needs. It cannot continue to steal a ride behind the domestic consumer. In consequence it would be wise for the operator to see if it is not possible to find ways in which more power would be used.



Here, some will say, "Surely the electric companies, having this as a direct interest, will have been lying awake nights figuring on means of selling more power and what can the operator who knows the game less well do to aid them?" That is an old manner of arguing and usually not a safe one. No one uses it as regards the coal industry which every one feels they could steer to better advantage than its present captains.

ORGANIZATIONS PROMOTE PROGRESS

The public utilities have formed a Society of Electrical Development with which operators should be acquainted and with which they might advantageously co-operate. This society has been quite active in developing small uses of power in the home. It is working on electrical refrigeration by which it understands the keeping of an "ice box" cool. This is an admirable project and in a way important to the backers of the Society as the current used for this refrigeration is sold at a high figure to small users. It helps to bear the heavy burden entailed in the domestic installations of electricity. As an aggregate it promises little to the coal operator, whatever it may mean to the public utilities. The Commercial Department of the National Electric Light Association is another interest that is seeking new outlets for the sale of electric power. Progress in the use of refrigeration can be advanced through that association also.

The cooling of air in public buildings and homes, however, promises to be a leading use of electric power. The public has desired to obtain the benefits of this development for centuries and would have had it years ago had it realized that it would not be too costly. Enough has been done to show that when applied to large numbers of people assembled together it is well within the compass of any pocket book.

In general the principle is as follows: A suitable gas is compressed by a motor-driven compressor. In so doing its temperature is raised. By means of a condenser the gas is brought back to normal temperature. It is then allowed to expand and in doing so becomes chilled. The cold gas is passed through pipes under water, thus cooling the water, and this water is sprayed on the air which is being admitted to the building, the air of which is to be conditioned. Sometimes the air to be used is purified in an ordinary air washer and then passed among the refrigerating coils, sufficient water being sprayed on the coils from flushing pipes or spray troughs to increase the efficiency of the cooling surface and to prevent the formation of ice on the surfaces of the coils.

Weather-Making Machine for Theater Cooling

This plant uses "dieline" or, more scientifically, "dichloroethylene" as the refrigerating fluid. This liquid is heavier than water, boils at atmospheric pressure at a temperature about 120 deg. F. It is flammable but only with relative difficulty. This 75 to 90-ton plant is a model of compactness.

During the administration of President Taft efforts were made to keep the Presidential offices in the White House cool by the use of ice but the quantity needed, several tons daily, soon convinced the Department of Public Buildings that the work was excessively costly.

As far back as 1907, Kuhn, Loeb & Co. arranged with A. M. Feldman, an architect of New York City, for the cooling of its bank on William and Pine Streets, New York City, the cooling being provided by the use of ammonia refrigeration. Mr. Feldman is an advocate of conservatism in cooling. He believes that "dwellings should never be cooled more than eight or ten degrees below outdoor temperature in the hottest weather nor below 73 deg. F. It appears that the human body has the faculty to adjust itself to atmospheric conditions and obtains comforts with only slight differences of temperature, especially if some of the excess absolute humidity has been removed from the air."

Mr. Feldman declares that Kuhn, Loeb & Co. was well satisfied when the outdoor temperature was 91 deg. F. and the outdoor relative humidity 53 per cent if the temperature admitted to the banking office was 71 deg. F., the average temperature in the office being 81 deg. F. and the relative humidity 63 per cent.

Certain it is that Kuhn, Loeb & Co. must have been satisfied, for four years ago the same architect using the same system reconstructed the plant to take care of three floors in the same bank. It will be observed that the air after being freed by mechanical methods

Digitized by Google

of the water it carries at about 71 deg. F. is introduced into the banking room where it becomes heated to 81 deg. F. In this process it gains a capacity to take up more moisture, so that its saturation falls to 63 per cent. This is what makes the air refreshing. If it were saturated it would not be comfortable because it would not assist in the removal of moisture from the surface of the body.

The general disposition of refrigerating engineers is to cool the air still more. It is not quite clear that this is necessary. It may well be that the people who are adopting refrigeration for the popularizing of their places of resort desire to advertise the fact that their buildings are cooled and so prefer to refrigerate them excessively in order to prove their claims. They may later choose to cool their buildings as little as will produce comfort, thus saving money and avoiding the risk of their patrons getting pneumonia or colds. It has been stated that some patrons of cooled motion-picture houses have left their seats and returned to the outside air rather than subject themselves to the possibility of contracting colds. At present, however, the tendency is in favor of greater refrigeration despite the increased cost.

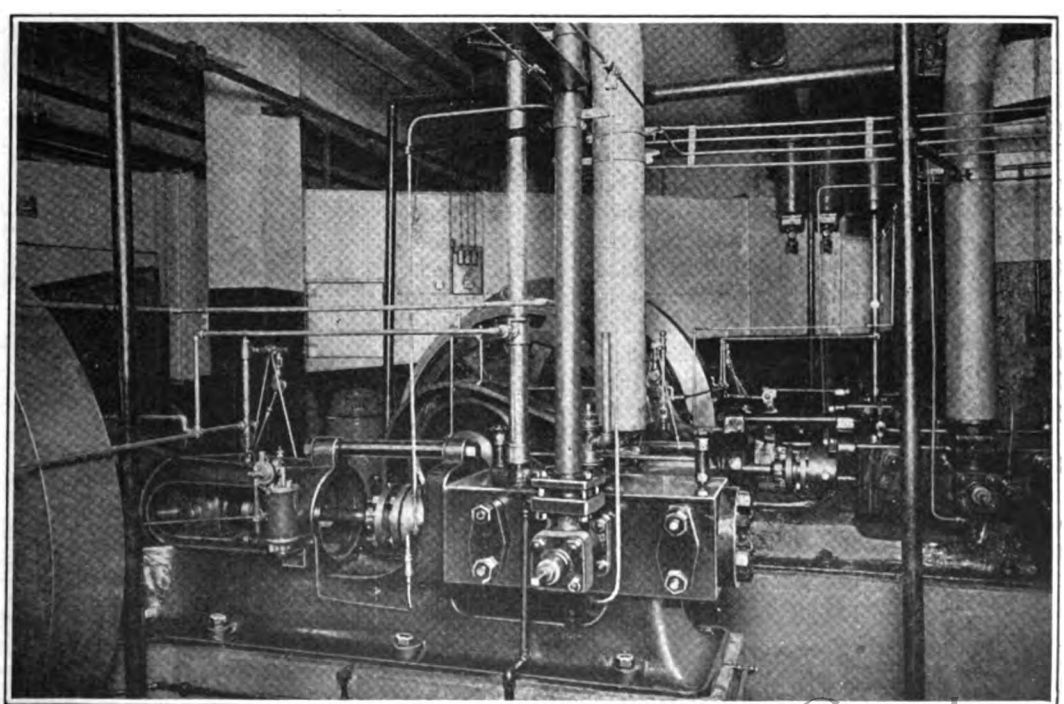
Installation in 1907 Still Working

An early installation was that made in 1907 for the Pompeian Room of the Congress Hotel in Chicago. This room is still cooled by this installation and since then the French and Gold Rooms have been similarly cooled. Another early installation was the Café of the Ritz-Carlton in New York City which has a machine capable of freezing 75 tons of ice daily.

In Chicago the following theaters have been refrigerated: the Chicago, State-Lake, McVickers, Pantheon, Tower, Senate, Harding, Madison Street, Diversey, United Masonic Temple, Uptown, Woods, Riviera, Palace Music, Annette, Central Park, Trianon, Laurence, Tivoli and Capitol. Chicago has led in the work of refrigerating buildings though there are many cities where the need for cooling is greater. The Woods Theater is the only one which houses the legitimate drama. The play which ran in this theater last summer had left New York where it had played to crowded houses and had come to Chicago to take advantage of the cooled air of the Woods Theater. It played to full houses, the seats being taken six weeks in advance. Today it is back in New York, the temperature in the city no longer needing improvement by refrigerating processes.

Opportunity in New York City

In New York the Capitol Theater and the Rivoli have refrigeration. So far little has been done in that city of many first-class theaters to keep such places cool. In Pittsburgh two theaters have recently been cooled by refrigerated air, the Davis and the Grand. In Philadelphia, the Fox is thus cooled and in Buffalo, Shea's Theater.



The South is plentifully supplied. Thus at St. Louis, Mo., is Loew's, the Grand Opera House, Delmonte and the Masonic; in New Orleans, La., is the Orpheum and Loew's State Theater, in Kansas City, Mo., is the Orpheum, Main Street and Newman theaters; in Dallas Tex., is the Palace, the Melba and the Majestic; in Houston, Tex., the Texan and the Majestic; in Fort Worth, Tex., the Majestic; in Tulsa and Oklahoma City, Okla., two Orpheum theaters. In San Antonio, Tex., also the Majestic Theater is refrigerated. The Palace Theater at Peoria, Ill., the Capitol theaters at Des Moines, Ia., and Cincinnati, Ohio, respectively, are other examples.

Other theaters where refrigeration is being installed are the Belmont, Ascher, Marks, Howard, Highland, Grove and Wasson in Chicago, the Hammond at Hammond, Ind., the New State at Detroit (209 tons), the Rialto at Joliet, Ill., the Lyric at Indianapolis, Ind., the Keith, at Atlanta, Ga., and the Miami at Miami, Fla. Keith's theater in Washington is to have an installation. These are only a few of the projected plants. The work of preparing for the coming summer is exceeding the capacity of the architects and manufacturers to fill the demand.

The cost of these installations is considerable and

Cools Seats at a Cent Apiece

Machinery of the 300-ton carbonic anhydride refrigeration plant which cools the big 5,000-seat Chicago Theater in the Mid-West metropolis. It has two duplicate units each of 150 tons refrigerating capacity. The variation in the theater from roof to orchestra pit has never exceeded 2 deg. in any place since the system was put in. Cooling is attained by direct expansion, the coils for this purpose being placed within the air washer. Examples like this suggest how much coal will be used when we temper our air to suit our bodily comfort.

Digitized by Google

is made more difficult by the fact that such plants require much room which is not always available. What space has been found is already pre-empted by the heating equipment. One authority said that a 400-ton plant which would supply a house with about 6,000 seats would cost, including air washers, $100,000. With current at 1½c. a kilowatt-hour the refrigeration plant could be run for $6 an hour. The ventilating fan by which the cooled air is circulated would cost another $2 per hour for operating charges, but that unit must be kept running whether the air is cooled or drawn direct from the street.

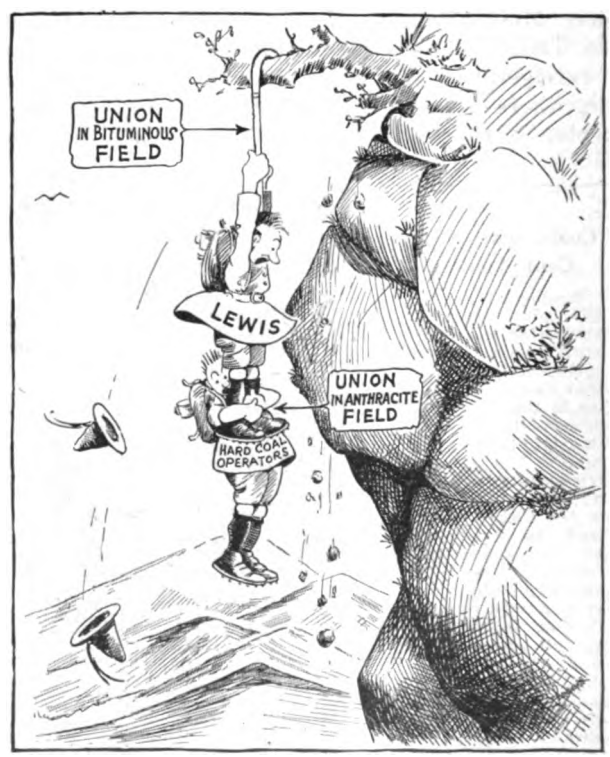
COST FIGURED AT 1½C. PER PATRON

Ventilation is necessary in any event so the cost is only 0.1c. per seat per hour. Just how often the seats are filled is doubtful. Throughout the industry perhaps it may be only 1½ times per day. One authority, speaking of a New York theater of modest size, says that "it is a safe estimate to say that the seats have never been filled less than 1½ times a day and the average is more nearly twice that. On some occasions the seats have been filled 3.9 times during the day." This same authority said that the rate of 1½c. per kilowatt-hour was unusually low and that the cost of a 400-ton plant would be nearer $150,000. Making the rate 3c. per kilowatt-hour the cost would be $30 per day per 1,000 seats for twelve hours' operation. Assuming the seats were filled twice a day as an average, the cost per patron would be 1½c. This, he assumed, would be a fair average for the season.

It is easy to see that this would not be a figure that would deter theater managers from making the investment. Dr. E. Leonard Hill, a ventilating engineer, said that the McVickers Theater in Chicago had spent $69,000 in cooling equipment and found that the increased profit in showing to large houses was such that in two years they hoped to have their expenditures back in those increased profits alone.

CHICAGO THEATER'S 300-TON PLANT

At the Chicago Theater, a 300-ton refrigerating plant cools the outside air from 95 deg. to 74 deg. The theater which houses from 4,000 to 5,000 people is kept cool by a plant that is said to be run for $50 a day or a cent a seat and for less than that therefore per patron. The plant has two units so that one only can be used if full refrigeration is not needed. R. A. Kroeschell said that 15 deg. of a drop between outside and auditorium was all that should be attempted. Dr. Hill said that the air could be profitably cooled to 50 deg. and then heated by radiators to reduce moisture or it could be passed through ducts that would add to the temperature or again it could be mixed with bypassed air. He advocated that when the air was 90 deg. outside it should be cooled so as to keep the temperature of the auditorium 75 deg. with 60 per cent relative humidity. Mr. Wittenmeier said that if anything 72 deg. was too low and that 75 deg. was better. With the air passing along the floor the women would complain that their ankles were cold and would wrap them in newspapers to avoid that discomfort and to allay their fears of catching cold. Mr. Wittenmeier thought that if the temperature was 90 deg. outside, it should be about 15 deg. lower inside the building for comfort.



It has been estimated that there are about 1,000 Class A motion-picture theaters which could immediately afford modern cooling plants. Each of them would require an average of 400 hp. including ventilation. Here is a total potential summer demand of 400,000 hp. to which should be added the demands of the legitimate drama which, though not nearly so great, is nevertheless considerable.

In other articles I desire to detail more developments in the art of cooling which show how rapidly it is spreading. Something also should be said of the various systems in use.

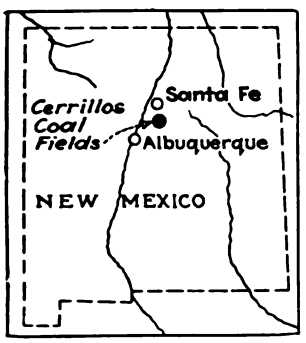
If all the motion-picture theaters, large and small, were cooled they would use almost a million tons of coal a year for cooling. Suppose they used on an average two-thirds of a million horsepower for twelve hours a day for six months and that each kilowatt-hour required 1½ lb. of coal, the "movie" industry would absorb the quantity of coal stated. The cooling of motion-picture houses is only a small part of the whole program which will not be reached till home cooling is introduced. Thus the importance of refrigeration as an outlet for more coal can readily be appreciated.

A Correction

On page 771 of our issue of Dec. 10 it was stated concerning the Chance process of coal preparation that: "These two agencies (paddles and water jets) serve to counteract each other and result in a tendency, toward whirlpools, eddies and boiling." Whirlpools, eddies and boiling are actions that would be detrimental to the operation of this equipment and the apparatus was specifically designed to avoid them. The passage quoted should have read: "These two agencies serve to counteract each other and check any tendency toward whirlpools, eddies and boiling."

But If He Strikes—!

Lewis: "Let loose of my feet or I'll strike with this stick!"



(With apologies to Sondaysnisse-Strix, of Stockholm, whose cartoonist could not have guessed that C. P. Daniel, of Knoxville, Tenn., would reinterpret and retitle his work.)

New Mexico
Has Anthracite Mines but No Strike

By John A. Holmes
Madrid, N. M.

PENNSYLVANIA, now strike-bound, does not mine quite all the anthracite that is normally produced in America. There are a few other small hard-coal regions. New Mexico has one of these, a little field containing scarcely six square miles, lying 50 miles east of Albuquerque on the Santa Fe railroad. In this territory both anthracite and bituminous coal are mined from a single bed—the White Ash—and there are soft-coal mines also in another seam—the Cook and White.

The field has eight mines all of which belong to the Albuquerque & Cerillos Coal Co. Five are now producing coal. Three of the five—Nos. 4, 8 and 9—are anthracite operations all delivering their coal to a single breaker. Two of these produce less than 100 tons a day. No. 4 is the main anthracite mine of the field, yielding about 300 tons daily. In it the company has experimented with various systems of mining within the last several years but is now using only standard methods.

Geologically this small field is exceptionally interesting. Coal is found solely in the Mesa Verde formation of the Upper Cretaceous area. It occurs only on the Mesita de Juan Lopez and a part of the Ortiz mine grants. This coal tract is surrounded by a vast mineral-bearing region producing gold, silver, lead and copper. This peculiar condition is accounted for by the fact that on both north and south of the coal area lie volcanic upheavals which have thrown out two major igneous sheets, each about 800 to 1,000 ft. thick. These intrusions of andesite porphyry, cut by many dykes, have forced their way between the sedimentary formations.

The first bed of coal to be developed years ago was the White Ash, the product from which soon gained prominence in the Southwest as a low-ash, non-coking fuel. This bed dipped to the southeast on a 15 per cent slope and averaged 6 ft. in thickness. As this mine was developed southward, the coal gradually changed from a bituminous to an anthracite, the thickness simultaneously decreasing to 4 ft. and even less. Later this operation caught fire and had to be abandoned. Several years afterward, however, a breaker was built and work started on the development of the anthracite.

The largest mine so far developed is the No. 4, whose main slope has been driven in more than a mile. This passage was projected on the dip and entries turned off every 1,000 ft. on the strike. When these entries have advanced far enough, dips are turned parallel to the main slope, rooms are necked off on either side and driven on the strike. All cars are delivered to the room neck by a hoist, whence they are pushed to the face by the miners. As the coal is only 2 to 3 ft. thick, rooms are driven wide and double tracked, the brushings being gobbed in the middle of the room. As soon as these rooms have been driven in their full distance, the pillars are drawn on the retreat. So far, several acres of coal have been removed and there has been no break in the igneous sheet which lies approximately 25 ft. above. Experiments have been made with longwall and the V-system of mining, but because of the many dykes and faults encountered, these methods have not proved practical.

Efficient Ventilation Essential

This mine is ventilated by a high-speed reversible fan delivering 90,000 cu.ft. of air per minute, driven by a 50-hp., 2,300-volt synchronous motor. As the workings are gaseous, all blasting is done at night by a shotfirer. Canvas brattice is carried to the face of all entries, but in spite of this it frequently becomes necessary to employ a booster or blower fan to clear the face especially if the passage is being driven to the rise. The main return normally carries about ½ per cent methane; air samples are collected and analyzed periodically.

The accompanying table shows the proximate analysis of coal taken from various beds and at various places in this coal field.

The breaker which prepares all the anthracite produced is located about a mile from the nearest of the

The headpiece accompanying this article shows, at the left, the slope mouth at No. 4 mine, the principal anthracite producer of the Albuquerque & Cerillos Coal Co.'s several anthracite and bituminous operations in the Madrid (N. M.) region. In the center is a distant view of the mine town, the power plant and the company's breaker serving all of its anthracite mines, Nos. 4, 8 and 9. No less than nine sizes of coal are prepared. At the right are the approach tracks to the breaker. At present about 400 tons a day from three mines normally is handled through this breaker.

Digitized by Google

Fig. 1—Section Through Los Cerrillos Coal Field

The three coal measures here appearing lie between the igneous intrusions that have forced their way between the sedimentary formations. The coal beds thus have not only been subjected to heat from these igneous measures but are broken by numerous dykes. These latter have precluded the adoption of longwall and V-mining methods, though these systems have been tried.

three mines tributary to it, the cars being hauled over this distance by a gasoline locomotive. First the coal is dumped into a bin and thence fed to the large main crusher by a horizontal apron conveyor. From the crusher the product passes to a shaking screen which removes the No. 1 size, or that passing over 4-in. circular perforations. The coal that drops through this screen goes to another shaker where the duff is removed, this passing direct to the duff bin. Everything coming over this $\frac{7}{8}$-in. screen goes to the main sizing shaker where grades Nos. 2, 3, 4, 5, 6, 7 and 8 are separated; each of these respective sizes goes to its own bin from which it is elevated to the spirals. After the different sizes have been spiraled and respiraled, each grade is lowered to the railroad loading bins by means of spiral chutes. As the coal is loaded into the railroad cars, it traverses a screen intended to remove any small pieces or degradation that may have chipped or broken off the larger ones in handling. These undersizes are delivered by a screw conveyor to a bucket elevator that feeds the material back to the main sizing screen.

The No. 1 size is hand picked after it has left the screen but before it reaches the spiral, and any pieces to which slate adheres are thus separated from the main body of the coal. These pieces are carried back to a small recrusher by a belt conveyor and after being broken down are discharged onto the main screen.

The following sizes are prepared:

No. 1—over a 4-in. circular opening,
No. 2—through a 4-in. and over a 3½-in. circular opening,
No. 3—through a 3½-in. and over a 2½-in. opening,
No. 4—through a 2½-in. and over a 1¾-in. opening,
No. 5—through a 1¾-in. and over a 1-in. opening,
No. 6—through a 1-in. and over a ½-in. opening,
No. 7—through a ½-in. and over a ¼-in. opening,
No. 8—through a ¼-in. and over a $\frac{7}{16}$-in. opening,
Duff—through a $\frac{7}{16}$-in. circular opening.

Sizes Nos. 4 and 5 are combined and sold as brooder No. 4. Sizes 5 and 6 are likewise combined and sold as base burner. At one time it was extremely difficult to dispose of the duff, but at present the Santa Fe railroad is using it in its shops at Albuquerque.

Generates Its Own Power

As no public utility plant is near this field, the company generates its own power. It now has a power house equipped with two 221-hp., and one 418-hp. Babcock & Wilcox boilers which are hand fired with duff and No. 8. A powdered fuel furnace under the 418-hp. boiler is contemplated for the near future. As this region is arid, tank cars are employed to haul all water for domestic use. Enough water, however, accumulates in the mine to assure the power house of an ample supply except in especially dry seasons when it becomes necessary to use city, that is, tank-car water. All boiler feed is treated before use.

This plant is also equipped with two 300-kw., and one 1,000-kw. condensing turbines, which are operated on a steam pressure of 150 lb. and exhaust to 21 in. of vacuum. The larger machine has been in operation only a short time, but a considerable reduction in water consumption has been obtained by it.

All power is transmitted to 2,300 volts, alternating current. In the mines, this is stepped down to 440 volts. Each circuit, of which there are eight, has its own individual feeder panel in the power house, on which watt-hour meters are mounted, giving the management of this operation an excellent check on the power distribution.

Proximate Analysis of Coals Produced

Bed	Grade of Coal	Moisture, per Cent	Volatile Matter, per Cent	Fixed Carbon, per Cent	Ash, per Cent	Heat Content, B.t.u.	Sulphur per Cent
Cook & White	Bituminous	0.43	35.91	52.45	11.21	13,760	0.82
White Ash	Bituminous	1.36	37.39	53.18	8.07	13,700	0.82
White Ash	Anthracite	1.78	14.14	78.58	5.50	14,091	0.73
White Ash	Anthracite	2.84	7.73	81.24	8.19	13,390	0.55

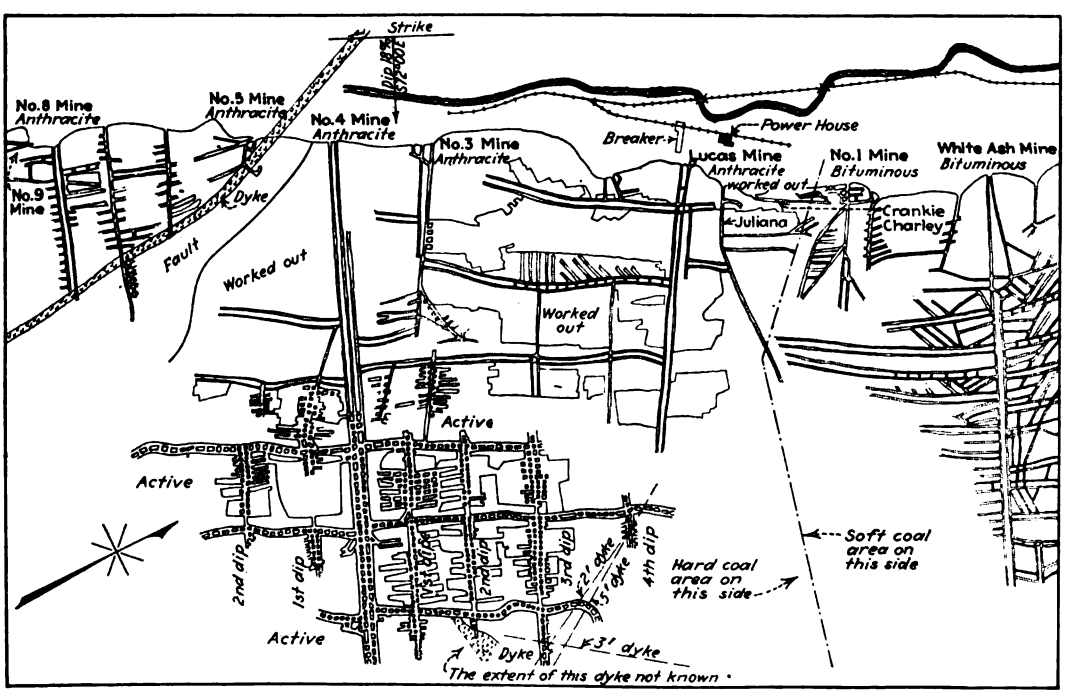

FIG. 2

Many Mines Work This Bed

The map shows the greater part of the coal region near Madrid, N. M., where the White Ash bed yields both bituminous coal and anthracite. Mines operating north of the dividing line shown on the drawing are in the bituminous territory and those south of it produce anthracite. At present the only anthracite operations working are Nos. 4, 8 and 9.

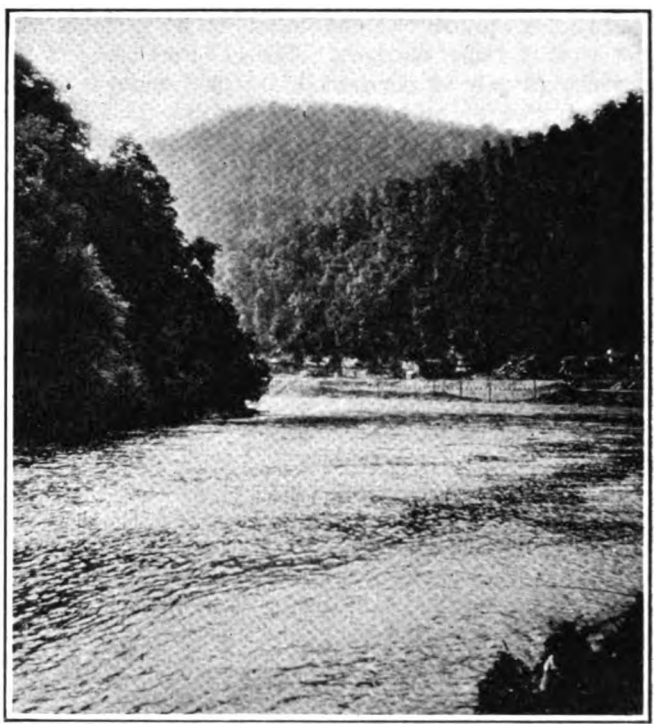
Union Succumbs with Violence in West Virginia And Quietly in Central Pennsylvania

By Sydney A. Hale
Special Contributor, *Coal Age*,
New York City



MORE EPITHETS have been hurled and more epitaphs wasted over the fate of organized labor in West Virginia than in all the rest of the coal producing states combined. The history of the United Mine Workers' failure to hold central Pennsylvania, covered in this article, is colorless by comparison with the violent drama of the Panhandle state. There have been struggles equally intense, equally bitter, elsewhere, but the picturesqueness of the West Virginia background has been so well advertised in recent years that that state is treated as the keystone in the arch of anti-unionism. Few commentators can resist the temptation to discuss the situation there in detail and to tinge an already colorful picture with their own individual sympathies and prejudices.

Undoubtedly the temptation is great. Armed marches with all the panoply of a miniature war, the lonely sniper in the wooded hills, riot and fatal gunplay in the village streets, an armored car dealing death as it careens through a beautiful valley, injunctions without end, charges and counter-charges of the abuse and the denial of civil liberties, distrust of the protection of the courts, men accused of treason against the state, plain and fancy slaughter carried to the threshold of the temples of justice, feudalistic conceptions clashing with "mobocracy," a whole commonwealth embittered by the jibes of the outside world—this is the stuff of which the story of the United Mine Workers in West Virginia is fashioned.

An elaboration of the incidents massed above would serve no good purpose in the present discussion. They are the byproducts of passions and prejudices to be weighed in an examination of the larger question of the public's responsibility in enforcing constitutional guarantees and in upholding American ideals in industrial warfare.

There is, however, another factor which gives West Virginia its commanding position in the labor situation. This cannot be ignored in any recital of the history of the labor movement in coal. One out of every four tons of soft coal mined in the United States is produced in West Virginia. Coal from that state shares with Pennsylvania anthracite the distinction of having the widest distribution. Moreover, little of the West Virginia product is consumed within the borders of that state. The lurid trimmings to the tale create a widespread popular interest in the situation, but the competitive power of West Virginia coal gives it a compelling influence in the coal set-up of every producing district east of the Mississippi River.

The idea of organizing the mine workers of the state is no recent development. There were union representatives from West Virginia at the historic Columbus conference of 1886 when the members of the National Federation of Miners and Mine Workers and the Central Competitive Field operators signed the first joint interstate agreement in coal labor history. Because the operating interests of the state declined to attend, however, the miner delegates were denied a vote in the conference. The same bar was raised against them twelve years later when they sent delegates to the Chicago meeting which firmly established the Central Competitive Field as the controlling factor in wage negotiations between the United Mine Workers and the operators. As in 1886, the West Virginia miners were excluded in 1898 because their employers scorned participation in the deliberations between the union and their fellow producers.

Some Coal Mining Country Is Idyllic

This coal "camp," of a variety that would bring gladness and song to the heart of a writer of advertising for summer resorts, is on the Guyandotte River close to the city of Logan, W. Va.

Despite this hostile attitude toward union recognition, organizers made considerable headway in establishing locals in West Virginia and the operators interposed no serious objection until 1902. In April of that year there was a union meeting at Huntington which voted a statewide strike. Operators felt that that action was taken, not because of any real grievance, but to help the striking anthracite miners. Against this southern West Virginia producers bitterly rebelled and, when the strike was broken, the union retained a strong foothold only in the Kanawha district. Two years later there was a split between the union and the Cabin Creek section of the Kanawha field over the open-shop. The Cabin Creek producers accused the

Seventh of a series of articles describing the changes in the labor status of the different bituminous coal producing districts of the United States in recent years. Preceding articles in this series appeared in *Coal Age* Sept. 25, Oct. 1, 8, 29, Nov. 19 and Dec. 31, 1925. The concluding article will be published next week.

Digitized by Google

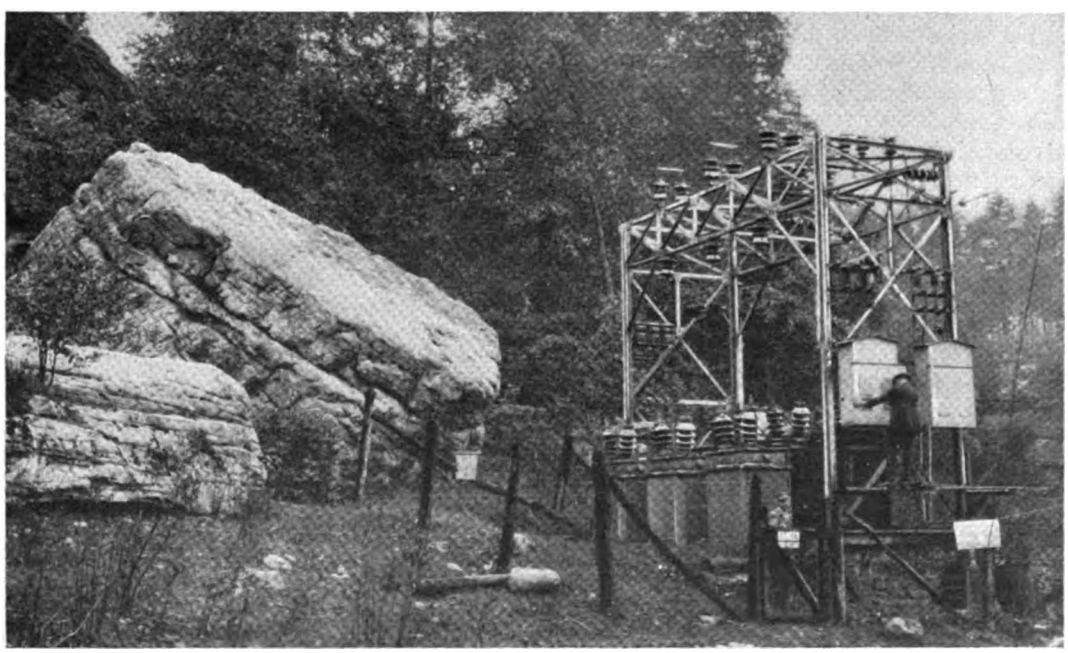
union of calling a strike in violation of its contract and declared for non-union operation.

The status quo was maintained in the rest of the field until 1912 when the Paint Creek section refused to renew its contract with the union. A strike was called, and spread to Cabin Creek with the usual quota of rioting and disorder. In July, 1913, the entente was restored in Paint Creek by the negotiation of contracts granting the check-off, but naming a lower wage scale than that in other parts of the district. A separate agreement in the Cabin Creek section made no provision for the check-off. The following year the check-off was made the issue of a strike in the Kanawha region. This ended in a three-year contract nominally permitting open-shop operation, but pledging the employeers to check off dues on request. In 1917 the union won the closed-shop and the compulsory check-off.

There was no further break until the nationwide strike of 1922. When that strike was called thirteen companies decided to continue operations. By the middle of August the number had increased to 126. At that time a minority signed individual agreements with the United Mine Workers. These defections left the union with only 35 per cent of the field under contract. With the beginning of the coal year 1924-25, there was a complete severance of union relations. The United Mine Workers has put forth strenuous efforts to recover its influence, but without success.

EARLY GAINS LOST IN 1902 STRIKE

The gains which the union was able to make in the other high-volatile fields of southern West Virginia in the early days were sacrificed in the 1902 strike. In the case of some of the newer developments, notably the Logan field, even the shadowy toleration of union activity has been absent. And that refusal to treat with or to recognize the United Mine Workers in any way was hardened by the campaigns of organization launched against the Williamson field in 1920 and 1921 and by the 1919 drive on Logan County. In both cases, union sympathizers started armed marches against the non-union fields and the campaigns culminated in guerilla warfare and the call for federal troops.



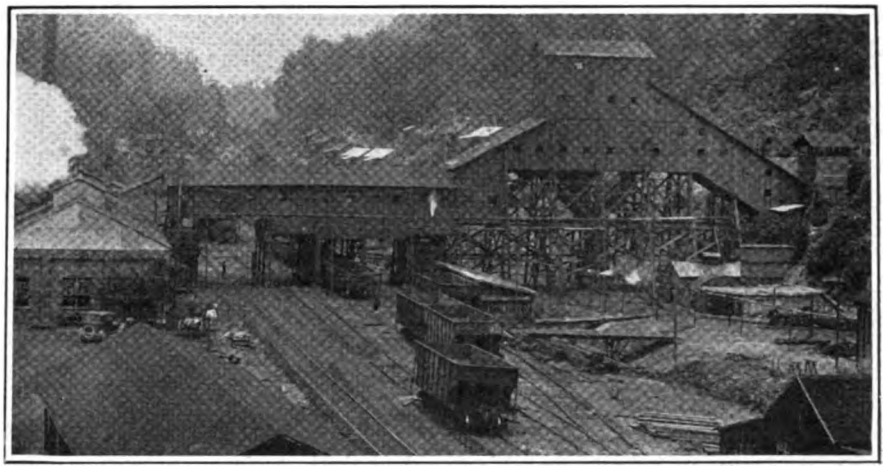
Except in the New River field, the United Mine Workers has at no time been a real factor in the low-volatile districts of West Virginia. For a few years preceding the 1902 strike there was no special antagonism shown toward union activity in the Pocahontas field, but since that strike the counties in that section have been closed territory to organized labor. The Winding Gulf district, opened in 1909, also has been non-union.

UNION LOSES NEW RIVER FIELD

Following the surrender of the Cabin Creek and Paint Creek sections to the union, New River operators agreed to collective bargaining with a committee of union miners in 1913 and during the war recognized the union itself. This recognition carried with it neither the check-off nor the closed shop, but these two demands were granted by a majority of the operators in 1919. A small group, including the Willis Branch mine, held out and a strike was declared. Intermittent violence marked the struggle which closed in May, 1921, when the Willis Branch tipple was burned. A suit for damages against the United Mine Workers was later settled out of court. With the depression of 1921, one by one the larger mines closed down to reopen later at the 1917 scale, without union recognition.

The early success of the United Mine Workers in securing closed-shop contracts in the Panhandle field in northern West Virginia was later marred by the revolt of some of the operators in that section. These revolters, seeking to escape union domination in a union territory, inaugurated another kind of closed-shop by compelling employees to agree not to become members of the United Mine Workers. Although these contracts have been denounced in opprobrious terms by the union, their validity was upheld by the Supreme Court of the United States in *Hitchman Coal & Coke Co. v. John Mitchell*, 245 U. S. 229. In that decision the court said:

"That the plaintiff was acting within the lawful rights in employing its men only upon terms of continuing non-membership in the United Mine Workers of America is not open to question. Plaintiff's repeated costly experiences of strikes and other interferences while attempting to 'run union' were a sufficient explanation of its resolve to 'run non-union', if any were needed. But neither explanation nor justification is needed. Whatever may be the advantages



Rugged Beauty

This 600-kw. transformer substation of the Virginian Power Co. supplies power for the Nuttallburg mine of the Fordson Coal Co. and the Brown mine of the Stover Coal Co., which mines are opposite each other on New River in Fayette County, W. Va. The beauty of the scenery in this section is hard to equal. Reposing on flat spots on the mountain side, and in the river, are numerous rocks, as large as houses, which have broken away and rolled to a new resting place. Mountain laurel, rhododendron and evergreen trees preserve the beauty through the winter.

Where Smokeless Coal Comes From

This is the tipple and power house of the Winding Gulf Colliery Co., of Winding Gulf, W. Va., in the heart of non-unionism. Seldom has the United Mine Workers been able to set foot in the smokeless region, so that today this section of southeastern West Virginia represents probably the most outstanding non-union field in the country.

of 'collective bargaining' it is not bargaining at all, in any just sense, unless it is voluntary on both sides. The same liberty which enables men to form unions, and through the union to enter into agreements with employers willing to agree, entitles other men to remain independent of the union and other employers to agree with them to employ no man who owes any allegiance or obligation to the union. In the latter case, as in the former, the parties are entitled to be protected by the law in the enjoyment of the benefits of any lawful agreement they may make."

The *Hitchman* decision, which was the outgrowth of a campaign against non-union operations in the Panhandle in 1907, proved no barrier to union activities. The United Mine Workers was unremitting in its efforts to force all mines to enter into contractual relations with it and by 1920 only three companies were outside the fold. Resistance upon the part of those companies was stiffened by events in 1922 when an attack was made upon the Cliftonville mine, a former union operation leased and reopened as a non-union property by the Richland Mining Co. For this attack, in which a deputy sheriff was killed, 230 were indicted and a number of union members in Pennsylvania were convicted. The most recent development was a strike order issued in April, 1925, to end non-union operations. This strike, to date, has been a complete failure. Not only have the companies which were non-union retained that status, but their number has been augmented.

FAIRMONT SICKENS OF UNION RULE

The Fairmont district had its first brush with the United Mine Workers in 1892. In that year local strikes, unsanctioned by the international officers of the union, were called. The operators won out, discharged the strike leaders and refused to recognize the union. In 1902, another attempt, this time engineered by the international headquarters, was made to extend the power of the union over northern West Virginia. This strike soon collapsed, but wages were increased after peace was restored. The union was unable to gain another foothold until 1917. In August, 1918, the majority of the operators agreed to the closed-shop and the check-off and the union was in control of the field until the beginning of the 1922 strike. At that time a number of companies broke away and in 1923 there were 156 out of 395 companies in northern West Virginia operating non-union.

A more serious blow was dealt union prestige, however, in the next two years. Under protest against the conditions imposed, many companies signed the Baltimore agreement of March, 1924, which was the northern West Virginia counterpart of the Jacksonville agreement. At that time, according to George I. Brackett, former executive vice-president of the Northern West Virginia Coal Operators' Association, there were 79 union and 74 non-union companies running and 242 not operating. The union mines were producing 70 per cent of the tonnage. In a month the number of union companies working had dropped to 49 and the union percentage of production to 60. By January, 1925, the number of union companies in operation had been reduced to 24 and the number of non-union companies operating had increased to 129.

The United Mine Workers made a vain attempt to check this drift by issuing a strike appeal to workers in the non-union mines to come out April 1, 1925. This gesture was repeated in September, but the percentage of non-union tonnage has been steadily increasing and many of the largest producers have negotiated individual agreements with their men, paying scales of wages more in keeping with existing competitive conditions. Aside from a few operations, this great field has thrown off the union yoke.

The story of the unionized section of western Pennsylvania and the recent breaks from union control in that region was told in preceding articles in this series describing the situation in the Central Competitive Field. Despite the temporary successes achieved by the United Mine Workers in 1922, the other major districts in the western part of the state have remained strongly non-union. Recent attempts to stir up trouble in the Connellsville district have failed and Westmoreland is quiet. There has been nothing in recent developments to indicate that Connellsville workers will repeat their bitter fights of 1877 and 1891 or that Westmoreland miners will renew their heart-breaking battle of 1910-11.

Nowhere, perhaps, is the process of gradual disintegration of union influence better illustrated than in central Pennsylvania. Certain districts in that region, it is true, have been so persistently non-union for so many years that the situation has come to be accepted as a matter of course. That, however, is not true of the greater part of the region. Labor organizations existed in central Pennsylvania before the Civil War and most, if not all, of the predecessors in interest of the United Mine Workers had some influence in that field during their brief days of power.

Central Pennsylvania was among the first to extend recognition to the United Mine Workers. Operators in

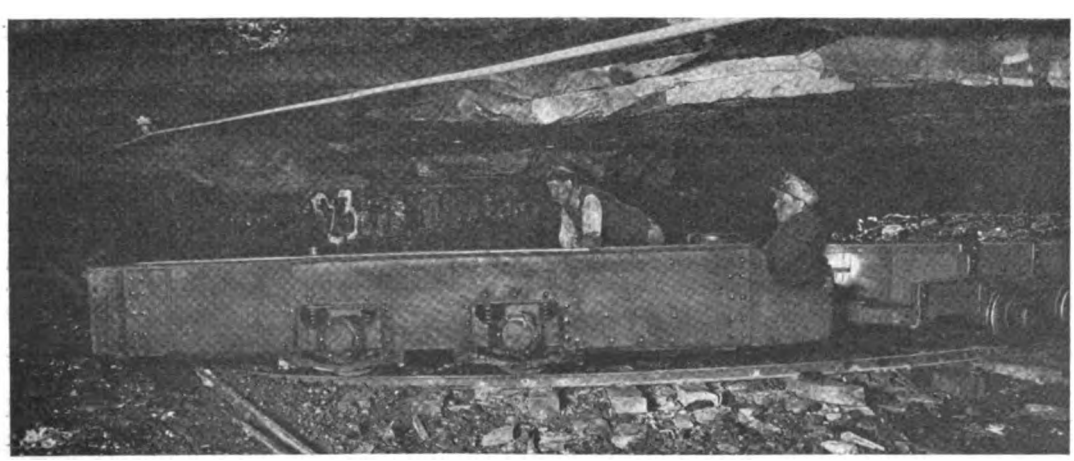
Digitized by Google

that region signed their first agreement with the United Mine Workers, District No. 2, on May 1, 1899. In 1900 the union producers there conceded the check-off and union membership jumped from between 8,000 and 10,000 to approximately 30,000. By 1920 the membership had grown to 46,000 out of a total of 55,000 to 69,000 workers—dependent upon season and demand—in the field as a whole.

The United Mine Workers won an early recognition in Somerset County and also lost it early in the history of the organization. On Dec. 1, 1903, the majority of the operators declined to renew their contracts with the union and a strike started which lasted until April, 1904. The only large producer that did not join in this movement was the Brothers Valley Coal Co., which continued union recognition until April 1, 1921. Cambria and Indiana counties also developed non-union tendencies, but not to the extent shown in the Somerset area. Wage rates and working conditions in these non-union fields, however, have been controlled by the rates and conditions prevailing in the organized parts of the region.

Despite these losses and the inability of the union to make counterbalancing gains, central Pennsylvania remained predominatingly union until after the war and in the 1920 wage scale, which later was rewritten into the Jacksonville agreement. This is clear from the division between union and non-union workers shown in Table XI. The 1920 figures used were compiled by the Central Pennsylvania Coal Producers' Association. The 1900 figures inserted for comparative purposes are those of the United States Geological Survey.

Notwithstanding an increasing number of petty and local strikes, the general strikes of 1919 and 1922 and the persistent refusal of union officials to consider negotiations with central Pennsylvania before contracts were signed with the Central Competitive Field, the process of disintegration was not accelerated to a marked degree until after the signing of the Jacksonville agreement. Following that, the union operators in central Pennsylvania protested that the act would be suicidal, but consented to the three-year extension of the contract in their district, because it was impossible to induce the union officials to agree to any downward revision. Later attempts to persuade the union to take such action were rebuffed.



That these forecasters of woe were true prophets has been fully demonstrated by the subsequent march of events. Union mine after mine was closed down. Some of these properties were later leased to friendly interests who reopened them at the 1917 wage scale. In a number of other cases, the operations were reopened by their owners on the condition that workers accept less than the Jacksonville basis. Reports of evasion of strict letter of the agreement have been too common to ignore. Although union officials have stoutly maintained that many of the smaller operations, some of which were forced into contracts in 1922 before the union would permit the resumption of work at other mines controlled by the same interests in closed-shop territory, pay the straight union scale, it is insisted by others who claim to be conversant with the facts that the union rate has been more honored in the breach than in the observance.

The net result of the union's "no backward step" policy in this field has been to reduce the percentage of union-mined coal to 30 per cent of the output of the field. Three of the largest producers in central Pennsylvania—one of which is railroad-controlled—have struggled along under union conditions, but in the case of the commercial companies the financial toll has been heavy. Many companies less favorably situated financially have found it impossible to meet competitive prices and pay the 1920-27 wage scales. These have either retired from the field or shifted to the non-union column. Even with the increased general demand for coal, hundreds of mines in central Pennsylvania have been idle for weeks and months. Broad Top alone remains solidly union—a fitting complement to union Blossburg in the north.

Table XI—Labor Status of Central Pennsylvania: 1900-1920

County	1900 Total Number Workers	1920 Total Number Workers	1920 Union Workers	1920 Non-union Workers
Armstrong	2,000	4,782	4,430	352
Bedford	1,002	1,486	1,385	101

New French Nitrate Industry Centers Upon Coal

Plants Capable of Producing 100,000 Tons of Ammonia Annually Are Now Operating or Are Under Construction Near Mines

By Victor Truant
Paris, France

NITROGEN is basic in the life of any nation. It is vital to the prosperity of agriculture—as a main constituent of fertilizer—and also in the production of explosives, dyes and chemicals. In order not to be at the mercy of nations that have it in plenty, France is fast learning how to produce it herself. Today, at her collieries, she is manufacturing approximately 100,000 tons of sulphate of ammonia every year. This activity is an important adjunct to the French coal industry.

Formerly, France produced little nitrogen, though her consumption was large, and she had to import sulphate of ammonia and nitrates. In 1900 that country consumed only 48,000 tons of nitrogen. From 49,000 tons of sulphate of ammonia (9,800 tons of nitrogen) and from 260,000 tons of nitrate of sodium (39,000 tons of nitrogen) she produced only 37,000 tons of sulphate of ammonia, yielding 7,400 tons of nitrogen.

In 1913, French consumption of nitrogen had increased by 50 per cent compared with that of 1900 to 72,000 tons, of which the country produced only 17,000 tons.

France Forced to Increase Output

It was absolutely necessary for France to increase her production as soon as the termination of the war would permit it. She made this effort and in 1924 produced 30,000 tons of nitrogen, from 98,000 tons of sulphate of ammonia and from 50,000 tons of cyanamide. But the French consumption rose at the same time to 91,000 tons and to make up the shortage the nation had to import in 1924, 63,000 tons of nitrogen, yielded by the following products:

	Tons	Yield in Nitrogen Tons
Nitrate of sodium	264,000	39,000
Sulphate of ammonia	102,000	20,400
Cyanamide	10,000	1,800
Nitrate of calcium	11,000	1,400
Sundries	3,000	690
Total	390,000	63,890

These figures clearly show what a future growth is necessary in the French nitrogen industry before it can satisfy the requirements of a consumption that is steadily increasing. It is striving along two lines to do so: (1) The development of the present production of sulphate of ammonia from the operation of byproduct ovens (92,000 tons, yielding 18,500 tons of nitrogen) and from the cyanamide process (increased from 12,000 tons, in 1913, to 50,000 tons, in 1924); (2) the creation of new works for the production of synthetic ammonia from atmospheric nitrogen.

While taking an important part in the rapid increase of the production of sulphate of ammonia at their coke-oven plants, the French collieries also have deliberately entered the business of producing synthetic ammonia. Both methods can be worked jointly as the various processes of production of synthetic ammonia are based upon the recovery of hydrogen from the gases of coke-ovens, which contain about 50 per cent of that gas.

Six coal-mining companies among the most important of the Nord and Pas-de-Calais, three companies of the Center coal field and one company of the Lorraine coal field have synthetic plants either in course of erection or working already.

Four Plants Use Claudé Process

The Compagnie des Mines de Béthune is producing 870 tons of synthetic ammonia per month. The Société des Houillères de Saint-Etienne began at the end of 1923 the construction of a plant for the production of 5 tons of synthetic ammonia every 24 hr. This plant was started Dec. 13, 1924, and since then the output has increased until it reached 3.5 tons of anhydrous ammonia in July last. The plant is expected eventually to produce 10 tons per day. The Société Ammoniaque Synthétique, which is a creation of the Société des Mines d'Aniche (Nord), has constructed its plant, which is to be started soon, close to the coke ovens. The Decazeville plant, established by the Société de Commentry-Fourchainbault, is also close to coke ovens.

These four enterprises are utilizing the Georges Claudé process, in which the synthesis of ammonia is brought about by burning hydrogen in dosed air, the reaction taking place afterward by catalysis under the influence of a considerable pressure (900 kg.) and of a high temperature (600 deg. C.).

The other collieries employ the Casale process, the French license of which is in the possession of the Compagnie d'Alais, Forges et Camargue. This process is derived from the same principles as Claudé's process, but has some peculiarities of its own.

The Société Ammonia is now erecting one plant at Lens and one plant at Roche-la-Molière, in which the two coal-mining companies of the same name have a strong interest. The Lens plant is designed for a yearly production of 22,500 tons of ammonia and the Roche-la-Molière plant for 5,000 tons.

New Concerns Will Start Soon

The Dourges plant and the Drocourt plant to have an annual capacity of 5,000 tons of ammonia will be ready to work within a few months. The Compagnie des Mines d'Anzin, in co-operation with the Kuhlmann group (chemicals), is having a plant built at Anzin to produce 7,500 tons per annum. As to the Société de Sarre et Moselle, its plants, which have certain peculiarities, will soon be completed and a part of the Merlebach Works is to be started immediately. Prospects for the utilization of one or the other of the two processes mentioned are now under the consideration of various other French collieries.

Considering only the collieries named in this article, it is estimated that, once their synthetic plants are in full working order, France will be able to make 60,000 tons of ammonia per annum, or about 100,000 tons of sulphate of ammonia. This is about the tonnage of sulphate of ammonia the country now is importing. But there is a wider scope for development, as France still imports from Chile 264,000 tons of nitrates each year. Nitrates can very well be replaced by sulphate of ammonia, as happened in Germany, where, by producing every year 325,000 to 350,000 tons of nitrogen, chiefly by the Haber process, the country has achieved "nitrate independence."

Union Pacific Coal Co.'s Code of Standards—V*

Safety Standards (Continued)

32. No employee, unless in the course of duty, will be permitted to travel slopes or haulageways where manways are provided, and any violation of this rule will subject the person so offending to discharge.

33. Sec. 3,510, Wyoming Compiled Statutes.—"Control of Fire Damp—Penalty. It shall be unlawful for any miner, fire boss, employee in any mine, or other person, to brush fire damp from any place in a coal mine by means of a coat, sack, sail cloth, or any like article or material; or by any other means, or to use water for the removal of fire damp, and any person so offending shall be deemed guilty of a disdemeanor, and upon conviction shall be imprisoned for a term not exceeding six months, and fined in any sum not to exceed $100. And any owner or superintendent, mine boss or fire boss, who shall knowingly permit the same to be done, shall be deemed guilty of a misdemeanor, and subject to the same penalties as heretofore described."

(a) In case gas (methane, CH_4) is discovered at any point within the mine, it shall be the duty of the person making the discovery to report the same to the fire boss or mine foreman who shall arrange for its removal.

(b) No body of gas shall be moved by anyone unless the mine foreman, his assistant or fire boss is present.

(c) No person or electrical apparatus, between the gas and return, is to be permitted to work or operate while the gas is being moved. (See ventilation section.)

34. No explosive except one designated as "permissible" by the U. S. Bureau of Mines shall be used.

35. Any explosives (permissible powder) in the possession of the miner must be stored in a suitable locked box which shall have the approval of the safety engineer. This box shall be kept at least 100 ft. from the working face, preferably in a crosscut, and not in direct line with the working face.

36. No man shall have in his possession at any one time, more powder than will be sufficient for one day's blasting.

37. Detonators must be kept at least 10 ft. distant from powder and placed in a recess in the solid coal. (It is suggested that several drill holes having a depth of from 8 to 10 in. be placed safely in solid coal for the storage of detonators).

38. The storing of powder and detonators together, or both or either of these with spikes, nails, tools, or other metallic substances is positively prohibited and subjects the person responsible for such storage to discharge.

39. Sec. 3,656, Wyoming Compiled Statutes.—"No person shall, whether working for himself or in the employ of any person, company, or corporation, while loading or charging a hole with nitro-glycerine, powder or other explosive, use or employ any steel or iron tamping bar; nor shall any mine manager, superintendent, foreman or shift boss, or other person having the management or direction of mine labor, allow or permit the use of such steel, iron or other metal tamping bar by employees under his management or direction, unless such steel bar be tipped with at least 6 in. of copper or be tipped with wood, and when needles are used, they shall be made of copper only. All holes shall be tamped with clay or other incombustible material and when incombustible material cannot be obtained in the vicinity of the working place, then it shall be the duty of the employer to furnish such material for tamping at some accessible point near such employee's working places."

Electrical Safety Precautions

1. An insulated platform shall be provided at all stations where it may be necessary to handle live parts, or those that are suspected of being alive or capable of giving shock.

2. Supply lines extending to remote parts of the mine where current is not required after the working shift shall be disconnected by a person delegated to perform such work.

3. Working on live lines is prohibited.

4. Before working on 2,300-volt lines all wires of the circuit shall be short-circuited and grounded.

5. Cables and wires carrying 2,200 volts (nominal) shall be painted yellow at intervals of 50 ft., except at terminals where intervals of 25 ft. shall be maintained. This will distinguish the high- from the low-voltage lines.

6. Standard caution notices shall be posted at such points as will render them most effective in reducing the likelihood of accidental contact with live electrical equipment and conductors.

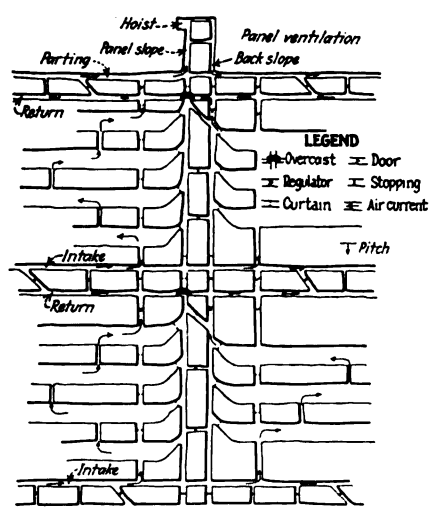

Fig. 27—Ventilation Plans Approved By an Engineer

Each panel is on its own split and no air is permitted to pass over two or more panels continuously.

7. At each pump, hoist, fan or motor-generator set, there shall be at least one Pyrene fire extinguisher or its equivalent. This shall be conspicuously marked that it can be used on live parts. Buckets of shale dust shall also be kept at these places, the aggregate volume of which shall not be less than 2 cu. ft.

8. No one but authorized persons shall be permitted to operate pumps, motor-generator sets, hoists or fans, and standard prohibitory notices to this effect shall be posted.

9. No person shall be allowed to work on or with electrical equipment of any kind unless authorized by the mine foreman or mine electrician.

10. Trolley wires that are less than 6½ ft. above the top of the rail shall be protected at all points where men are regularly required to work or pass under them and at all other points where men may come in contact with the wires.

11. Trolleys are to be carried on the opposite side of headings from the travelingways.

12. Light circuits shall not be installed in places known to generate gas.

13. Electric lamps shall not be installed where they can come in contact with combustible material.

Some Safety Don'ts

Don't:

—leave tools where men and mules will have to walk over them.
—drive spikes, nails, files or other tools into props.
—leave nails sticking up in boards—bend them over.
—neglect to report what you consider unsafe conditions.
—work under loose coal or rock.
—be careless with powder and detonators.
—use too much powder.
—drill beyond the depth of cutting, where mining machines are used.
—tamper with electrical equipment.
—take unnecessary chances.
—violate any safety rules.
—leave doors or curtains open when they are supposed to be closed and vice versa.
—countenance unsafe practices by others.
—fail to mark and report broken bonds (it may save a life).
—fail to provide proper clearance between props and track—(viz. 2 ft. 6 in.).
—neglect to sprinkle.
—think that a shovel is your only necessary tool. Get a good saw, ax and bar, keep them in good condition and use them.
—take chances with gas (CH_4).
—delay in reporting the discovery of gas to your foreman.
—try to move gas without authority from the foreman or fire boss.
—enter the mine without your life check.
—fail to warn the new employee of the dangers incident to his work and working place.
—ride on loaded or empty trips without permission.

*This is the fifth of a series of articles giving the Code of Standards put into effect by the Union Pacific Coal Co., at its operations in Wyoming. The first four articles appeared in the issues of Dec. 17, 24, 31 and Jan. 7, and the remainder of the code will be published in future issues in this form that permits of easy filing.

Digitized by Google

—enter old workings. (Stay in your own working place.)
—take strangers into the mine without permission.
—travel slopes or planes.
—fail to report faulty equipment or apparatus not properly safeguarded.
—litter the floor of your working place with mining refuse. (Keep your gob in neat and orderly shape.)
—congregate on partings or haulageways.
—carry tools with you on a man trip.
—stand in the bight of a rope or chain in tension.
—sit on the same side as the trolley when riding a trip.

Mine Ventilation

Sec. 3,508, Wyoming Coal Mining Law—"The owners, lessee or agent of any coal mine, whether shaft, slope or drift, shall provide and maintain for every such mine, ample means of ventilation affording not less than 150 cu.ft. of pure air per minute for each and every person employed in said mine, and as much more as the circumstances may require, which shall be circulated around main headings and cross headings and working places, to an extent that will dilute, carry off and render harmless the noxious or dangerous gases generated therein; the main current of air shall be so split, or subdivided as to give a separate current of reasonably pure air to every 50 men at work, and the inspector shall have authority to order separate currents for smaller groups of men, if, in his judgment, special conditions make it necessary; and the air current for ventilating the stable shall not pass into the intake air current for ventilating the working parts of the mine.

"In mines generating fire damp, worked out or abandoned parts thereof shall be kept free of standing gas, or be properly walled off and the entrance thereto properly closed, and cautionary notice posted on the stopping to warn persons from danger, and every working place where gas is known or supposed to exist shall be carefully examined by the fire boss within two hours immediately before each shift, and all accessible abandoned places shall be examined twice each week with a safety lamp (flame), and in making said examination the inspector shall leave at the face of every place examined, evidence of his presence, with the exception that when special conditions warrant the state mine inspector may designate a place or places in the mine, where the fire boss can meet the men and pass them to their respective working places. The fire boss shall make a daily written report on a form approved by the state mine inspector. The report shall be made before the fire boss goes off duty for the day and this report shall be kept as a permanent record. And it shall not be lawful for any miner to enter any mine or any part of a mine generating fire damp until it has been examined by the fire boss aforesaid, and by him reported to be safe. No room shall be driven more than 50 ft. in advance of a break-through or airway:

"Provided, however, that entries may be driven 100 ft. ahead of the last crosscut, but in this event proper brattice or other means must be used to carry the air to the working face, the same to be approved by the state mine inspector. All crosscuts in rooms and entries, except the one nearest to the working face, shall be sealed in such manner that the air current shall be directed across the working face."

Penalties for violation of the above act are provided in Sec. 3,509.

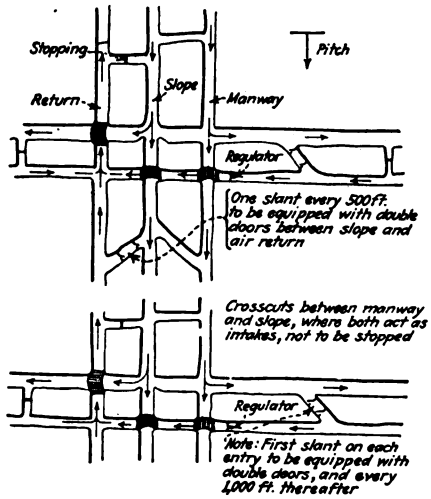

Fig. 28—No Doors Are Located In Overcasts

Overcasts do not include doors. Instead, inbye of the entry the first slant is equipped with double doors forming an air lock which can be used as an entrance to the air course.

Regulations Are Complete

1. In no case shall the amount of air passing through the last break-through on any split be less than that set forth in the law.

2. The short circuiting or loss of air through leaks must not in any case exceed 35 per cent of the total air entering any split and, as stated, the quantity set forth by law shall pass through the last break-through.

3. Panels shall be ventilated as shown in Fig. 27 wherever it is possible. In any event each panel shall be on its own split. Do not pass air continuously over two or more panels.

4. The quantity of air passed through any split shall be subject to the approval of the ventilation engineer.

5. In panels or entries not working, that is, standing, the quantity of air passed shall be in accordance with the recommendation of the ventilation engineer.

6. The fan housing and airdrift shall be of fireproof construction.

7. All fans shall be equipped with automatic starters, open-phase relay, and pressure recording gage. Motor to be equipped with sliding base take up and endless belt. In no case is the distance between pulley centers to be less than three times the sum of the diameters of the two pulley wheels.

8. Motor house to be of ample size to give clearance around machinery to permit oiling without stoppage of the fan.

9. Belts shall be properly guarded by pipe-rails or other suitable means to prevent persons from coming in contact with them.

10. Abandoned rooms (rooms standing, in which the pillars have not been drawn) shall be walled off, confining the circulation of air to the entries and working places.

11. Regulators shall be of substantial fire-proof construction with the door one-half the width of the entry and made of steel plate.

12. Permanent stoppings between main intake and main return shall be of concrete construction and set into the rib 12 in. Thickness of wall shall be 6 in.

13. The cross-sectional area of an overcast shall in no case be less than the area of the air course upon which the overcast is located.

14. Side walls and top of overcast shall be made of concrete, the top reinforced with steel.

15. No doors shall be placed in overcasts. Instead, inbye of the entry upon which the overcast is placed at the first slant shall be placed double doors forming an air lock that may be used as an entrance to the air course. (See Fig. 28.)

In entry stoppings a small door shall be placed every 500 ft. to allow rock dusting in back entries.

16. The roof above each overcast shall be sloped, eliminating sharp breaks and corners and the end walls of the overcast are to be banked or graded forming an approach or easement for the air. Drainage under overcasts to be by pipes and not by ditches, the pipe to extend far enough back from the end wall so that the end banking will not cover it. Ends of pipe to be left open and accessible for rodding in case the pipe becomes plugged.

17. Sec. 4,436, Wyoming State Law— . . . "And in all mines the doors used in assisting or directing the ventilation of a mine shall be so hung and adjusted that they will close themselves, or be supplied with springs or pulleys, so that they cannot be left standing open." In addition to this, every door is to have a clearance of 8 in. from the floor so that loose coal or other material that might be on the floor will not hold a door open. Doors to have sills to fill up this 8-in. space and on haulageways the bottom of door is to carry heavy canvas. The use of doors for the directing or diverting of air is absolutely prohibited within the mine where this can be accomplished by overcasts or other means.

No Sharp Turns in Air Courses

18. Air courses must be properly driven, of uniform cross sectional area, avoiding sharp breaks and turns. They must be thoroughly cleared before pulling the track, and where the roof has a tendency to cave or slough all back entries and main returns are to be center propped.

19. When a mine is ventilated by having a main return on either side of the slope these main returns are to be connected by means of overcasts at every third cross entry. New mines must be opened with separate returns on each side of the slope.

20. In all mines having two parallel main intakes the crosscuts between these intakes must not be blocked. (See Fig. 28.)

21. For the handling of gas (CH.) see Safety Standards.

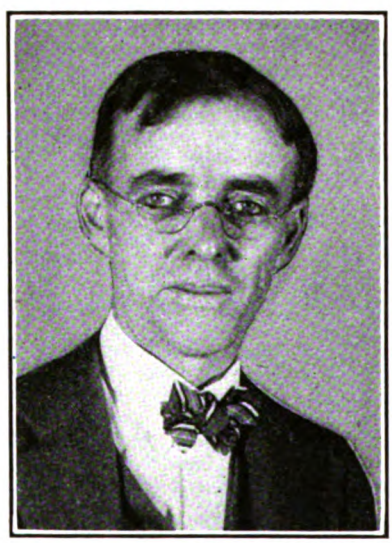
Hard-Coal Wage Parley Breaks Up; Inglis Decries Lewis' "Rule or Ruin" Policy



The anthracite wage conference, resumed at the Union League Club, New York City, on Dec. 29, was adjourned *sine die* at noon on Tuesday of this week. This is the second time such action has been taken in the history of the present negotiations. The first break came on Aug. 4 at Atlantic City. In both cases arbitration was the rock upon which the conference split.

Each side blames the other for the rupture of negotiations. "As predicted in my statement yesterday," said John L. Lewis, president of the United Mine Workers, after the break, "the operators were determined to break up this conference without an agreement. After a period of fruitless discussion this morning (Jan. 12), the operators moved an adjournment without delay and demanded that the mine workers second the motion. Conscious of our responsibilities and still imbued with the hope that an agreement might be reached through the operators abandoning arbitration, the mine workers refused to do so. The operators later seconded their own motion and the chairman put the question. Under such circumstances, the mine workers recognized that they could not then through their own efforts keep the conference in session with the operators present, and reluctantly voted for the motion.

"The mine workers profoundly regret the operators maintaining throughout the sessions the same unyielding attitude which they evidenced when negotiations began six months ago at Atlantic City and which they have maintained ever since. The responsibility for the failure to agree and a continuance of the strike rests entirely with the anthracite operating interests, who thus arrogantly refuse to make any contribution toward industrial peace. The mine workers are prepared to continue this struggle for any period necessary to induce the operators to make a lasting peace which will preserve for our people the rights of free men."

Mr. Lewis, not the operators, retorted the latter, must bear the onus of prolonging the strike. "After many days of conference," declared a statement issued by Major W. W. Inglis, chairman of the operator members of the negotiating committee, and his associates, "we find there is no change whatever in Mr. Lewis' attitude. He absolutely refuses to consider any constructive policy. In a few words, his position is that he will rule or ruin. He has informed us in no uncertain terms that he cares nothing for the opinion of the public or public officials, chambers of commerce, religious organizations or the press. He will have his own way or nothing.

"The operators' proposals, the Luzerne legislators' plan, the Markle plan, the engineers' and economists' plan—

James A. Gorman

Secretary of the joint conference of hard-coal miners and operators recently in session at the Union League Club, New York City, in an effort to arrange a settlement of the hard-coal strike. Mr. Gorman also is a member of the anthracite conciliation board.

all were discussed at length, only to be summarily rejected by the miners' spokesman because they 'smelled of arbitration.'

"While the operators were pressing for practical measures to end the strike and put the industry on a permanent basis. Mr. Lewis dragged in unconstitutional proposals for federal price-fixing and wage-fixing. Such proposals are neither workable nor practicable, and while consuming time did not form a basis for any serious discussion. Their insincerity was further shown by Mr. Lewis' statement to us that we might raise the price of anthracite $5 a ton so long as he got what he wanted.

"The operators have had but one object in view—maintaining production at a fair wage and a fair price. This requires some means of avoiding deadlocks and suspensions. They have offered to open the mines, pay the old wages and, while production is going on, submit every issue in dispute to arbitration. The utmost effort has been made to meet Mr. Lewis' views, but he will consent to no settlement on a basis on which the industry could reasonably expect to exist.

"On the record of the past four years, with three general strikes and constant threats of strike, and the menace of disturbance in the industry by reason of Mr. Lewis' policy, the operators have been forced to the conclusion that arbitration is the only safeguard. Without this means of assuring production, the industry cannot perform the only function for which it exists, namely, to supply coal.

Inglis Objects to Force

"The breaking up of the conference is due to just one cause—the refusal of Mr. Lewis to accept any form of settlement that would bring some assurance of peace to the industry. The operators have been trying to reach a sound settlement based on reason and justice. Mr. Lewis insists that force alone shall rule. Until his attitude changes, further discussion is useless."

The details of the negotiations leading up the break are summarized in the paragraphs following.

The operators again pressed the proposal for arbitration at a prolonged session on Jan. 6. The miners again rejected the idea and countered with a demand that the operators throw open their books to the union negotiating committee. The producers retorted that they would submit their records to an arbitration board, but not to the miners' committee. The union conferees then asked that the operators support them in promoting a bill to establish federal regulation and control of the industry. The operators retorted that they had been advised by counsel that a law fixing prices and wages would be clearly unconstitutional. The Pinchot plan was again dragged forth. Major Inglis and his associates would have nothing to do with it. When they offered the Markle plan as a substitute, the miners turned it down.

Asked what their next move would be, the operators replied that inasmuch as the miners had rejected arbitration there was nothing left but "to compose our differences by a continuation of negotiations." Mr. Lewis answered that that was satisfactory to the miners and that he would regard a break-up of the

Digitized by Google

meetings without an agreement as a public calamity. Mr. Markle then moved an adjournment of the conference, which had lasted nearly twelve hours.

The next day observers were given no information as to the progress of the negotiations. "After an all-day discussion which did not result in any definite conclusion," read the brief official communiqué, "the anthracite coal conference adjourned at the suggestion of Chairman Markle to meet tomorrow at 11 o'clock." In response to sharp protest by the assembled newspaper correspondents, the statement issued on Jan. 8 was expanded to the point of admitting that various modifications of the various plans before the conference had been talked over without either side changing its position. A four-hour meeting Saturday afternoon was followed by the announcement that the conference would hold a Sunday session for the first time in the history of wage negotiations.

Miners Revise Markle Plan

Chairman Markle opened the Sunday meeting with the suggestion that the principal plans before the conference be submitted to Charles Evans Hughes, former Justice of the Supreme Court and counsel for the union in the check-off case before Judge A. B. Anderson at Indianapolis in 1919-20, for the purpose of formulating a plan that would be the basis of a contract. The miners voted this down. After the operators had refused to join in a night session, the miners then presented what they designated as "a revised Markle plan." The principal features of this plan are:

(1) A five-year contract, subject to a modification by a board consisting of two miners, two operators and three members to be suggested by Mr. Hughes.

(2) This board would have the power to investigate and determine whether the operators could pay an increase, and if so found, such increase would be retroactive. Records of both the miners and the operators would be thrown open to this board.

(3) The board would also investigate, determine and recommend means for avoiding future suspensions and methods for increasing efficiency and reducing the cost of operation.

(4) The establishment of a joint commission in each district consisting of one miner, one operator and a conciliator to strive for greater co-operation, harmony and efficiency in the industry.

(5) The establishment of the check-off, limited to $14 per year.

(6) Equalization of wages, as provided for in the 1923 contract, by the Board of Conciliation. The Board also would handle questions of working conditions.

Major Inglis opened the meeting Monday morning with the declaration that this "revised Markle plan" was really the Pinchot program and could not be considered. "In order to make our position entirely clear," he continued, "we now desire to place on the record a plan that is constructive and should meet all your objections to plans previously proposed. It establishes a way out in case of disagreements and represents the utmost concessions that can be made and still preserve the essentials of a workable contract."

The provisions of this plan were as follows:

(1) A five-year contract ending Aug. 31, 1930.

(2) The wages in effect under the last contract to be paid until Aug. 31, 1926, as a consideration for an immediate resumption of work; and to continue thereafter, subject to revision, when and as economic conditions may require, in the manner outlined herein.

(3) Either party may on June 1 in any year make request of the Board of Conciliation for a reconsideration of the wages paid.

(4) The Board shall meet forthwith, consider the facts presented and render a decision within thirty days.

(5) If the Board deadlocks, the questions at issue shall be referred to three persons to be appointed by Charles Evans Hughes, or, in the event of his inability to act, by some person of similar standing to be mutually agreed upon.

(6) The personnel of the appointees to consist of one man representative of labor but not affiliated with the United Mine Workers, one man representative of industry but not affiliated with the anthracite industry, and on man of eminent reputation and attainments.

(7) The three men thus appointed shall sit with the Board of Conciliation, hear the arguments, ask for and obtain any additional data they may consider essential and render a decision on the points in dispute before Sept. 1.

(8) The decision thus rendered shall be final and binding on both parties for the remaining term of the contract unless reopened as provided in paragraph three.

This plan was voted down by the miners after President Lewis had made his accusation that the operators were trying to break up the conference.

The operators, declared the miners' chief, "have made similar propositions a countless number of times since their first statement at Atlantic City on July 9. They have stubbornly resisted every suggestion of the mine workers that they arbitrate their profits upon the inflated capitalization of the industry and that they arbitrate the price which they charge the anthracite consuming public for coal. They have refused to reveal to this wage conference any of the records of the industry as proof of their unsupported allegations.

"The mine workers choose to refuse to accept the operators' brand of arbitration because it is obvious that it is not to the advantage of the mine workers to do so. The operators frankly desire arbitration as an instrument to effect wage reductions and to decrease the annual earning power of the anthracite mine workers. The mine workers believe they are within their rights in refusing to permit the operators the use of a weapon which would enable them to degrade the living standards of the mine workers and the people of the anthracite region.

Union Seeks Federal Action

"The mine workers have offered in this conference to make a contract for any period suitable to the anthracite operators, from a minimum of two to a maximum of five years. We have offered to set up the Anthracite Board of Conciliation, exclusive of the umpire, as a harmonizing, constructive and co-operating tribunal in the industry, designed to promote and establish a greater degree of confidence between employers and employees.

"In order to prove the insincerity of the anthracite operators, the mine workers suggested that they join in a petition to the federal Congress to establish complete regulation within the industry, both as to profits and prices of their commodity. This suggestion, without question, would offer to the public greater security and more fair treatment from the industry than any other of the numberless plans and theories which have been presented. The operators, of course, opposed the suggestion of governmental regulation of the industry for the same reason that they resent and oppose any suggestion that the mine workers be accorded fair treatment as to wages, conditions of employment and greater safety for human life in the industry. The operators occupy the hypocritical position of desiring the arbitration of human rights while resisting any suggestion that there be arbitration of property rights."

Real Earnings of Contract Miners In Anthracite Fields—V

(GLEN ALDEN COAL CO.)

Are contract miners in the anthracite fields underpaid?

John L. Lewis, international president of the United Mine Workers, insists that they are. He has repeatedly drawn upon the reports of the Coal Commission, with their misleading figures basing earnings upon the number of starts made, to support his assertion. In a statement published in the *United Mine Workers' Journal*, on Sept. 15, 1925, Mr. Lewis declared that the average was $1,700 per year, from which "there must be deducted over $200" for supplies.

Check of actual payrolls, however, tells a far different story.

In 1924 the breakers of the Glen Alden Coal Co. averaged 291.6 days and employed an average of 4,390 contract miners. Of this number, however, only 2,829 worked regularly enough to appear on each of the 24 semi-monthly payrolls of the year. Eighty-two men, or 2.9 per cent of this group, averaged $3,764 *net* for the year. The lowest paid section, 68 men, averaged $1,543.

The average earnings by $100 groups for the 2,829 contract miners were as follows:

Miners	Average Annual Earnings	Miners	Average Annual Earnings
82	$3,764	239	$2,549
41	3,433	236	2,450
39	3,346	228	2,351
72	3,251	261	2,252
72	3,145	193	2,152
118	3,049	177	2,050
133	2,952	141	1,956
154	2,852	90	1,861
202	2,730	58	1,749
225	2,649	68	1,543

The average earnings for the entire group was $2,516.09. The daily average ranged from $13.56 to $6.35. Nearly half (48.67 per cent) of the entire group averaged in excess of $2,500 for their year's labors and 87.36 per cent received over $2,000.

Pittsburgh Coal Producers' Association Dissolved

Deplores Conditions in Industry Due to High Wages and Unfavorable Freight Rates

The Pittsburgh Coal Producers' Association, known nationally for its participation in labor negotiations as part of the Central Competitive Field, has been dissolved.

The following statement, issued by B. H. Canon, chairman of the executive committee, is self-explanatory.

"The Pittsburgh Coal Producers' Association, whose members were the principal commercial coal producers in the Pittsburgh district, was dissolved effective Dec. 31, 1925. The dissolution of the association was directly caused by the prostration of the coal business in the Pittsburgh district which has existed during the last two years and which may be traced to two principal causes, wages and freight rates.

"The wage scale being paid to coal-mine labor in the Pittsburgh district is the highest rate that ever was paid for such labor. Miners of the district have for many years been affiliated with the United Mine Workers of America. Their leaders, entirely unmindful of the changed conditions in the coal industry, have refused to consider modifications of the wage scale to meet in any degree the competition from other districts where the 1917 scale has prevailed for some time past.

"Efforts are being made by the Pittsburgh Coal Co. and some other producers to operate their mines independent of the United Mine Workers of America, on the 1917 scale, which, based upon the experience of those who are working under it, provides a very fair measure of miners' wages.

Rates from Pittsburgh Are High

"The freight rates on coal in the eastern part of the country have for many years been made almost entirely with the idea of permitting other coal-producing districts to compete successfully with Pittsburgh. The rates from the Pittsburgh district to practically all consuming markets are on a basis higher than from almost any district that produces and ships bituminous coal.

"An outstanding instance of this situation is in the rates on lake cargo coal to the ports on the south shore of Lake Erie, where the Pittsburgh district pays $1.66 per ton for a haul of 166 miles, while competing districts in southern West Virginia and eastern Kentucky pay only 25c. additional rate for additional hauls amounting to as high as 290 miles. This situation is now before the Interstate Commerce Commission on a complaint from the local operators and will be fought through to a final conclusion.

"While these efforts are being made to improve the situation of the Pittsburgh coal industry from the standpoint of wages and freight rates, the industry in the meantime is in a deplorable condition. The Pittsburgh Coal Co. found it necessary to withdraw from the association early in December. The other companies who were members were forced to the conclusion that they could no longer sustain the expense of the organization and at a meeting held late in December resolved to dissolve the association."

The Pittsburgh Coal Producers' Association was an outgrowth of the Pittsburgh Coal Operators' Association. The original association was formed in 1914 and the name changed in 1917.

Miner Is Willed $500,000; Wants New Overalls!

E. A. Duke, a coal miner of McDowell County, W. Va., has been informed by the executors of the estate of the late James Duke, of North Carolina, that he is heir to something over half a million dollars. Mr. Duke is employed by the Monarch Coal Co. His comment when he received news of the legacy was: "Well, if I do get the money I may be able to buy a good dinner pail and some new overalls to work in."

Vote to Move Union Offices In Kansas Indecisive

The United Mine Workers of District 14 (Kansas) will have to hold a run-off election on the proposal to remove headquarters from Pittsburg, where they have been located more than 30 years, to either Arma or Frontenac. Practically complete returns from the referendum of Dec. 29 show 2,000 votes for Frontenac, 1,174 for remaining in Pittsburg and 1,084 for moving to Arma. A majority of votes cast is required to settle the question. Frontenac, which is so close to Pittsburg as to be practically a suburb, offers a building valued at $50,000, and Arma offers $10,000 in cash toward erecting a building.

Since the vote was taken there is increased talk by conservative miners that moving the headquarters would be a serious step. The Kansas office of the Southwestern Interstate Coal Operators' Association and the offices of the principal coal companies are within a block of the union district offices in Pittsburg. Should the union move its headquarters transaction of business would be slowed up, it is being argued by those opposing the move. Proponents of the move urge that the union should own its own building and that it should be located more centrally for what is now the most active part of the mining field. The date for holding the run-off election will not be selected until official canvass of the returns from the first election has been made.

Bull Movement Falls Flat

Some effort has been made to discredit the Bureau of Mines coal stock report on the ground that stocks were much larger than shown by the report. This criticism was not taken seriously, defenders of the report contend, as no break in prices followed its publication.

Idle Nova Scotia Miners Loot Provision Stores

Owing to lack of steady employment in collieries Nos. 2 and 4 of the British Empire Steel Corporation there has been a great deal of hardship and want affecting practically the entire communities of Glace Bay and New Aberdeen. The prevailing distress culminated on the night of Jan. 3 in raids on provision stores, the stocks of which were looted, one store at New Aberdeen being burned. A mass meeting had previously been held by the United Mine Workers to consider any reply that might have been made by the Nova Scotia government to appeals for relief, a resolution having been passed at a previous meeting to the effect that if no relief was afforded they would be forced to take whatever they needed.

Rioting and looting were renewed on the following night, when six stores at Stirling and Dominion were raided. In all sixteen stores were robbed. It is believed that much of the later disorders was the work of irresponsible characters taking advantage of the situation. Vigorous measures have been taken by the government and the civic authorities to afford immediate relief to those in want and to check further disturbances. Sixty-three special constables were sworn in and $8,000 provided for present necessities.

J. C. Douglas, Attorney General, provided that the government would guarantee any bonds of the municipality issued to provide funds for the relief of destitution and stated that rioters would be arrested and prosecuted. The curfew law has been put into force and at last accounts order had been restored and no further trouble was anticipated.

John Cleveland Osgood Dies; Founded C. F. & I.

John Cleveland Osgood, 74, president of the Victor American Fuel Co. and founder and former president of the Colorado Fuel & Iron Company, died at his home at Red Stone, Colo., Jan. 4.

Osgood started his business career as an office boy in a cotton manufacturer's office, later becoming a clerk for a commission firm. He was cashier of the First National Bank of Burlington, Iowa, from 1874 to 1877, and then entered coal mining. He made a thorough investigation of the coal resources of Colorado in 1882 and in 1887 organized the Colorado Fuel Co., later consolidated with the Colorado Coal & Iron Co., the merger being called the Colorado Fuel & Iron Co., which he organized in 1892, and of which he was president or chairman of the board until his resignation in 1903.

He was forced to relinquish control of Colorado Fuel & Iron in 1903, after being buffeted between the Rockefeller and John W. Gates interests, both of which sought control. He was invited to remain as chairman of the board after the Rockefeller interests gained control, but stepped out and organized the Victor company.

Colorado Fuel & Iron at the time Osgood was forced out had properties estimated at between $40,000,000 and $50,000,000 in value.

Shots and Dynamite Usher in New Year In W. Va. Strike Zone

Trouble broke out anew in the northern West Virginia coal fields last week, when a non-union miner was shot and is likely to die. The trouble zone has now shifted to Galloway, in the Flemington section, near Grafton, where the Simpson Creek Collieries Co., composed of Youghiogheny & Ohio officials, is attempting to work non-union on the 1917 wage scale. The Galloway mine was operated union until several months ago, when, it was reported, the existing contract expired and the large plant then shut down.

The trouble at Galloway is reported to have had its beginning Jan. 4, when union pickets are alleged to have stopped non-union miners on the way to work. The next morning two state troopers went to the home of Pasquale Floria, in Galloway, to serve a warrant, and upon receiving no response to their knocks proceeded to break down the door. The troopers charge that Floria brandished a revolver and fired a shot, whereupon one of the troopers returned the fire and Floria was shot through the back. Floria was removed to the Grafton Hospital and from last reports was in a serious condition.

Officials of the United Mine Workers allege that when Floria saw the state police coming he dropped his revolver, which was unloaded. C. Fremont Davis, international representative, accuses the state police of kicking and beating Floria, according to the statement made by the dying man.

Keen Interest in Politics

Interest was keen in the town elections at Monongah and Rivesville on Jan. 7, and from last reports the tickets supported in both towns by the coal companies won out. The results in Monongah are close, only 16 or 17 votes separating certain candidates, with a tie in another instance. The contest in Rivesville is overwhelmingly in favor of the coal interests. For some time there have been clashes between the town authorities and other officers of the law, and operators think that the election result will go a long way toward clarifying the general situation.

Bonds in the sum of $16,500 have been furnished by the United Mine Workers in a series of cases marked by violence. A number of men with high-powered rifles are alleged to have attacked the home of Frank H. Brooks, superintendent of the Ida May mine of the Consolidation Coal Co. Samuel Boykens and William Austin are charged with shooting Mr. Brooks and each has been released under bond of $4,000. E. W. Wilson and Henry Rosser, charged with conspiracy in the same offense, were released under bond of $2,000 each. Cosmo Amoroso and Walter Bruzzy, charged with dynamiting a vacant house in Monongah, were released on bond in the sum of $2,000 each.

Officials of the Western Maryland Railway Co. last week posted notices offering $1,000 reward for the arrest and conviction of the parties who dynamited the Bingamon bridge on Dec. 23.

Samuel L. Poole, superintendent of the Bingamon mine of the Bingamon Gas Coal Co., and Marion Shobe, a mine guard, have been held to await the action of the Marion County grand jury for shooting Robert Bostic, a union miner, after an altercation over moving automobiles from company property. Poole furnished bond in the sum of $2,000, but Shobe was committed for trial.

Coal production in the 12½ counties of northern West Virginia has shown signs of increase after the holidays. A return of cold weather may help the situation, operators think. In the first four days of last week the mines produced 8,806 cars of coal. Non-union mines loaded 7,801 cars compared to 6,505 cars in the corresponding period of the previous week. Union mines loaded 1,005 cars of coal in the first four days of last week compared to 978 cars in the first four days of the preceding week.

Lemuel Burrows

Mill Creek and Elkhorn Cos. In Smokeless Merger

Another consolidation of coal properties in the smokeless area was consummated on Jan. 2, when the Mill Creek Coal & Coke Co. took over the mines of the Elkhorn Coal & Coke Co. at Maybeury, W. Va. About four years ago the Elkhorn company acquired the properties and mines of the Coaldale Coal & Coke Co. These properties, which lie directly beneath the Flat Top Mountain, are among the best in the Pocahontas field. The seam of coal averages 8 to 8½ ft. thick. The Mill Creek mine has been in constant operation for more than 40 years. C. B. Smith will continue as general manager of the consolidated property, with his main office at Coopers. It is stated that a short tunnel will be driven on the line of the No. 2 seam connecting the Mill Creek mine with the Elkhorn tipple. When this has been done, the Elkhorn tipple will be rebuilt so as to accommodate the entire output and the Mill Creek tipple will then be abandoned.

Lemuel Burrows Dead at 54; Had Recently Retired

Lemuel Burrows, president of Castner, Curran & Bullitt, Inc., died Jan. 6, at his residence in Forest Hills, L. I., after a brief illness. Born in Brooklyn, N. Y., June 1, 1871, he attended the public schools in that city. In 1888 he entered the employ of Castner, Curran & Bullitt, Inc., at 1 Broadway, in the capacity of office boy and worked his way up through various positions until he was appointed manager of the New York office in 1902. At that time the New York office handled all of the export business and quite a lot of the bunkering of the large steamship lines, this business being under this care.

In 1910 Mr. Burrows was appointed general manager and filled this position until 1916, when he was elected president of the company, at which time the New York office became headquarters of the corporation. Mr. Burrows retired Jan. 2 when the company passed into the control of the Massachusetts Gas Companies, as announced in *Coal Age* last week.

At the time war was declared on Germany Mr. Burrows went to Washington and offered his services to the Council of National Defense, and was very active in matters that came before the Coal Committee of this council under Mr. Peabody.

During the severe winter of 1917-18, when a serious coal shortage threatened New England, Mr. Burrows offered all of the facilities of his company to the Fuel Administration, with the result that a large amount of coal was supplied to the Northeast over the wharves of the company, and a number of loading and discharging records were broken in the handling of the government colliers "Ulysses" and "Achilles," each of which carried 13,000 tons of coal per trip to the New England consumers. It was generally believed that the handling of this coal through the splendid facilities of the company at Boston prevented a grave situation.

Mr. Burrows also was requested by the Fuel Administration to use his best efforts in obtaining and supplying coal to the Italian Government during the war in order that that ally might not suffer for lack of navy fuel. This work was discharged with such satisfaction that he was decorated by the King of Italy with the order "Corona d'Italia."

It was said among shipping men of long standing in Norfolk that Mr. Burrows had done more than any other person or agency to make Hampton Roads one of the principal coal ports of the world.

Mr. Burrows is survived by his wife and three sisters.

To Extend Alaska R. R. Rights

The rights granted the Alaska Anthracite Railroad Co. in 1898, which have been extended from time to time, will be extended for three years from May 11, 1925, if Congress approves a bill introduced by Delegate Sutherland. The maps showing the definite location of the Stillwater Creek and Canyon Creek branch lines are to be filed within two years.

"Hands Off" Policy In Coal Situation Spreads to Congress

By Paul Wooton
Washington Correspondent of *Coal Age*

Objection lodged by Senator Reed, of Pennsylvania, having been withdrawn, the Senate on Jan. 5 passed without debate the resolution by Senator La Follette, of Wisconsin, calling upon the Secretary of the Treasury "to furnish to the Senate a statement based on corporation income-tax returns covering the year 1924 showing for each corporation engaged in the mining of anthracite coal the amount of capital stock, the amount of invested capital, the amount of net income, the amount charged to depletion and depreciation accounts, and the amount of federal tax paid by each such corporation."

The Senate is in the habit of allowing most resolutions of this character to go through. Some Senators known to be out of sympathy with the revelation of legitimate business secrets are thought to have been influenced by the realization that in this instance the makers of the returns are likely to be benefited more than they are likely to be harmed.

If the Secretary of the Treasury decides that compliance will not be contrary to the public interest and divulges the tax returns made by the anthracite companies, it will emphasize the fact that earnings have decreased markedly since the report made by the Hammond Coal Commission. Senator LaFollette's real purpose probably would be served better by the Coal Commission data.

Congress with Administration

Congress apparently thinks well of the administration's coal policy. It is becoming increasingly clear that the majority is not disposed to interfere in the present strike. It will take some radical change in the situation and some unforeseen pressure from consumers to change this attitude. Thus the great effort of the United Mine Workers to make the situation a national issue is failing with Congress just as it failed with the administration. Congress is much more concerned with farm relief, a readjustment of taxes and other domestic issues, to say nothing of the world court, than it is with coal. No hearings are in prospect on the several bills introduced. The Interstate and Foreign Commerce Committee of the House, which is being importuned to investigate coal, is engrossed in the rubber situation and as this is written has no plan to inquire into the need for coal legislation.

Although wage negotiations have been broken off it is probable that Congress will await the action of the Pennsylvania Legislature.

The attitude of the administration seems not only to have been communicated to Congress but has influenced public sentiment as well. The policy of holding industries responsible for the settlement of their own affairs seems to have been accepted by the public. There is abundant evidence that the conscience of the country supports the principle of arbitration. It is believed by observers in Washington that the great majority of the people want no settlement that does not provide for the peaceful adjustment of all matters of controversy in the future.

Small Firms Safeguarded By Trade Associations

Trade associations rapidly are throwing a new defense around the small units of business, those who are watching their increasing activities declare. The statistical data which they gather greatly aid the small unit in its effort to compete with the large unit. It is one of the checks on consolidation in too large units. The big operation can afford to amass all of the figures it needs to conduct its business to the best advantage.

Membership in a trade association has become a factor in the determination of credit, it was revealed at a recent gathering of an association of credit men. The general conclusion seems to be that a business which is contributing to the stability of an industry is entitled to a higher rating.

The point also is made that business papers are in a position to render particularly valuable service by making available those statistics in which the time element is an important factor.

Governor Smith Recommends Permanent Coal Agency

Gov. Alfred E. Smith in his annual message delivered to the New York State Legislature Jan. 6, recommended among other things the establishment of a permanent coal agency as a part of the state government. Concerning this the Governor said:

"Closely related to marketing and transportation is coal supply. In order that the state might not find itself without any agency to protect its people in this period of coal shortage caused by the strike in the anthracite fields, I appointed a Fair Price Coal Commission which has served with considerable success as a volunteer agency of the state government. Entirely aside from the question of the merits of the contention of the conflicting parties, a strike that halts production of a necessity of life finds the greatest number of sufferers among the people who have no part in the quarrel.

"I recommend that the Public Service Commission be directed by law to be in continuous touch with this problem and be ready to represent the state and its needs when the occasion arises. In the last analysis this is a federal problem which must be solved by the authorities at Washington and in which the state is more or less helpless acting by itself. There should, however, be a continuing and well-informed state agency always ready in these emergencies."

Fires at Non-Union Mines Near Evansville, Ind.

Two fires of undetermined origin occurred last week at mines near Evansville, Ind., which were closed by union miners when they attempted to operate non-union. Flames destroyed the wash house of the Swanee Coal Co. at Yankeetown and the home of Grover Hogan, top foreman of the Korff mine, near Booneville.

John A. Riddle, general counsel for District No. 11, United Mine Workers, speaking at a meeting of union miners at Princeton, urged the miners to continue their persuasive methods in bringing non-union workers back into the union fold.

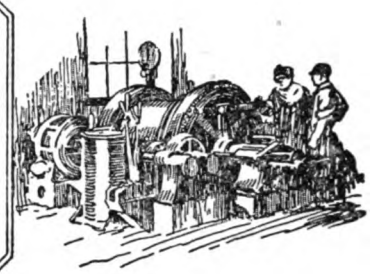
Non-union mines were forced to close Jan. 6 when a veritable army of union miners took peaceful possession and brought into the union the workers who had manned the non-union mines.

The operators of non-union mines in the district declare they will reopen their mines and trust to the state to give them protection. William Kershner, Adjutant General of Indiana, stated on Jan. 7 that every unit of the National Guard, many of them veteran outfits from the late war, could be mobilized in an hour and started for the district if necessary.

In the meantime, the organized forces hailed as a triumph the commencement of negotiations with James Moore, owner of the Crescent and Sunnyside mines, in Vanderburg County. Mr. Moore conferred with union leaders before a big mass meeting and agreed to return his properties to a union basis.

Walter Korff, general manager of the Bosse Coal Co., with holdings in Gibson and Warrick counties, ignored an invitation to attend the mass meeting and met with a group of operators in his office in Evansville. After the meeting he announced that his mines would open and expressed the belief that he would have sufficient workers to man the holdings. Plans also were made for reopening the Schimmell-Hampton mines.

Mr. Turner Takes the Reins



Scott Turner, the new director of the Bureau of Mines, has completed the task of winding up his personal work and has assumed active charge of the Bureau. The chief interest of the new director for the present will be centered on the organization of the economics branch of the Bureau. While some obstacles have arisen in connection with the transfer of appropriations, Mr. Turner expects to be able to get the new work under way in the near future on a basis whereby the economics branch will be a real handmaiden to the industry.

Another meeting of the advisory committee probably will be called for Jan. 26 and 27 in Washington. The board of directors and the government relations committee of the National Coal Association will meet on those dates and it is thought desirable to have some discussion at that time on the matter of co-operation with the coal producers.

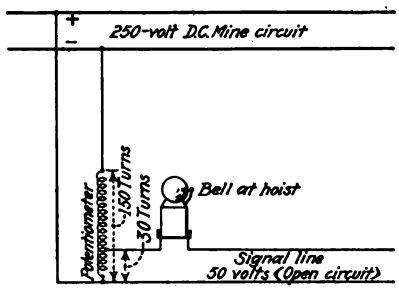
Practical Pointers For Electrical And Mechanical Men

Potentiometers Save Money and Labor In Hoist Signaling

Radio's leap to popularity has acquainted millions with the meaning of electrical terms such as condenser, rheostat, and potentiometer. Before the advent of radio the latter term was not commonly used or understood by many who are classed as electricians. A potentiometer has been aptly called a "direct-current transformer." It is by this name that such a device is spoken of at the mine of the Montevallo Coal Mining Co., located near Aldrich, Ala.

Here, potentiometers connected to the 250-volt power circuits have replaced primary batteries as energy sources for the low-voltage signal lines. The new method is saving the $100 per month formerly spent for repair and renewal parts of the primary signal batteries, and in addition is saving considerable labor and preventing a loss of time due to the failure of signals. Against these advantages there is, of course, a charge for the energy taken from the direct-current lines.



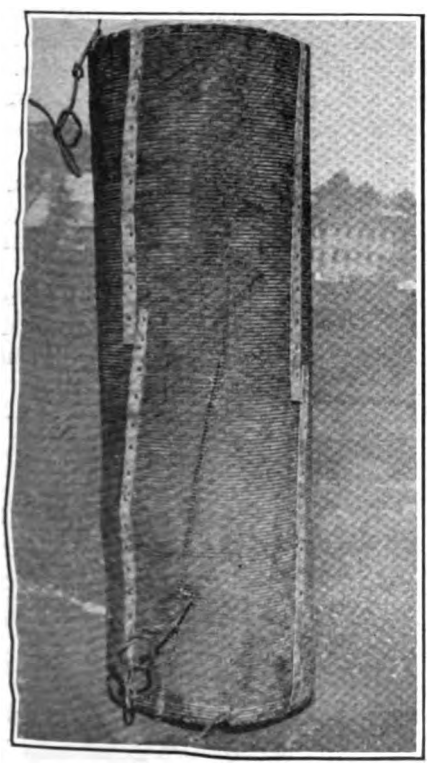


Diagram of Connections

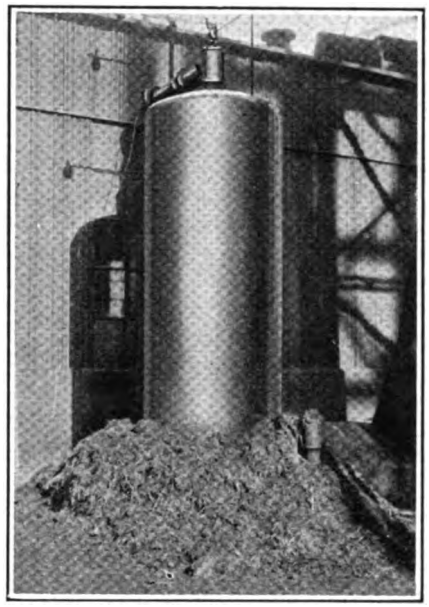
Each potentiometer takes approximately 1.7 amp. from the 250-volt line. Assuming that they are used twenty-four hours per day, the cost at 2c. per kw.-hr. to operate the twelve at the Aldrich mine, is $74 per month.

Assuming that all of the twelve potentiometers are energized for twenty-four hours per day, the maximum energy cost at 2c. per kw.-hr. is approximately $74 per month.



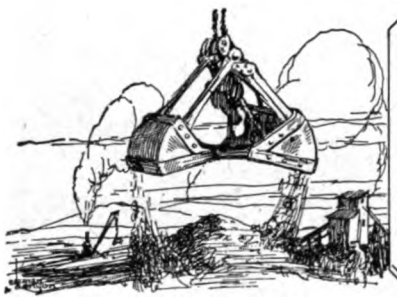
The potentiometers used at Aldrich are home-made because the company was unable to find a factory-made resistance of the proper characteristics and one having a tap at the desired point. The resistance wire ("Climax," No. 18 B. & S. gage 450 ft. long) is wound on a maple or cedar spool 29 in. long x 9¾ in. in diameter. On this is cut a thread, six turns to the inch, to maintain proper spacing. After the wire is wound on the spool, strips of fibre are nailed on longitudinally at four points to hold the turns in case the spool shrinks or a break occurs.

The wire used has sufficient resistance and carrying capacity to limit the current—and therefore the heating—to a temperature far below the charring point of wood. But in spite of this fact it must be admitted that the use of wood presents a hazard.

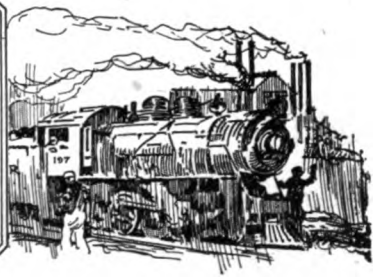
Resistance Removed from Box

The company could not locate a factory-made resistance of the desired type, so built up this one, using a wood spool. The two outside terminals are connected to the 250-volt line. The signal line is connected to the tap, and to the bottom terminal.

No Freezing in This Air Receiver



At the Harmar mine of the Consumers Mining Co., Harmarville, Pa., the dumping equipment at the bottom of the skip-hoisting shaft is air-operated and so are many of the gate controls in the tipple. The air compressors are located inside the hoist house while the air receiver is outside. To prevent water which collects in the receiver from freezing, manure is piled around the base of the receiver as shown. This scheme works satisfactorily.



This Danger Board Is Well Placed

Where gas is discovered at the face the particular place should be boarded off as here shown until the gas is removed. The board in this case rests in a rib niche at one end and is nailed to a prop at the other. It is not laid across the track, for in that position it would not be easily discernible. The danger sign conforms to the specifications of the Pennsylvania Compensation and Inspection Bureau. All supplies and tools are kept outside the inclosure of the fence. The canvas has been hung to remove the gas.

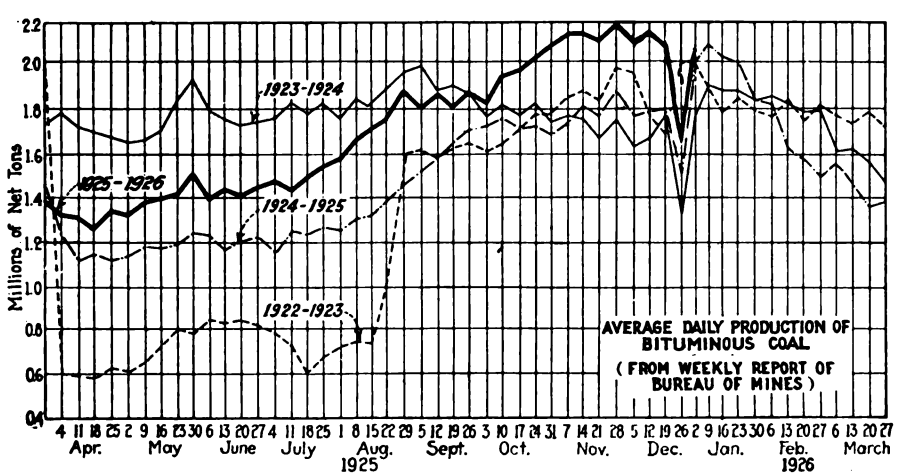
Production And the Market

Coal Market Remains Firm as Demand Eases; Hard-Coal Substitutes Slightly Stronger

Though the cold snap which stimulated the coal market pretty generally two weeks ago was short-lived in some localities a considerable degree of firmness still is in evidence right down the line. A noticeable slowing-up took place in the Middle West, where unseasonably warm weather followed close on the heels of the mercury's fall, but prices hold fairly well. Plenty of business in lump at circular prices is reported by producers in the more favored districts of Illinois, Indiana and western Kentucky, though the demand for egg and nut sizes is extremely unsteady. Business in high-volatile coals from West Virginia and eastern Kentucky has been very irregular with a wide range in prices.

West Virginia smokeless, which had been floundering somewhat since the close of lake navigation, has been steadied to a considerable extent by demand in the East, which is reflected by a stronger price line-up. Another important influence as a market stabilizer is the policy of Kentucky operators in holding a large amount of coal on track at mines rather than let it get into the distress classification. The foolish virgins are not all dead yet, though, for coal is still going into Chicago on consignment, and shippers are paying dearly for the practice.

Dullness persists in the New England market, practically all grades being in only fair demand. Except for a brief flurry early last week, the trade in the Middle Atlantic district has been fairly steady with no change in prices. Business has been in good volume since the holidays in the Northwest, and the dock operators are optimistic regarding prospects for the next few months. Demand in Alabama is steady and bookings are fully equal to moving output without difficulty.



That portion of the trade catering to the usual consumers of anthracite have been somewhat "edgy" as peace negotiations dragged along. Buyers have displayed a disposition to be cautious, but cold weather and snow have quickened the demand for substitutes at least temporarily. The call for coke has been moderately heavy and prices have hardened.

Soft-Coal Output in 1925 Is 523,072,000 Tons

Output of bituminous coal during the week ended Jan. 2 is estimated by the Bureau of Mines at 10,796,000 net tons, an increase of 2,365,000 tons over the revised figure for the previous week but 10,000 tons less than in the corresponding week a year ago. Total production of soft coal during the calendar year 1925 is estimated at 523,072,000 net tons, compared with 483,687,000 tons in 1924 and 564,565,000 tons in 1923. Anthracite output during the week ended Jan. 2 was about 28,000 net tons, as against 32,000 tons in the preceding week. Total hard-coal production for the calendar year just closed is estimated at 62,120,000 net tons, a decline of 25,807,000 tons from the previous year and of 31,219,000 tons from 1923—the falling off being due, of course, to the strike. Output in the first eight months of last year—or until operation was suspended—was 61,621,000 tons, compared with 59,247,000 tons in the corresponding period of 1924 and 66,849,000 tons in the same months of 1923.

Coal Age Index of spot prices of bituminous coal stood on Jan. 11 at 180, the corresponding price being $2.18, compared with 181 and $2.19, respectively, on Jan. 4.

Dumpings of coal at Hampton Roads underwent a further decline during the week ended Jan. 7, the total being 339,761 net tons, compared with 355,126 tons in the preceding week.

Estimates of Production

(Net Tons)

	1924–1925	1925–1926
BITUMINOUS		
Dec. 19	10,814,000	12,689,000

Warm Wave Causes Midwest Market to Buckle

Unseasonably warm weather during the last week has slowed up the Midwest coal market to a great extent. Operators in the more favored districts of Illinois, Indiana and western Kentucky report that they have plenty of business on lump coal at circular prices, but that the demand for 6x3-in. egg, 3x2-in. small egg and cook-stove nut is extremely precarious. Prices are being held fairly well, although it was rumored, but not verified, that one of the large Franklin County operators had reduced his price on Franklin County 6-in. lump from $3.50 to $3.25.

The market on high-volatile coals from West Virginia and eastern Kentucky was very erratic, with a wide range of prices. Furthermore, it was noticed that some of the good coals were among the weakest when it came to prices. This was brought about by the fact that the operators did not expect a slump and did not book up as heavily as they could have during the last cold snap. Pocahontas prices are holding up fairly well, with lump moving at $3.50@ $4.50; egg $3.75 @ $4.50, and stove, $3.50@$4.25. Smokeless mine-run was offered freely at $2.25, with some coal on demurrage going as low as $1.75. Coal still comes into Chicago on consignment, and operators continue to pay heavily for shipping coal in this manner.

Steam coals have kept up well during the past week for two reasons: First, the warm weather has put a stop somewhat to production owing to the difficulty in moving the prepared sizes; and second, some labor difficulties in the southern districts of Indiana closed most of the mines in that district, with considerable doubt as to when they will reopen. This forced a number of buyers who have been in the habit of drawing on southern Indiana coal to place orders elsewhere, and this diversion of business has led to a general tightening up of the steam market all the way through.

The general tone of the Midwest market, on the whole, is fairly optimistic, as it is believed that cold weather will come along soon to offset the warm days of the past week.

A little seasonable weather in southern Illinois brought some activity in domestic sizes, principally lump. Egg and No. 1 nut are heavy and there is no unusual demand for steam, with the result that nearly all mines have "no bills" of various sizes on hand. In spite of this, good working time prevails at most mines—usually four and five days a week, with the usual exception. Railroad tonnage is fairly good from the shaft mines. Car supply likewise is good but the train movement is slow. Strip mines are working steady on account of good weather. Railroad tonnage here also is reported good and coal is moving on special prices. In the Duquoin field conditions are somewhat similar with no change in price except on railroad tonnage.

The Mt. Olive field shows an increased demand for domestic sizes and steam is slow with a lot of "no bills." Working time is five days a week. Prices are unchanged.

Coal Age Index of Spot Prices of Bituminous Coal F.O.B. Mines

	1926		1925	
	Jan. 11	Jan. 4	Dec. 28	Jan. 12
Index	180	181	178	175
Weighted average price	$2.18	$2.19	$2.16	$2.12

This diagram shows the relative, not the actual, prices on fourteen coals, representative of nearly 90 per cent of the bituminous output of the United States, weighted first with respect to the proportions each of slack, prepared and run-of-mine normally shipped, and second, with respect to the tonnage of each normally produced. The average thus obtained was compared with the average for the twelve months ended June, 1914, as 100, after the manner adopted in the report on "Prices of Coal and Coke; 1913-1918," published by the Geological Survey and the War Industries Board.

In the Standard field there is no change. Prices are about cost of production and, with a few exceptions, all mines have various sizes of "no bills" constantly. Railroad tonnage was reported good last week. Car supply is plentiful and working time ranges from three to five days a week.

Domestic trade in St. Louis reports movement of middle and Illinois high grade egg and a little spurt for smokeless. Anthracite is pretty well cleaned up on the smaller sizes and there is no demand. Coke showed an increased demand last week. There is some call for Standard from apartments and cheaper business houses, but not in the volume usual at this period of the year. Country domestic demand is fairly good for cheaper coals and unusually good for west Kentucky domestic sizes. Country steam is quiet. There has been no change in prices.

Demand Slumps in Kentucky

The slump over inventory period, along with mild weather last week flattened demand for both steam and domestic coal in Kentucky. Prices are holding firm, however, as operators are holding much coal on tracks at mines, instead of letting it get into the distress fuel classification. There hasn't been much trouble about car supply for some time, and the operators don't mind holding coal on track, as they did when cars were scarce and held cars were counted against their loading.

Steam coal demand is expected to pick up as industry gets back into the running. Cold weather would bring back the retailers, as many of them haven't much coal on hand.

The eastern Kentucky market on 4-in. block coal is $2.75@$3.25, in spite of absurd rumors of $2 block. There may be some off-grade and off-size stuff at $2.50, but 2-in. lump and egg are the only items offered as low as $2. The operator would rather keep his coal, especially in view of the fact that screenings are off. With a dollar and a half slack market the operator might sell some cheap prepared, but not on a 90c.@$1.10 slack market.

The slump in industrial demand hit eastern Kentucky screenings, which dropped below $1 for the first time in weeks, being quoted at 90c.@$1.10 for all grades. Western Kentucky screenings are firmer due to lower production of prepared, at 90c.@$1. Other western and eastern Kentucky prices are unchanged.

Year Starts with Promise in Northwest

Trade has been running in good volume in the Duluth-Superior market since the turn of the year, and dock operators are hopeful regarding the outlook for the first half of the year at least. What is regarded as especially satisfactory is the placing of orders by industrial companies over northern Wisconsin and Minnesota, with foundries and other iron and steel enterprises bulking up well in that connection. A revival of interest also is reported from over the northern Minnesota iron-range territory.

While retailers are still ordering coal on an immediate requirement basis it has been bulking up into good proportions. Utilities companies and municipalities over Minnesota and eastern North Dakota have been ordering good tonnages on contracts made last fall. Shortage of water supplies in storage dams is forcing some of those consumers to resort to operating steam power plants in the emergency.

Pocahontas and other smokeless coals are in heavy demand as substitutes for anthracite. Only two docks are carrying any anthracite stocks and they are taking only small orders from regular customers of their retail yards.

Shipments of coal from the docks during December totaled 25,735 cars, compared with 27,411 cars during November and 29,615 cars during December, 1924. The aggregate cars loaded during the year was 239,548, compared with 242,604 during 1924 and 199,503 cars in 1923.

Prices are steady and unchanged for both anthracite and bituminous coals. Domestic coke is selling freely at $8.50 and briquets at $9.

Milwaukee dock managers have nothing new to report as to the coal situation, which continues as it has been for weeks. There is an ample supply of bituminous coal, for which there is a fairly good demand, which fluctuates sharply with the weather. The only change in prices reported by retailers is an advance of $1 for nut coke, which now sells for $15 a ton.

Boreas Comes to Rescue of the West

Winter weather again has come to the relief of Kansas operators. While tracks are not cleared of "no bills," the surplus in the field has been much reduced, and the market, which had begun to soften, has stiffened. Shading was particularly evident in Kansas lump, on which the list price has been $5. At present there is a slight surplus of lump, but there is a shortage of nut, and screenings are even. Arkansas is still looking for business, with the expectation that the normal midwinter recovery from the November slump cannot be far off. Semi-anthracite lump is quoted at $6@$6.50, with many accepting less. Screenings are scarce at $2.

There has been no material change in the domestic trade for Colorado and New Mexico coals in the past week, but operators look for a substantial increase in the next month to six weeks, as the stocks in bins are about depleted and inquiries and orders are beginning to come in in large numbers. Colorado mines are working about 90 per cent.

Utah mines are working about three days a week, and some operators describe business at "rotten!" Retail trade is good, due to a light fall of snow. Lump coal is somewhat of a drug on the market, but slack is a little scarce, if anything. The metal industry is taking a large proportion of the coal used for industrial purposes.

Utah operators have more orders than usual from the Pacific Coast and Northwest, demand being largely for stove size. Business is only fair in Idaho and Nevada.

A few dealers have been trying to persuade the trade to increase the price of slack from $3.50 to $4, but the effort is not likely to succeed. The schedule price at the mine is $1.25, but for the past two or three months it has been 75c. Gossip has it that some of the smaller operators cut the price to unload surplus stocks of slack but would now like to raise them. The big operators are not inclined to make a change, however, feeling that it may prove a good lesson to those who reduced them.

Prices for coal other than slack remain firm.

Wintry Spell Stimulates Cincinnati Market

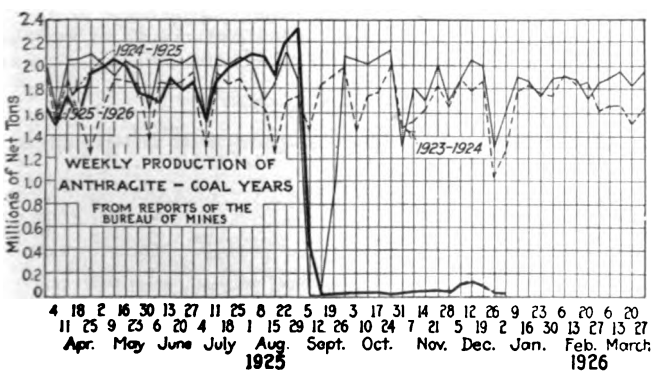
At Cincinnati the feeling-out process, so common at this time of year and accentuated by the deliberations of the anthracite negotiators, went along merrily last week until Friday, when heavy snow falls and colder weather put fresh life in the market. While orders flowed in good volume few noticeable changes were made in values.

High volatile has been on a "brokers' market" since Christmas, as shown by the spreads in some of the makes. Mine-run has been variously priced from $1.40 to $1.85. Both steam and gas were obtainable at the low, these coals coming from mines that have had to look to the middleman for a sales outlet. On the other hand, byproduct and gas takers with an assured source of supply paid up to $1.85 for choice coals. Domestic has moved up to $2.75@$3.50, the top being for specialized and advertised product. Egg prices ranged $1.60@$2.25 and slack from 90c. for off-grade Kentuckys to $1.25 for the choice.

Better demand in the East has helped the smokeless market, which had been floundering since the close of navigation. Egg and stove sizings going to tide were around $4.50 with the inland from $4@$4.25; lump also picked up a little, with more selling around $4 than at the low of $3.75. Mine-run showed weakness in the fact that the spread between $2.25@$2.50 was softer than the mere figures indicate, and slack too was off 10c. with a spread between $1.75@$2, and it had to be standard stuff to bring this price.

Retail business is in practically the same position as it was last week. Buying has been a bit better, but this is a weather result. After a few days of open weather in which the river people were able to break through the ice the snow came along and has held them up again.

The report of the Cincinnati district of the American Railway Association places total coal loads interchanged last week at 9,161. This is a decrease of 2,883 compared to the previous week, and an increase of 320 compared to same week last year. It is expected that there will be an increase this week, as the demand for empties at the mines shows signs of improvement. All coal-loading roads have heavy surpluses on their lines.



Warmer weather following the blizzard caused a slight recession in domestic demand in Columbus and vicinity. This was not as marked as might be expected, as dealers' stocks were not heavy and occasional buying to replenish stocks is reported. Smaller orders are expected from householders during the remainder of the winter anl dealers will be in the market not only for smokeless and splints but also for Ohio mined varieties. Retail prices are well maintained at previous levels. There is little distress coal on the Columbus market and bargain prices are few.

Steam business has shown little change outside of weakness in screenings, the declines having amounted to 15 to 25c. per ton in the past two weeks. One of the causes given is the closing of the lake trade. Steam plants are buying for current needs only as their fuel stocks are heavy. Utilities are taking their usual quota and iron and steel plants are good buyers. Some improvement in general industrial conditions is noted, and this, it is believed, will be reflected in the steam fuel business.

In eastern Ohio the market is in a somewhat chaotic state as demand has been at a low ebb for this time of the year. About a week or so ago retailers had quite a rush of orders, and were fairly busy, only to experience a warm spell and a dropping off in trade. During the holidays, however, many of the schools were putting in coal.

In the steam trade, orders are for current needs only, which are not heavy. The railroads are said to be taking full quotas on contracts.

During week ended Jan. 2 the eastern Ohio No. 8 field produced 217,000 tons, or about 37 per cent of potential capacity. This is 30,000 tons over the preceding week, but 38,000 tons under the corresponding week a year ago. Revised figures for the calendar year 1925 show a production of 13,237,000 tons, or around 37 per cent of capacity.

Pittsburgh Trade Stationary

The Pittsburgh district coal market presents no new features this week. Buying of domestic coal continues fairly good, but this does not represent a large part of the district's business.

Consumption by the industries has been running heavy and bids fair to continue so. There is practically no demand of any consequence from the East for Pittsburgh district coal. There is such a demand for nut and egg that the district is able to sell some in the East at $2 to $3, but its production of such sizes is small.

Competition continues very keen, both between producers in the district and between the district and non-union fields, and while prices are low they show no disposition to harden.

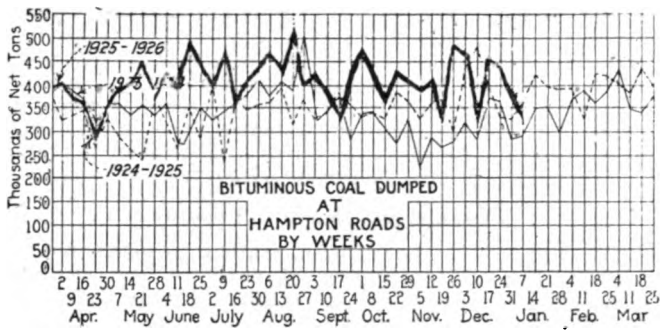
At Buffalo the demand in the regular soft-coal trade is more a matter of accepting what is urged on the consumer than anything more active on his part. There is often complaint that coal is bought that is not really wanted, but just to accommodate a friend who must make a showing of business or lose standing at headquarters. Slack, and especially gas slack, has not been as plentiful as sizes, but prices are about as usual.

New England Market Drags

So far, in New England there has been no reaction from the dullness usual during the holidays. The trade drags much as it did a week ago, with screened sizes about the only relieving feature. For run-of-mine in practically all directions there is only fair demand; there is no new buying of any moment, and the range of prices continues as low as during December. Contract shipments are coming through in usual volume, the seasonable weather having influenced rehandling factors and others to keep reserves on a prudent basis. With the anthracite strike not yet settled, all the retailers are sharing in the demand from a proportion of the consumers for run-of-mine for household heating. To the spot market generally, however, there is no snap, and the agencies are easing along in the hope that somehow more remunerative prices can be obtained.

No. 1 Navy standard Pocahontas and New River can be had in cargo lots at $4.75 f.o.b. vessel at Hampton Roads, and in special circumstances at an even lower figure. A few shippers more fortunately placed with respect to the volume of coal at and en route to the piers are able to get $4.90@$5. The quotations given are in gross tons.

For inland delivery there is a spasmodic demand from small users and from retailers. Varying with the individual situation of the rehandler the range on cars at Boston and Providence seesaws between $6 and $6.50. At retail the price runs from $8.50 to $10 per net ton delivered.



For Pennsylvania coals all-rail there is an improved request for egg and nut sizes, the quality grades commanding up to $5.25 per net ton at the mines. Pocahontas and New River are to be had on about the same delivered cost, although owing to difference in the through tariff $4 is about the top figure for smokeless prepared. A number of splint coals are being offered at from $3 up when shaker-screened. The bulk of the consumers who are in the market, however, are buying coke and such imports as Welsh anthracite and briquets when they can be had.

Passing Flurry in New York

Indications that the anthracite wage conference would fail to reach an agreement last week caused a flurry in the bituminous coal market at New York, and resulted in a few heavy sales of coal for delivery during the present month. There was no change in prices, however. With that exception the market was quiet. With the coal in reserve consumers are not inclined to increase their supplies, not wishing to end the coal year with large stocks on hand.

Movement of mine-run is the feature of the market, screened bituminous not showing much strength. Low-

Digitized by Google

volatile egg from Pennsylvania is quoted at $4.50@$5, with lump bringing $3.50@$4. Prepared sizes of Broad Top coals are quoted by some houses at $5@$6. Screened sizes of smokeless coals were quoted at $4.25@$4.50, and high-volatile egg and nut coals $2.50@$3.

The Philadelphia market remains quiet. Consumers are still shy on contracting, relying on the spot market. There is a little better demand for screened coals, particularly sizes; as coke is almost sold up in the domestic market, there is a better chance for low-volatile screened coals. As a result there is a better supply of slack, although the market is a bit quiet on slack.

Beginning Jan. 1 coal from the New River and Pocahontas region is able to be delivered to buyers on the lines of the Reading Co. on the $3.94 rate. Heretofore this rate applied only to Pennsylvania R.R. delivery. The so-called emergency freight rates, effective from Jan. 1 to April 1, from distant regions also are in effect now, and business has been solicited on Kentucky coal on a freight rate a bit under $5.

The Baltimore soft-coal trade looks to 1926 with some rather mixed feelings, in which doubt is not absent. Industrial demand is not such as to give assurance that prices will be maintained at a fair level over the coming year. The business that has grown up in prepared sizes as a substitute for anthracite is somewhat dependent upon the resumption of mining in the anthracite fields—just what proportion of the business gained is to be held in prepared sizes of soft coal for the future is a real unanswered problem. At present there is no export business and bunker business also is below level. Warmer weather followed the recent cold snap, but the somewhat accelerated demand for soft coal, especially for prepared sizes, seems to hold. Prices remain about the same.

Demand for steam coal is considered exceptionally good in the Birmingham market so soon after the holidays. While business is not as brisk as it was just before the Christmas rush, inquiries are coming in in good numbers and ample business is being booked to move the output without delay. There are some little stocks in the hands of consumers yet, which is serving to hold back buying to some extent, but normal activity is expected soon. Contract coal is moving well to the railroads and large industrial users. The bunker tonnage being booked is larger than usual at this season.

Domestic demand in the spot market is good, and practically all the high-grade coals have been sold up through this month and the low and medium qualities are moving in a satisfactory way.

Quotations are unchanged from a week ago.

Coke demand also is good and local and foreign requirements are absorbing production; additional sales could be made were the product available. Foundry coke is quoted $6@$6.50 per ton; gas coke, $6@$6.50; egg, $5.25, and nut, $4.75@$5 per ton ovens.

Coal output for the week ended Jan. 2 is reported at 339,000 tons. Figures compiled by the Alabama Mining Institute show a total production for 1925 of 19,857,000 tons, which is approximately 240,000 tons more than in 1924.

Wage Parley Rules Hard-Coal Substitutes

The wage conferences are ruling the so-called anthracite market at New York. When the prospects for a settlement look bright wholesale dealers and retailers expect and do receive many cancellations of orders but when these reports prove groundless the effort made to reinstate the orders is just as strong. Because of such rumors the market changed rapidly last week. Meantime dealers and consumers are buying from hand to mouth, low temperatures causing many orders for small lots.

The demand for coke is increasing rapidly now that anthracite is practically out of the situation. Retail prices range all the way from $13.50 to $18 according to quality and manufacture. Crushed beehive coke was quoted on a range of $7@$8 at the ovens and byproduct coke at $9@$9.50. Mine-run bituminous coal also is being used where hard coal formerly was used, it being mixed with buckwheat for heating purposes with success.

Dealers felt convinced that even if an agreement on wages should be reached shortly not enough anthracite would arrive in this market this month to make a dent in the situation. A few retailers have small tonnages of domestic coals in their bins, but the demand is for either coke or mine-run bituminous coal.

The Philadelphia anthracite trade is pretty much on edge due to the various meetings of the miners and operators. With warmer weather there was a tendency to relax buying, but when the committee failed to reach an understanding last week, the ordering of substitutes became a bit stronger. Consumers are still calling for coke.

Some buckwheat was shipped last week by the P. & R. C. & I. to hospitals and the city water works. It is said this company has held back about 30,000 tons of steam sizes for emergencies such as these.

With the anthracite strike in its fifth month, Baltimore hard-coal dealers report that there is no situation, as far as they are concerned, as there is no hard coal in local yards. Dealers everywhere are pushing prepared sizes of bituminous and the public seems to take to these without any great effort. Prepared sizes of coke went up rather sharply in this market during the past week, the advance being about $2 per ton and the quotations to the trade at the ovens around $9. A mild winter, so far, except for a short sharp spell, has helped the situation very much.

Interest in the chances of an early settlement of the strike overshadows everything else in the entire Buffalo coal trade. While it will give the hard-coal people a prospect of full return to business as soon as the men go to work it is not so favorable to soft coal, for it will not help the regular trade and will force a readjustment of both the smokeless and the coke movement.

Connellsville Coke Market Hardens

Coke prices in the Connellsville market showed a decided softening tendency late last week, which was considered quite natural in view of the sharp advance before Christmas and the presumption that with the holidays out of the way production would be restored. Later on prices began to harden again. While production had increased, apparently it had not increased as much as expected, while demand from the East continued moderate'y heavy.

Run-of-oven coke, which was at $4.50@$4.75 on the last day of the old year, reached a level of $4.75@$5 by Tuesday of last week, while prepared coke, rather poorly defined at $5.50@$6.50, got up to a range of $7@$8, with the latter figure obtainable on any coke fairly well prepared.

There was practically no blast-furnace buying last week, though there was a little—rather unexpected—the week before. The furnaces in operation are covered by contracts for the quarter, on which deliveries probably will be adequate, while few if any idle furnaces are likely to come in at this time. Accordingly the Connellsville coke market bids fair to be purely a matter of Eastern buying.

Foundry coke has been very dull and hardly makes a market of its own. It may be quoted nominally at the usual dollar differential over furnace coke, or at $5.75@$6.

The *Courier* reports coke production in the Connellsville and lower Connellsville region in the week ended Jan. 2 at 114,600 tons by the furnace ovens, an increase of 18,800 tons, and 105,400 tons by the merchant ovens, an increase of 11,110 tons, making a total of 221,000 tons, an increase of 29,910 tons.

Foreign Market And Export News

British Coal Market Improves Notably; Welsh Mines Reopen

Improvement has been marked in the British market, but, of course, the volume of trade is not up to the levels of former years. Some Welsh collieries have reopened in order to meet the recovery, and as colliery owners usually are well booked up for the beginning of the new year, it is expected that about another half a dozen pits will be restarted in the course of the next few weeks. This will still leave a large number idle, and in some cases no resumption of work will take place until questions regarding cutting prices and financial adjustments can be settled. Prices, however, are stationary.

At Newcastle-on-Tyne all classes of coal are very scarce and firm for prompt shipment, and the tendency of prices is upward in view of orders that have already been booked and the good inquiries now circulating. The outlook for the month is regarded very hopefully. In the forward market there are important railway, gas-works, and bunker coal contracts in negotiation for this year, though the business matures slowly owing to difficulty in quoting for delivery after next April. The Swedish State Railway authorities have contracted for about 32,000 tons of Northumberland steam coals (Broomhill classes) for shipment from January to April next.

Output by British collieries during the week ended Dec. 26, according to a special cable to *Coal Age*, totaled 3,965,000 gross tons, compared with a total production of 5,555,000 tons in the preceding week.

Prices Firm in Fair Market At Hampton Roads

Hampton Roads business was fair last week, foreign trade having slumped, but bunkers appeared to hold up well. Mines quite generally were back in operation after the holidays, and while demand was somewhat below normal, prices strengthened slightly.

The apparent deadlock in the anthracite situation was having only a moderate effect on the local market. In the domestic trade one or two dealers had good supplies of hard coal which they were holding for $20 a ton, and getting no inquiries. Many hard-coal users have turned to soft coal and find it meets the situation.

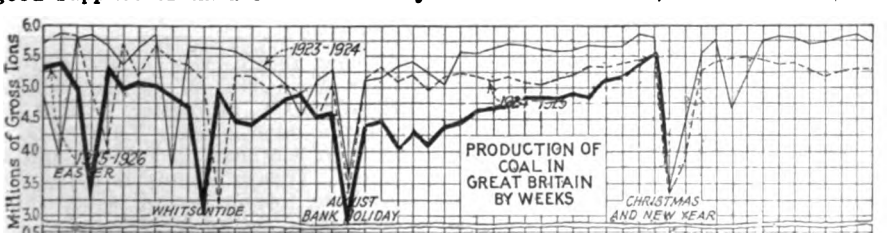
Belgian Domestic Coals Strong, Industrial Grades Dull

Industrial coals in the Belgian market continue inactive, as they have been for a long time. Domestic grades, on the contrary, are much sought and demand is expected to increase soon, as consumers' stocks are depleted.

Owing to the continued depreciation of the French franc, competing French coals are gaining headway in Belgium.

Free German coals (outside of indemnity coals) cannot for the present enter Belgium, except bunkering sorts at Antwerp. As in France, the admittance of such coals would be solved if Germany agreed that they be considered as "payments in kind" and paid for by the Agent of Payments of the Commission of Reparations.

The wage question has not been settled. The collieries maintain that wages should be conditioned not only by the index figure on living costs but also by the selling prices of fuels.



French Market More Active, British Imports Higher

The French coal market is becoming increasingly active; December production of both industrial and domestic coals was committed early and the collieries have been limiting themselves to the carrying out of contracts. Imports of British coals have shown some improvement, but arrivals at Rouen are still much restricted.

Negotiations with the Kohlensyndikat are still suspended. The Germans lay the responsibility on France, though they have put in question various points that had already been settled, such as agreeing not to compete with French coals and restricting sales to certain well defined areas.

The canal freight rate from Bethune to Paris has been raised 2 fr. to 30 fr.

Deliveries of indemnity fuels from the Ruhr from Dec. 1 to Dec. 5 included 68,700 tons of coal, 46,700 tons of coke and 5,500 tons of lignite briquets. During the first twenty days of December the O.R.C.A. received from the Ruhr 160,564 tons of coke.

As the price of the French coke will certainly be increased owing to the advance in transportation rates and taxes, it is almost certain that the decrease of 2.50 fr. applied last month to the price of indemnity coke will not be maintained.

French fuel exports in November included 419,051 metric tons of coal and lignite, 60,915 tons of coke and 20,605 tons of patent fuels, compared with October figures of 425,505 tons of coal and lignite, 49,322 tons of coke and 17,039 tons of patent fuels. Fuel imports to France in November consisted of 1,595,785 metric tons of coal and lignite, 416,117 tons of coke and 126,850 tons of patent fuels, against October totals of 2,040,952 metric tons of coal and lignite, 390,233 tons of coke and 110,113 tons of patent fuels.

News Items From Field and Trade

ALABAMA

The Alabama ByProduct Corporation, Pratt Division, is constructing a new coal washery at its No 10 Mine, at Dora, in Walker County. This operation, which has been idle for some time, will resume production when improvements have been completed.

The Connellsville Mine of the New Connellsville Coal & Coke Co. has resumed production of coal after a long period of idleness. The work of rehabilitating this operation has been in progress for about six months. New tipple and other necessary mine structures have been built, a new washery constructed and other modern preparation equipment has been installed and the entire plant has been reconstructed along the most modern lines. Modern equipment also has been installed inside the mine for the mining and handling of the coal. This mine is located on the Jagger seam, the coal being considered a high-grade blacksmith and coking product. The operation is under the direction of the Yolande Coal & Coke Co., of which J. B. McClary, of Birmingham, is president. Production will be increased as rapidly as possible to a maximum of around 2,000 tons daily.

E. L. Elliott, who had been superintendent of the operations of the Davis Creek Coal & Coke Co., at Rock Castle, Tuscaloosa County, for a number of years, has been transferred to Connellsville, where he will be superintendent. Mr. Elliott is succeeded as superintendent of the Davis Creek Coal & Coke Co. by W. A. Upton, formerly with the Nelson Coal Corporation as superintendent at Red Star, Walker County, which mine is now being operated by the Pratt Fuel Corporation.

ARKANSAS

A new tipple for mine No. 2 of the Western Coal & Mining Co. at Denning, is almost completed and the mine will be ready for operation in about a month. The old tipple was destroyed several months ago when the shaft caved in. The shaft is nearly 100 ft. deep.

The store and office building of the Bernice Anthracite Coal Co.'s mine, at Russellville, where a strike has been in progress for several months, was dynamited about midnight, Jan. 1. The explosives, which caused considerable damage to the property but injured no one, were placed several feet from the building. The mines have been operated several months with non-union labor on the 1917 wage scale, union men having gone on a strike when the company refused to operate on a later scale. The miners are said to have been producing 200 tons of coal daily just before the holidays.

Many miners who walked out on strike at Alix, Aug. 19, have returned to work under the reduced wage scale, it is said. It is thought the men returned to the mines because no assistance was forthcoming from District No. 21, United Mine Workers. Only about half of the 175 men who walked out are remaining loyal to the union. Open shop mines are operating every day.

A large steam shovel has been installed in the coal field near Scranton by C. E. Packard and E. P. Linsey.

COLORADO

John B. Marks, formerly assistant to the president of the Colorado Fuel & Iron Co., has been elevated to the vice-presidency of the corporation as a result of a special meeting held Dec. 30.

B. W. Snodgrass, vice-president of the Victor American Fuel Co., has been appointed president of the same company with headquarters at Denver.

ILLINOIS

U. S. District Judge English at East St. Louis has appointed Wilbur E. Crane, of Chicago, receiver for the Standard Coal & Coke Co., of which Mr. Crane is president. Application for the receivership was made by a stockholder who charged that the company defaulted on obligations totaling $128,000, including $50,000 in bonds, due Dec. 31 last. The board of directors consented to the appointment of a receiver, stating that the company had been operating at a loss for several months. The Standard company is a Delaware corporation and owns properties in Williamson and Sangamon counties, Ill., and in Clarion County, Pa. Total assets as of Sept. 1, 1925, were $3,868,498 while the outstanding bonded debt of the company was placed at $1,756,200 in the receivership petition.

The first move toward the reopening of the mines formerly owned by the Southern Gem Coal Corp. and only recently purchased by the Brewerton Coal Co., of Lincoln, was made at the Sesser mine the first week in January, when the new owners started the fan and put pumpmen and examiners into the shaft to find out the condition of the inside workings. All maintenance men formerly employed at the mine have been paid their back pay by the Brewerton company and indications are that if conditions prove at all favorable, work will be resumed some time during January or early in February.

The St. Ellen coal mine at O'Fallon has resumed operation following a shutdown of 17 months.

The Majestic mine, at DuQuoin, owned by the Crerar-Clinch interests in Chicago, has made a record for steady production, having worked continuously since Oct. 1.

Operators in Saline County are said to be studying the possibility of getting into the Missouri markets as a result of the Interstate Commerce Commission ruling that established rates into that territory on the Burlington, Big Four and Illinois Central railroads beginning Nov. 30. Williamson and Franklin counties have done considerable business in the territory covered by the new rates, but Saline County, up to Nov. 30, was barred. Saline County operators believe that they have a chance to compete for business now and it is expected that selling campaigns will be inaugurated out of St. Louis.

For the first time in several months the Cherry mine at Cherry, operated by the St. Paul Coal Co., employed more than 500 miners every day in the week during the last two weeks in December. Heretofore the miners worked five days per week and this is the only large mine in Bureau County and one of the few large mines in northern Illinois which gives steady employment to miners.

It is reported that the Rowling coal mine at Litchfield, which has been idle for two years, has been sold to R. Williams, of Harrisburg, and will be reopened immediately.

A fire which has been raging for several days on the Hussey dock at Waukegan has threatened hundreds of tons of soft coal. The dock owners have thirty men at work moving the stored coal.

A new record was established at Zeigler Mine No. 2, of the Bell & Zoller Coal Co., at Zeibler, on Dec. 23, when the mine hoisted 7,642 tons of coal from one shaft in 7 hours and 42 minutes. This mine only recently surpassed its former record, establishing a new high record by hoisting 7,640 tons of coal. The mine employs 1,100 men. E. L. Berger is the superintendent.

INDIANA

Fire on Jan. 2 burned the tipple and loading sheds of the Indian Creek coal mine at Bicknell, owned by the Knox Consolidated Coal Co. The loss was estimated at $75,000. The origin of the fire, which put 450 men out of employment, was undetermined.

The Crescent Coal Co., at Evansville, has awarded the contract for the construction of an office building on South Third St. The building will be of brick construction and will house all the company's offices.

The Patoka Coal Co., of Petersburg, has opened a new strip mine a few miles from that city and will begin work soon. The company, which is the first to engage in stripping coal in Pike County, has another mine in operation on Sugar Ridge, five miles south of Petersburg.

The Indiana Coal Co. at Sullivan, has filed a preliminary certificate of dissolution.

A federal injunction to prevent repetition of the disturbance at the Bosse Coal Co.'s non-union mine at Buckskin will be sought at once, Walter Korff, general manager of the company, declared. Five miners, who were brought to the mine to prepare it for reopening after 18 months' idleness, were taken from the premises by a group of 300 union miners. Later the five men were found at a railroad station where they had been ordered by their abductors to wait for a train.

KANSAS

A verdict of $50,000 damages was awarded by a jury in the Circuit Court at Kansas City to Matt Span, of Franklin, against the Jackson Walker Coal & Mining Co., of Kansas City. The verdict was the largest returned in a damage suit in that city in several years. While employed by the company at Franklin, Spann suffered an injury to his spine and paralysis resulted. He sued for $100,000.

Complete returns from the referendum held by the United Mine Workers of District 14 on Dec. 29 show almost unanimous approval of the proposal to postpone the biennial convention from next March until a year later.

Incendiaries are believed to have set fire to the tipple of mine No. 7 of the Girard Coal Co. at Radley, Dec. 27. The tipple and machinery were destroyed, entailing a loss of about $10,000. The estate of the late J. R. Crowe, of Kansas City, is the heaviest stockholder.

As a result of the fire which destroyed the washhouse at the Western Coal & Mining Co.'s mine No. 13, near Yale, the night of Jan. 5, each of the 175 men employed there lost about $15 worth of tools and equipment. A day's operation was lost before new lamps and tools could be obtained.

D. Frank Moore, mining engineer, was killed instantly Dec. 23, when he fell 100 ft. down a mine shaft at the Star Mine of the Roseland Coal Co., near Roseland, south of Pittsburg. Mr. Moore had been engaged in the mining activities in the district for 40 years.

First Rock-Dust Plant

This 20 x 32-ft. pulverizing plant was erected by the Old Ben Coal Corporation at No. 9 mine, West Frankfort, Ill., in 1918, when rock dusting was novel. There was no precedent to follow, but the design was so successful that no important changes have ever been made.

Several general officials of the Western Coal & Mining Co. visited the Pittsburg field Jan. 6 to make a special inspection of two new properties, No. 22 being sunk near Arma, and No. 23 at Minden, Mo., which was opened last fall. The Arma shaft is down 250 ft. to the coal and the Minden mine 54 ft. to the coal. Both shafts will be operated with electricity throughout. Tipple and machinery installation are about complete and both mines will soon be put in operation.

Peter Keegan, for several years statistical clerk in the Kansas mine inspection department in Pittsburg, but for the past two years with the U. S. Bureau of Mines, again has his old home town for headquarters, being assigned as foreman miner of the bureau's car No. 6, which is now in Kansas. Mr. Keegan is the son of Francis Keegan, of St. Louis, general superintendent of the Western Coal & Mining Co., who was for many years superintendent of its Kansas mines, with headquarters in Pittsburg.

KENTUCKY

Gov. W. J. Fields, of Kentucky, in his message to the 1926 Legislature, on Jan. 6, refrained from mentioning the movement for a tonnage tax on coal, which is one of the most discussed matters to come before the 1926 session. The Governor, however, recommended an appropriation of $75,000 for base mapping of minerals by the Kentucky Geological Survey.

Judge William F. Hall, president of the Three Point Coal Co. and other mining companies in the Harlan field, recently traded the Everett Coal Co., a going and producing concern, for 1,700 acres of farming land near Montgomery, Ala. The Judge said that he intended to rest up a bit and see if there were as many thrills to farming as there are in coal production.

The Main Jellico Coal Co., Williamsburg, has filed amended articles reducing its capital stock from $500,000 to $50,000.

The Whitco mines of the Whitesburg Coal Co., in Letcher and Perry counties, in the Elkhorn seam were leased on Jan. 1 to G. C. Clark, who formerly was superintendent of the mines. Mr. Clark will continue the development of the mines and plans to increase output.

The Trio Coal Co., Madisonville, with a capital of $30,000 has acquired the Finley Coal Co. and will increase the daily output from 6 to 25 carloads.

Sale of the holdings of the Sullivan Pond Creek Coal Co., on Pond Creek, Dec. 18 has been confirmed. Will M. Smith, well known Pike County farmer, who already owned the land, bought the plant. This mine, which has been closed for several months, is the last of the idle mines on Pond Creek, and with the resumption of production, practically all large mines on the creek will be running on almost a full-time basis. Cincinnati people are taking a controlling interest and will operate the plant. The company will be incorporated in the name of the "Octavia J."

MINNESOTA

The Civic and Commerce Association of Minneapolis, in its annual business review for 1925, places fuel at $6,000,000 for the year, the same as for the preceding year. Most other commodities show a gain over 1924. Petroleum products are placed at $160,000,000 against $145,000,000 for the previous year. There is much speculation on what portion of the increase represented the displacement of coal by fuel oil.

MISSOURI

W. B. McGregor, of Brookfield, a member of the Board of Penal Institutions, says that a coal mine has been opened in Callaway County, near Holt Summit, with convict labor, which will provide more than enough coal to supply the Penitentiary and leave a considerable surplus for state institutions. There is a large supply of coal in sight, he said. He estimated the saving by the state mining its own coal for the Penitentiary at $2,000 a month. The board employs forty convicts in the mines.

MONTANA

The West Virginia Coal Co. of Missouri, Boatmen's Bank Bldg., St. Louis,

Digitized by Google

has been granted a refund on 1925 income taxes amounting to $152,635. It was one of thirteen St. Louis firms and individuals receiving such refunds.

Opening of a new coal mine, one-half mile south of Burlington, to be known as the Miller mine, has been announced by the owners, W. E. Gross and A. L. Miller, of Burlington.

OHIO

The Pan-Handle Colleries Co., of Columbus, has filed suit in the Franklin County common pleas court to recover $12,100 from the estate of the late David C. Thomas, who was associated with the present owners of the company during his life. It is alleged that Mr. Thomas contracted to purchase $20,000 worth of stock in the company on which he had paid $7,900 at the time of his death.

The Ohio Collieries Co. has put into operation Mine No. 210, located north of Athens, after an idleness of more than seven months. About 300 miners are producing 1,800 tons daily.

The Columbus Board of Purchase has rejected all bids received Dec. 23 for approximately 27,000 tons of nut, pea and slack for various city departments and will readvertise for bids Jan. 27 for five-sixths of the original tonnage including 12,500 tons of Ohio nut, pea and slack for the municipal light plant; 7,000 tons for the Scioto River pumping station; 2,500 tons for the garbage disposal plant, and 500 tons of West Virginia nut, pea and slack for the coal pulverizer at the garbage disposal plant.

The Kentenia Coal Co., Cincinnati, is in the process of liquidation. Its business and good will, which consists of the production from several mines in the Hazard and Harlan sections of Kentucky, has been taken over by the Midland Coal Sales Co. which thus adds about 300,000 tons a year to its disposal. According to P. H. Henry, president of the Kentenia company, all claims will be met and a surplus divided among the stockholders. Mr. Henry says he has not decided what he will do but he cannot see any chance for the jobber with overproduction to be contended with for the next five years at least. He will not be entirely out of the coal trade, as he is part owner of a large retail yard in Detroit. W. G. Polk, treasurer of the company, is a heavy stockholder in the Tennessee Jellico Coal Co. and will devote all of his time to the operating end of the business.

PENNSYLVANIA

The Reading Co. transported 2,126,428 gross tons of bituminous coal during November, 1925, as compared with 1,516,016 gross tons in November, 1924, according to a report of Albert B. Bierck, comptroller.

The following changes have been made in the personnel of the organization of the Snowdon Coke Co. effective Jan. 1: William T. McKnight retired as secretary of the company and was succeeded by William D. Rankin, auditor of Pittsburgh, who will retain the same office in the Farmers Bank Bldg. Mr. McKnight retires from active business and will spend his time looking after his personal interests, also keeping an office in the same building. Edward H. Coxe, of Uniontown, Pa., resigned as general manager of the company.

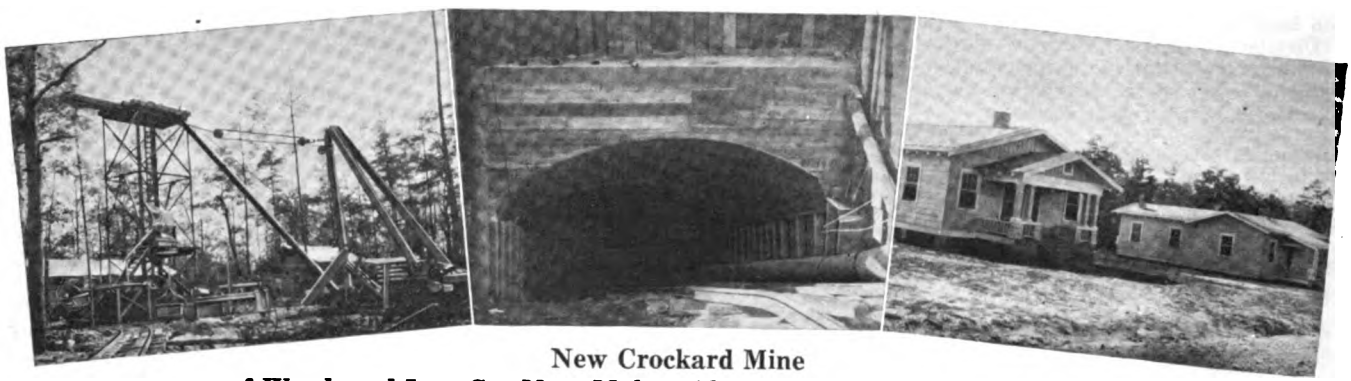
TENNESSEE

W. B. Dimmick, general superintendent of the Ridgway Sprankle Co., owner and operator of the Buffalo Creek Coal Co. at Helenwood, Tenn., while in Cincinnati recently said that thousands of dollars in improvements had already been put in these mines and other mechanical betterments would soon be started.

UTAH

The Gordon Creek Coal Co. has received a permit from the Securities Commission renewing its right to sell 10,000 shares of 6 per cent guaranteed cumulative preferred stock at 20 per cent commission. A share of common stock goes with two shares of preferred, the total price being $10.

VIRGINIA



All the large mines in the state are going full blast, and many of them are working day and night according to A. G. Lucas, chief mine inspector of the Virginia state bureau of labor and industry. A number of the smaller mines which have been idle have been reopened. All the miners have plenty of work, and the operators are taking on everybody that comes along looking for a job.

WEST VIRGINIA

One of the largest coal land deals consummated recently was announced last week by Howard W. Showalter, president of the Continental Coal Co., of Fairmont, which purchased 1,000 acres of undeveloped Sewickley coal land in two 500-acre tracts for $300,000 in the Scotts Run section of Monongalia County. One block was purchased from Mr. and Mrs. D. E. Lemley and Dr. and Mrs. Chesney M. Ramage and the other from the David Henderson heirs and the Tennant heirs, both being located in Cass district. This gives Brock mine a total of 1,800 acres of choice Sewickley coal land and makes this plant the largest producing mine in the 12½ counties of northern West Virginia. Its present capacity of 3,000 tons in eight hours will be increased to 4,000 tons by April 1, Mr. Showalter predicts. The plant works non-union and on the 1917 wage scale.

The Baltimore & Ohio R.R. attained a new performance record over the Allegheny Mountains, east of Grafton, in December, when a daily average of 1,089 loaded cars were moved. In the 31-day period there were 33,759 cars moved over the mountains. It is estimated that from 65 to 70 per cent of this freight was coal.

The Imperial Coal Corporation of Johnstown, Pa., which purchased the

New Crockard Mine

of Woodward Iron Co., Near Mulga, Ala., Is Almost Ready to Produce

The photograph on the left snapped on Nov. 14, the day the coal was hit, shows the contractors' top equipment for sinking and concreting the skip shaft of the new mine. This shaft, 17 ft. 8½ in. x 7 ft. 1 in. with eliptical ends and 517 ft. deep to the top of the coal is lined all the way down with reinforced concrete. The Crockard mine taps, at a record depth for that coal, a virgin area in the Pratt seam. Two 6-ton skips operated by an electric hoist will provide a hoisting capacity of 6,000 tons in 9 hr.

The center illustration shows the concreted portal of the partially-completed 8 x 16-ft. man-and-material slope. This slope, which will hit the coal at 987 ft. has already been driven 635 ft. A short distance from the portal a 90-ft. shaft connects into one side of the slope. This shaft will be equipped with a temporary fan and used as an outlet airway for the slope until the mine has been developed to a point where another opening in a nearby hollow will connect with the surface. Finally, the 90-ft. shaft will be a permanent air intake in parallel with the manway portal.

A few houses, representing the standard set for the entire camp, already have been built at the Crockard mine. These houses are a five-room type, spaced 60 ft. apart, and equipped with strictly modern plumbing throughout.

Yukon mine of the Whyel Coal & Coke Co. recently, assumed charge of the property Jan. 4.

According to a statement made to Congressman J. Alfred Taylor of West Virginia by the Bureau of Mines, the Governor anticipates that the state will handle about 185,000 tons of New River coal from Raleigh and Fayette counties during the current fiscal year.

CANADA

The Nova Scotia Coal Commission has completed its investigation and its report will be submitted to the government in a few days. Sir Andrew Rae Duncan, chairman of the commission, will return to England soon.

Traffic

Would Uphold Decision on Rates To Chicago District

Examiner R. L. Shanafelt of the Interstate Commerce Commission has made a report in Docket 11224, Chicago Coal Merchants' Assn., vs. Director General, as agent for the Santa Fe R.R. et al., recommending that the Commission find in accordance with its previous decisions, which is that interstate rates on coal from various producing regions to the Chicago switching district, higher to some delivery points than to Chicago itself, are not unreasonable, but that they are unduly prejudicial, the same as previously found. This is the third or fourth hearing in this case.

The substance of the previous decision was that the Commission found not unreasonable the rates assailed on coal from mines in Pennsylvania, Maryland, West Virginia, Ohio, Kentucky, Indiana and Illinois to points within the Chicago district and certain points in Illinois just beyond that district on the north and west. In other findings of undue preference and prejudice the Commission required reductions in the spread between the rates to Chicago and the points beyond the district on bituminous and anthracite coal from mines other than those in Illinois and Indiana, and the maintenance of rates on both kinds of coal from all mines to Greenwood Street in Evanston, Ill., on the Evanston basis.

In the Commission's decision just preceding this one it found that the rates on coal from origins involved to the Chicago district were not unreasonable, but that such rates were unduly prejudicial to the points within the district taking the higher rates.

Halts Increase in Breeze Rates

Increases in rates on coke breeze from the Birmingham (Ala.) district to St. Louis, Mo., and related points, which were to have become effective Jan. 4, have been suspended until May 4 by the Interstate Commerce Commission. The tariffs affected are Louisville & Nashville R.R. supplement 5 to tariff I. C. C. No. A-15643; Mobile & Ohio I. C. C. No. B-708 and St. Louis-San Francisco supplements 9 and 10 to I. C. C. 8524. The Commission has instituted an inquiry into the reasonableness of the proposed advances under I. & S. Docket No. 2576.

Car-Distribution on D. &. S. L. Unfair, Says Examiner

Examiner John T. Money of the Interstate Commerce Commission has made a proposed report in Docket 14968, Victor American Fuel Co. et al. vs. Denver & Salt Lake R.R., et al., involving the distribution of cars to coal mines between Aug. 1 and April 6, 1923. The examiner finds for the complainants on practically all points raised. It is in substance an assigned-car case, but involves certain other phases of the car-distribution rules incident to the placing of equipment.

It seems that the Denver & Salt Lake placed cars at some coal mines without charging them against the mines, as provided by par. 12, Sec. 1 of the Transportation Act. The examiner says the Commission should find defendant railroad's rules, regulations and practices are unreasonable, unlawful and unduly prejudicial; that its special practice of not counting cars against the mine's distributive share for railway fuel loading is unlawful and unduly prejudicial; that certain defendant coal companies have received an undue preference with their knowledge and consent by reason of their agreement with the carrier and the practice of the carrier under that agreement.

After a 30-page mimeographed report, in which the rules operating on the railroad are gone into in great detail, the examiner recommends that the coal operators on the Denver & Salt Lake R.R. and the officers of that line get together and promulgate rules that will avoid any preference to any shippers and set up a basis of rules that will be satisfactory to all concerned.

New York Canal Traffic Light

Transportation of coal through the New York State canals during 1925 decreased considerably compared with the tonnage carried in the previous year. Shipments of anthracite up to the end of September, when the effects of the strike began to be noticeable, were only 1,598 tons less than the tonnage for the corresponding period of 1924, but the total for the year shows that 35,560 tons was transported northbound via the Champlain Division, a decrease of 12,712 tons in comparison with the previous year. During the year 1,642 tons of bituminous coal was transported as compared with 3,471 tons carried in 1924.

Hearing to Equalize Coke Rates On Boston & Albany R. R.

Joseph Weed, chairman of the Coal & Coke Committee, Trunk Line Territory, announces that a hearing will be held at 11 a.m. Jan. 28, at 143 Liberty Street, New York, to consider adjustment of rates on coke, coke breeze, coke dust and coke screenings from Geneva, Solvay and Syracuse, N. Y., to various stations on the Boston & Albany R.R. The reason given for the investigation is a desire to establish rates in line with rates for similar distances from other shipping points in Trunk Line Territory to New England.

As an illustration, the present rate to Brookview, N. Y., from Geneva is $3.28; it is proposed to make it $3.02; the present rate from Geneva to Pittsfield, Mass., is $3.28; it is proposed to make it $3.15; the present rate from Solvay and Syracuse to Mellenville, N. Y., is $2.77; it is proposed to make it $2.90; the present rate from Solvay and Syracuse to Pittsfield is $2.77; it is proposed to make it $3.02; the present rate from Solvay and Syracuse to Springfield, Mass., is $2.77; it is proposed to make it $3.28.

There are about as many increases as reductions except that increases seem to be greater to distant points; for instance, the present rate from Geneva to Framingham, Mass., is $3.28, and it is proposed to make it $3.91; the present rate from Solvay and Syracuse is $2.77, and it is proposed to make it $3.65.

N. Y. Central Joint Rates On Coke Approved

The New York Public Service Commission has approved new rates of the New York Central (East) on coke, coke breeze and coke dust from Troy to New York, Ontario & Western stations: Eaton to Bernards, inclusive, $2.65; Constantia to Fulton, inclusive, $2.77; Minetto and Oswego, $2.90; New Hartford and Clinton, $2.39; Franklin Springs to Bouckville, inclusive, $2.52; Pecksport and Hamilton, $2.65; Randallsville to Galena, inclusive, $2.65; Galena to New Berlin Junction, inclusive, $2.77; Sidney to Walton, inclusive, $2.90; Beerston to Fish's Eddy, inclusive, $3.02; East Branch to Livingston Manor, inclusive, $3.28; Summitville, $3.40; Port Jervis, $3.53; Phillipsport to Kerhonkson, inclusive, $3.40; Accord to Hurley, inclusive, $3.53; Mamakating to Middletown, inclusive, $3.40; Crystal Run to Firthcliffe, inclusive, $3.53; effective Jan. 30, 1926. No joint rates heretofore have been in effect.

Obituary

Frank L. Fisher, vice-president of the Harvey Coal Corporation, Harveyton, Ky., interested in other coal-mining properties and a large holder of coal lands, died Dec. 31 at his home in Knoxville, Tenn., at the age of 76. Mr. Fisher also was president of the East Tennessee National Bank.

Association Activities

The Chicago Wholesale Coal Shippers' Association held its annual meeting at the Great Northern Hotel Jan. 6 and elected these officers for the coming year: John N. McCabe, of the Gruschow-McCabe Coal Co., president, succeeding R. B. Starek; James Andersen, of C. M. Moderwell & Co., vice-president, succeeding John N. McCabe; Geo. H. Merryweather, of the Waubun Coal Co. and the National Wholesale Coal Association, re-elected secretary; Fred A. Brahm, of the Platt & Brahm Coal Co., re-elected treasurer. Directors, J. B. Beardsley, of the Mitchell & Dillon Coal Co.; George H. Bridges, of D. E. McMillan & Brother; P. H. Holland, of the Holland Coal Co.; T. C. Irwin, of the Abbott-Irwin Coal Co.; Roscoe B. Starek, of the D. C. Shoemaker Coal Co.; William C. Hill, of the E. F. Daniels Coal Co., and George S. Wood, of the George S. Wood Coal Co.

Digitized by Google

Coming Meetings

The Engineers Society of Northeastern Pennsylvania. Annual banquet at Hotel Sterling, Wilkes-Barre, Pa., 6:30 p.m. Thursday, Jan. 21. Secretary, T. F. McKenna, Scranton, Pa.

Hazard Coal Operators' Exchange. Annual meeting Jan. 22, at Lexington, Ky. Secretary, J. E. Johnson, Lexington, Ky.

American Wood Preservers' Association. Annual meeting, Jan. 26-28, 1926, at Cleveland, Ohio. Secretary, E. J. Stocking, Chicago, Ill.

Coal Club of Philadelphia. Annual meeting, Jan. 28, 1926, at the Bellevue-Stratford Hotel, Philadelphia, Pa. Secretary, C. K. Scull, Philadelphia, Pa.

Northeast Kentucky Coal Association. Annual meeting, Jan. 28, 1926, at Ventura Hotel, Ashland, Ky. Secretary, C. J. Neekamp, Ashland, Ky.

American Institute of Electrical Engineers. Annual convention, Feb. 8-12, 1926, at Engineering Societies Bldg., New York City. Secretary, F. L. Hutchinson, 29 West 39th St., New York City.

American Institute of Mining and Metallurgical Engineers. Annual meeting, Feb. 15-17, 1926, at Engineering Societies' Building, New York City. Secretary, Dr. H. Foster Bain, 29 West 39th St., New York.

The Rocky Mountain Mining Institute. Winter meeting, Feb. 23-25, 1926, at Albany Hotel, Denver, Colo. Secretary, Benedict Shubart, Boston Building, Denver, Colo.

New Companies

The Baby Grand Coal Co. has been incorporated at Paris, Ark., by C. W. Stone and L. B. Bench.

The Lily Meade Coal Corporation, Owensboro, Ky., capital $14,000 has been chartered by R. L. O'Bryan, William O'Bryan and William J. Mulligan.

The Day Coal Mining Co. of Whitesburg, with a capital of $5,000 has been incorporated at Frankfort, Ky., by S. B. Pearce, C. H. Latimore and D. R. Tomb.

Industrial Notes

The Pennsylvania Crusher Co. moved its general offices on Jan. 1, 1926, from the Stephen Girard Building to the new Liberty Trust Building, at Broad and Arch Sts., Philadelphia, Pa.

The Climax Engineering Co., Clinton, Iowa, announces the appointment of F. M. O'Laughlin as sales representative for its Eastern sales territory. Mr. O'Laughlin will make his headquarters at the company's offices, 30 East 42d Street, New York City. Previous to his connection with the Climax company, Mr. O'Laughlin was assistant manager of the New York office of the Buffalo Gasoline Motor Co. George A. Colley, who previously represented the Climax Engineering Co., has associated himself with the A. G. Griese Co., New York City.

The Drake Non-Clinkering Furnace Block Co., of New York, announces that Alfred Campbell, formerly district sales representative in the Pittsburgh and Cincinnati territories, has been appointed general manager of the company, and D. B. Wilson has been appointed district sales representative in Philadelphia and also is in charge of Baltimore and Philadelphia territories. Harry Baumgartner has been retained as refractory engineer.

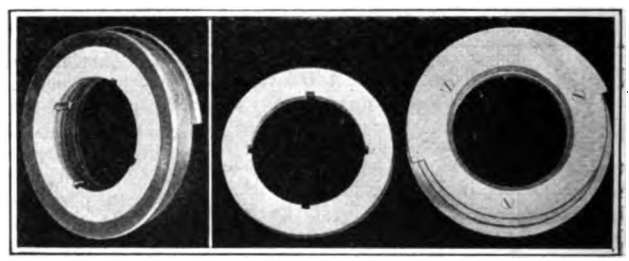
The Maxim Silencer Co., of Hartford, Conn., manufacturer of silencers for industrial machinery, has appointed W. O. Whitney sales manager, effective Jan. 1, 1926. Mr. Whitney formerly was with the Brunswick-Kroeschell Co., New Brunswick, N. J., manufacturer of refrigerating machinery.

All designs, patterns, patents and good will covering Earle centrifugal pumps have been sold to the **Aldrich Pump Co.,** Allentown, Pa. This transfer will in no way conflict with the Earle Gear & Machine Co.'s regular business of manufacturing Earle cut gears, Earle movable bridge operating machinery, Lea-Simplex cold metal saws and Earle special machinery.

R. B. Sinnock has joined the **Climax Engineering Co.,** Clinton, Iowa, as a sales representative. He will make his headquarters at Clinton and will handle sales of Climax gasoline engines in the territory adjacent to that point. Mr. Sinnock was previously a member of the sales force of the Dayton-Dowd Co., Quincy, Ill. C. H. Adams also has been appointed a sales representative for the Climax company, and will travel throughout the southeastern portion of the United States. Mr. Adams has had a wide experience in the sale of mechanical equipment throughout that territory. Climax engines are used not only in industrial equipment such as cranes, shovels, locomotives, excavators, etc., but also as power units for operating pumps, generators, hoists, etc.

New Equipment

Adjustable Ring Maintains Pump Efficiency



In the accompanying illustrations may be seen the adjustable ring recently developed by the Frederick Iron & Steel Co. for use on Frederick pumps. The photographs give a good idea of the appearnace of this ring and the cross-section shows its application. This ring, which is known as the "Adjusto" and which is used in pairs, makes it possible to maintain the original efficiency of the pump over long periods. When the pump is sent out from the factory the rings are adjusted to give maximum efficiency.

The new ring is made up of only five parts including the binding screws. It consists primarily of two main parts or collars, one threaded into the other, thus affording a means for varying the thickness of the assembled ring and compensating for wear. The outer bronze ring as shown in the section is held stationary within the pump casing by means of its interrupted flanges. It forms the inlet to the impeller. The inner ring, or collar, is threaded into it, being provided with spanner slots on its interior surface and is held in place by three adjusting screws. Both rings, as well as the adjusting screws, are made of bronze but of different compositions to avoid corrosion.

Only running clearance is necessary between this ring and the end of the impeller intake as these two parts will always be separated by a thin film of water. When, after several months of operation, appreciable wear develops at this point and causes the efficiency of the pump to decrease, it is an easy matter to readjust the ring and restore the original efficiency. The screws are first backed off releasing the adjustable ring. This ring is then screwed forward a distance that will give a clearance of about 0.003 in. between its face and the end of the impeller.

By this means the original efficiency of the pump is restored without the replacement of any parts; and this efficiency can be maintained at all times by merely keeping the rings in proper adjustment relative to the impeller. An outboard thrust bearing keeps the impeller in proper central position within the casing. In order that no seizure may take place between the impeller and the adjustable ring these parts are not only made of unlike metals but the threads on the rings are in such a direction (right or left hand) that any rubbing between the two surfaces tends to back the ring away from the impeller. As now built this ring is applicable to pumps 8 in. in size or larger.

FIG. 1
Two Views of New Ring
There are only five parts: a case ring, a collar and three adjusting screws.. All are of bronze, but of differing compositions to avoid corrosion.

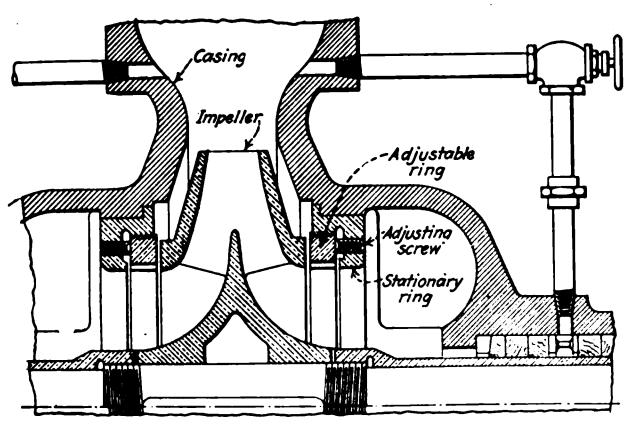


FIG. 2
Section of Pump
Efficiency of a pump depends upon the tightness of the joint between casing and impeller. These rings render it possible to adjust quickly the clearance of this joint, thus maintaining the original efficiency of the pump indefinitely.

FIFTEENTH ANNUAL REVIEW NUMBER

JAN 23 1926

COAL AGE

The World's Accepted Authority on Coal Mining

McGraw-Hill Co., Inc. **January 21, 1926** 50 Cents per Copy

Blackwood Coal & Coke Co., Blackwood, Virginia

AGAIN

1925 Has Repeated the Success of "RandS" Installations

During the past year 65 percent of our contracts were *repeat* orders. Isn't that the soundest evidence of *satisfied customers* any organization can compile?

An impressive reason why this organization has gained and keeps the confidence of the coal industry is our uniform policy of improving and adopting new and better equipment—every "RandS" installation reflects this policy.

Let us tell you what this policy provides for your 1926 requirements.

Some of our 1925 Clients are

National Mining Co., National Station, Pa.	Marcus Tipple
Pittsburgh Coal Co., Pittsburgh, Pa.	Marcus Tipple
Gulf Smokeless Coal Co. Covel, W. Va.	Air Cleaning Plant
West Canadian Collieries, Blairmore, Alberta	Air Cleaning Plant
Hillman Coal & Coke Co., Edna, Pa.	Marcus Tipple
E. E. White Coal Co., Stotesbury, W. Va.	Marcus Tipple
Upland Coal & Coke Co. Elkhorn, W. Va.	Marcus Tipple
Algoma Coal & Coke Co., Algoma, W. Va.	Marcus Tipple and Air Cleaning Plant
Pittsburgh Terminal Coal Co., Castle Shannon, Pa.	Local Trade Bins
Berwind White Coal Mining Co., Windber, Pa.	Air Cleaning Plant and Tipple

"RandS" Service embraces the design and construction of Tipples, Washeries, Air Coal Cleaning Plants and Re-Screening Plants. CONSULTATION WITHOUT OBLIGATION.

ROBERTS AND SCHAEFER CO.

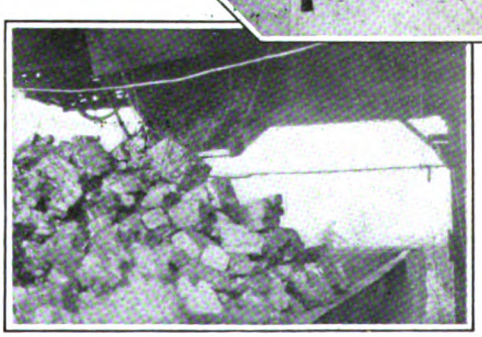
Four locomotives equipped with Exide-Ironclad Batteries, in the charging barn of Consumers Mining Company, Harmersville, Pa. An Exide-Ironclad has a high efficiency on charge. It takes current in quickly, easily, and uses it sparingly.

Here are empties badly needed at the face. When miners have to wait for cars the fault may lie in the speed with which batteries drive your motors. Exide-Ironclads have pep enough to keep cars moving rapidly all day long.

Here's one place you don't want your storage batteries to visit—the repair shop. Where there are Exide-Ironclads this shop stays empty most of the time, for these batteries are rugged.

When the motorman comes to a steep hill he needs extra power. He gets it if he is driving an Exide-Ironclad-equipped motor. Here's one that is breezing up a 4% grade with a long trip of loaded cars—and it's the last trip of the day, too.



How to cut haulage costs

IF you put a storage battery in your motors that will handle more cars per shift, do it in less time, and keep the coal flowing smoothly without fuss or trouble, then your haulage costs will drop.

They will drop just as they have in hundreds of coal mines that have equipped their battery motors with Exide-Ironclad Batteries. The great power of this battery, its boundless pep, the ease with which it charges, its ruggedness and long life, cannot fail to improve your haulage system.

You should know more about Exide Ironclad Batteries. A representative from our nearest branch will gladly call, or write today for a free copy of our Booklet No. 1791, "Facts for Consideration in *Selecting a Battery* for Locomotive Service."

How many cars you ship each day depends largely upon the speed and efficiency of your haulage system, and that in turn falls back upon the work your battery motors do. More cars shipped—and loaded in quicker time—is the rule where Exide-Ironclads are used.

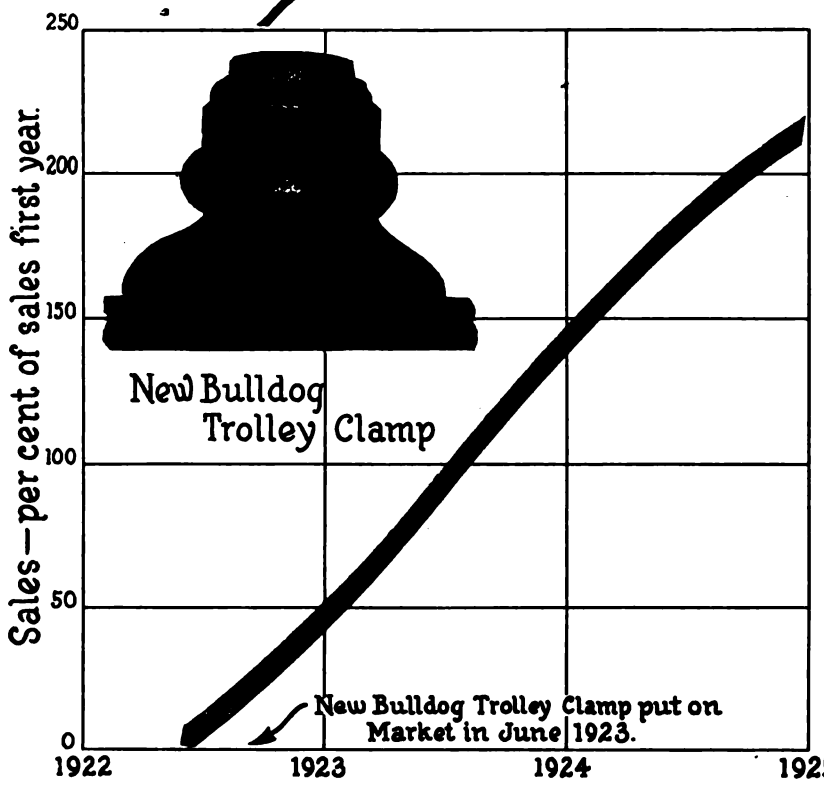
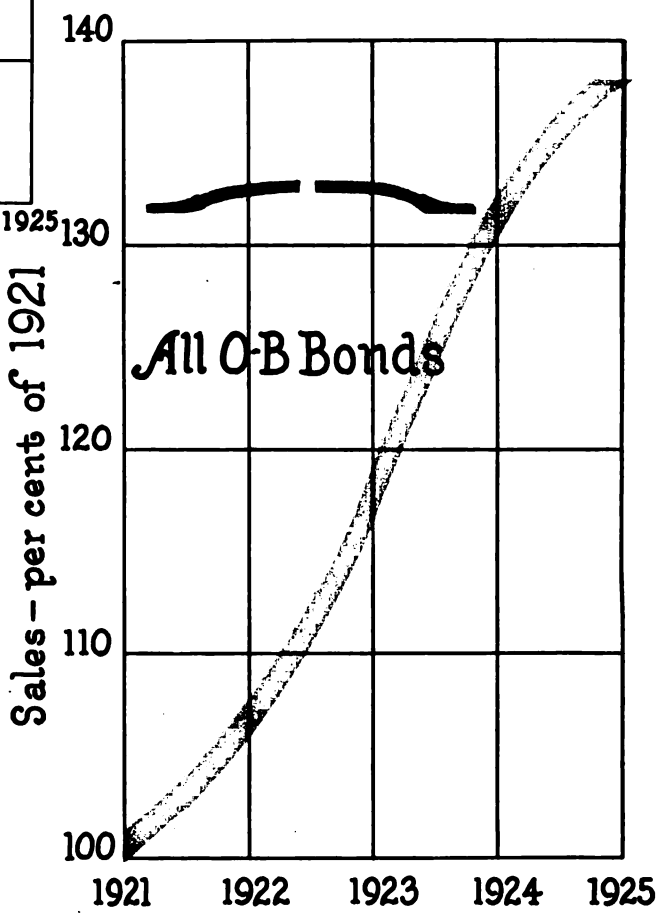
Swift Tonnage

FAST LOADING of coal underground by machines has taught the Sheridan-Wyoming Coal Co. several truths that are not always accepted by men with less experience in operating loaders. One of these explained in an article in next week's issue of *Coal Age* is that a mine may not reduce its number of pit cars when it goes on a loading machine basis. This Wyoming company had 475 cars at Acme in hand-loading days before last June and did not retire a single one. Instead it had to increase the capacity of them all.



GOODMAN SHOVELING MACHINES working in rooms have averaged 196 tons for a whole month in this mine and the latest type Joys in entries averaged 160 tons. These figures are high but so is the coal. Improved shooting methods and perfections in haulage, with 5-car partings in each room to keep empties always at hand are expected to raise the tonnages even higher.



SIBERIAN COAL MINING comes in for a further treatment in next week's issue by Alfred Pearson, Jr., whose initial article, describing general conditions in the Kuznets basin appeared in this magazine Nov. 26, 1925. Mr. Pearson, who ran a group of mines for the Soviet government, explains some interesting things about primitive Russian mining and remarks upon the opportunities for betterment such as the Russians are striving after in the new mining movement they are initiating with the advent of 1926.

Volume 29 NEW YORK, JANUARY 21, 1926 Number 3

A Year of Reconstruction and Business Activity Without Inflation Predicted for Bituminous Coal

DESPITE ALL THE disappointments of the year 1925, the industry enters 1926 not without renewed hope. The United States is just over the threshold of a period of prosperity which appears to be based on a most substantial footing. There is no panic purchasing. People are not buying for speculation nor are they placing a half-a-dozen orders in the expectation of cancelling five when one of the six is filled. So there is a safe and sane background for aggressive business. It seems likely to continue.

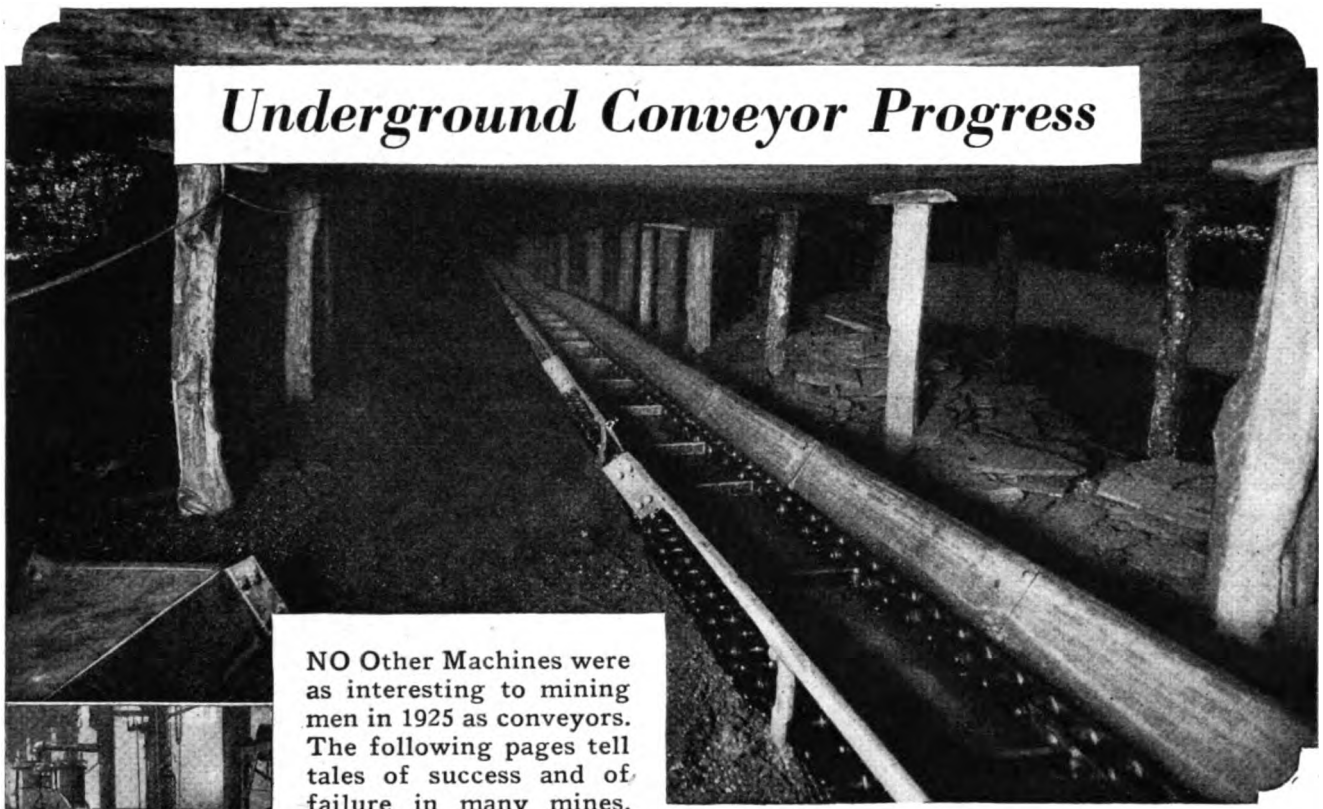
The bituminous coal industry is active. The whole coal tonnage for 1925, large as it is, does not give any adequate indication of the activity for 1926, because the output of the later months when business got its stride is immensely greater than in preceding months of the year. It is not safe to predict the market activity for 1926, but it should be a bigger year than that which preceded it. Stocks are not abnormally large, 48 millions on Nov. 1 of last year, enough for only 35 days at the present rate of consumption. The only uncertain and abnormal feature in the record productions of bituminous coal now being made is that they, in part, result from the anthracite strike.

Five Years of Bituminous Coal

	Annual Output (Net Tons)	Av. Spot Price (*Coal Age* Reports)
1925	523,072,000	2.06
1924	483,687,000	2.08
1923	564,565,000	2.77
1922	422,268,000	3.67
1921	415,922,000	2.55
1920	568,667,000	5.64

No rocks are ahead till 1927 and perhaps none then. No one is alarmed about the prospect of getting all the coal he wants. So there is no fever for fuel, only a steady healthy demand. Toward the end of the year production will be sustained, perhaps, from fear of a strike, but just now the industry has no such stimulus to business and yet the market is exceptionally brisk. In consequence, bituminous operators are hopeful of a large production and the only dampening influence is the low price of the product. The bigger and better mines will not fail to draw some dividends while the present condition lasts. In the summer a falling off is to be expected. That is every year's experience, barring a strike. By and large, 1926 will be a good year, though as far as prices are concerned not a booming one.

Large consolidations and the extensive entry of capital into the business as the result of bond issues (over $150,000,000 since early in 1924) are sure to help to steady the market. Bankers do not advocate an excessive anxiety for business such as would cause production to be conducted at a loss. In consequence all the gains in the technique of the industry, all the mechanisms and applications in loading machinery, electrification, conveyors, low-temperature carbonization and preparation are bound to make further progress. The advance in 1925 under the terribly adverse conditions which the industry faced during the greater part of the year make this certain. The many articles on these subjects in this issue, all give verification and countenance to this assurance. This will be a year of reconstruction.



Fortunately the industry is mending its standing with the public. The closing years of 1925 showed the anthracite industry entering into the good graces of the man on the street, a position which the bituminous industry gained, in the beginning of the year, as a result of its multiplied tribulations. One cannot but feel that the present anthracite strike must soon come to an end. The operators have taken a most reasonable stand and are supporting it by action that deserves and receives approbation. On the whole the anthracite operators merit and are receiving the goodwill of the public. As for the miners, they are beginning slowly to see that in their strike they are not opposing the operators' interest so much as their own. How long will they be in realizing that they have asked of the union, the operators and the public more than conditions will permit? For their sakes and for the sake of everyone, their well wishers trust that soon a more reasonable attitude will prevail.

A gratifying increase in output was registered in 1925. In 1924 the United States production was 483,687,000 net tons. This year the tonnage is estimated by the Bureau of Mines as 523,072,000, an increase of 8 per cent over 1924. The anthracite mines produced 62,120,000 tons in 1925 as against 87,926,000 in 1924. This decline was due, of course, to the extended hard coal strike.

The cost of bituminous coal according to the *Coal Age* index averaged $2.06 in 1925 and $2.08 in 1924. The improvement in equipment and the cutting out of high-cost mines would account for more than these 2c. So it would look as if the year 1925 made a better record on the books than the previous year. A study of coal uses, however, is to be recommended. No industry can rest with comfort so long as it finds its capacity so grossly in excess of its market as does the coal industry.

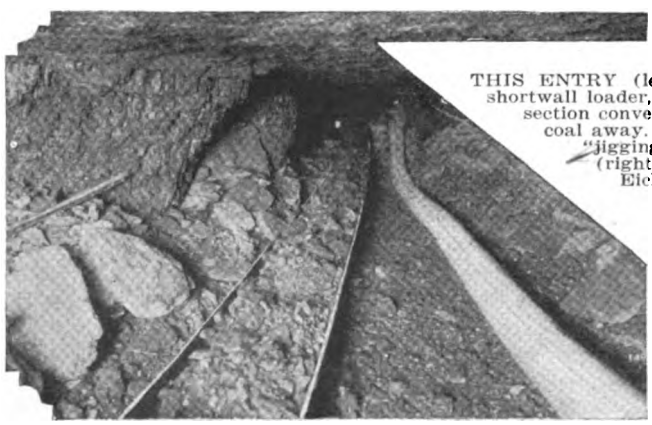
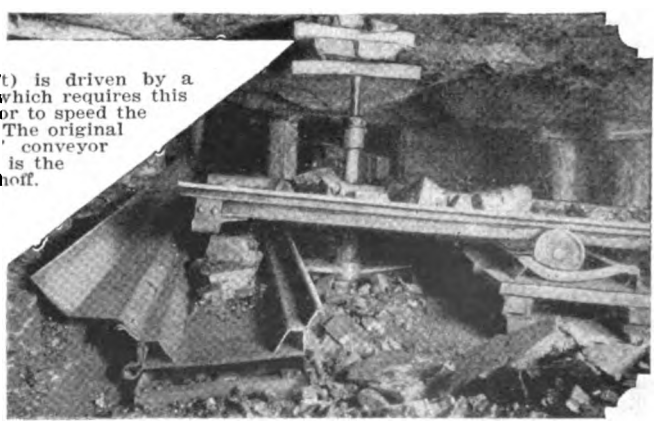
Underground Conveyor Progress

NO Other Machines were as interesting to mining men in 1925 as conveyors. The following pages tell tales of success and of failure in many mines. Various belt, flight, pan and shaker devices loaded about 5 million tons in a volume increasing daily.



THIS ROOM CONVEYOR in low coal is used successfully in a room-and-pillar layout in the Knickerbocker mines near Johnstown, Pa. Coal is loaded onto self-contained face conveyors which discharge into this sectional conveyor leading to the haulway. The under strand moves on the floor and over rollers on about 6-ft. centers, making for light weight construction.



AN ARMORED CONVEYOR which, when placed close to a long undercut face, would stand up under a fall of coal, was desired by the Bertha-Consumers Co. This Fairmont face machine met the specifications.

IT IS a small trick for a man to load 30 to 40 tons of coal on a conveyor which is placed so close to the face as this one at Sweetwater, Wyo. It almost touches the props and cribs. The latter are always used though generally they do not take much weight.

THIS ENTRY (left) is driven by a shortwall loader, which requires this section conveyor to speed the coal away. The original "jigging" conveyor (right) is the Eickhoff.

Year Gives Great Impetus to Use of Conveyors Underground in Many Coal Fields

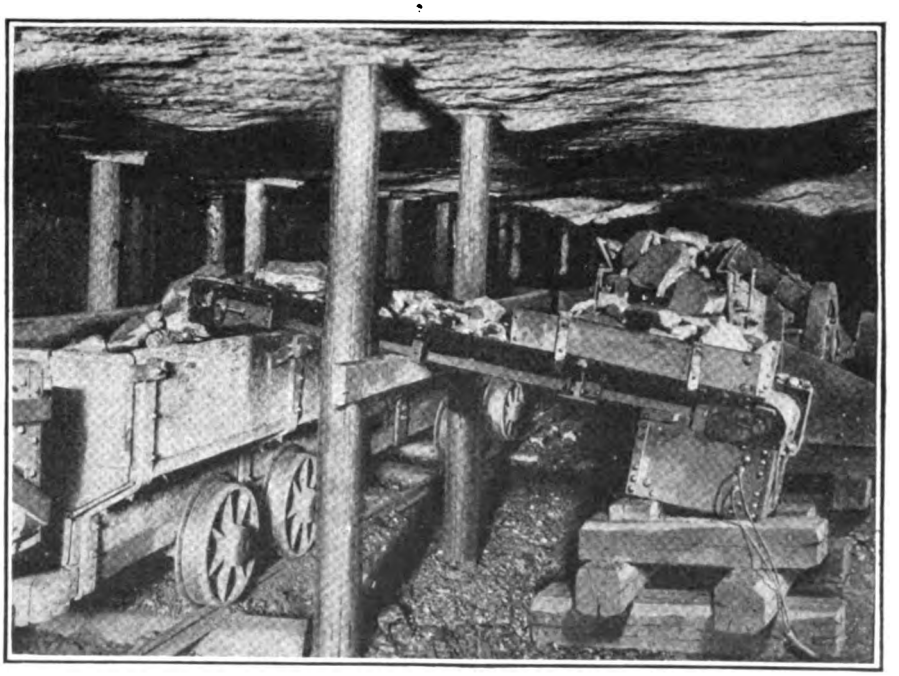
Probably 5,000,000 Tons Were Handled by Various Types of Belt, Pan, Flight and Shaker Machines—Pittsburgh Coal Co. Developed Y System with Them

By Alphonse F. Brosky
Assistant Editor, *Coal Age*, Pittsburgh, Pa.

IN 1925 THE production of coal loaded by hand into conveyors nearly stepped up to the production loaded by machines into mine cars in our bituminous mines. Conveyors played a part in the mining of about 1 per cent of the country's production of soft coal last year or approximately 5 million tons. This is an estimate which seems to be well substantiated by the far-flung activity along this line. Conveyors are being built and used everywhere. Without doubt there are in existence now more types of conveyors than there are loading machines. because they are simpler mechanically and, therefore, more easily built. Their application to the mining of coal is more rapid than that of loading machines because they are more flexibly handled. In 1926 the industry may see more coal mined by the use of conveyors than by the use of loaders.

In what has already been said it is not intended to infer that the conveyor eventually will supersede the loader, for each has its special capacity to meet different sets of conditions. Primarily, the loader saves labor and the conveyor saves time; together, each facilitates the use of the other. As individual units the two have not yet been successfully co-ordinated but that will, and must, come later.

Of the conveyors now in use, some are light for the sake of portability; others are heavy and rugged enough to withstand the fall of a cut of coal upon them when they are laid to touch the face. Some are self-contained and others are sectional; all are more or less portable, as they must be. Wood, steel and rubber are worked into the construction of mine conveyors of many types using belts, flights, aprons or shaking pans.



These at first were applied to long face layouts, the belief being current that the tonnage obtainable from a given area mined by rooms and pillars was not sufficient to insure efficient conveyor operation. Concentrated and intensive working is proving the good judgment of those who are applying conveyors to room-and-pillar layouts where long faces can be maintained only with extreme difficulty.

Light and portable, self-contained conveyor units, which can be thrown together at will, are doing fine work in the drawing of pillars from rooms and entries. In the brief period of a year the conveyor has sprung to a place of real importance. It now bids fair to transcend the lead which the loading machine heretofore has enjoyed.

Variations in the design of present-day conveyors are only partly due to the ingenuity of the makers. Mining men, understanding the requirements of the conveyors and the conditions under which they must work, have specified details of design and have dictated changes. This they have done to a far greater degree than with mechanical loaders. Several distinct types of conveyors are required, for one variety will hardly meet any two conditions inasmuch as the design must depend upon the duty of the machine.

The H. C. Frick Coke Co. has pioneered in the use of a heavy face conveyor. It contends that for successful longwall operation the unsupported span of roof between the face and the timbers must be a minimum and, therefore, that the conveyor must be laid so as to touch or almost touch the face before the latter is shot down. So placed, it must be rugged enough to withstand the fall of a cut of coal. This arrangement is advantageous in that much of the coal is placed on the conveyor without shoveling.

This company seems to place its hopes for more efficient mining on true longwall layout. Spasmodically it has experimented with straight

Portable Transfer Conveyor

The short conveyor in the foreground transfers coal from a longer sectional conveyor which is parallel to the mine track. This arrangement provides a means of loading in a room a trip of a length equal to that of the parallel conveyor. The one here shown is a self-contained Jeffrey flight conveyor with a capacity of 60 to 75 tons per hour.

Digitized by Google

faces in its Leckrone mine with no startling results but is continuing active planning in this direction. Right now it is arranging a trial of retreating longwall, not necessarily from the boundary but from a starting point several thousand feet within solid coal.

In the Sweetwater mine of the Gunn Quealy Coal Co., in Wyoming, a Link-Belt sectional conveyor is working on a 250-ft. straight face. Three such faces, each using 500 ft. of conveyor, are in operation. The conveyors were first employed in a modified V-layout but the feeling that a greater tonnage from the same length of conveyor could be obtained by straight faces caused the shift to the latter. The coal averages 6½ ft. thick and lies on an average pitch of 5 deg. Over it lies a good sandy shale top. One of these faces during August of last year averaged 359 tons per day.

Props of 8-in. diameter are placed on 18-in. centers along the entire length of the face and are backed by a row of cribs on 15-ft. centers. The cribs are built of rejected railroad ties resting on about 6 in. of bugdust. They seldom take weight and serve their purpose only when an unusual condition causes the roof to ride over to the face when they protect the men and machinery. The roof caves every other cut. The coal which lies under 500 ft. of cover is shot directly onto the conveyor. Despite this fact, because this machine is heavily constructed, reasonable falls have not in the least damaged the conveyor. By this arrangement approximately 10 per cent of the coal is loaded out without shoveling. Recovery in the sections worked by long faces thus far has been 100 per cent.

Long Straight Face Used

Experience at this mine has shown that the long straight face is more flexible than the V-face and stands better during idle periods caused by a lull in the market. The company believes, however, that continuity of operation is a big factor contributing to successful long face operation.

In the Rachel shaft of the Bertha-Consumers Co. in West Virginia, heavy face conveyors are operated on a series of 100-ft. saw-tooth faces in the Pittsburgh seam. These are developed by rooms, 12 ft. wide on 80-ft. centers, turned at right angles to the butt entries. Movor and Fairmont flight conveyors are placed along these faces which are at 50 deg. to the rooms. These conveyors

Conveyor Hastily Digs Out of This

This photograph of a Jeffrey sectional conveyor operating on a 300-ft. face was taken immediately after the coal was shot down. The coal is lumpy and has rolled out to and on the conveyor satisfactorily. At least one-third of this shot will be loaded out with scarcely any labor on the part of the face men. The coal is undercut on one shift and loaded in a following shift. Fifteen loaders, stationed at 20-ft. intervals, have loaded out as much as 480 tons per shift or 32 tons per man.

are elevated so as to discharge into mine cars in the rooms. The face and the room track not flanked by coal are protected by cribs placed on a bed of bugdust, as in the Sweetwater mine. The crib is built so that by the removal of a trigger timber, it collapses falling forward toward the face. The salvaged timbers are utilized for rebuilding cribs closer to the face. Six men in a single shift are expected to load one cut which yields 150 tons.

Inasmuch as the coal is shot directly onto the Fairmont conveyor in the Rachel mine, the machine must be rugged in design and the chain totally inclosed, which necessarily adds to the weight of the machine. The frame is made up of bolted-together sections, about 6 ft. long, which are somewhat flexible when the bolts are not drawn tightly. The conveyor is taken apart only when it is moved from place to place. It is shifted forward by jacks or by mining machine chain or by barring it over greased skids. The drive section may be placed at any intermediate point and is reversible so that the motor may be placed on either side of the conveyor.

An interesting longwall-conveyor operation is in the mine of the Paris Purity Coal Co. in the Paris basin of Arkansas. The bed being mined averages 24 in. thick, is free from partings, and pitches about 5 deg. The roof is of hard shale and the bottom of hard clay to a depth of about 5 in., below which is another layer of hard shale. The layout consists of faces 275 ft. long and on a pitch of 3 deg. at right angles to the haulways serving them. These faces extend across the end of blocks 1,200 ft. long and are mined advancing. A conveyor is placed along the face and loads direct into mine cars in long trips on the haulway in which 4 ft. of bottom is lifted. The conveyor used was designed by Clarence Claghorn, consulting engineer, of Baltimore, Md., and was furnished by the United Iron Works, Kansas City, Mo. It meets the requirements specified by the coal company, which stipulated that the height be limited to 7 in. and that it carry the coal, not drag it. The traveling element consists of a double-strand chain, each strand of which is about 10 in. wide with a pitch of 5 in. The capacity of this conveyor is 60 tons per hour.

Conveyor Breaks Coal

Lump only is loaded on this conveyor so that the coal does not rub to any extent on the bottom of the pan. Practically all the coal mined is lump due to the practice of allowing the weight of the cover to break the coal which, incidentally, is hard and lumps well. After being undercut (in the clay) the coal falls as one slab from one end of the wall to the other and must afterwards be broken into lumps by sledges and wedges. In the cover, which is 130 ft. thick, is some sandstone and sandy shale; yet breaks extend to the surface. This company has found that the roof must be supported rather rigidly near the face if the roof is to be broken and that breaks must be

Digitized by Google

made if the system is to succeed under these conditions.

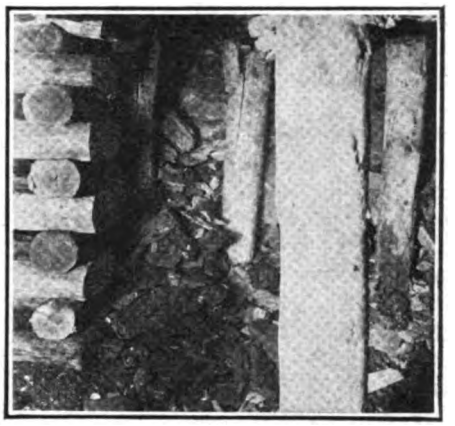
Sand jacks, designed to withstand a pressure of 300 tons, are employed to support the roof. They consist of a heavy cast-iron cylinder fitted with a plunger which, in working position, rests on sand. A bleed valve is provided at the bottom of the cylinder. Though the sand is subjected to an enormous pressure it is easily drawn off. During the last year over 100 of these jacks have been put into use. Many of them have been in service for a full 12 months and have proved successful in breaking the roof along definite lines. Patent rights covering this jack have been applied for.

A 5-ft. undercut along this face yields 90 tons of coal which is loaded in a single shift by seven or eight men. On the night shift are two timber men, two cutters and one shoveler who gobs the clay cuttings. Due to the small capacity of the car in use three men are required on the entry—two trimmers and one conveyor operator. H. Denman, consulting engineer, and president of the Paris Purity Coal Co., contributes further some interesting experiences and comments on conveyors and mining in general:

"The Paris Purity Coal Co. installed its first conveyor, 250 ft. long, a little over two years ago. In 1925 we installed one more 250-ft. conveyor and one 300-ft. conveyor. All three are of the same general type. Since the Paris Purity Coal Co. installed its first conveyor twelve others have been installed in the Paris field by different operators. At this time all these conveyors appear to be operating successfully. Most of these machines have been installed within the last year and a number of them within the last three or four months. They are all of the chain type furnished either by the United Iron Works on the design worked out by Mr. Claghorn, or by the Pittsburgh Boiler & Machine Co. of Pittsburg, Kan., on a somewhat similar design, though much lighter and cheaper. The conveyors are all working on faces ranging from 200 to 300 ft. in length. Sometimes a wall is started about 100 ft. long and gradually extended.

Close-Up of Link-Belt Conveyor

This conveyor is installed in the Sweetwater mine of the Gunn Quealy Coal Co. in Wyoming. The heavy chain and scraper flights have been comparatively free from break-downs. They stay on the bottom of the trough carrying with them all of the coal which is placed on the conveyor.



"Our first conveyor is now working for the third season, operating practically every day the mine runs and producing from 85 to 100 tons a day. The second conveyor, which is 300 ft. long, was installed about the middle of last summer. It puts out about 100 tons a day. The third was installed this winter. My partner, Mr. Johnson, believes that with a 200-ft. wall he will have fewer difficulties in handling the roof than with a longer wall. The last conveyor is being used in a layout which is virtually a 200-ft. room served by a roadway which is brushed on one rib.

"In the operation of these conveyors it is our aim and intention to load out one cut every day. In low coal especially, I believe conveyors are not a success unless one cycle of operation is completed every 24 hr. If on any day the men fail to load out the entire cut, so that the wall can be cut again that night, during that day and the one ensuing a loss of money is sure to be sustained.

Must Keep Even Bottom

"As we cut in a hard clay under the coal the machine runners at first made a step of some 6 to 10 in. along the entire length of the cut, which caused trouble in moving the conveyors. Later on, the machine runners learned how to keep an even bottom. We have found that certain types of mining machines can cut a more uniform and even bottom than others, an important point which must be kept in mind to insure ease in moving the conveyors.

"Out of nearly 30 mines operating in the Paris field I believe there is only one working on the room and pillar system, and at this mine the rooms are driven 100 ft. wide. In this field longwall holds sway and the mines have been worked in this way for six or seven years. The longwall system is what put Paris on the map. The conveyors here are not just being used on trial or as an experiment. They are being used every day to mine the coal. At our mine about three-fourths of the output comes from conveyors and if these cannot work the mine is shut down.

Props and Cribs Behind a Long Face

This face is under 50 ft. of cover. Even so, the roof caves every other cut. The props have an average diameter of 8 in. and the cribs are constructed of rejected railroad ties resting on a bed of bugdust.

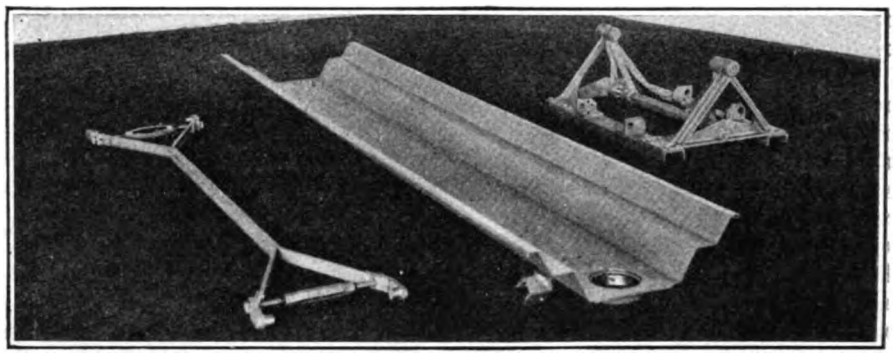
"Judging from a number of articles I have read, it seems that many of the conveyor systems in the country are being tried out only to see what they can do, and not as a regular system of producing coal. I note in a recent article that a company put in a system similar to ours, using scraper loaders, the use of which was discontinued after they had been proved successful. The conveyors in the Paris field are standard equipment on which we rely in making our living in the coal business.

"During the last year there has been considerable agitation on the part of the United Mine Workers to force some kind of a contract on the operation of these machines. The operators of the Paris field believed it impossible to inaugurate any kind of a contract scale for these conveyors that will meet the varied conditions encountered in operating them.

"It has been the experience everywhere in the past that when the miners make a scale no reduction in the cost of operation is possible. The scale for contract work is always based on the present method of mining and made high enough to absorb any advantages in the system by allowing the operator only a small differential which in most cases does not cover the power bill for the operation of the machinery, much less take care of interest, depreciation, repairs and the great risks of failure when new machinery and processes are tried out."

In the No. 5 mine of the Kemmerer Coal Co. at Sublet, Wyo., in a seam which pitches 20 deg., shak-

Digitized by Google



ing conveyors are operated on a 100-ft. face which is turned to give a 3-deg. inclination. The coal is about 5½ ft. thick and is topped by a weak roof which falls when not supported. The thickness of the cover is about 1,100 ft. of which at least 50 ft. is sandstone. The coal is not undercut. Ten face men and one man on the entry jointly produce about 125 tons in 8 hr., all mining duties accounted for. The direct result of this layout has been better coal, less powder consumption and higher recovery.

The face conveyor is placed 5 ft. from the coal in each advance. Five rows of props on 5-ft. centers each way are maintained behind the conveyor and two rows of props are set between the face and the conveyor before the latter is advanced. The face conveyor discharges into a second conveyor which is on the pitch. At the lower end of the pitch conveyor is a curved chute which causes the coal to discharge into the mine cars on the haulway in a direction parallel to the track.

The sections of this conveyor are suspended from chains hung from cross bars between posts. The forward stroke is imparted by a motor-driven engine and the return stroke by a helical spring.

In the low coal beds of central Pennsylvania the Pennsylvania Coal & Coke Corp. has driven rooms 25 to 35 ft. wide and drawn pillars by the use of portable and extensible belt conveyors, resulting in a substantial increase of efficiency of cutters and loaders. The most satisfactory results from conveyor loading in these mines have been obtained in the drawing of entry pillars. Light, 12-ft. and 20-ft. belt conveyors, made by the mechanics of the company, have proven most satisfactory in this work. The company believes it is too early to tell whether or not the wear and tear on these conveyors and the labor of shifting them will offset the economies effected in cutting, shooting, loading and hauling.

Great concentration and speedy recovery are obtained by the use of conveyors in a room-and-pillar layout in the mines of the Telford Coal Co. and the Jasahill Coal Mining Co. in central Pennsylvania. Here the Suppes sectional conveyor is used, supplemented by self-contained, portable belt conveyors. Rooms are driven 35 ft. wide and 250 ft. long, leaving 18-ft. pillars. Five men completely mine as many as three cuts from such a room in one shift and as many as four from the pillar which is drawn immediately after the room reaches its limit. A saving of 25 per cent in the production cost is reported. This conveyor is used also in these mines to advance entries and for brushing the top or taking bottom.

Ironton Conveyor Parts

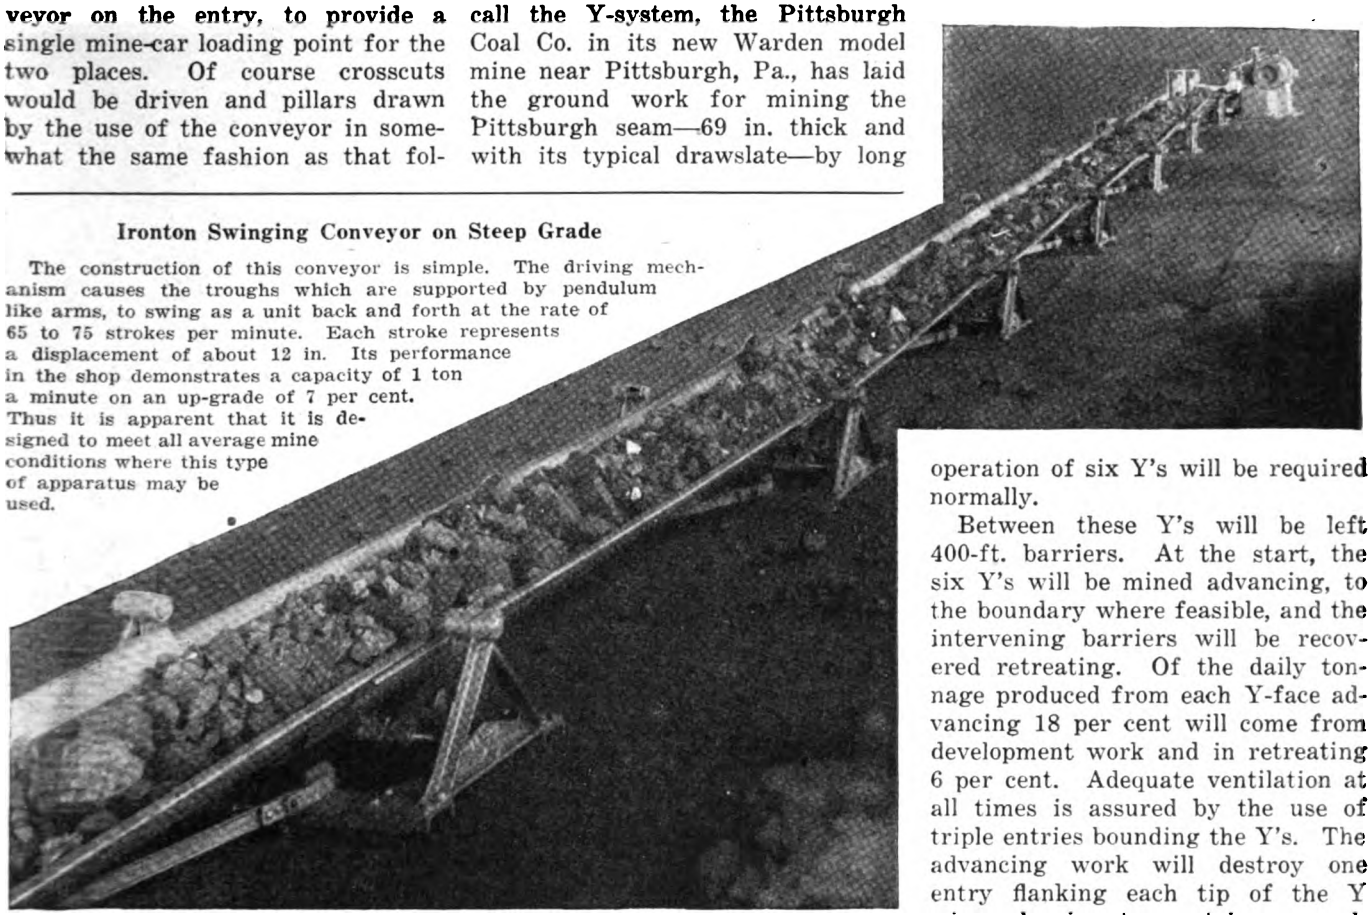
Each trough section is composed of only three pieces which are joined together without bolts. For each trough section there is one hanger and one spacer which holds the latter in position with respect to adjacent hangers. The trough sections are fastened together by a flexible point, the respective mates of which are a part of the trough sections. Accurate alignment is unnecessary.

Down in Alabama in the Aldrich mine of the Montevallo Coal Mining Co., in the Cahaba field, which works the Montevallo bed lying on a pitch of 12 to 15 deg., true longwall and conveyors have been in operation for a long time, the former since 1906. In this mine five 325-ft. faces are mined advancing by the use of shaking conveyors after at least one other type had been tried and scrapped. On each face are employed a total of 8 men on the night shift and 16 men on the day shift, of which 10 are loaders. These men take one 4-ft. cut a day in coal which is 50 in. thick including about 16 in. of rashings. The mine worked 310 days last year and during the last two years only five times has the company failed to make one cut a day on each of the five faces. Convict labor is used exclusively.

METHOD EMPLOYED

The layout, in plan at least, is somewhat like that employed by the Paris Purity Coal Co., of Arkansas, except that the walls are longer and the aircourse on the otherwise closed end of the wall is maintained in the goaf by a pack wall instead of by cribs. Bottom is taken in the haulway—which is kept open behind the advancing face by rock-filled cribs—so that the top of the mine cars is on a level with the bottom of the coal to facilitate direct loading from the shaking conveyors. The walls are turned to provide an inclination of not less than 1¼ per cent in favor of the conveyor load. The average grade is equivalent to an 8-deg. pitch.

The face is kept open by props on 4-ft. centers which are not recovered. Two rows of timbers are maintained behind the conveyor and two are established in front of it before it is advanced to a new position. Bug-dust, rashings and slate are thrown behind these timbers and generally are of sufficient quantity to fill to the roof. Where the quantity is inadequate soft cribs are built over the refuse. The roof, consequently, is allowed to subside gently and does not cave violently as it does in many of the mines where long faces are being tried these days. Definite roof breaks occur every 200 to 600 ft. except where slips in the sandstone of the cover are encountered when much cribbing and timbering is required at great expense. The cover varies from 435 to 800 ft. in thickness.



The conveyor being used is a modification of the Mavor & Coulson shaker. Pan sections, provided with rollers which ride on a cradle, are 9 ft. long. Actuation is through the medium of a rope from the walking beam of a 27-hp. motor-driven shaking engine to a bell crank supported by an anchoring roof jack at the drive section of the conveyor. A ropeway is maintained in the goaf by cribs which obviate the necessity of moving the engine after every cut.

Because it believes as a result of its experience that the maximum efficiency in mechanical loading cannot be obtained by loading directly from the working face into the mine car, and because the seam which it is working is so badly cut up by erosion as to militate against a systematic layout of long faces, the Portsmouth By-Product Coke Co. is turning its attention to the application of conveyors in wide rooms in a room-and-pillar layout. It has already experimented with the layout using mine cars in place of conveyors and is con-

Digitized by Google

vinced that its roof conditions will lend themselves readily to such a layout, in which conveyors can be efficiently applied.

The plan provides for 40-ft. rooms on 80-ft. centers, driven about 325 ft. long, two of which would be mined simultaneously by face and room conveyors, the last of which would discharge into a common conveyor on the entry, to provide a single mine-car loading point for the two places. Of course crosscuts would be driven and pillars drawn by the use of the conveyor in somewhat the same fashion as that followed by the Knickerbocker Mines in central Pennsylvania. Thomas Devenny, superintendent of its Freeburn mines, believes the tendency is unmistakably in the direction of machines which will cut and load—a necessary adjunct of which will be conveyors.

Ironton Swinging Conveyor on Steep Grade

The construction of this conveyor is simple. The driving mechanism causes the troughs which are supported by pendulum like arms, to swing as a unit back and forth at the rate of 65 to 75 strokes per minute. Each stroke represents a displacement of about 12 in. Its performance in the shop demonstrates a capacity of 1 ton a minute on an up-grade of 7 per cent. Thus it is apparent that it is designed to meet all average mine conditions where this type of apparatus may be used.

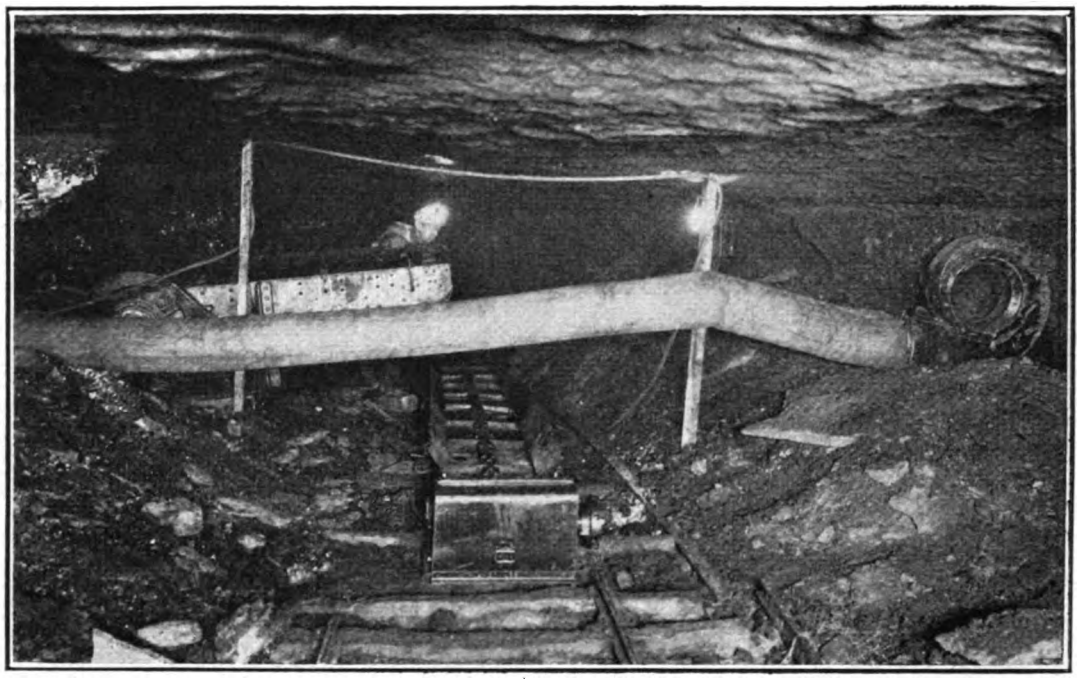
At Dawson, N. M., the Phelps Dodge Corp. is using 20-ft. belt conveyors of the Jeffrey type in pillar work and in a narrow-V layout. Two of these conveyors are laid in tandem along the V-faces of blocks 45-ft. wide (developed by single entries) and discharge at the throat of the V into mine cars on a haulway which is maintained partly in the goaf. The haulage arrangement in the working places is like that being followed by the Bertha-Consumers Co. in its Rachel mine. These V-faces in a panel have retreated well over 100 ft. without a pronounced cave, upon which the success of the system depends; so this company is not ready to commit itself on the results of this work. In certain sections of its mines it is effecting a saving by the use of short conveyors, especially on pillars from 40 to 50 ft. wide, by eliminating brushing and the laying of additional track.

By what R. Y. Williams, who is in charge of the work, is disposed to call the Y-system, the Pittsburgh Coal Co. in its new Warden model mine near Pittsburgh, Pa., has laid the ground work for mining the Pittsburgh seam—69 in. thick and with its typical drawslate—by long faces and the use of conveyors and also loading machines when these can be applied to the system.

The plan is that of a double chain of 200-ft. blocks developed by triple entries and divided by single entries. Each of these will be mined by faces which converge to a common point on the one longitudinal single entry between each chain. The faces will be inclined at 90 deg. to each other and each will subtend an angle of 45 deg. to the longitudinal single entry, with which they form a Y. Conveyors will be laid along the faces and in the stem entry of the Y, discharging into cars of 4-ton capacity (hand-filled) on cross haulways.

Each face or wing of the Y is about 282 ft. long, this length being fixed to conform in shift tonnage to the single shift capacity of the equipment installed. Thus an undercutting machine is calculated to cut normally about 18 in. per minute. At this rate it would cut two faces or about 564 ft. in 6 hr., leaving 2 hr. or 25 per cent of the shift as leeway for delays. Incidentally, the plant equipment throughout is designed to handle its output in 6 hr. Since this mine is designed to produce 4,800 tons a day and since each Y will yield about 800 tons per shift, the operation of six Y's will be required normally.

Between these Y's will be left 400-ft. barriers. At the start, the six Y's will be mined advancing, to the boundary where feasible, and the intervening barriers will be recovered retreating. Of the daily tonnage produced from each Y-face advancing 18 per cent will come from development work and in retreating 6 per cent. Adequate ventilation at all times is assured by the use of triple entries bounding the Y's. The advancing work will destroy one entry flanking each tip of the Y wings, leaving two entries on each side for complete-circuit ventilation in the retreat. In either case the goaf will be on the return end of the circuit.



Already this company has initiated the plan by the development of a single wing of one Y. The work was started in a small way so that the details might be worked out and co-ordinated, and because the coal-handling equipment was in the course of construction at the time. Incidentally, it has only recently been completed. This single face had been extended to a length of 220 ft. and advanced 140 ft. from the point of start, perpendicularly to the face, when about two months ago all the mine cars had been filled. The tipple now having been completed the face will be started again.

A major break occurred when the face had moved 110 ft. from the starting point, after which the face was advanced four cuts before it was

Digitized by Google

Side Line Type

The tributary conveyor is serving a shortwall loader. That at least two such loaders and two tributary conveyors are in operation is evidenced by the fact that a main conveyor is being used. The location of the blower at a distance from the mouth of the working place which it is ventilating prevents a closed air circuit.

stopped. This and a normal condition at the face after two months of idleness indicates the effectiveness of the roof control system which has been tried out.

The face is held by a line of mechanical jacks, set on 3-ft. centers 6 ft. from the face, each provided with a screw for adjustment and a removable head. A 10x30-in. boiler plate, ½ or ¾ in. thick, is placed over each jack to keep it from pushing through the roof. The drawslate, which is 10 in. thick, is held by steel beams 14 ft. long running perpendicularly to the face. One end of each beam is inserted in a hole cut to a depth of 1 ft. in solid coal while the other end rests in a depression in the head of the jack.

DRILLS 6-IN HOLE 7 FT. IN 30 SEC.

A drill has been built in the shops of the company which in 30 sec. will put in a 6-in. hole to a depth of 7 ft., penetrating a 6-ft. cut and extending 1 ft. into solid coal beyond the limit of the kerf. The beams are inserted in these holes before a cut of coal is shot down. The face plan, therefore, involves a span of heavily supported roof, measuring 6 ft. and 12 ft. from the line of jacks and posts to the undercut face and to the solid coal respectively. Jeffrey sectional conveyors with hand loading are used on the face and in the stem entry leading to the cross haulway. The results thus far indicate the ability of a man to load out 25 tons of coal in 6 hr.

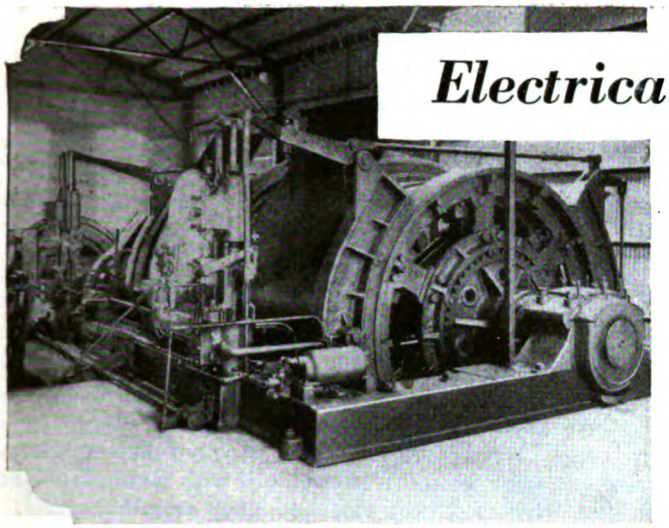
In the C mine of the Union Pacific Coal Co., at Superior, Wyo., an Eickhoff jigging conveyor is now functioning as a take-off for coal gathered by a scraper. Later it will be laid for hand loading along a 275-ft. face which will be extended to 450 ft., worked across the pitch. The Eickhoff conveyor is comparatively new in this country, though it has been used extensively in Europe for many years.

INSTALLATION AT TOMS CREEK, VA.

In a mine of the Virginia Iron, Coal & Coke Co., at Toms Creek, Va., Eickhoff conveyors are working on a 70-ft. face in a layout of 10-ft. rooms on 80-ft. centers. The pillar face is mined retreating from the inby end of the room. Coal is loaded by hand into a face conveyor, which is driven by a chain from a swiveling sprocket attached to the main delivery conveyor in the room. Full details of this installation will appear in an early issue of this magazine.

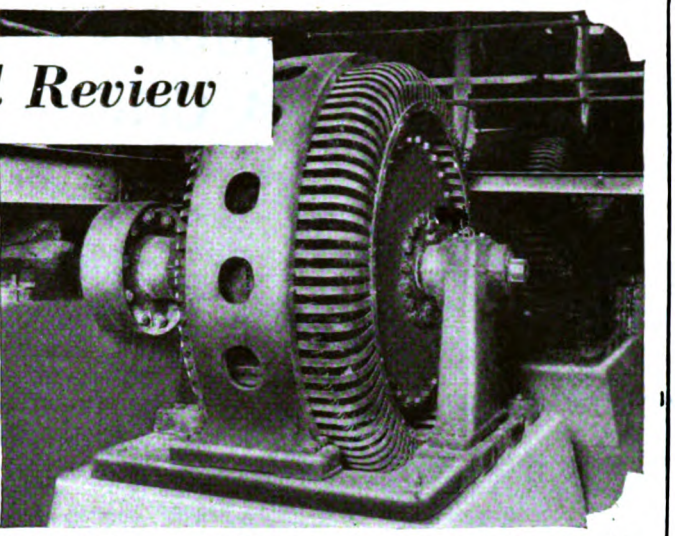
The Ironton Engine Co., of Ironton, Ohio, completed in the last month the development of a swinging or pendulum conveyor. This machine is simply a chain of interconnected 9-ft. troughs, which are supported by swinging arms pinned from hangers and driven as a unit by a heavy bell crank from a simple crank on a motor-driven engine at the rate of 65 to 75 strokes per minute.

The driving mechanism produces a rapidly accelerated stroke in one direction and a slow stroke in the other. The individual troughs are moved positively as a single unit about 8 in. to the front of the hanger centers and fall back through the remainder of the swing to the rear. Thus is imparted a slow forward and upward stroke in the direction in which it is intended the coal shall move and a quick downward return stroke in the reverse direction. The movement is similar to that which a man uses in slinging coal from a shovel. The swinging design obviates any buckling of the trough sections where the conveyor is erected on an uneven mine floor.



No bolts are used in connecting the units. The hangers are held in correct position by spacers between them. As the joints between adjoining sections are flexible accurate alignment is unnecessary. Two men can easily handle any of the three parts of the extensible portion of the conveyor. A portable scraper conveyor is provided in conjunction with this conveyor. This elevates the coal from the swinging conveyor to the height of a mine car. The height of the discharge end of this conveyor is adjustable.

CHIEF PROBLEMS OF MINING



The introduction of conveyors of itself will not guarantee any advantages over the older method of loading directly into mine cars. The success or failure of any conveyor installation will depend more upon the attention devoted to related problems of layout, supervision and management in general. The ironing out of wrinkles will be accomplished quickly or slowly, as the degree to which the several phases are correlated. The problems encountered are chiefly those of mining and coordinating it with equipment.

Size of Electric Power Load Has Become A Criterion of Profits

Modernized Plants Are Setting New Ideals of Design, Operation and Success — Investments in Electrical Machinery Show Handsome Returns—Future Is Bright

By Edgar J. Gealy
Associate Editor, *Coal Age*
New York City

THE UNUSUAL profit-producing advantages proved by electrically-driven mining equipment, last year, have left no room for doubt regarding the better efficiency, greater reliability and larger success of motorized apparatus. With the aid of up-to-date tipples, breakers, haulage and pumping systems many mining companies even though operating under most adverse labor, economic and production handicaps have come back with renewed life.

Today, in both the bituminous and anthracite fields, other conditions being nearly equal, successful and unfortunate companies can be divided respectively into two groups—those which are highly electrified and those which continue to work with obsolete equipment by direct use of steam generated at isolated boiler plants.

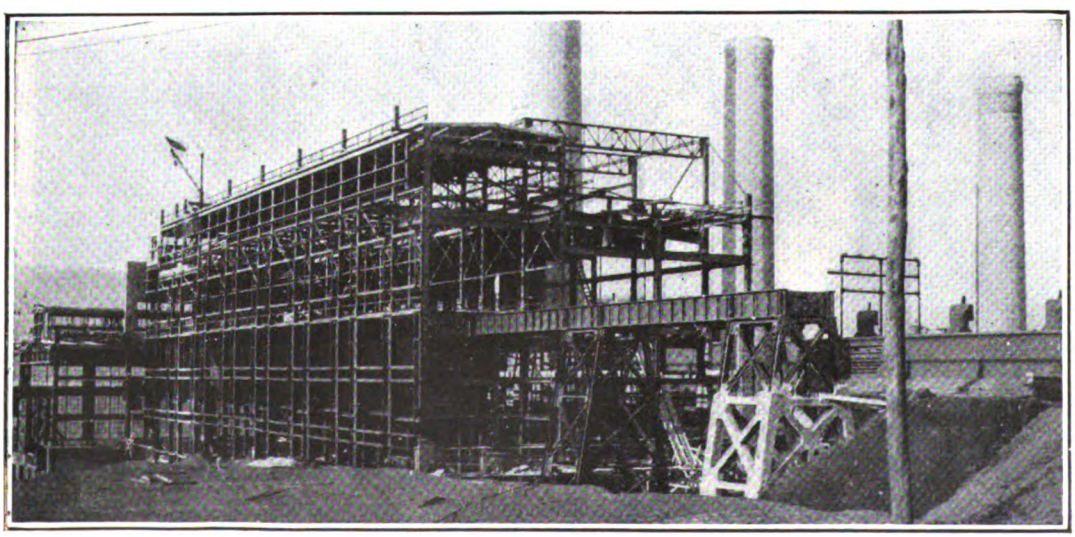
Most conclusive proof of these facts is found in territories paying high wage scales which still find it possible to mine coal at a profit. Such a territory is that in southern Illinois where one can also see some of the most elaborate large-scale electrifications in the coal fields.

Operating cost data, lately collected by several anthracite engineers, have revealed the large economies of electrical equipment and the wastes of steam-driven machinery, especially, when supplied through long steam lines. Consequently, there are under way many forces tending toward larger and more efficient electrically operated breakers and the rapid abandonment of steam-driven engines. All through the coal fields marked success has been attained by electrical apparatus.

A few weeks ago the Westinghouse and Nordberg two-motor 4,000-hp. electric hoist at the Orient No. 2 mine of the Chicago, Wilmington & Franklin Coal Co., at West Frankfort, Ill., broke the world's daily output record by hoisting 12,823 tons during one shift.

The Glen Alden Coal Co., of Scranton, Pa., lately installed a 15,000-kva. turbo-generator, built by the Allis-Chalmers Manufacturing Co. At the same time an addition was built to the Nanticoke power plant large enough to house fourteen new Stirling type boilers of sufficient size to handle about 45,000 kva. more generating capacity.

CONFIDENCE IN ELECTRICITY



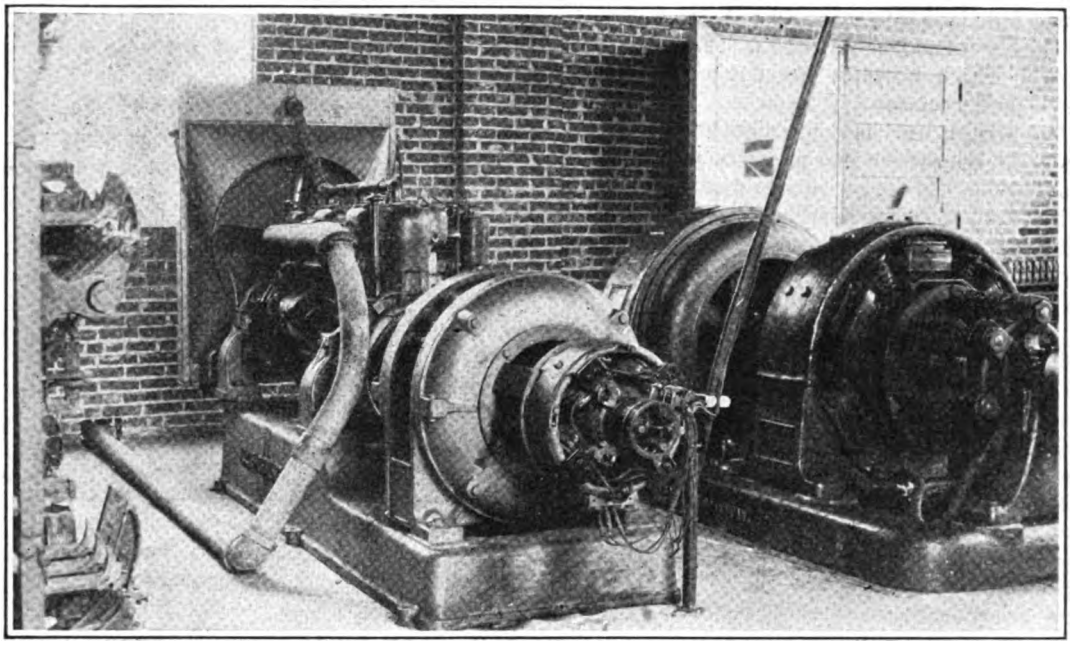
In Illinois the Old Ben Coal Corp. practically completed its work of changing its mines from steam to electric drive and effected unusual power savings.

At Colstrip, Mont., the first all-electric open-pit mine was made possible by the use of two 60-ton General Electric storage battery locomotives equipped with Exide-Ironclad cells rated at 1,800 amp.-hr.

Within a radius of a few miles, in the lower anthracite region, three new electrically operated breakers destined to set new standards of construction, operation and success are being completed.

The largest of these is the 10,000-ton breaker of the Lehigh Coal & Navigation Co., at Lansford, Pa. Standing near the site of the old wooden breaker, which formerly prepared the coal at this place, all the surrounding buildings are dwarfed by the new structure of steel and concrete which towers more than 200 ft. above the ground level. Mine cars are transported to and from the breaker on four inclined trestles. Near St. Clair, the Repplier Coal Co. is finishing a modern electrified steel breaker known as Newcastle Colliery. Here there is a connected motor load of 4,500 hp.

Between Mount Carmel and Shamokin the Colonial Collieries Co. has erected an electrically operated breaker completely covered with asbestos siding. This building is unique in many other respects. Flotation coal cleaners, manganese-



Mine Power Plant Made Larger

Fourteen new boilers can be placed in this addition to the Nanticoke power plant of the Glen Alden Coal Co. This company now has 50,000 kva. in electric generating capacity. Last year the company finished its electrification of all its mine pumps and now the work of complete modernization revolves around fan and hoist drives. Many shaft hoists requiring large-size motors may next be electrified.

Digitized by Google

Auxiliary Drive

View in the substation at the North Diamond mine, Earlington, Ky. This shaft mine, one of the St. Bernard group of the West Kentucky Coal Co., is the most modern in that section. The 50-kw. 2,300-volt gasoline-electric generating set is the auxiliary for driving the 50-hp. wound-rotor, variable-speed motor of the ventilating fan. This set was the second of its type to be installed at a coal mine. The first was at the Dehue (W. Va.) mine of the Youngstown Sheet & Tube Co.

steel centrifugal pumps, magnetic clutches, belt conveyors, car dumping equipment, hoists, belt-type loading booms and recovery plants co-ordinated in novel ways and used for new purposes are a few of the items of interest in this most modern coal preparing plant.

Nothing has done more to hasten the formulation of new programs involving the rapid installation of electrical equipment than the collection of comparative operating costs showing the advantages of electric power over steam. One large company has found that in most instances the quantity of steam required for power applications to mining equipment is three times that necessary to generate electricity to perform the same duty. This was at mines which had already electrified its most inefficient machines. Some steam-driven apparatus was found to use as much steam during the 16 hr. of idle time as in the 8 hr. when running. The reason for these conditions was the fact that steam lines must always be kept hot and leaks are almost unpreventable. Also, it is common practice to leave throttles and valves open to keep the lines free of condensate.

Costs Reduced

At a small independent mine in the lower anthracite region, previously well equipped with both electric and steam drives, the change to complete electrification reduced its power costs alone from 70c. to 45c. per ton. Another anthracite company found that when steam and electric energy were used at one of its mines its average power was between 65c. to 70c. per ton. Now, when completely electrified the average cost is about 35c. A saving of 25c. or 35c. a ton may seem small but when applied to an annual output of 8,000,000 tons it amounts to $2,000,000 or $2,800,000.

More than $140,000,000 has been placed recently in the coal industry by means of new bond and stock issues. This money is being spent upon modernization plans. That satisfactory results are attainable is a sure fact, because even companies which have always enjoyed the reputation of being most progressive are realizing worth-while returns upon their investments in more electrical equipment. Such assurances of success will surely exert a strong urge upon many companies which have much greater opportunities to effect savings. A few examples show the results obtained by these new investments.

Proof of Examples

One breaker recently completed is designed to save $1,000 a day. Another similar type structure costing about $700,000 will make a saving of $10,000 a month. More than $100,000 a year will be saved by another company which recently spent $142,000 for a few electrified hoists and pumps which were installed at only one of many mines it owns.

Many new and improved appliances particularly designed for mine service were developed during the last year.

The major improvements in the design of electric locomotive equipment were with a view toward obtaining better balance, greater pulling effort, lower maintenance costs and greater safety. Early in the year the Jeffrey Manufacturing Co. and the Goodman Manufacturing Co. each had a locomotive approved as permissible, thus increasing the latitude of choice of the coal operator.

The dynamic braking controller has been strengthening its position in the coal industry. Another advance has been in the use of battery locomotives for main-line haulage. Realizing the advantages of electric haulage over all other types mine operators in places have introduced battery equipment where the use of the trolley would be neither desirable nor safe.

Introduces New Locomotive

A new storage-battery locomotive has been introduced by the Vulcan Iron Works. It is equipped with equalizing levers, a worm-gear drive, self-locking brakes and a cast-steel bar frame. This company has also placed on the market a bar-steel trolley locomotive with three-point suspension.

The Westinghouse & Manufacturing Co. has recently had approved by the U. S. Bureau of Mines a Baldwin-Westinghouse storage-battery locomotive for use in gaseous mines. This locomotive is of the company's standard bar-steel construction, equipped with two motors, single reduction geared drive and having a rated drawbar pull of 2,000 lb. at 3.5 m.p.h. All wiring is inclosed in metal conduit, flexible type is used where required by movement of apparatus. The locomotive is designed and approved to use either the lead-acid or the nickel-alkali storage bat-

Digitized by Google

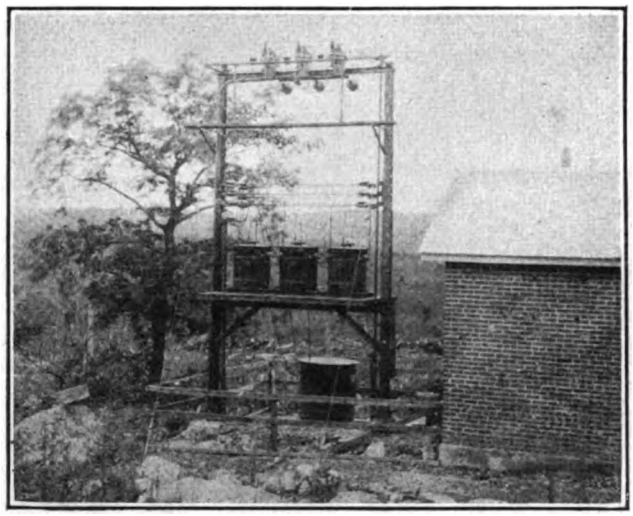
tery. Efficient operation is obtained by the use of series-parallel and field control which permits the use of a very small resistor.

The switch unit is conveniently located for inspection and consists of a double-pole fused disconnecting switch and a fused headlight switch combined in a single case. These switches are interlocked with a sliding door which permits safe and easy renewal of fuses.

There has been a large increase in the number of electric shovels used for open-pit mining. Today it is claimed that 40 per cent of such shovels are electrically operated. Practically all sizes of shovels have been successfully electrified, some being equipped with 90-ft. booms and 10-yd. dippers. One of the largest used in an open pit mine is that owned by the Sunlight Coal Co. of Boonville, Ind. It is a Marion model 350 supplied with the General Electric Co.'s Ward-Leonard voltage control apparatus.

An improved form of liquid slip regulator for use with wound-rotor motors on flywheel motor-generator sets for mine hoists has been developed by the Westinghouse Co. The method of operation is the same as for the older designs in which a torque motor receiving current from a series transformer in the primary circuit of the motor causes the electrodes to separate on overload, thereby increasing the slip of the motor and allowing the flywheel to take the load.

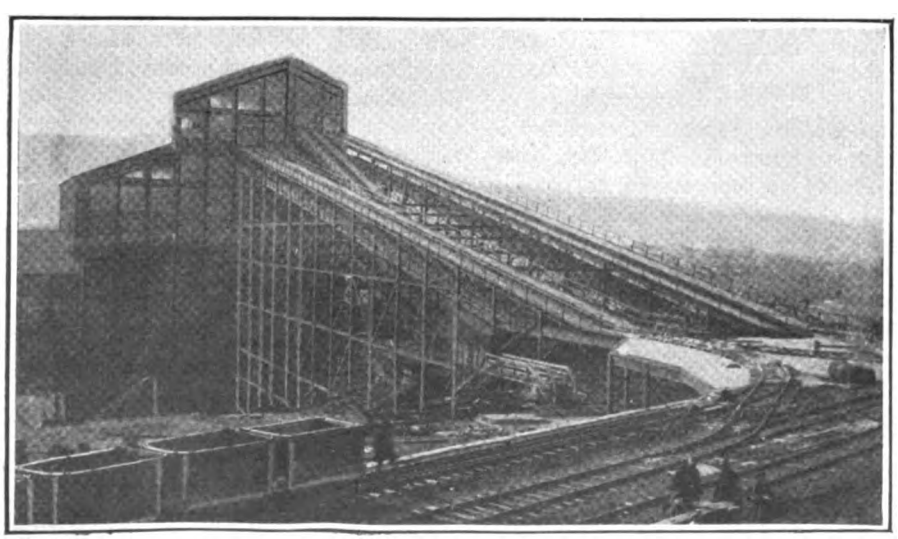
In the past there has been difficulty in bringing the main motor connections to the electrodes within the electrode cells. This arrangement has recently been improved. Former designs employing wood pot cells gave more or less trouble due to leakage of electrolyte. The newly designed stationary electrodes are supported by insulated bars from the top of the tank on a framework.



The cooling system consists of a number of deep narrow troughs open at the top, suspended around the inner side of the tank. This construction has a decided advantage over the pipe coils, where the cooling water contains a considerable quantity of suspended matter which would quickly clog up a pipe coil. The troughs being open at the top can be cleaned readily either by flushing out with water or by removing the trough and dumping.

The first electro-pneumatic hoist control outfit, designed by Westinghouse, was installed at Lansford by the Lehigh Coal & Navigation Co. A similar unit recently was sold to the Consolidation Coal Co.

A safety electric room hoist driven by a 5-hp., 250- or 500-volt direct-current motor designed by the South Fork Foundry & Machine Co., was approved by the U. S. Bureau of Mines.



The anthracite strike gave much impetus to the installation of electric equipment. Just before the workmen were called out the operators did not know how many or what maintenance men would be allowed to work. Realizing that lack of fuel for steam plants and scarcity of labor for attendance would bring about serious consequences, there was the grand rush for pumps, motors and control equipment for several weeks preceding the strike. However, there were already several other economic forces exerting their effects upon pumping problems.

A new line of high-speed synchronous motors was developed by the General Electric Co. for the operation of centrifugal pumps. The size of these motors, for a given horsepower output, was reduced greatly as compared with previous designs.

Substation on Top

This particular substation is automatic feeding current to a slope through a borehole. Outdoor transformers are here used thus minimizing building expense. Stations of a similar nature requiring little or no attendance are often installed underground, in many instances separated from the balance of the workings by fireproof doors o partitions.

Cars and Coal Are Lifted to the Breaker on Trestles

Four long sloping trestles over which loaded and empty mine cars are transported will be kept busy feeding this 10,000-ton breaker at Lansford, Pa.

SAFETY TO THE FRONT

The first complete motor and controller for use in a gaseous mine was brought out by the General Electric Co. and approved by the U. S. Bureau of Mines. The motor is a direct-current unit rated 5 hp., 900 r.p.m., 550 volts. Other motors and controllers of this type are now being designed.

More and more automatically primed, started, protected and controlled centrifugal pumps were installed. Also, many breakers were changed to wet-process preparation methods and several new types of pumps have been needed; consequently, many lead-lined, manganese-steel, rubber and bronze units were used.

Digitized by Google

There has been a marked tendency toward simplification and improvement of automatic pump control apparatus. A new priming valve actuated by a spring instead of a solenoid was developed by the Barrett, Haentjens Co. The notching relay has been supplanted by definite time relays and thermal relays which lock out the starting device after several trials to start have been made, if something is wrong with the pumps or its appurtenances.

The first application of super-synchronous motors to mine fans was made, during the year, by the Glen Alden Coal Co. Five General Electric motors of this type having a total horsepower of 1,500 were put in service during the summer. The largest one of these motors was installed at the Truesdale mine. It drives a Jeffrey double-inlet, exhaust, non-reversible, stepped, multi-blade fan supplying 380,000 cu.ft. of air per minute at a water gage of 3.8 in.

Another motor of this type was installed at Bliss Colliery. It is a 250-hp., three-phase, 60-cycle, 4,150-volt unit. Its synchronous speed is 109+ r.p.m., it has sixty-six poles. Besides being designed to carry a 250-hp. mechanical load it is rated at 200 kva. unity power factor, with a temperature rise of 40 deg. F. The normal direct-current field current is 23.9 amp. and the full load stator current is 28.1 amp. A small motor-generator set supplies the field excitation.

When the motor is started the outer frame revolves on its own set of bearings which are mounted in the same housing as the revolving element which is directly coupled to the fan shaft. After the stator has reached full synchronous speed it is slowly brought to standstill by the application of a hand brake. By this means the full-speed torque of the motor is available to start the fan. One of the largest fans to which this type of motor was applied was quite heavy as is indicated by the fact that its WR^2 was 1,440,000.

Another notable fan drive installation was one made by the Price, Pancoast Coal Co. at its mine in Throop, Pa. To assure continuous operation of its ventilating system a 225-hp. Stirling internal combustion engine is provided.

Automatic substation equipments were sold in greater volume than in any preceding year. Most of the outfits were for single-unit instead of multiple-unit substations. A few double-unit control systems were furnished so that when the first machine becomes overloaded the second one is started.

Records of one of the largest manufacturers of automatic substation apparatus reveal the fact that there is still a marked tendency toward the use of motor-generators sets in preference to rotary converters. This company's list of automatic control outfits sold to date show that more than 75 per cent of them were for synchronous motor-generator sets.

More Sectionalizing

Greater appreciation of the desirability of automatically sectionalizing power feeders in mines was evidence by many installations of automatic reclosing switch equipments. Many direct-current and alternating-current automatic feeder switches were placed in service to localize overloads and prevent such conditions from interfering with all the other functions performed by electricity.

One of the most progressive movements of the year in the better design of electric motors was the production of anti-friction bearing motors by the Allis-Chalmers Manufacturing Co. These motors are equipped with Timken tapered roller bearings.

A new type synchronous motor is being offered to meet the need for a motor having extra high starting torque, low starting current, and the recognized high efficiency and good power factor characteristics of a synchronous motor. The new motor, available in standard ratings from 60 to 600 hp., is manufactured by the Westinghouse Electric & Manufacturing Co. It consists of a combination of two pieces of apparatus which are well established in the electrical power field.

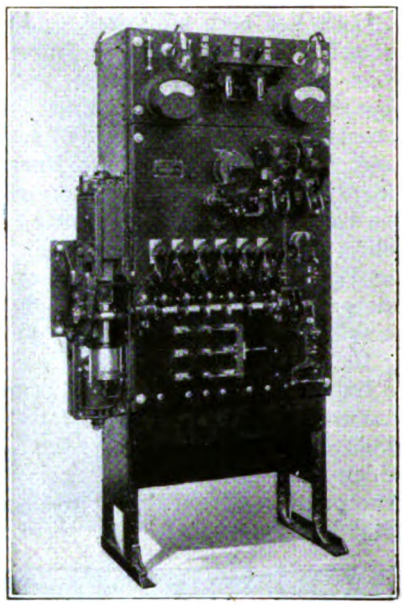
The complete unit consists of a standard synchronous motor combined with a magnetic clutch in a single compact frame. The over-all dimensions are practically the same as the hitherto standard synchronous motors of the same ratings, with the exception of the length which is usually from 4 to 10 in. longer.

This clutch-type synchronous motor is started in the same manner and with the same equipment as used with a standard synchronous motor started under light load conditions. It is particularly adapted for driving crushing or grinding machinery, fans, rolls and other loads requiring high starting torque. The starting torque of the motor is the same as the maximum running

Visitors Get a Good Eye-Full While Inspecting Modern Electrified Hoisting Equipment

These are a few of the anthracite engineers who recently visited the mammouth new breaker of the Lehigh, Coal & Navigation Co. at Lansford. The men had just arrived at the hoist building which houses two large electric hoists. One of them is provided with new electro-pneumatic contactors, a progressive step in the design of large hoist control apparatus.

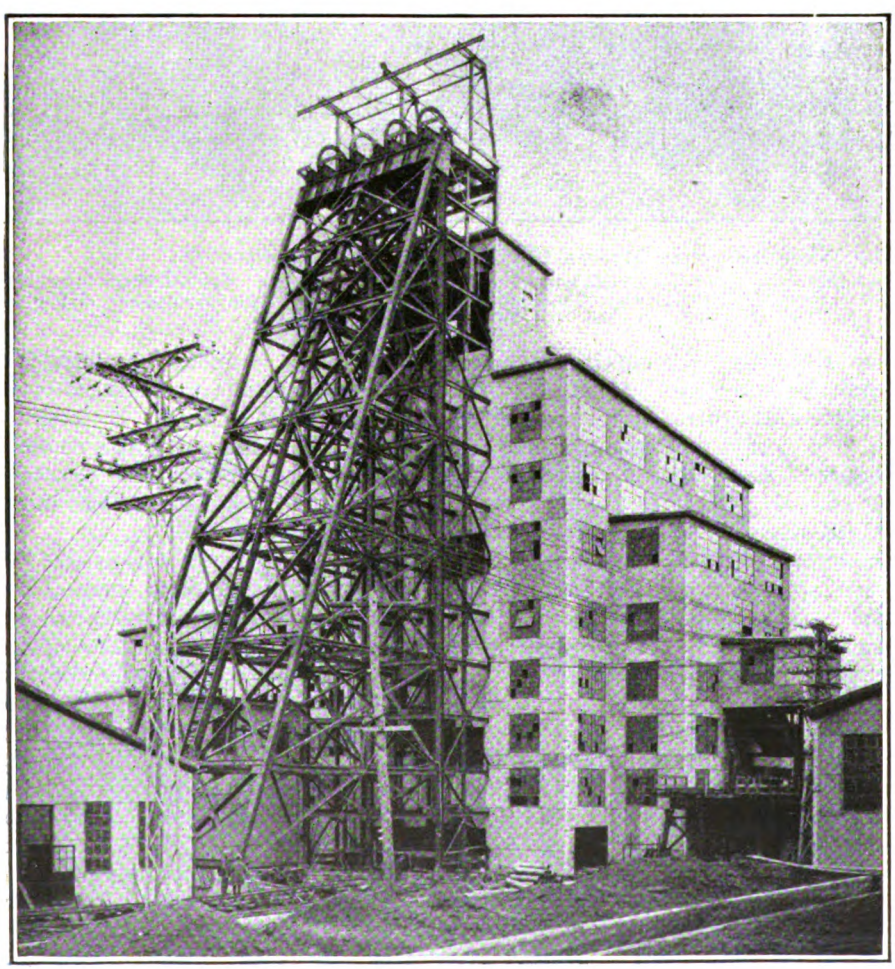
Digitized by Google



torque because the motor is brought to synchronous speed and fully excited before being connected to the load. It can thus exert any required torque up to the value of its pull-out torque during starting periods. Furthermore, this is accomplished without shock and at an acceleration rate controlable by adjusting the clutch excitation current through a rheostat. The clutch cannot be excited during starting periods, and as a result the rotor quickly reaches full speed.

The rotor section of the clutch is faced with asbestos lining, riveted to a steel ring and made in halves for easy removal. The armature member of the clutch has a smooth surface where it comes in contact with the brake lining. Steel shims may be inserted between the asbestos lining and the ring to compensate for wear.

Ample clearance between the clutch plates is provided by spring plate construction. The armature member is mounted on a steel disk which has sufficient flexibility to allow the clutch faces to make contact when the clutch coil is supplied with current. When excitation is removed, the flexible member will spring back into its normal position which provides sufficient clearance between the friction surfaces to prevent contact.



The motor shown in one of the illustrations is similar to one used in a new breaker built by the Repplier Coal Co. It is rated at 575 hp., 180 r.p.m. and 100 per cent power factor. An interesting feature is that it occupies but 2½ in. more space than a standard motor of the same rating.

Increased interest has been shown in the subject of power factor correction, a great demand is consequently growing for more synchronous motors and static condensers. Pioneering installations of new type synchronous motors have been made to breaker and tipple drives, also fans, pumps and air compressors. Several static condenser outfits have been applied and proven unusually successful in reducing power costs, bettering voltage regulation, and releasing equipment capacities for useful work.

Automatic Panel Reduces Costs

Accurate control and regulation of electrical equipment has taken away the difficulties occasioned by human effort.

Built to Produce at Low Costs

This new breaker of the Colonial Collieries Co. is, no doubt, destined to set new standards of design, operation and success in the anthracite field. It is completely electrified and modern in every respect, in fact, many unique features successfully tried out in other industries are incorporated here. The building looks white because it is completely covered with Johns-Manville corrugated asbestos transite siding.

Measured by the success of past achievements, the future of electrical progress in mining will undoubtedly be great. Even today when relatively few mining companies are completely electrified, E. M. Herr, president of the Westinghouse Electric & Manufacturing Co., has said, "The coal industry, now the largest consumer of electric power, will continue to offer a large market for electrical apparatus."

Economic, market and labor conditions have exerted strong influences promoting electrification; today the advantages of electrical equipment have been proved. Companies which formerly owned the most modern types of steam-driven apparatus have found from experience and operating cost data that savings made by electric drives are big enough to pay capital charges and still show large returns on investments.

Thus the results of the old year forshadow bigger things for the new. Further application of electrical apparatus will be made along approved lines, new problems will be solved with specially designed devices and machines, companies already highly electrified will modernize their remaining steam units and completely supplant stand-by steam stations with internal combustion engines driving electric generators.

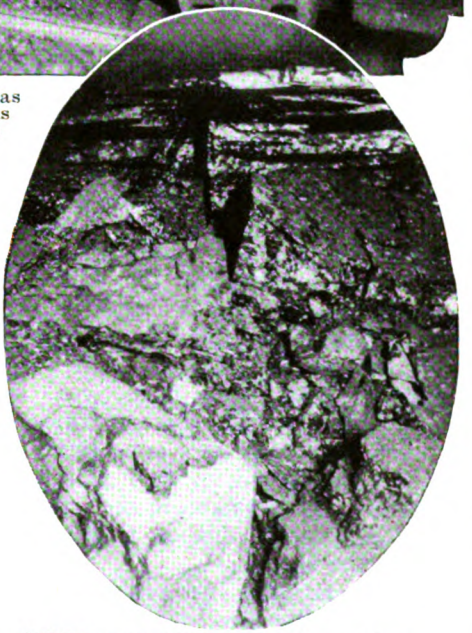
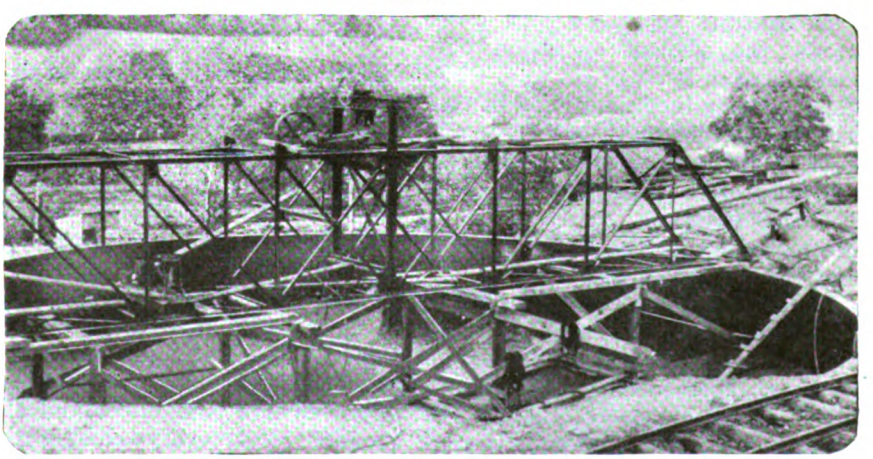
Does "Equipment Make the Mine"?



THIS center-shearing machine has been used in southern Illinois to increase lump output. Its cutter bar swings up and down in line with the center of the machine

THE "rehabilitation" that has been going on in a number of mines in 1925 and mentioned in more or less detail in the following pages proves that it pays to "spend money in order to save it."



POSITIVE operation and large capacity are the characteristics of rotary dumps of this kind Two or more solid-body cars can be discharged as quickly as one.

AFTER a shot in a center sheared face. The size of the coal produced speaks for itself.

THIS compact vibrating screen is popular for preparing small sizes of bituminous coal.

SLUDGE thickener at an anthracite colliery. Today even the smallest size is reclaimed. The water, freed from the sludge, is returned to the washery system.

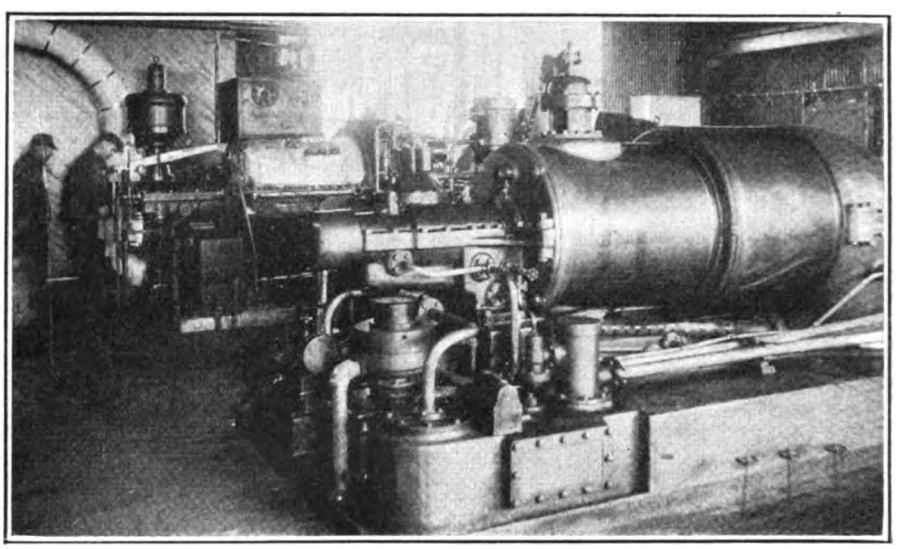
Rehabilitation Is Big Feature in Progress Made During 1925 in American Mines

Cost-Cutting Devices Adopted With Avidity and Power Generation Much Improved—Managements Learn How to Spend Money in Order to Save It

By Frank H. Kneeland
Associate Editor, *Coal Age*, New York City

IF ONE WERE to search for some terse expression that would effectively sum up the progress made by the coal industry during the past year in mechanical improvement he could hardly select a better term than the word "rehabilitation." And, as here used, this would mean "to put on a proper basis," not necessarily to restore to some former state of prosperity or glory.

During 1925 the coal industry was faced with approximately the same adverse conditions that prevailed during the preceding year. Demand was not particularly heavy or insistent, competition was keen, and as stated elsewhere in this issue, the weighted average realization for the bituminous product of the mines amounted to $2.06, or two cents less than that realized during the preceding twelve months. Under such circumstances, only the fittest could hope to survive. The best energies of many operators were accordingly directed toward putting their mines, practices and equipment, in such condition as would enable them to weather the storm.



During the year just past, mines closed down literally by the dozens. On the other hand, the number of operations that worked six days per week steadily increased. In other words, the efficient operation pursued the even tenor of its way, while the hopelessly inefficient mine banked its fires, boarded up the windows, and went to the wall, where it belonged. And the fewer mines working satisfied the country's needs quite as effectively as did the larger number that tried to work in 1924.

Thus, throughout every field strenuous efforts have been made to adapt the mines to better working and to secure cheaper costs. Never before have mechanical devices been adopted with greater avidity, never have consolidations looking toward more efficient operation been more carefully projected, never have improvements in power generation and distribution been more carefully planned or more quickly adopted, never have officials and executives scanned the details of their plants and practices more minutely in the hope of being able to cut down power consumption here, dispense with the services of a man there, or increase the quality of the product by one-half of one per cent somewhere else. Nor have managements been as niggardly as they sometimes have been in making appropriations for improvements.

Probably few individual operations have carried this program of altering top and bottom conditions so as to meet more effectively developed needs, and of transforming equipment and practices in such a way as to assure less expensive production, than has the Valier Coal Co. of Valier, Ill., This mine invested approximately $50,000 in a series of improvements both under and above ground. Yet, every change there made is now earning dividends and will pay for itself in not to exceed three years. Some of them will earn their full purchase price in less than twelve months. One big change made at this operation—the method of distributing bits—paid for itself almost over night. The cost was practically negligible but the savings amount to some thousands of dollars yearly.

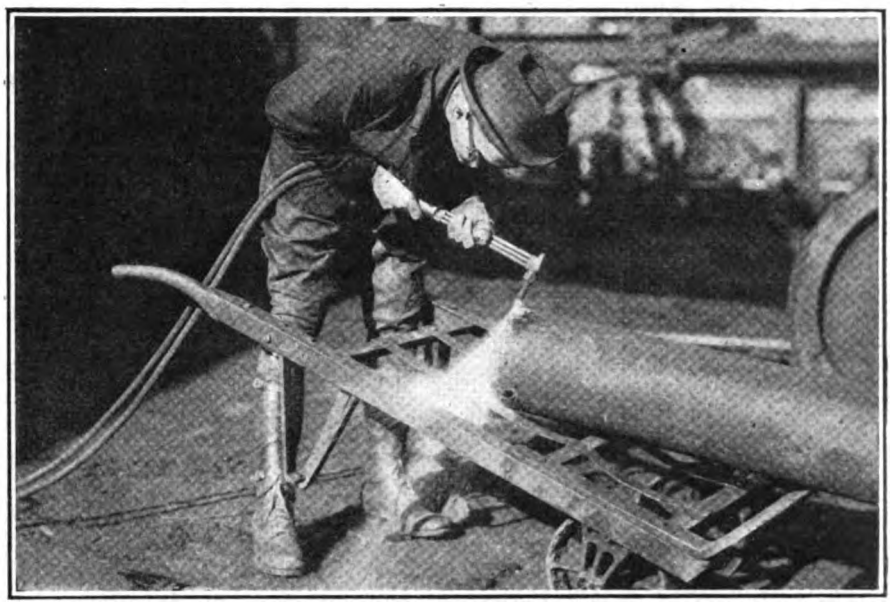
Another Illinois plant that well illustrates this trend toward rehabilitation and saving, is that of the Indiana and Illinois Coal Corp., at Witt. The mines of this company were formerly operated chiefly on purchased power with steam used to a limited extent, chiefly for heating water and for hoisting. The demands for power became so large however, and the expense involved became so great that a modern steam power plant has been erected at one of the mines and power is transmitted at high voltage to the company's other operations in the vicinity. In this plant, high-pressure superheated steam will be generated in modern water-tube boilers and utilized in turbo-generators operated condensing.

A few years ago a decided trend was apparent at the mines, particu-

Turbines Bring Down the Cost of Electric Energy

Years ago many coal companies found the purchase of electric power to their advantage. Today the cost of purchased energy has so increased that in many cases decided economies may be realized from the generation of electric current at the mine. This photo shows the interior of the new power plant of the Indiana and Illinois Coal Corp. at Witt, Ill. It is estimated that not only can power be generated here at a material saving over purchased current but that many of the expensive shutdowns to which mines operated on public service energy are always subject, will be avoided.

Digitized by Google



larly those of the West and in the Appalachian Region, toward the adoption of purchased power. Today apparently the pendulum has started a swing in the reverse direction, as many mines are now forsaking the purchase of current and are building highly efficient generating plants of their own. Of course some mines are so located that water for plant operation cannot be obtained. The mercury boiler has not yet been developed to such a stage as to render it a competitor of the steam boiler for mine operations, and for plants that cannot secure an adequate supply of water the purchase of power is the only alternative at present available.

Utilization of mine refuse as fuel during the past year has been carried further than in the year preceding. At many operations pickings from the tables and sweepings from the mine and tipple tracks possess an ash content that render them unmarketable, yet they have a fuel value sufficiently high to make them available for the generation of power at the mine. This material may be burned either in the powdered form or on mechanical stokers. Naturally, the stokers must be of such kind and type that the ashes are either voided continuously, as is the case with the chain grate, or may be dumped periodically as with certain of the underfeed and other varieties. Probably one of the best examples of a "refuse-burning" mine plant to be started during the past year is that of the Fordson Coal Co. in Kentucky, which utilizes pulverized bone as a fuel. Such plants as this are blazing the way for cheaper power at the mines—power generated at a cost that will clip a few cents per ton off the f.o.b. price of the mine products.

MAKES STEADY PROGRESS

Mechanical loading, which got a real start in American mines only a few years ago, has steadily advanced during the past twelve months as reported in another article in this issue. Some mines are already operated by mechanical means exclusively, others use both mechanical and hand loading, while still others are trying out different makes and types of loaders in order to determine from actual experience which variety will afford the best commercial results. The findings of these operations will be watched with extreme interest.

Last summer a new mining, or rather a cutting, machine of decidedly unusual type, was installed in a mine in Ohio. This saws the coal on a face, 100 ft. or more in length, by means of a flexible cutter passing around and driven by rubber lined sheaves. This cutter travels at high velocity, and the percentage of bug-dust made by it is approximately one-third of that made by the ordinary chain machine. In fact, the quantity of fine material produced is so small as to be almost negligible. The percentage of lump obtained is remarkably high, and no explosives are necessary to bring the coal down. Naturally, the present machine is largely experimental in character, but the results so far secured, both in performance and costs, are encouraging. Much interest will attach to its development.

Cutting Pipe with a Torch Is a Time Saver

A few years ago oxyacetylene was the exception rather than the rule at mine repair shops. Today many shops are equipped with both oxyacetylene and electric welding outfits. The former has the advantage that it may be used for cutting also. The operator is here shown trimming up the end of a heavy pipe that he has just cut off with his torch. Much time and money can be saved around a mine plant by doing large cutting in this manner.

Not only have efforts been made to increase the quantity of coal produced, but to improve its quality as well. In many regions, particularly those catering to a domestic market, the proportion of lump coal produced determines in large measure the return realized for the coal sold. As a result, any increase in the proportion of lump size obtained from the mine product is reflected directly in the amount realized per ton of output hoisted. While much can be gained by careful handling during transportation and preparation, it is at the face and in blasting that the really big economies can be made.

To this end the practice of center shearing the undercut face has been tried, especially in southern Illinois. At least two large coal companies operating in this field have used shearing machines with excellent results, one firm having increased its proportion of lump by as much as 15 per cent. This company makes a shear cut in the center of an undercut face to a point about 8-in. above the kerf. The cutter bar is then raised to its full height and allowed to fall, thus breaking out the coal between it and the under cut. This break widens out for some distance upon either side of the shear. The face is thus snubbed to a certain extent. By this means a free end is provided in the coal face, the quantity of explosive necessary to bring the coal down is decreased, and the product of the shot is rolled out on the floor in better shape for loading. As in the case of many another improvement acting to the benefit of all concerned, however, more or less pronounced opposition to its adoption has been encountered from the miners' union.

BETTER PREPARATION DEMANDED

Year by year the public becomes more fastidious and exacting in its choice of coals. Or, what is another way of saying the same thing, it lays greater and greater stress on preparation, demanding a clean, carefully sized product. This has been reflected during the past year in the installation of better washing and flotation plants, as well as better screens in the tipples. Thus, the Chance and flotation process, and the Rheo washer have made great strides, particularly in the anthracite region of

Digitized by Google

Pennsylvania, although both processes are now invading the bituminous industry. Some remarkable results also have been obtained from the apparatus which for want of a better name has sometimes been called the hydroweir or hydrowasher. This machine separates the coal from its accompanying impurities in an upwardly moving current of water. It is most efficient in treating the smaller sizes, but has been successfully used on grades up to and including pea.

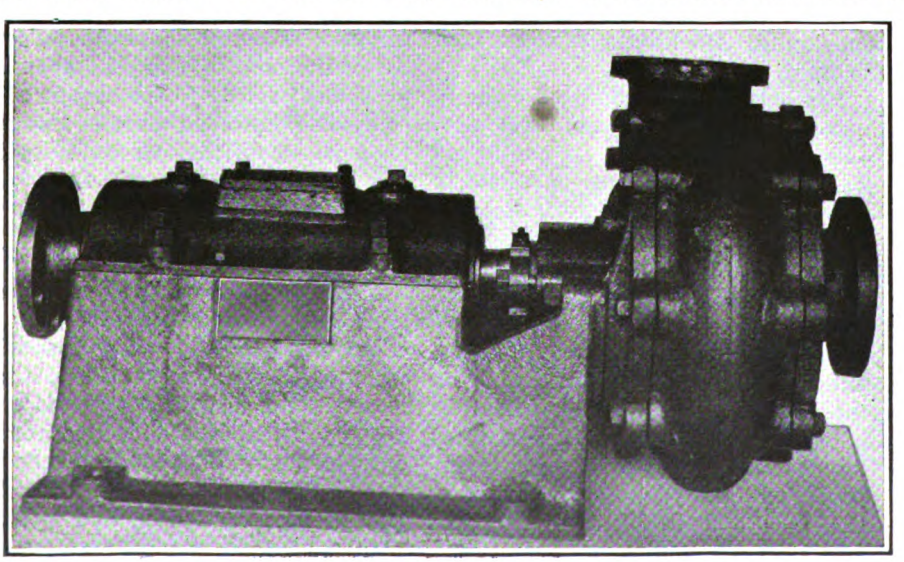
LESS ROOM REQUIRED

All of these devices take up less room than do the usual jigs and tables. Some of them, notably the Chance cleaner, may be used most advantageously if the breaker or washery is built especially to accommodate this type of machine. Some such installations have already been made and more are under construction and in prospect. The hydrowasher on the other hand is so much smaller than the ordinary jig of equal capacity that when installed in a breaker or washery built for jigs it gives the casual observer the impression that the building is far larger than necessary to house the equipment installed.

For treating the smaller sizes of bituminous coal the vibrating screen is in many instances supplanting the much larger oscillating screen or shaker. The vibrating screen trembles or vibrates under the action of a rapidly revolving, unbalanced weight, causing the tightly stretched wire cloth forming the screening surface to tremble in much the same manner as does the belly of a violin under the action of the bow, strings and bridge. The capacity of these machines is high, and they may be made multiple-decked so that several sizes may be prepared on the same machine. They are becoming justly popular, particularly in the Middle-Western fields, where the preparation of small sizes is carried to a fine point.

Nor have improvements in equipment been confined to machines employed directly in coal production or preparation. There is no question but that the caterpillar mounted stripping or overcasting power shovel possesses advantages over the type that must be provided with rails or track. Heretofore it has not been considered possible to mount a shovel of the size now used in stripping operations in this manner. During the past year, however, a big stripping shovel of this kind has been built and mounted on caterpillars.

This machine, which was constructed for the United Electric Coal Co., of Danville, Ill., and intended for use in one of this firm's strip pits in the western part of that state, will weigh over 1,000,000 lb. Naturally, it is of the full-revolving type. The generous use of alloy steel in its construction has rendered its caterpillar mounting possible. The operation of this new shovel will be watched with keen interest by coal men interested in stripping.



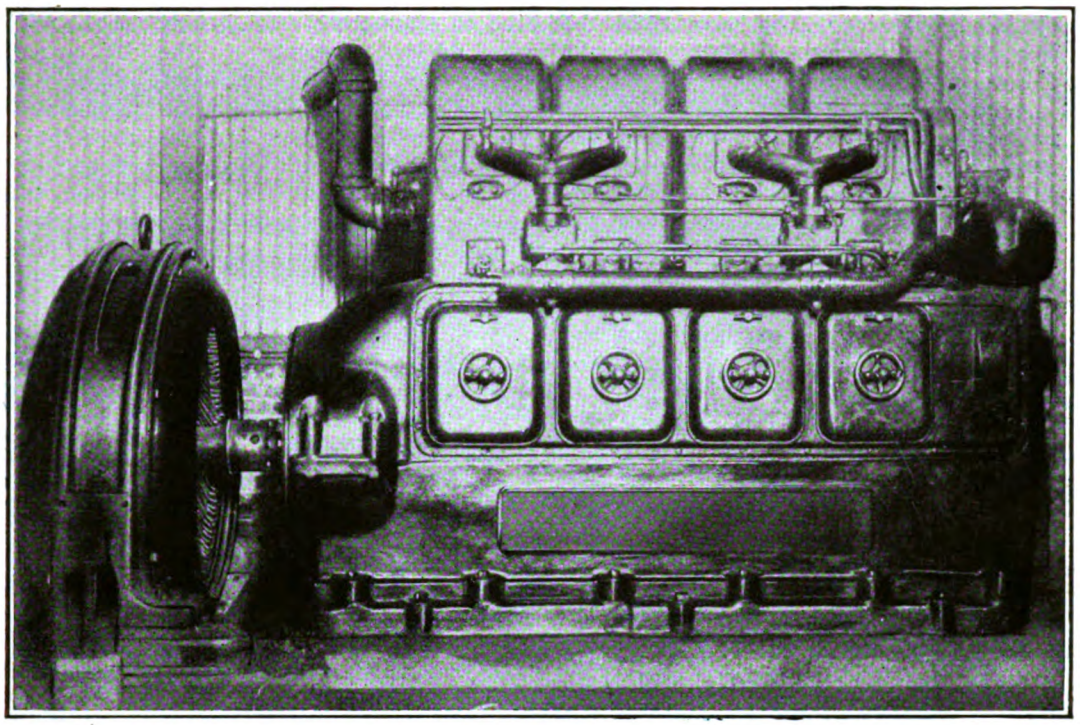
One of the potent factors in this program of rehabilitation and cost lessening, has been the further adoption and installation of automatic substations and automatic pumping stations. The electrical transmission of power within the mines has now become all but universal. Placing the control of substations and pumping stations in various electrical devices which "never slumber nor sleep" but are constantly "on guard" permit the men previously employed to care for and manipulate such installations to be used in productive work elsewhere. Stations of this kind have fully demonstrated their utility and practicability. Last year saw several of them installed, and their use will unquestionably increase in the future.

In the matter of mine haulage, several improvements have been made. Although many of these may rightfully be considered as being of a minor character, they have, nevertheless, an appreciable influence on the cheapening of costs. Bigger cars are today the rule. In some instances this necessitates the employment of larger locomotives; in others it merely means doubling or articulating units: that is, placing two or more under the control of one man. This limits the stress imposed upon the track to the weight of one locomotive.

CARS BUILT BIG AND LOW

Present practice tends toward the large, low, solid body, box type of car intended for discharge by means of a rotary or some other type of dump which will turn the car almost completely upside down. Automatic couplers have been employed with good results.

Grease lubrication applied under high pressure is largely supplanting the older oil lubrication. This change has been contemporaneous with the extensive adoption of the roller bearing on transportation equipment. Packing a roller bearing of large capacity with grease under pressure once in six months is far cheaper and more satisfactory than employing a boy continuously to oil the cars. In fact the playful young oiler, whose presence in the tipple or dump house or on the shaft bottom or landing, was once common and who beguiled the monotony of the day's labor by occasionally squirting blackstrap at one or more of his associates even though such a course might necessitate a hasty and precipitate retreat, is now fortunately almost extinct. The "car greaser" with his pail and "squirtgun" was unquestionably a picturesque figure, but he could not compete in cost or efficiency with the "power gun" that now lubricates the cars at comparatively infrequent intervals.



New Pump for Special Flotation Processes

For the several flotation methods of cleaning coal now used the Morris Machine Works has developed this new pump. All wearing parts of this unit are made of manganese steel, thus it has been possible to combine the high efficiency of the usual type centrifugal pump with the ruggedness and durability of a dredging pump.

Digitized by Google

Dependable Stand-by

Should power for any reason go off the line, this stand-by engine can be started on short notice and is large enough to furnish emergency current. The installation of such units as this is becoming quite a common practice, especially at mines that operate on purchased energy. With a machine of this kind a mine is seldom completely "down and out."

Further progress has also been made in adapting the use of electric haulage to so-called gassy mines. This, however, has largely taken the form of improvements in the details of construction of the storage battery locomotive and the portable power unit, as well as in their charging facilities. A new binder to hold the active element in the battery plate was discovered in England. This apparently possesses great possibilities for increasing the capacity, life and efficiency of the battery itself. Experiments with this material have not yet been completed even in Europe, and, therefore, it is here mentioned merely to indicate a possibility of the future.

For many years coal mines in England and English possessions, including Canada, have been large users of steel mine car wheels, whereas this country has clung tenaciously to the chilled tread cast-iron wheel. Within the recent past however, the steel wheel has made its appearance in the United States chiefly in the mines of the South. Admittedly this type of wheel possesses many advantages chief of which are its greater lightness, toughness and strength. Decreasing the dead weight of a car is equivalent to increasing its carrying capacity as well as adding to the coal handling capacity of the locomotive.

Naturally, the railroads have perfected the science of material handling and brought it to a point well beyond that attained by other industries. As coal mine haulages grow longer and heavier they parallel more and more closely the problems of railroading. The mines may well in many cases, therefore, take a leaf from the notebook of the common carriers and emulate their practice. Some operations are doing this very thing and installing not only telephonic dispatching systems but also railroad switchboards provided with electrically lighted targets, semaphores or their equivalents, remote control switches and the like, all of which tend toward the rapid and efficient movement of the coal from the face to the shaft bottom. Valier furnishes an excellent example of work of this kind although many other mines are making improvements of a similar or parallel nature.

Rock Dusting Leads

Probably the chief safety measure extensively employed during 1925, at least the one which is most spectacular and which is intended to forestall the most spectacular of mine accidents, was rock dusting. Although this practice has been followed for years by some coal companies, it did not receive general attention until about 1924. Work begun during that year was continued in 1925 and now more than 200 mines producing in excess of 10 per cent of the country's coal have been treated with this inert material. Rock dust has demonstrated its effectiveness as a killer of explosions upon several occasions. Its use is now compulsory by law in some states and it is only a question of time until most mines throughout the country will be thoroughly protected in this manner.

During the past twelve months electrification of mine equipment kept up the pace established in previous years. Even at mines where the hoist is installed in close proximity to the boiler house and steam is therefore available for use in hoisting engines it has been found advantageous in many if not most cases to operate the hoist electrically. Power consumed by an electric machine is easily and accurately measurable, thus revealing not only the average but the peak loads as well. This fact has been largely responsible for the adoption of the cylindro-conical drum in lieu of the older cylindrical and double conical forms. For a given capacity this shape of drum imposes a smaller inertia load on the machine than do either of the other forms mentioned. This type of drum, therefore, is the one usually selected on present-day hoists.

Purchased power has brought problems of its own. One of the most exasperating of these is line failure. During recent years it has become increasingly customary to make provision at mines served with purchased energy for operating at least the fan and the man hoist should power go off the line from any cause. To this end stand-by engines and generators have been provided. In many cases the stand-by unit consists of a vertical multi-cylinder engine direct connected to an

Digitized by Google

electric generator. The year 1925 saw the installation of many machines of this kind.

According to the old fable the reeds bent before the wind and escaped injury whereas the sturdy oak stoutly resisting the force of the gale was destroyed. A somewhat similar principle has been put to good effect by lining mine pumps with rubber. In machines of this kind handling gritty water or that carrying much foreign matter a non-yielding metal is quickly abraded or cut away whereas rubber, because of its resiliency is little affected. An advantage inherent to the rubber lining is the fact that it is almost inert to the action of acid in such concentrations as are usually encountered about coal mines. Pumps of this type are being given a thorough trial in coal preparation plants using the sand flotation process. This type of service closely parallels their use in the metal industry in pumping concentrator slimes.

It would be manifestly impossible within the confines of an article of this kind to enumerate even briefly the many devices applicable to the mines that have been introduced, developed or improved during the past year. Their number and variety have been too great. The reason for the intense interest manifested in mechanical devices intended to replace hand labor and in advanced methods for improving the quantity and quality of the mine product is not hard to find. Highly competitive conditions have brought the bituminous industry face to face with the necessity of reducing costs. In only slightly lesser degree the same is true of the anthracite industry as well. When muscular energy under the present wage rate costs anywhere from $4 to $8 per horsepower-hour, whereas an equal quantity of power in the form of electric current may be delivered at the working face for approximately 2c., it is only logical that mechanical energy will be used whenever and wherever its adoption is possible.

Again, although improved methods of operation, such as center shearing of the working face, may not increase the output produced by so much as a single ton, yet if it improves the quality sufficiently or to such a degree that the increase in realization more than outweighs the added expense, this practice should by all means be adopted. If other practices that improve the quality of the output, such as cushioned shooting, for instance, interfere with state laws that were framed long before these practices were invented, it is high time that the statutes thus infringed were modified.

Many long strides have been taken toward the mechanization of American coal mines; many others yet remain to be taken. The progress accomplished during the recent past unquestionably will be continued and extended during the year that lies ahead. The industry is today confronted with a new set of conditions which it has never before been required to face. It is solving its difficulties by the adoption of improved practices and improved equipment. The mines are being rehabilitated.

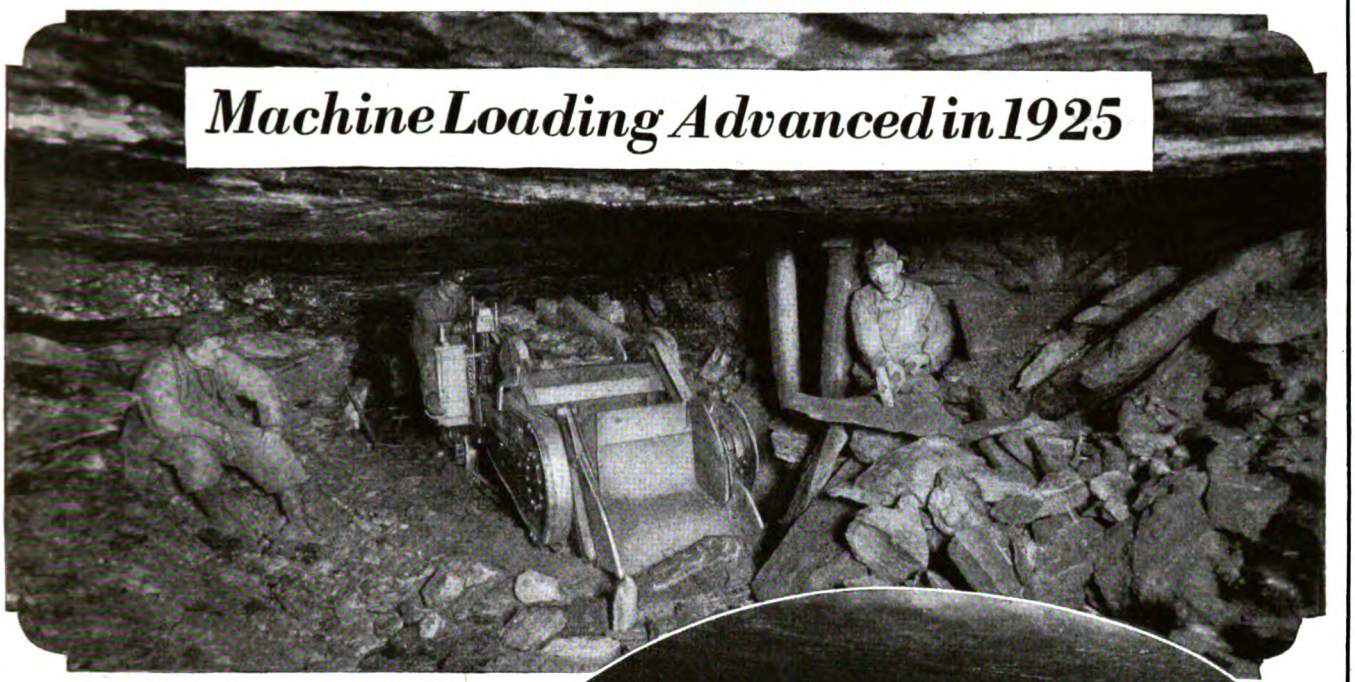
a Note that the coal statistics of the Geological Survey for a given year include only the mines that had an output in that year. The number of active mines of commercial size in West Virginia was 1,666 in 1923 and 1,220 in 1924; in Wyoming 62 in 1923 and in 1924. Many mines that operated in 1923 produced no coal in 1924; moreover, many of the mines that did produce in 1924 worked for a short time only.



b Includes also loaders and shotfirers.

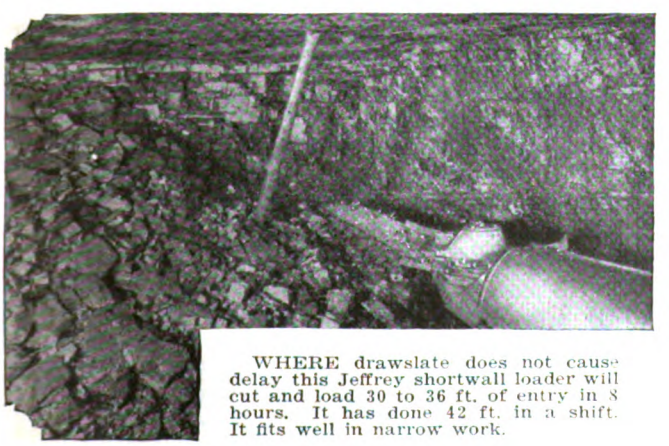
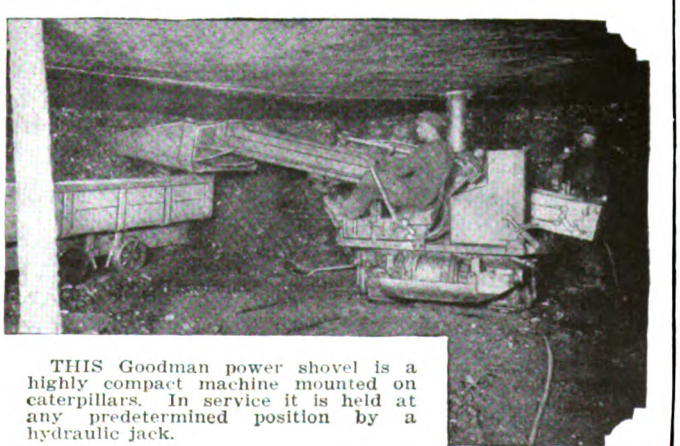
Machine Loading Advanced in 1925



CLEANING up a gangway with a Myers-Whaley in West End Coal Co.'s anthracite mine at Mocanaqua, Pa.

FIVE HUNDRED machines are covered in the performance record spread on the pages that follow. These give a definite impression that underground loaders are an indispensable aid in mining.



THE ENTRYLOADER (left) solves the sore problems of loading and transportation. In the platform, overhanging the mine car, is a hoist which draws the bucket (shown above) to and from the face. The operator of the scraper is on the entry and cannot see the bucket when it is at the face. Yet the control is so positive and flexible that this man can feel conditions and the position of the bucket with respect to the face.

WHERE drawslate does not cause delay this Jeffrey shortwall loader will cut and load 30 to 36 ft. of entry in 8 hours. It has done 42 ft. in a shift. It fits well in narrow work.

THIS Goodman power shovel is a highly compact machine mounted on caterpillars. In service it is held at any predetermined position by a hydraulic jack.

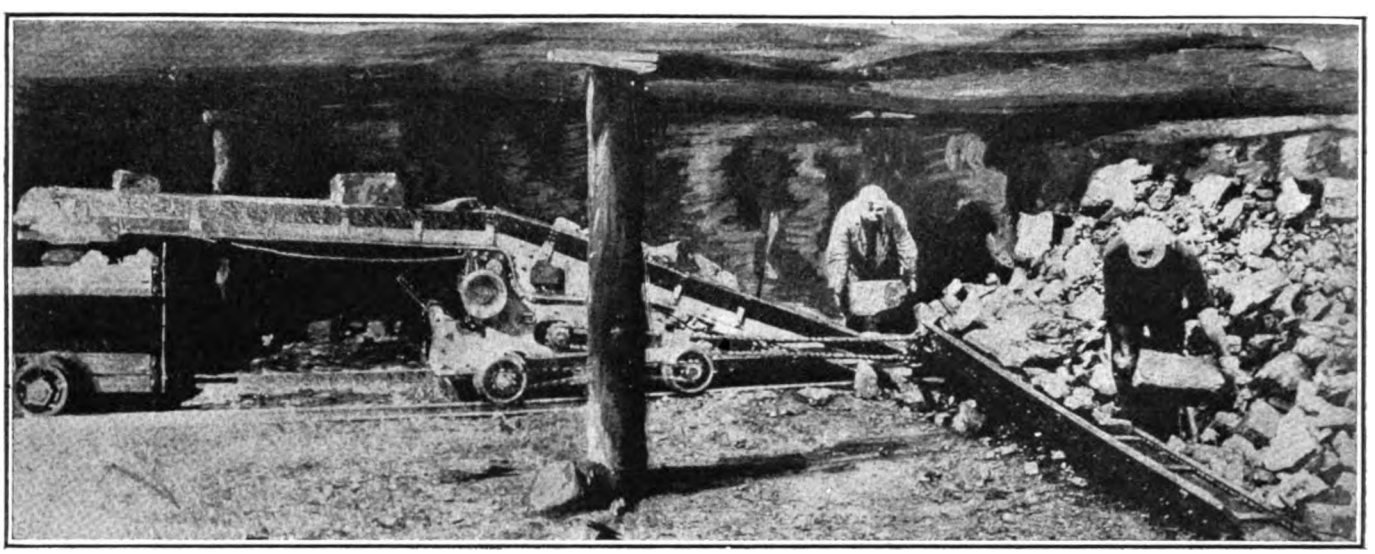
Experience in 1925 with 500 Mechanical Loaders Clears Way for More Progress in 1926

These Machines, Exclusive of Conveyors, Handled Eight Million Tons or 1½ per Cent of Country's Output—Fewer Delays by Machine Failure

DURING 1925 underground loading by machines flourished in some places, developed slowly in others or died out, according to the degree of its opportunity. Experimentation, practiced broadly, stimulated its growth however. A variety of experience with various machines in many fields contributed to the industry's knowledge of the art and in recording the results it is the intention in this article, and another in this issue on the kindred subject of conveyor usage, frankly to give the good with the bad. The industry profits by its failures as well as by its successes.

In this magazine's review a year ago of progress in mechanical loading it was estimated that 1½ per cent of the nation's coal produced in 1924 was loaded mechanically into mine cars or by hand into conveyors. It was predicted that the tonnage of 1925 loaded by these means would exceed the combined output similarly produced in all preceding years. This prediction was fulfilled. The total tonnage handled by loading machines was nearly 8 million tons.

Definite figures of production from a number of mechanized operations, added to piecemeal data from others give a total for machine loaded coal alone slightly in excess of 1½ per cent of the entire production of bituminous coal for 1925. Various types of conveyors produced during the year about 1 per cent, so that the two handled at least 2½ per cent of the year's bituminous production.

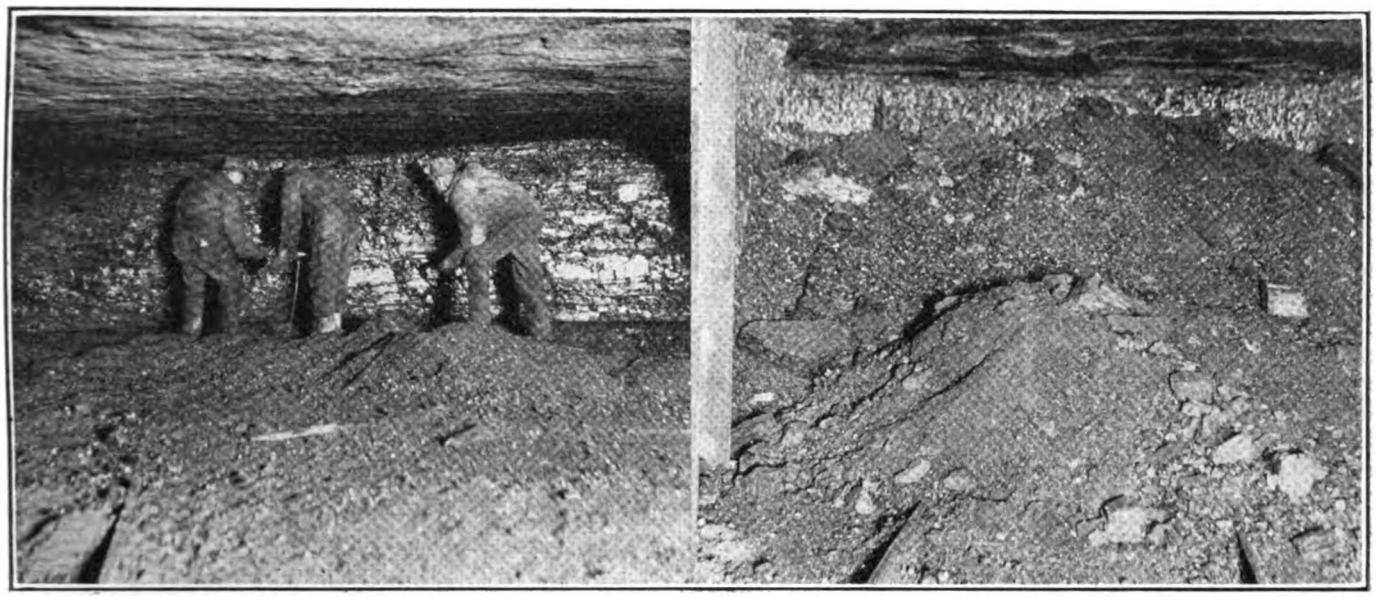


This survey has accounted for about 500 machines, which are in more or less constant use. Most of these, loaded more than 75 tons per shift. By assuming this as an average for 200 days, the 1½ per cent estimate stands as reasonably accurate.

Investigation brought to light a good many interesting facts as to loading machine performance during the year. The Pocahontas Fuel Co. produced with Coloders about 1.6 million tons and in this respect continues at the top of all single companies. Joy machines in operation during 1925, numbering 175, have produced nearly 4½ million tons. One of these machines alone in the mine of the Gay Coal & Coke Co., in Logan County, W. Va., produced about 70,000 tons last year, working two shifts each day. The Monitor Coal & Coke Co., in the same field, is reported to be producing regularly a minimum of 200 tons per shift using a Goodman power shovel, and the company claims the installation is beyond the experimental stage. The Ayrshire Coal Co., in Indiana, is gaining a consistent output of 1,200 tons per day with Joys.

Two completely mechanized mines of the Pennsylvania Coal & Coke Corp.—Ehrenfeld No. 8 and Arcadia No. 42—jointly produce 1,200 tons per day using scrapers and portable conveyors. Six other companies have reported daily averages of machine loaded coal in excess of 1,000 tons, with requests that their identification be hidden. Production of 500 tons per shift by this means is rather common.

Last year at the Acme mine of the Sheridan-Wyoming Coal Co., in northern Wyoming, eight Goodman power shovels and four Joys were installed in a program of complete mechanization. During November of last year the machines working in rooms 26 ft. wide and 10 ft. high loaded nearly 200 tons per shift each. The coal is 40 ft. thick but only 10 ft. of it is brought down in first mining. Other machines while working two-thirds of their time in pillars and the remainder in entries averaged about 160 tons per shift each.



Driving of entries by machine has

Jeffrey Pit-Car Loader Proves that Mechanical Complications Are to Be Avoided

One of the simplest and most effective loading devices thus far developed is the pit-car loader which is nothing more than a portable inclined conveyor into which coal is loaded by hand and elevated to the mine car. In wide places portability is most helpful.

Correct Drilling and Shooting Are Important to Machine Loading Success

These men are drilling coal for mechanical loaders, expert shooting of coal is essential. That being the case, responsibility for drilling must be vested in men who understand shooting. The electric drill insures the proper location of holes. The coal shown at the right was shot too hard. The need for better blasting methods where loading machines are operated is imperative. Where the coal is pulverized, as it was in this room, the loss of lump coal offsets any saving in loading. This subject is getting more attention nowadays and will be one of the leading subjects at mining conventions next year.

demonstrated its superiority over the hand method. By and large, loaders and conveyors are already achieving satisfactory results in entry work. The reason for this is, no doubt, the close supervision which such operations receive by reason of the anxiety of the operator to push development. Even where the cost of driving mechanically is slightly greater than that incurred by hand loading, the operator is satisfied with his investment because the advance is more rapid.

Almost every one of the loading machines now in use has been applied in some degree to the driving of narrow places. The Pennsylvania Coal & Coke Corp. has been successful with a small type scraper in this work. This device and two others—the Jeffrey 43-A shortwall loader and the McKinlay entry driver—belong in one class because all three operate more or less continuously in a single place. The shortwall loader and the scraper, of course, can be relocated readily, but the McKinlay machine must be torn down at the old location and reassembled at the new or else it must cut its way through solid coal to a new place.

The Jeffrey shortwall loader is demonstrating its ability to advance an entry 30 to 36 ft., or 5 to 6 cuts, in a shift where the roof is good and the machine, therefore, is not delayed by the handling of roof material. This machine cuts and loads, discharging into a sectional conveyor. While a place is being cut it is being drilled also and the machine, consequently, is idle only during the time required for shooting and clearing away the smoke. Incidentally this lost time is little inasmuch as a blower moves smoke speedily.

At one of the mines of the Fordson Coal Co. at Kentenia, Ky., one of these machines was in service during the last six months of 1925 and in that period advanced an entry 2,651 ft., which is equivalent to about three 6-ft. cuts per shift. Following is the comment of this company on its experiences with this machine:

SHORTWALL LOADER INSTALLED

"On June 15, 1925, one of the Jeffrey shortwall loaders was put in service in entry driving. In conjunction with this machine is a sectional conveyor composed of 6-ft. segments which are added one at a time as the loader advances in the entry. This conveyor is laid along one side of the entry parallel to the mine track for the cars which carry the coal away from the conveyor. This arrangement necessitates the use of a 7-ft. cross conveyor for carrying the coal from the sectional conveyor to the mine cars. At this transfer point, which is advanced about every 250 ft., a pot hole must be shot in the roof over the discharge point above the mine car.

"The rate of advance with this machine depends on several factors, such as the height of coal, width of entry, character of top and coal and any regulations or state laws governing shooting. One of the claims made for this machine—that it will achieve continuous operation—does not hold good where heavy drawslate is encountered. Under this condition this machine is at a disadvantage because it is delayed while the operating crew cleans up the slate. In one of our experiences we encountered a heavy drawslate which could not be held by timbers. As the operating crews on our loaders are among the highest paid, we were compelled to use high-wage men on work which is usually accomplished by men who are paid the least; besides, we suffered a loss due to the part-time idleness of the machine.

"Although the machine has disadvantages it has made a pretty fair record as to cost, production and advance during the last six months or so. Mechanically it has given us little trouble. One of the biggest items of repair has been the charge for feed ropes which drag the machine across the face."

The Fordson Coal Co. installed the first new type McKinlay cutter and loader, which started to operate early in 1925. In the eight months of the year in which it was in actual operation this machine advanced an entry 3,961 ft., cutting and loading 7,205 tons. During the month of June it advanced the entry 745 ft. On this machine the company reports to *Coal Age* as follows:

"The McKinlay cutter and loader is strictly an entry driving machine and is not adaptable to wide work. It operates most favorably where long entries are to be driven and, therefore, little moving of the ma-

Digitized by Google

chine is necessary. Due to the size and weight of the machine it is necessary to take the machine apart to move it any great distance, which requires at least 15 days and the services of about six men. On one occasion we moved the machine 1,800 ft. by driving it through solid coal, deciding that this course would be cheaper than its alternative. While driving to the new location it was necessary to negotiate two right-angle turns. This was done by driving it 40 ft. beyond the turning point which was widened out in the new direction by four cuts of a mining machine, allowing the machine to be backed and slewed in the new direction under its own power.

"Our McKinlay was idle approximately four months during 1925 due to breakdowns which were not quickly remedied, ours being the first machine of its kind in commercial use. With further developing and some redesigning we think this machine will have real promise as an entry driver.

COST OF ADVANCE LESS

"Our experience has been that the cost per ton of coal mined by this machine is slightly greater than that of hand loaded coal. The cost per foot of advance by the machine, however, is about 2 per cent less than that incurred when the driving is by hand. The reason for this is that the section mined by the machine is of less area than that of an entry driven by hand."

A test machine of this type, equipped with a 75-hp. motor which is much larger than that on the McKinlay machine at the Fordson operations, is now in use in the Nason mine of the Illinois Coal Corp. It is equipped with a conveyor under which two mine cars can be placed. In this mine it has made an advance of 42 ft. in 8 hr. which is not the limit by any means, for frequently it has advanced 10 ft. in one hour.

A wide difference of opinion prevails as to whether loaders and conveyors should be applied to the old room-and-pillar layout with possibly some few modifications or whether these devices should be used on long faces to gain the benefit of economies long face layouts theoretically provide. Many failures in trials of long faces can be attributed to lack of knowledge and experience. Roof action, as applied to each particular condition, is not well enough understood. So attempts to control the roof in many cases have failed.

Thus far no loader that is easily portable has been applied successfully to advancing or retreating long faces. This, however, does not apply to scraper loaders, to the Jeffrey conveyor loader or to the O'Toole long face machine, none of which can be moved quickly from place to place. All portable loaders thus far developed have been working in rather narrow places and on pillars which sometimes are slabbed. This slabbing is the nearest approach to an application of portable loaders to long face work.

MACHINE PRODUCES 70,000 TONS

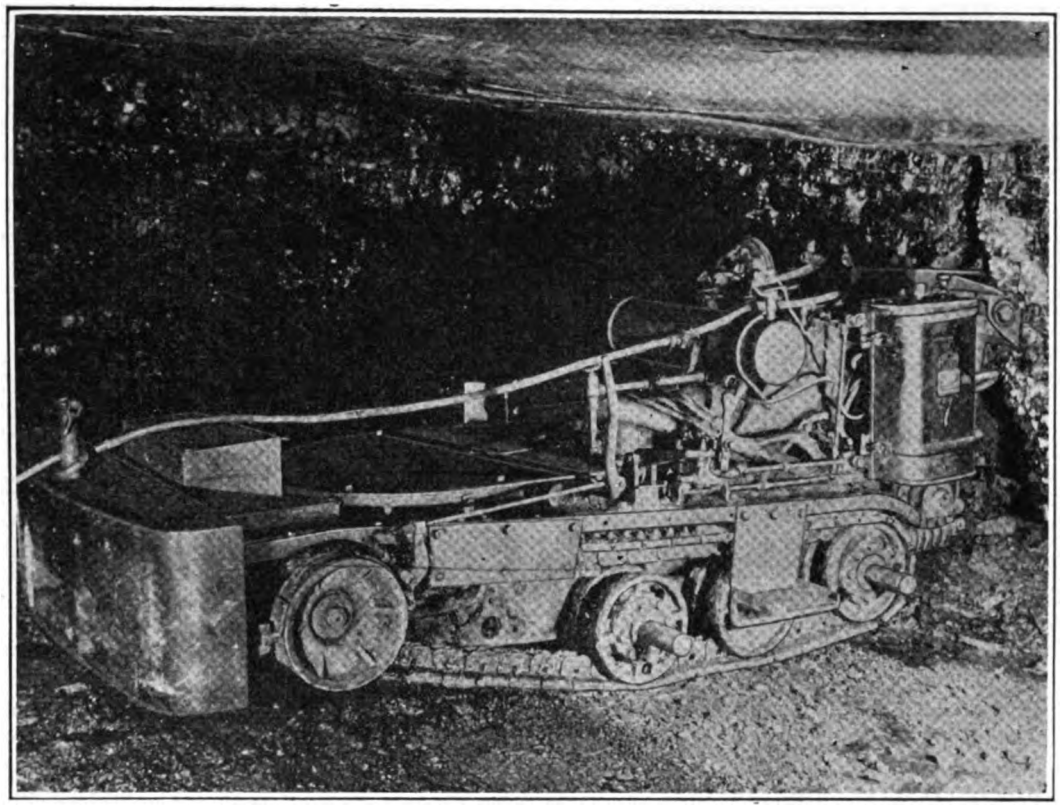
It is by this arrangement that the Gay Coal & Coke Co. established its enviable 1925 record of 70,000 tons from one machine. In the section of the mine worked by this loader several inches of loose roof slate overlies the coal; also there is a heavy shale band in the coal which is removed by a turret cutter. Pillars 135 ft. wide and 350 ft. long are mined by slab cuts which move toward each other and toward the long axis of the pillar. The seam is approximately 6 ft. thick.

The Bertha Consumers Co. is operating five Joys and one Myers-Whaley machine in the Eureka mine which is located near Morgantown, W. Va., and in the Pittsburgh seam. Here a typical Pittsburgh region room-and-pillar layout is employed in which rooms are driven and pillars recovered by means of these machines. Rooms which are 18 to 20 ft. wide on 50-ft. centers are driven 250 ft. long. The pillars are drawn by butoff places 18 ft. wide supported by a 6-ft. stump or peg which is pick-mined. As this mine was closed during much of 1925 because of a fire, records of full-time operation are not available. An output of as much as 236 tons has been produced by a single machine in one shift and on many days individual machines have loaded 150 tons.

JOYS LOAD AYRSHIRE'S OUTPUT

The Ayrshire No. 6 mine of the Ayrshire Coal Co., Indiana, is now producing about 1,200 tons per day, all of which is loaded by Joy machines. The No. 5 seam here is about 6 ft. thick and is overlaid by drawslate which varies in thickness up to 18 in. and comes down with the coal as a general rule. The depth of cover is about 100 ft. There is no gas, and no dust is stirred up by the machines. Rooms are 26 ft. wide on 33-ft. centers. The output is obtained by seven machines on the day shift and three on the night shift.

Inside and outside, about 130 men are employed, all of whom are paid a day wage except the cutters who are paid the tonnage scale provided by the agreement for the district. The coal is undercut and drilled electrically. This company finds that expert shooting of coal almost entirely offsets the breakage due to machine loading. The presence of drawslate requires one man to clean up after each machine, and to set timber and pull down loose slate. David Ingle, the president of the company, believes long faces could be worked quite satisfactorily in this mine if it were not for this drawslate.



At present only 60 working places are maintained as against 180 for an equal output under hand loading methods. The plant's labor cost has been reduced about 30 per cent but the supply cost has increased appreciably because the company must stand the overall charge for drilling and shooting, of which the cost of explosives is by far the biggest item. Additional power charges and machine repairs contribute to the increase.

MACHINES AID POCAHONTAS CO.

The Pocahontas Fuel Co. continues to roll out big tonnages mechanically from its mines in the Pocahontas No. 3 seam. A few additional machines and bettered efficiency of those in long time operation have enabled this company to increase its machine loaded output from 1.25 million tons for 1924 to 1.6 million tons last year. Four Coloders have been installed in the new Faraday mine of this company and three more machines will be installed soon, to be followed by others as development progresses. The company is pleased with the fact that the cost per ton over long periods varies by only a fraction of a cent. Upkeep costs and interruptions are few.

In practically every coal-producing state scraper loaders are being tried and with a fair measure of success. That this type of loading device will not pass away is evidenced by the keen interest being taken in it everywhere. Its utility for loading and transporting coal without sacrificing simplicity and ruggedness and its comparatively low cost, has made many friends. If the practicability of the various forms of "V" layouts is eventually proved, the future will probably see many scrapers applied

Digitized by Google

Joy Shearing Machine

It is mounted on a caterpillar tread and is provided with demountable mine car wheels such as are used on the Joy Loader. It follows the undercutting machine from place to place. Shearing not only increases the percentage of lump but also boosts the daily tonnage of a mechanical loader by eliminating tight shots.

to this mining plan which provides an easy path for them in moving from the face to the mine car or conveyor.

In its Ehrenfeld No. 8 mine and its Arcadia No. 42 mine the Pennsylvania Coal & Coke Co. is using scrapers of 1,500-lb. capacity, equipped with 35-hp. motors, in a modified "V" layout. In the first mentioned mine the seam is 4 ft. thick and in the last it is less than 3 ft. At Ehrenfeld, where three bands of impurity occur in the seam, outside mechanical preparation is required. At Arcadia, where the impurity is confined to a small sheet of bone over the seam, the coal is satisfactorily prepared at the face. The entire output of these two mines, which totals 1,200 tons per day, is produced mechanically. The experience of this company with mechanical loading methods has been uninterrupted operation and a substantial increase in output per man.

In this company's mines trials of machines designed to pick up coal with flights, arms, bits, etc., have not been successful.

In most parts of the country the tendency is toward the use of large capacity scrapers in thick seams. In the No. 4 mine of the Union Pacific Coal Co., Rock Springs, Wyo., a 3-ton scraper, made by the company, is now in use and a 4-ton Goodman scraper will be installed soon in an adjoining mine. The scraper now in use in coal from 6 to 9½ ft. thick is producing 200 to 270 tons per 8-hr. shift, with a crew of only six men who perform all the duties incident to the work of this machine. During its operation in 1925 this machine worked on a long, inclined face.

The new big Goodman scraper will be equipped with a 3-drum hoist propelled by a 125-hp. motor. This hoist will spool 800 ft. of ⅞-in., 1,200 ft. of ¾-in. and 1,700 ft. of ⅝-in. rope. In conjunction with this equipment four sections of conveyor mounted on mine car wheels are provided to carry the coal from the discharge point of the scraper to a trip of cars on a parallel entry. By this means it is believed the scraper will not have to be moved oftener than once in 10 days. The layout will employ a long straight face.

Scraper Loaded 450 Tons in 8 Hr.

One of the big scrapers introduced last year is the Ace which proved its high capacity while in operation in Mine A of the Pike County Coal Corp., Petersburg, Ind. It has loaded as much as 450 tons in 8 hr. over a period of many shifts in coal which ranges from 7 to 9 ft. in thickness and which has good roof and bottom. The bucket is 10 ft. long, 5 ft. wide and 32 in. high. It loads into a dumping platform extending over a haulway on which mine cars are spotted. This scraper is operated by a 125-hp. hoist which is capable of dislodging standing coal and imparts running speeds to the bucket of 500 ft. per minute when running light and 350 ft. when loaded. The loading platform incorporates a storage basin under which is an apron conveyor extending to the tip of the mine-car loading boom.

The Jeffrey shortwall loader is applicable to room-and-pillar work as well as entry driving. In places 25 to 30 ft. wide it loads directly into a sectional conveyor but in wider places it discharges into an auxiliary face conveyor which joins with the sectional conveyor. It also is claimed to have application in long-wall work in which case it would load from an end-on position into a sectional conveyor, thus requiring no space between the latter and the face. In two mines where the entire output is loaded by these machines the average daily output per man, inside and outside, is 10 tons.

Another interesting mechanical loading operation which bore fruit last year, as reported by Dever C. Ashmead, anthracite mining engineer of the U. S. Bureau of Mines, is the Hoar shovel installation in the Pancoast colliery of the Price Pancoast Coal Co., in the anthracite field. In the operation of this colliery during the past year this shovel facilitated the reclamation of pillars in old workings by loading out rock, 1 to 8 ft. thick, in caved chambers. The cost of this method of clean-up as

Joy 5-BU Operating in One of the Mines in Which It Has Had Conspicuous Success

One of these machines in an operation of the Gay Coal & Coke Co., Logan County, W. Va., last year loaded 70,000 tons, double-shifting. In that time, states Harry S. Gay, Jr., general superintendent, the machine more than paid for itself.

compared with that of hand loading showed a saving of 35 per cent.

In the King mine of the Princeton Mining Co., near Princeton, Ind., two 4-BU Joys, two Jeffrey pit-car loaders and one Myers-Whaley loaded a combined average of 452 tons per day over a long period despite the fact that three of these machines were working in narrow places while only two were in operation in rooms. An Oldroyd loader was in operation there during the last half of the year but no record of its production was received.

The intense interest taken at the recent meeting of the Coal Mining Institute of America in the discussion of the highly successful use of the Myers-Whaley machine for cleaning up falls in back entries and for assisting in the brushing and taking of bottom indicates that this type will serve another specific purpose besides loading coal. One company in central Pennsylvania is operating six of these machines in this work in a low seam. The Lynch mines of the U. S. Coal & Coke Co., Lynch, Ky., are using two of these machines in the work of increasing the height of their entries. In rock work the Myers-Whaley is loading from 50 to 125 cars—1½ tons of coal capacity—in 8 hr.

The Jeffrey conveyor-loader belongs to the family of loading machines as well as to that of conveyors. As its name implies this device both loads and conveys coal and is applicable to long face work. Briefly, it is a flexible conveyor which rests flat on the bottom and is fed forward into loose coal by ratchet jacks. This conveyor extends the entire length of the face, is only 28 in. wide and 17 in. high, for which reason it is suitable for low coal and timbers may be set close to the face. Flights hinged to the conveyor chain gather and convey the coal. This mechanism facilitates the taking of two cuts from a long face in one shift.

The O'Toole machine, which is 42 ft. long, is intended for long face work in which it loads as it cuts. During 1925 it produced 89,887 net tons of coal in an actual working time of 2,272 hr., an average of 39.5 tons per hour. On the performance of this machine during 1925 in one of the mines of the U. S. Coal & Coke Co. at Gary, W. Va., Colonel O'Toole reports: "The operation of the cutting and loading machine has been satisfactory and by its use we have increased the production per man 25 per cent. We consider this good inasmuch as the machine is experimental and we would have done better had we not been experimenting for the greater portion of the year with a new roof control machine."

NEW JOY DESIGN SUCCESSFUL

During the past year the Fordson Coal Co. operated one 5-BU Joy at its Kentenia operations in Kentucky. With regard to its performance L. C. Skeen, superintendent of these mines, has this to say:

"The 5-BU Joy loader has been in use here for the entire year of 1925 with the exception of the month of June when the machine was thoroughly overhauled and the new improvements of the later type added. Our experience with this machine during the first six months of last year, before it was rebuilt and the new improvements added, involved one delay after another, due to mechanical trouble. Our records for this period show that the machine was down for repairs 23 per cent of the operating shifts. During the last five months of the year, after the design and construction of the machine had been revised, we lost only one shift due to mechanical trouble. Of course, short delays occurred due to burned out cables and things of that sort which cannot be blamed upon the machine. This experience leads us to the conclusion that the machine is now approaching the endurance of the ordinary cutting machine.

"During 1925, up to Dec. 23, this machine loaded 37,791 tons, despite the fact that it did not operate during July and was idle practically one-fourth of working time prior to that month. From January until June economies by the use of the Joy were negligible after depreciation was deducted; but during the last five months of operation it has effected a saving, over hand loading, of 13 per cent. In the accounting, to the total cost of operation is added a depreciation charge of 5½c. per ton. We also add an additional haulage charge to the cost when the loader fails to load as many tons as one gathering locomotive hauls on an average from hand loaders."

The Joy machine has been improved in a number of places. One of the improvements is a change of the gathering arms in size and shape, giving the machine increased capac-

Digitized by Google

ity and the arms greater strength. The latter are now made of manganese steel. The demountable track wheels are now cast solid, an improvement over the old type of wheels which were built up. Changes have been made in the caterpillar mechanism, which may add to the life of this part of the machine. A new control valve provided with renewable seats has been designed, which gives dependable hydraulic pressure for raising and lowering the gathering head and the rear conveyor. The hydraulic pump which supplies this pressure has been improved by the insertion of ball bearings.

A new type of Myers-Whaley for use in 4-ft. coal was introduced last year. This machine does not replace any of the other sizes. It is about 24 ft. long, 4½ ft. wide, stands 3¼ ft. off the rail, has a reach of 8½ ft. and weighs 14,000 lb. Its capacity in loose material is about 34 cu.ft. per min.

Another of the new machines of the past year is the Stockly loader. It is one of the smallest and lowest of the machines thus far developed, is mounted on caterpillar treads and is distinctly different from other machines in that the front conveyor is a mat of interlocked endless drive chains which also serves the purpose of driving a digger shaft at the nose of the machine. On this digger shaft are mounted 20 five-tooth sprockets which are provided with digging teeth. In loose coal it has a capacity of 2 to 3 tons per min.

Thus it is apparent that not only have mining men increased their knowledge of how to fit loaders into methods of mining but several manufacturers have been alert to their own opportunities and have equipped the industry with more effective loading machines for 1926. Machine loading is steadily advancing.

Gandy Shows What National Coal Association Has Been Doing During 1925

The 1925 activities of the National Coal Association outlined in a statement by Harry L. Gandy, executive secretary, show that the association rendered a good many services to the industry. His statement covers especially the period from June, when the association's year began following the annual meeting at Chicago.

The association's standing committees are: Executive, finance, foreign trade, government relations, membership, publicity, research, safety, tax and cost accounting, and transportation. And there is a special committee to develop a plan for the collection and dissemination of trade information. This list of committees gives a general index of the major lines of work. The committees are functioning through definite programs.

The National is, of course, closely concerned with the advisory committee of Secretary Hoover, of the Department of Commerce, in relation to the reorganization of the Bureau of Mines. On this committee the National is represented by J. G. Bradley. Recently, at the instance of the American Wholesale Coal Association, the National named a committee on trade relations, and this committee met in New York, Dec. 16, with members of the wholesale organization to consider several matters of mutual interest.

Other than attending many meetings of local associations, Mr. Gandy during the last few months has addressed important gatherings, which afforded excellent opportunities to broadcast the message of bituminous coal, namely, the annual meeting of the New York State Retail Coal Dealers' Association at Richfield Springs, N. Y., the annual convention of the Purchasing Agents of the Institute of American Meat Packers, Chicago, and the meeting of the Executives of Industrial Associations at the annual convention of the National Association of Manufacturers, St. Louis.

Several conferences were held with the New England governor's fuel committee and co-operation was given also to the New York state coal commission, assisting in several educational programs for the burning of bituminous coal. The association purchased and distributed thousands of pamphlets, issued by the American Society of Mechanical Engineers and carrying directions for the use of this coal.

Studies Stream Pollution

Recent activities of the association include a study of stream pollution. In order to obtain data on this important subject for the benefit of the entire industry, a representative of the National, in the company of an official of the Bureau of Mines, made an investigation in October of stream pollution in the Indian Creek District, Pennsylvania.

The association has several representatives on the sectional committees of the American Engineers' Standards Committee. These sectional committees are outlining recommendations for the industry. We are financing a research fellowship in the Carnegie Institute of Technology in the person of Russell B. Cooper, a graduate of Pennsylvania State College.

Activities of the government relations committee have been in full force for some period. The only sound program, according to the National's experience, is one of absolute freedom from governmental interference. The attitude of the National, however, really is not arbitrary. The association is constantly studying with an open mind suggestions made by legislators, economists and others, in this and other countries, to determine if there is merit in proposed panaceas.

In order to inform fully the membership in respect to the editorial opinion of the country concerning the coal situation and also the trend of events in Washington, the association commenced on Oct. 13 a weekly series of government relations committee letters. These letters, to date, have carried thirteen symposia of editorial opinions, representing a review of more than 5,000 editorials, nearly 700 of which have been quoted, from about 500 different papers in 41 states. Our members, in not a few instances, acting on information obtained in these letters, have been successful in efforts to tone down or change for the better the policies of not a few consequential organs.

In order to keep the members completely in touch with the vital news of the industry, a bulletin is issued weekly or oftener which contains in brief and pointed paragraphs such information as we consider of outstanding value. It is largely through the medium of this bulletin that the National renders the membership a most important tax service in the form of digests of rulings of the federal tax commissioner and opinions of the solicitor of internal revenue and decisions of the U. S. Board of Tax Appeals and of the federal courts which concern operators of coal mines. Since June, the bulletin has carried more than 100 statements from the traffic bureau.

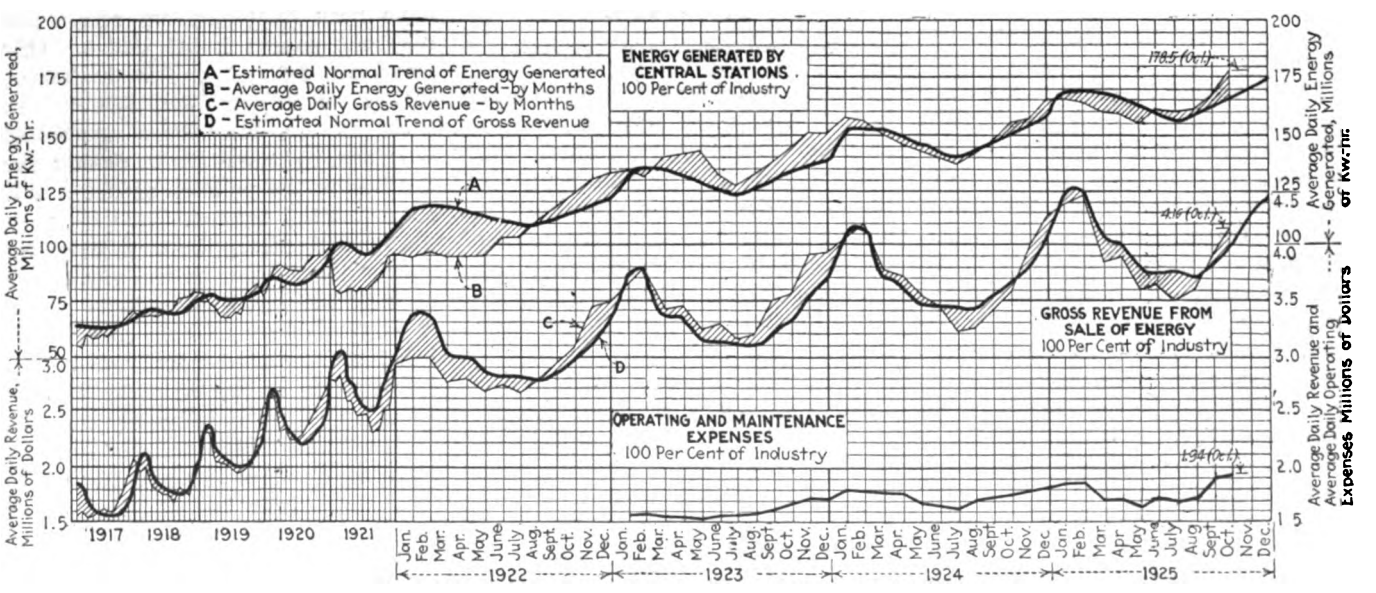
Coal Industry Battles for Bigger Business

Electrification Is Its Best Friend and Worst Enemy—Railroads Increase their Use of Electric Power — Anthracite Briquetting Grows — Fixation of Atmospheric Nitrogen Makes New Fuel Demand

IN THE LATTER PART of the past year the sale of coal was so active as to revive the drooping spirits of those who questioned what the future had in store for the coal industry. The country's call for coal is insistent and from a widening field of consumption.

The demands of the public utilities are growing so fast that the cut in coal consumption which their fuel economies made will be largely overcome by their own volume of business. For August of this year 16 per cent more energy was used than in the same month the year before, in September 14.8 per cent more and in October 14.7 per cent. At the beginning of 1917 the daily energy generated was a little less than 65,000,000 kw.-hr. and at the end of 1925 it had reached about 180,000,000 kw.-hr., an advance of nearly 170 per cent in nine years or a little less than 20 per cent per annum.

However, one might draw more comfort from this fact than the actual conditions justify, because some of this business has been obtained by the dismantling of uneconomical isolated power plants that used to be large consumers of coal. Economies in central-station practice and economies due to the purchase of power from central stations are making dubious any attempt to get comfort from the growth of energy output from such plants, especially, as many of them are getting their coal from mines which they own or control. The increase in the demand for central-station power does, however, develop the demand for coal of small size and so decreases the necessity for careful handling of coal in mining and preparation.



USE OF ELECTRICITY GROWS

It must not be forgotten, however, that 14,533,000 houses occupied by 63 million persons or 54 per cent of the population in the United States are supplied with electricity and all those who are using it in any form are disposed to increase that use from year to year. Illumination steadily grows more general, because of the safety, cheeriness and helpfulness of good light. It reduces accidents, it improves morale, and it makes many difficult operations easy. It also lessens eye strain.

The degree to which better lighting may be carried is hard to predict. The public slowly breaks away from parsimonious practices based on years of education in economy obtained when light was more expensive and less convenient. But the movement for better light is under way and at the same time is coming the refrigeration of buildings with relief from much of the misery accompanying existence in an atmosphere overburdened with moisture and in a temperature too near the blood heat. With that consummation an enlarged market for coal will be inevitable.

Coal has gradually been ousting oil in the production of steam for power purposes, though the anthracite strike put a crimp in this movement wherever anthracite fines were being used. However, the cream of the anthracite is in prepared sizes, and here unfortunately oil has made rapid strides in dispossessing coal since the strike started because of the uncertainty of anthracite supply and because of the ease with which oil can be burned.

A new cloud has arisen on the horizon, the Diesel electric locomotive, a unit deriving its primary power from liquid fuel of any kind and driving a motor which in turn drives the locomotive. This may be used only for switching purposes in

Courtesy, Electrical World

With This Graph the Steady Progress of the Central-Station Business Can Be Traced

The average daily revenue has progressed from about $1,800,000 in the beginning of 1917 to about $4,500,000 at the end of 1925, and the energy generated daily from about 65,000,000 kw.-hr. to 175,000,000 in the same length of time. The operating and maintenance expenses that were in January, 1923, about $1,600,000, were in Oct., 1925, a little over $1,900,000 daily. The growth of this industry, though attained partly as the result of absorbing the functions of the wasteful isolated station is one of the most hopeful answers to the question "Where will we find a place to put the increasing flood of coal?" "Cooling with coal" will draw up the summer sags in the gross revenue curve and make it look like a railroad grade.

Digitized by Google

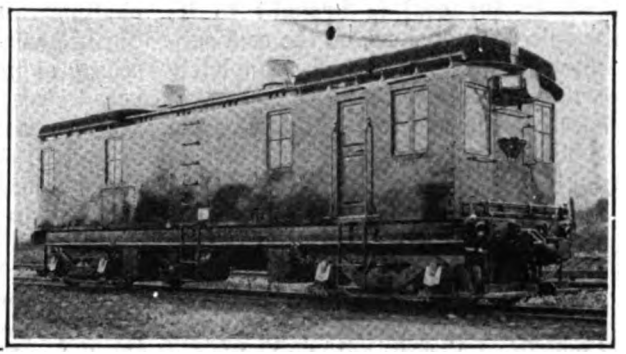
large cities where its smokelessness is in its favor, but it seems not unlikely that it may have a wider range of usefulness and be applied to main-line and branch line service, in which case it may reduce the railroad use of coal in an even larger degree.

As a result of the successful demonstration of one of these units, six roads will soon have similar locomotives in service. These roads are the Baltimore & Ohio, the Lehigh Valley, the Delaware, Lackawanna and Western, the Erie, the Chicago and Northern, and the Central of New Jersey. In addition, the Long Island is using a 100-ton unit which has power equipment consisting of two 300-hp. engines and generators with somewhat larger motors. Marked reductions in operating costs are considered possible by the much lower cost of fuel and the elimination of standby losses which are unavoidable with the steam locomotive.

New Motor Car

The gas-electric motor car is another development. It is said to be particularly well adapted to light-traffic branch lines where the volume of business is not sufficient to justify the high operating costs incurred with steam locomotives. Performance data on a number of roads indicate that the cost per mile of operation is as low as 40c. or less per train-mile, as compared with $1 to $1.75 for a steam train and crew.

About 50 of these cars have now been built and more than half of them have been in daily service for a sufficient period to give accurate data on operating costs.



In the application of the oil engine to the propulsion of electrically driven motor cars, the Canadian National Ry. practically completed in 1925 seven single cars each approximately 60 ft. in length, equipped with a 185-hp., 700-r.p.m., oil engine direct connected to a 600-volt, direct-current generator.

A remarkable demonstration recently was made by one of these cars traveling from Montreal to Vancouver in three days. Not only were all records broken as to actual schedule, but the car was credited with making the longest non-stop run ever made by any engine. The route of 2,937 miles was covered in an actual running time of slightly under 67 hr. with an average speed of 43½ m.p.hr. During this time the oil engine was running continuously.

Another installation using the same principle is being made by the New York Central R.R. using a 200-hp. oil engine direct connected to an electric generator.

New Oil-Electric Locomotive

Engines like this 100-ton type resemble in their flexibility the storage-battery locomotives of the coal mines and are receiving much attention from the railroads. They are a new and dangerous invasion of the coal market, for they burn inferior oils.

Progress has been made during the past year in the electrification of railroads, and the advance promises a reduced use of coal due to the economies which accompany operation by electricity. The Staten Island Rapid Transit Ry., a part of the Baltimore & Ohio R.R., has been electrified from St. George to Tottenville, South Beach and Port Ivory, a distance of 21.6 route miles making 50 miles of actual trackage. The Long Island R.R. has been electrified during the past year from Jamaica to Babylon, a distance of 28 route miles. An extension of the Long Island electrification system to Mineola and over the Oyster Bay and Hicksville branches is projected.

Virginian Ry. Electrifies

The Virginian Ry. during the past year completed 14 miles of electrification from Elmore to Clark's Gap and eventually it is to be electrically operated from Roanoke to Mullens. The New York, New Haven & Hartford R.R. finished the electrification of 24 miles with 31 miles of track in 1925 and the Norfolk & Western Ry. completed an extension of its electrification system over a distance of 20 miles between Farm and Iaeger. The Detroit, Toledo & Ironton R.R. began the electrification of 15 miles between Flat Rock and Detroit (Fordson). This, of course, is part of a much larger scheme.

The Great Northern Ry. is working on a 24-mile section, and the Illinois Central R.R. has projected for the present year the electrification of 37.4 miles with 122 miles of track all within 28 miles of the Chicago terminal. Under the Kaufman Act all railroads entering New York must be electrified within the city limits. The Pennsylvania R.R. is considering the extension of its electrification so as to make possible the operation of electric trains between Philadelphia and Wilmington, Del. During 1925 the electric street railways system increased in length by 236 miles.

So many have been the savings which electricity has made possible in all the industrial enterprises that purchase coal that the coal operator will do ill if he does not continue to seek similar savings by the entire electrification of all his operations.

The mercury boiler that has promised efficiencies greater than can be obtained by the use of the steam boiler and that has given such excellent results at Hartford, Conn. is being improved by W. L. R. Emmett, the inventor. To facilitate cleaning and inspection the boiler will now be built in sections. Designs have been prepared for units of 9,000-kw. capacity in the mercury turbine and 12,000-kw. in the steam unit. With the 70-per cent efficiency which is anticipated and with 70-lb. gage pressure for the mercury vapor a kilowatt-hour should be delivered to the switchboard on 10,000 B.t.u. or a little less than the number of heat units in a pound of somewhat inferior fuel.

Pulverized Coal Up Front

Pulverized coal continues to make progress. River anthracite is being used at the Holtwood station of the Pennsylvania Water & Power Co., and the same concern is contracting for the erection of another installation at its Pine Grove station. During the year important installations have been made at the Bruno Island Plant, of the Duquesne Light Co., the Columbia power station of the Columbia Power Co. and the Gould Street station of the Consolidated Electric Light & Power Co., of Baltimore. Some coal operators look with anticipation to the further introduction of pulverized coal systems as they make possible the use of clinkering coal and coal of inferior quality. When coal is used for non-metallurgical purposes the disadvantage of

Digitized by Google

ash in the coal is brought to its smallest dimensions, as the coal substance can be burned completely without loss and the drawbacks consist only in the cost of hauling the non-combustible, pulverizing it and taking away the ash.

During the year the estimated production of pig iron in the United States reached 36,750,000 gross tons which was almost as great as in 1920 when the output was 36,926,000 gross tons. Steel, however, showed a bigger output than in 1920 and in 1923—both big years. In 1925, 45,250,000 gross tons of steel were produced. These facts have much to do with the strong market in the close of the past year, for it must be remembered that the production of iron and steel is an index of activity of the industries which make use of it.

MINE MAKES ONLY LARGE SIZES

In the course of the year the St. Clair Coal Co., which has a mine near Minersville, Pa., put in operation a briquetting plant and it intends to supply a product for the domestic market. It will take sizes above buckwheat from the coal as it passes through the breaker and will treat the finer sizes so that they will be saleable for domestic use.

The briquets which are made by the Mashek Engineering Co.'s method with sulphite pitch and asphaltum are known in the trade as Super-Anthracite and are said to be selling at prices above those of prepared sizes. The coal is cleaned by the Chance process. Because the briquets neither clinker nor smoke and because they burn more completely than true anthracite, hold fire more readily and require less air, because of better distribution, they sell at better prices than the natural coal. The capacity of the St. Clair plant is about 22½ gross tons per hour.

ANTHRACITE BRIQUETTING ACTIVE

The activity in briquetting has been largely in the preparation of anthracite. Thus the Anthracite Fuel Corp., of Baltimore, Md., has erected a briquet plant of 15 gross tons per hour; the Philadelphia & Reading Coal & Iron Co., one of 7 gross tons at Schuylkill Haven; the Grasselli Chemical Co., one of the same size briquetting iron ore and coal. The Mines Department of Canada is to build one of 7 tons per hour capacity, the location of which is not yet announced. All these are briquet plants of the Mashek type.

Another expanding use for coal in this country is in the manufacture of ammonia. Lazote, Inc., one of the du Pont industries, is completing a plant at Belle, W. Va., (about 12 miles from Charleston) for nitrogen fixation, using bituminous coal as a source of power and raw material. The first unit of the plant is designed to turn out 25 tons per day of pure anhydrous ammonia. The French Claude process will be used, the nitrogen of course, being taken from the air. Steam will be blown over red-hot coal or coke to form water gas. This will be purified, and the hydrogen taken out by a liquification process. A portion of this hydrogen will then be burned with a definite quantity of air leaving the free nitrogen.

The nitrogen so obtained is mixed with the correct proportion of hydrogen. The mixture is then compressed to an extremely high pressure and exposed to the action of a catalyzer forming ammonia. The carbon monoxide which is taken from the water gas in the process of isolating the hydrogen is burned under the boilers in conjunction with coal. It is rumored that if the first unit of the plant is as successful as expected, three additional units will be constructed in the near future.

Thus the uses of coal are constantly widening and former industrial demand is strongly maintained by vast business activity throughout the land in spite of new economies that are accomplished in fuel consumption and despite the inroads of substitutes.

a Note that the coal statistics of the Geological Survey for a given year include only the mines that had an output in that year. Many mines that operated in 1923 produced no coal in 1924; moreover, many of the mines that did produce in 1924 worked for a short time only. The number of active mines of commercial size in Montana was 48 in 1923 and 68 in 1924; in New Mexico, 42 in 1923 and in 1924; in Oklahoma, 115 in 1923 and 94 in 1924.

b Includes also loaders and shotfirers.

c Blaine, Chouteau, Custer, Dawson, Gallatin, Hill, Judith Basin, Pondera, Rosebud, Toole and Wibaux.

d Lincoln, Sandoval, Santa Fe and Socorro.

Anthracite Operators by Management Cut Costs While Seeking Labor's Aid in So Doing

By H. S. Gilbertson*
Approved by
S. D. Warriner
Chairman of the Anthracite Operators' Conference

THAT THE ANTHRACITE industry is not in the "hard-boiled monopoly" class has been made clear to those who are willing to read the signs, in the comparative complacency with which the public has accepted the recent strike, and satisfied its wants with low-volatile bituminous coal, coke and oil. Long before the strike, competition made itself unmistakably and increasingly felt as the prices of anthracite were forced to higher levels. Many of those who would like to have burned anthracite burned substitutes, just as many of those who would like to have driven Pierce Arrows have contented themselves with Fords.

Competition forced down prevailing prices of the domestic sizes at the mines, so that even after the beginning of the 1925 strike, they were from 10 to 30c. lower than in September, 1924. From which it is evident that by no such monopoly formula as "cost-plus" may the industry "help itself" to "enormous profits."

What the public has completely overlooked is the sharp drop since the period immediately following the war in prices of steam sizes, which always have sold at less than the cost of production and comprise from 20 to 50 per cent of the output of the various companies.

Considers Management

Thus has a severe pressure been applied on margins of profits from the revenue side. And from what follows it should also be clear that rather than following, or seeking to follow, the path of wage reductions, *the industry has put the first and chief burden of adjustment upon management.*

From the cost direction comes a pressure from countless sources which can only be appreciated by those who are actually in the production end of the business.

To a large extent the future cost problem inheres in the very nature of the physical conditions of mining. Taken as a whole the industry is in the stage of second mining; in many cases third mining. Many years ago, with the application of the comparatively crude mining methods then in vogue, the cream was skimmed off, leaving for the present and future generation the thinner seams and old workings which require a larger amount of timbering, yield a larger percentage of the poorer sizes and necessitate a more thorough treatment in the breakers, and the disposal of a larger amount of refuse.

Conserving Resources

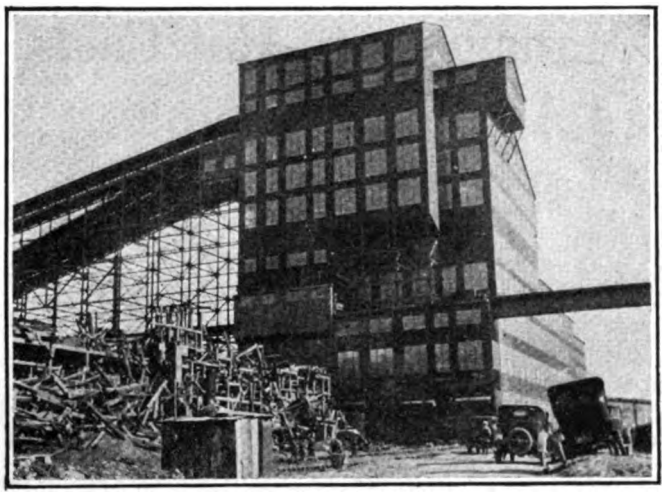
To face these conditions squarely and make the best of them is as much in the interest of the public as of the owners. It is conservation of natural resources. The percentage of recovery in mines which, thirty or forty years ago were considered completely worked out has been increased from an original of less than 40 per cent to as high, today, as 70 per cent. Reflecting these increasing mining difficulties, and possibly other factors, the daily output of the men at the face has decreased, according to data compiled for this magazine, from an average of 7.5 tons in 1877 to 4.0 tons in 1922. During the last 25 years the wage rates of all mine workers has steadily mounted.

The alternative to remining is to tap the lower levels, which involves increasingly greater drainage, ventilation and timber costs. This entrance into new territory also, of course, involves heavy charges for the sinking of new shafts and driving new tunnels.

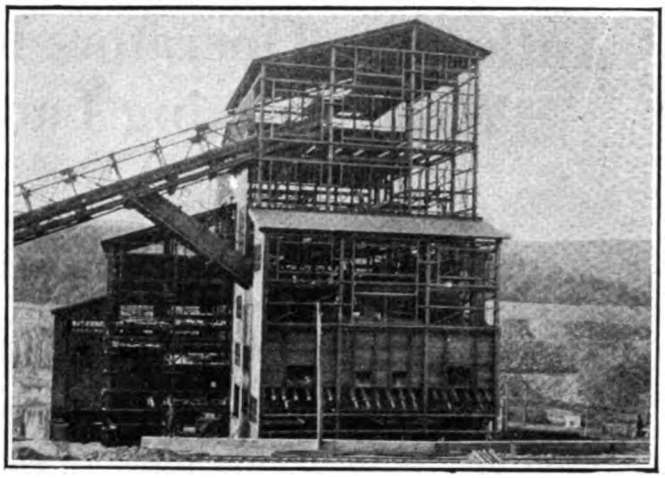
Thus, the anthracite management problem is a two sided one, with the public on one side insisting on lower prices for its fuel, and labor, which constitutes 70 to 75 per cent of f.o.b. mine cost, with labor on the opposing side insisting upon a stable or even an increased wage rate. That the industry is attempting to meet this double pressure with due consideration for, and, if possible, actual accommodation to the desires of both the public and labor, should be evident from a recital of recent accomplishments.

It may seem paradoxical that the industry is undertaking to increase revenues, and at the same time reduce prices. The explanation, however, is simple, when one realizes the enormous spread between prices obtainable for a product the units of which at all times are substantially the same in heat and cleanliness values and differ only in the size. If, with the same total tonnage an increasingly larger proportion can be moved up from the low-revenue to the higher revenue classes, the desired results will be obtained.

Effort begins at the working face. Experiments have proven beyond a doubt that with the better placing of shots a smaller amount of explosive power can be utilized to bring down an equal tonnage, but a tonnage richer in prepared sizes. Some of the coal companies, with the very able assistance of the powder manufacturers are making extensive scientific tests along this line, with encouraging results.



Not Suited for Machines



In some portions of the anthracite field, where the veins are practically horizontal, undercutting machines are used, eliminating in part the need for powder and increasing the percentage of larger sizes. In some few instances also mechanical conveyors from the face to the gangway are employed to prevent breakage. Unfortunately, however, these devices are not available in a large portion of the anthracite field because of the pitch of the veins. Through the introduction of such mechanical devices as rotary dumps, spiral chutes and mechanical systems of loading into railroad cars the campaign for bigger sizes goes on at the loading point in the mine, at the breaker dump and through the breaker to the railroad cars.

Turn now to the other end of the business, and we find the anthracite industry attacking the problem of fine sizes from the sales point of view. It took the better part of a century for the public to come around

*Director of Personnel, Lehigh Coal & Navigation Co., Lansford, Pa.

These Two New Breakers Indicate a Trend Toward Modernization in Anthracite

More than 10,000 tons of material can be handled in a day in the new colliery shown at the left. Towering more than 200 ft. above the ground level this breaker of the Lehigh Coal & Navigation Co., at Lansford, is a giant in size and capacity. The only steam used around here is for heating, all equipment is electrically operated. The wood piled in the left foreground marks the spot where the former colliery stood. The new breaker being built by the Repplier Coal Co. and shown at the right is in the lower anthracite region. By using the most modern equipment available and eliminating wastes, operating costs can be reduced.

to the practice of using, domestically, anything smaller than chestnut. Everything smaller went out to the culm banks. Even of later years the acceptance of the smaller sizes has been a matter of extremely slow growth. Under the pressure of high costs and public demand for lower prices, the industry has found it imperative to stimulate their use. To this end the operators established, in 1924, the Anthracite Coal Service, a co-operative agency to educate the public in the fact that economies can be effected without loss of service by utilizing the buckwheat sizes.

BIG SAVINGS MADE

In the first ten months of 1924 this service estimates that it has saved to the anthracite industry a tonnage of 803,444. Individual companies have rendered a similar service to the small users, particularly in large centers near the source of production. Their demonstrators go to the schools and churches and to private homes and give instruction in the economical use of No. 1 Buckwheat.

The gradual increase in the use of the small sizes has justified and encouraged much better preparation, and should result in even better sales results as time goes on. Modern jigs and concentrator tables have been installed in most of the modern breakers. New processes have made it possible to put on the market a cleaner No. 4 buckwheat product suitable for industrial uses.

In the direction of general cost reduction many changes have been effected both in the inside and outside operations, designed to eliminate labor and to speed up the movement of the coal. Electric haulage, including the use of storage battery locomotives, has been rapidly displacing other forms of transportation. The size of rails has been increased and steel and roller bearing mine cars are replacing the wooden ones; automatic doors are replacing door tenders, and shaker conveyors are in many instances replacing coal pushing. Mechanical loading, in a number of mines is displacing a disagreeable form of manual labor.

In the outside operations anthracite progress is visible in the replacement of many old wooden breakers by those of steel construction. In a number of instances a consolidation of breakers has resulted in substantial reduction in labor force. Another outstanding achievement is the automatic remote control of fans and pumps, which in all cases eliminates attendants. General electrification of the operations appears to be the ultimate goal of all the progressive companies which are in a position to undertake the initial expenditure.

Reduction in cost is frequently tempered by considerations of safety. High power electric fans furnish enormously increased volumes of air at the working face. Electric firing batteries have been extensively installed in gaseous mines, and permissible explosives (at the expense of prepared sizes), have been generally adopted as a substitute for the slower but more dangerous black powder. First aid work has been stimulated by the U. S. Bureau of Mines and heartily supported by the coal companies and the men. While the introduction of safety devices and measures occasion an apparently unproductive outlay, it has its economy reward in a substantial decrease in fatal accidents per million man days and in tons produced per fatality.

INDUSTRY IS PLANNING

It is often said in disparagement of business organizations that they seldom have within themselves the capacity for developing improved methods and procedure and that the main impetus for improvement comes from outside agencies which have something to sell. While it is true that very many of the changes, particularly in the mechanical field which have been utilized to advance the anthracite industry, have come from manufacturers of supplies and equipment, it is also true that *the industry itself is doing much thinking and planning. At least one large company has a well organized and effective research department.* At the present time it is conducting detailed studies of outside labor forces, inside transportation control, cleaning and closing gates on railroad cars, treatment of mine timber, analysis of clerical functions at the several collieries, excessive overtime, and several automatic devices at various points in the operations.

Important and promising as are the efforts of the companies in the direction of greater mechanical efficiency, sales service, and elimination of abuses in taxation, all these matters sink into insignificance in comparison to the human factor. It is not a question of "taking it out of labor," but rather of promoting an enlightened and farseeing attitude of

Digitized by Google

self-interest on the part of labor. The committee of prominent engineers and economists who addressed the operators' and miners' negotiating committee were right: the vital problems of the industry can and should be solved by a joint effort of management and men. In the case of the high-cost, low-realization companies the only alternative may prove to be ruin for both parties. The plain economic facts of the industry cannot continue to be ignored.

The human problem in the mines is, of course, as complex as human nature. It cannot be analyzed here. From an operating standpoint the important aspect of it is not so much wages as it is discipline. Discipline in the anthracite mines, whatever may be the cause, is frankly unsatisfactory at all times. The periodical strikes by which the public is reminded of the industry are but an acute manifestation of daily operating conditions concerning which the outside public hears little.

Workers Are Antagonistic

No doubt the ultimate cause of much of this condition lies in the inability of operators and managers to strike a proper note in dealing with their men. No doubt serious mistakes were made many years ago by those in charge of the mines, and the memory of those mistakes is still potent. On the other hand there is no doubt that the advent of unionism in the form known to the anthracite industry has contributed largely to the difficulties. It is a part of the permanent, underlying conscious strategy of the United Mine Workers to create not only a diversion of loyalty from but a positive, active antagonism toward, the employer.

Aside from this more or less peculiarly anthracite phenomenon there are certain tenets of unionism generally that militate against changes that even remotely affect the so-called rights of the workers. In the old inefficient days prior to 1900 when the mines were under an unsatisfactory system of supervision, a form of workers' independence grew up that in many ways was of immediate or seeming advantage to the individual. According to the philosophy of the union, rights thus acquired through long usage may not be taken away except by agreement. This doctrine, in fact, is deeply embedded in the award of the Anthracite Strike Commission of 1902 and in subsequent agreements.

The principle is not without much sound justification: genuine rights which are really and ultimately beneficial to the workers should not be arbitrarily taken away, nor should they be bargained away lightly. The real complaint of the operators is that it is so often extremely difficult to strike a bargain on such matters even when the terms are extremely generous. For instance, there are many mines in the anthracite region where there is no checking of workers' time, for the simple reason that such a system was not in effect in 1902. The workers have a vested right in inefficient accounting!

Nor can there be any doubt that under union methods there has been a definite restriction of output at a number of points. This is most clearly shown in the short day worked by most of the miners in parts of the field. Whereas, the present agreement bases compensation upon a full 8-hr. day at the working place, compliance with this provision, on the part of contract miners, is the exception rather than the rule. (The last investigation of the U. S. Department of Labor shows an average of 6.3 hr.) Threats and fines have been imposed in numerous instances upon individuals who did nothing more than produce the daily output which they were fully capable and willing to produce.

It is true that a reversal of these policies and particularly greater productivity and amenability to discipline would bring results of immeasurable value not only to the operators and to the public but in equal measure to the workers themselves.

Solution Is Difficult

To state the labor problem is simple. To formulate, much less to effect, a solution is by all odds the most difficult undertaking in anthracite operation. What seems to be required on the part of everyone concerned is a more complete understanding. This may sound like the threadbare, cant phrase that crops out so often in industrial discussions, but the thought in mind is something definite, as exemplified by the program of one of the companies.

This company, which probably faces more than the average mining and commercial difficulties, has chosen to lay the facts of its situation with complete frankness before its supervisory forces, the mining community and the rank and file of the workers. It has broadcasted the facts concerning its profits and losses, its costs, its margins. It has pointed out, not in general terms, but in specific detail, the common interest of all in preserving a satisfactory market.

Building upon this basis of better confidence and understanding, the company in question is also taking definite measures to tap hitherto undeveloped resources among the operating executives. More specifically, it is undertaking to take hold of the "practical" men of the organization, those who are right next to the big problems of industry, and bring them into contact with the larger aspects of the business.

Conferences Prove Successful

The particular procedure employed is the "foreman conference" which, by the way, is designed more especially for the assistant foreman than for his chief. Twice each month these operating men meet, discuss and report upon assigned problems of operation, costs, safety, organization, the handling of men, etc. The results of this effort have far exceeded expectations and, in addition to making available to the whole organization much valuable information and experience, are in a new but very real sense taking these important keymen into the management.

It is through such constructive means that the industry may hope to solve both revenue and cost problems without recourse to what, in some industries, is the easy but, in the long run, unsatisfactory route of wage reductions—*provided*, organized labor can be persuaded to use its imagination and become a party to that program of joint effort which the committee of economists and engineers suggested.

Organized labor, in this industry, as in others, does well to take a vigorous and determined stand against ruthless levelling of wage scales and living standards. In doing so it promotes its own interest but also performs a service of inestimable importance to the whole economic community. The first responsibility *for any adjustments to meet price conditions undoubtedly rests upon capital and management. But these factors cannot bear the whole burden.* For labor to fail in making its contribution to efficiency or, if necessary, to refuse to make some temporary sacrifice in compensation standards is suicidal.

Strike Dominated Anthracite History of 1925

No Public Clamor for Hard Coal Rose Because Consumers Stocked Up Heavily in Advance and Accepted Well-Organized Plan for "Substitutes"

THE STRIKE, which started on Sept. 1, 1925, and still continues with no signs of an early approach to a settlement, is the overshadowing feature of anthracite history for 1925. Inaugurated as a demand for increased wages and improved working conditions, the struggle has developed into a bitter fight over the question of arbitration as a road to permanent peace in the industry. The situation has been further complicated by proposals for legislative action at Washington and the intervention of Governor Pinchot of Pennsylvania, who is now trying to induce the state legislature to declare the industry a public utility.

The demands of the mine workers were formulated at the tri-district convention of the anthracite districts of the United Mine Workers, held at Scranton, Pa., the week ending July, 4, 1925. The report of the scale committee made the following demands:

(1) A two-year contract terminating Aug. 31, 1927, with full union recognition, including the check-off.

(2) A ten per cent increase to contract workers, an increase of $1 per day to day men and the restoration of differentials existing prior to the award of the Anthracite Coal Commission in 1920.

(3) Uniformity and equalization in day rates, consideration rates equal to contract miners' earnings, and the payment of the "standard" recognized rates in the region to skilled mechanics.

(4) Payment for coal on a gross tonnage basis, establishment of permissible percentages of refuse and abolition of existing system of dockages and penalties.

(5) Payment for props, forepoling, etc., free jackhammers and air and free electric lamps and batteries.

(6) Minimum rates of 20c. per inch for refuse in all kinds of mining up to 10 ft. wide and 30c. for blasting top and bottom rock.

(7) Crediting of all cars at working place, continuous employment for maintenance men, five-day week, seniority rules, more prompt adjustment of grievences.

Joint conferences between the miners' committee, headed by John L. Lewis, international president of the United Mine Workers, and the operators' negotiating committee, William W. Inglis, chairman, began at the Hotel Traymore, Atlantic City, N. J., July 9. Following the formal presentation of the demands, S. D. Warriner, chairman of the Anthracite Operators' Conference, in a public session, declared that the competitive situation was such that the industry could not stand further increases in the cost of production.

THE COST OF STRIKES

From Sept. 1 to Dec. 31, 1925, striking anthracite miners sacrified over $100,000,000 in wages, the operators lost the sale of approximately 23,500,000 gross tons of coal and the business interests of the anthracite region untold millions. Production to Sept. 1, when the strike began, was estimated at 55,000,000 gross tons, as compared with 78,506,127 tons for the full calendar year preceding. Worse still, the industry faces the permanent loss of a share of its markets to other fuels.

To assure the public that there would be no interruption in the flow of coal, he asked the miners to join with him in an agreement to continue work after Aug. 31, if no contract had been signed by that date and also suggested that subjects upon which the conferees were unable to agree be submitted to arbitration. This offer of arbitration, renewed several times during later conferences, was rejected by the miners.

LEWIS ENDS CONFERENCE

The conference was abruptly terminated by Mr. Lewis on Aug. 4 before the miners had completed the presentation of their case because the operators refused to agree to the wage increases. It was estimated that the granting of the demands would add 30 to 35 per cent to the cost of coal.

A last-minute effort, engineered by business interests of Scranton and Wilkes-Barre, to prevent the strike failed. Disputes over the status of the maintenance men were ironed out a few hours before the suspension became effective and these men continued at work. Later during the strike some of the local unions started agitation for the calling out of these men, but their demand was ignored by district and international officers of the union.

GOVERNMENT STAYS OUT

From the outset the federal government at Washington adopted a hands-off policy. It has held to this policy consistently, although President Coolidge, in his message to Congress in December, urged a reconsideration of the recommendations of the United States Coal Commission and several bills have since been introduced to effect government intervention.

Governor Pinchot, whose settlement of the strike of 1923 occasioned widespread criticism, stepped into the picture at an early date. He invited representatives of the miners and the operators to discuss the situation with him, but made no public recommendations until Nov. 28. At a public meeting in Harrisburg on that date he proposed an eleven-point peace program, providing, among other things, a five-year contract, for a general investigation, price-fixing, a modified check-off, and arbitration to determine whether wages should be *advanced.*

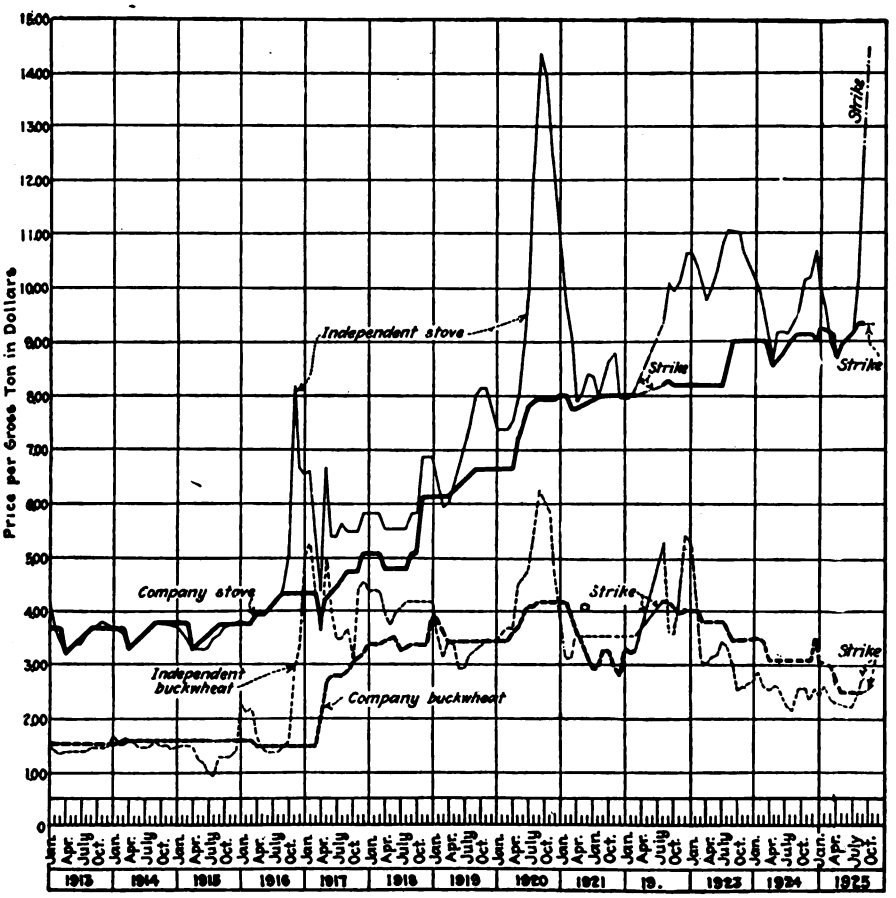
MINERS FOR PINCHOT PLAN

The miners promptly accepted his plan as a basis of settlement and the operators promptly rejected it. In their rejection the producers made public the fact that a union emissary had come to them several days earlier and that they had submitted terms of settlement providing an immediate return to work at the old wages, and a five-year contract, subject to annual revision by a board of seven members, including three representatives of the public. Later a number of legislators from Luzerne County submitted a proposal along somewhat similar lines and the operators expressed a willingness to negotiate on the Luzerne basis.

Region business interests and the

Digitized by Google

mayors and burgesses of the anthracite belt again became active. The Governor invited the municipal officials to confer with him, but they refused to bind themselves to an indorsement of his plan. In the meantime, the Governor issued a call for a special session of the state legislature to meet Jan. 13, 1926, to consider, among other things, the enactment of legislation regulating the industry as a public utility and authorization to enter into interstate compacts with consuming states to control prices and distribution.



MARKLE SUBMITS PLAN

Christmas Eve, following the failure of a mayors' committee to effect a resumption of negotiations between operators and miners, Alvan Markle, chairman of the conference, issued a call for a meeting at the Union League Club, New York, on Dec. 29. At the opening session, he, too, submitted a plan, which was printed in full in *Coal Age*, Dec. 31, 1925. This plan also was rejected by the miners because of its arbitration features. Mr. Lewis and his associates again presented the Pinchot program and it was summarily dismissed by the operators. Later the miners incorporated many of its provisions in what they designated as a "revised Markle plan." The suggestion that the issues he left to Charles Evans Hughes was voted down by the miners.

On Jan. 11, Major Inglis, for the operators, offered a plan which he said represented the utmost that the producers could go in the way of concessions. This plan, rejected by the miners, called for a five-year contract at the old wages, subject to annual reconsideration by the Board of Conciliation. In the event of a deadlock in the Board, a board of three arbitrators would be named to decide the dispute. The next day the conference was again adjourned *sine die*.

DEMAND NOT URGENT

Unlike the course of events during previous strikes, there has been little clamor by the public for hard coal. This is due to two facts—heavy stocking in anticipation of the strike and a well-organized campaign to teach the consumer how to burn soft coal and coke. The Interstate Commerce Commission issued orders, establishing all-rail rates on prepared sizes from the West Virginia low-volatile fields. The scope of these orders was subsequently extended to cover shipments from the high-volatile districts and from Virginia to New England and the Middle Atlantic states. The West Virginia smokeless operators, encouraged by the New England Governors' Fuel Committee, opened demonstrating stations in Boston and other New England cities. New York City also established instruction centers.

Anthracite Prices for Thirteen Years

This diagram shows in dollars per gross ton the average company circular prices and average spot quotations on "independent" stove and buckwheat sizes of Pennsylvania anthracite at the mines. Prices shown are averages of the range as quoted on the New York market.

Up to Dec. 31, it was estimated that the smokeless operators had shipped over 250,000 tons of prepared coal all-rail to the New England and Middle Atlantic States and the Kanawha district approximately 112,500 tons. Demand for coke has taxed the capacity of by-product ovens in the Northeast and the supply available from those sources has been supplemented by erratic shipments from the Connellsville region and some lots from ovens as far distant as Alabama.

In addition to these sources of supply, communities accessible to the seaboard have turned to foreign countries. Coke and coal have been imported from Germany and Scotland, anthracite from Wales, Scotland and Germany and bituminous from the British Isles and Canada.

Figures for the eleven months ended Nov. 30, 1925, compared with the corresponding period in 1924, show an increase of 67,233 gross tons in the imports of anthracite coal, 137,636 tons of bituminous and 56,088 tons of coke. In the three months beginning Sept. 1, 1925, compared with the corresponding period in 1924, anthracite imports increased 74,025 gross tons; bituminous coal 96,172 tons and coke, 30,245 gross tons.

BETTER MERCHANDISING

The year just closed witnessed considerable expansion in the program of better merchandising for anthracite coal. The industry adopted uniform standard sizing requirements which give the retailer and consumer opportunity to check on the preparation. The engineering service of the producers has been further extended to help anthracite hold and recover markets. Dealer helps have been pushed. The latest development calls for series of lectures to retail groups on coal and efficient combustion.

The old spirit of "take it or leave it" is dead.

Labor History Traces Decline of Union Tonnage From 70 to 34 per Cent of U. S. Total

By Sydney A. Hale
Special Contributor, *Coal Age*
New York City

AT THE CLOSE of the World War over 70 per cent of the bituminous tonnage mined in the United States was produced by union labor and under contractual relations between the United Mine Workers of America and the operators. Last year less than 34 per cent of the tonnage came from union mines. Had it not been for the general improvement in soft coal demand incident to the anthracite strike during the final quarter of 1925 the percentage of union-mined tonnage would have been still smaller.

This assertion is fully borne out by the figures in Table XI. The shift of districts and entire states from the union to the non-union column is striking. Equally significant is the rapid increase in the output from the non-union districts of the Appalachian Region. Maryland and the skeleton-organized Tennessee, which is really non-union and is so treated here, are the only exceptions. Central Competitive Field tonnage has suffered a marked decline since the war-time peak. The Virginias, the non-union areas in Pennsylvania, Kentucky and Alabama, on the other hand, are forging ahead and the 1925 output for those sections establishes new records. And yet, great as these gains have been, they by no means test the productive capacity of the non-union fields.

How and when these changes took place was traced in the preceding chapters in this history of the decline of union influence. Why there has been such a recession in union power remains to be considered. It is possible, of course, to give new twists to the many theories which have been advanced from time to time to explain the collapse of union control, but, upon analysis, they all resolve themselves into two underlying causes:

(1) Dissatisfaction with and hostility to the set-up and policy of the United Mine Workers of America, and,

(2) Competitive conditions.

Hostility finds its fullest expression, perhaps, in southern West Virginia, the Somerset field of Pennsylvania and in Alabama. In many respects unionism is the antithesis of individualism — and there are hundreds of strong individualists in the states named. West Virginia, in particular, early rebelled against a union policy which closed down mines in that state to help organized labor win a battle in some other part of the country. Dependent almost wholly upon interstate markets to sustain their enterprise, the pioneering coal producers matched the militancy of the growing union with a militancy as virile and as ruthless.

WHAT PRICE OBSTINACY?

The impetus given non-union development by the stand-pat wage policy of the United Mine Workers has placed the operations not recognizing the union in a position to supply 85 per cent or more of the normal bituminous coal requirements of the country. Organized labor in the coal fields, given a real start by the abuse of power by capital, is now menaced by the results of its own abuse of power.

Oversteps the Bounds

Even in those fields in which hostility to organized labor is a minor factor, there has been a growing dissatisfaction with and a rising resentment against union policies which seem to the operators affected to penalize them for dealing with the United Mine Workers. The petty strike, which the head of the union himself admits his organization cannot completely eradicate, is naturally a sore point. Infringement by local union officials upon the province of management is another cause of complaint. Irresponsible district leadership also has been added to the burdens under which unionized mines have been compelled to operate.

The chief grievance of the outlying districts, however, has been their lack of autonomy. In the perfection of its control over the Central Competitive Field the union has adopted a program which makes all the other districts and their problems subsidiary to that field.

"It has become increasingly evident by reason of the accumulative experience over a number of years," declared the commercial operators of the State of Washington when they severed union relationships, "that the policy of the United Mine Workers of America is not one of consideration for the interests of the industry and its members in this district, but one under which those interests are sacrificed to the interests of that organization in remote districts."

This complaint merges into the broad question of competitive conditions. Without violence to the facts it may be stated that some of the pre-war breaks between operators and the United Mine Workers were due to the inherent hostility between two opposing conceptions of the basis upon which labor relations should rest. For the most part the reverses which the United Mine Workers has met since 1918 have been due to refusal to recognize the competitive conditions confronting the producers.

Whatever may have been the humanitarian considerations which persuaded the operators in the Central Competitive Field to enter into relations with the union and to assist in creating a strong labor organization by granting the check-off, the desire to stabilize conditions within their own sphere of activity and the hope that that stabilization would be extended to other districts were controlling factors in their decision. Within that field and within the outlying districts as they came into the union fold that stabilization, insofar as it applied to basic labor costs, was effected.

But the defeat of the union's efforts to enforce that stabilization in other competitive districts has made the union operators question

---

Concluding article in a series describing the changes in the labor status of the different bituminous coal producing districts of the United States in recent years. Preceding articles in this series appeared in *Coal Age* Sept. 25, Oct. 1, 8, 29, Nov. 19, Dec. 31, 1925, and Jan. 14, 1926.

Digitized by Google

the price paid for stabilization. So long as demand was at a peak there was no complaint because the basic wage scales in effect in the union districts set the standard for wages in competitive non-union fields. In periods of depression, however, the unorganized districts have taken full advantage of their power to readjust wages to reduce the cost of production and to maintain an undiminished tonnage.

This is strikingly illustrated in the tonnage records of central Pennsylvania and the Pocahontas region of West Virginia. In 1920, when the total bituminous output of the United States was 563,490,845 tons, the Pocahontas region produced 18,037,736 tons and central Pennsylvania, 58,172,416 tons. The following year production for the country as a whole decreased 147,538,955 tons, or 26.2 per cent; central Pennsylvania output declined 19,009,342 tons, or 32.6 per cent. But the tonnage loss for the Pocahontas region was only 587,917 tons, or 3.2 per cent!

Table XI—Dwindling Union Tonnage

Union-Controlled Tonnage at Peak of Power Compared with Union Output in 1925 and Non-Union Potentialities in 1926

(Figures in Net Tons)

	1918*		1925†		1926‡

Union Percentage	71.7		33.2		

*Division between union and non-union tonnage based on areas affected by general strike of 1919.
† Total tonnage estimated from weekly coal production figures.
‡ The estimates in this column were fixed by multiplying by 52 the maximum weekly production of each state during recent months of 1925.

Wage Handicap Heavy

Union mines in central Pennsylvania at that time were paying $1.1431 per net ton for pick mining, as compared with 50@53c. in the Pocahontas district, 59.11c. in New River and 55@85c. in Westmoreland County. Non-union mines in central Pennsylvania were paying 90.31c. Skilled inside labor at the union mines was getting 93.75c. per hour, as compared with 47@67c. in the competing non-union districts; the low union rate on outside labor was 82.5c., as compared with non-union rates of 30@64c.

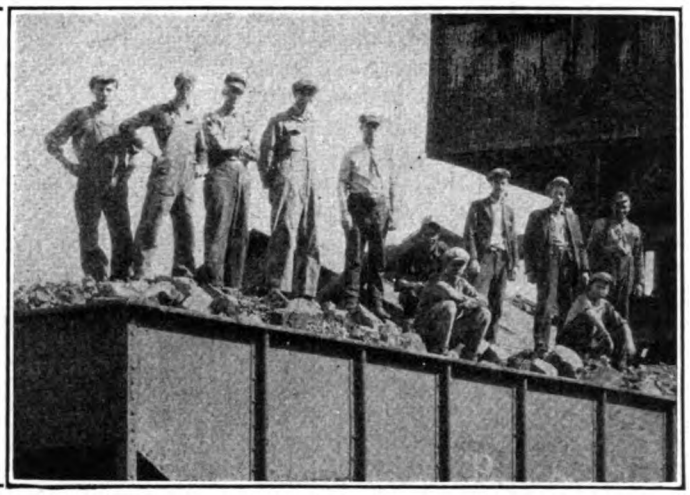
Under such handicaps, it is easy to understand how and why union production in the outlying and semi-organized districts has steadily shrunk and why, as in western Pennsylvania, southern Ohio and Indiana, the movement to operate independent of the union has spread. This independence, however, was not sought until after the operators had exhausted all efforts to induce the union to accord them some relief.

Western Kentucky, which competes with both the Central Competitive Field and the Appalachian Region, is typical of this situation, Muhlenberg, Ohio and McLean counties were completely organized for many years and partial recognition in Henderson, Union, Hopkins and Webster counties was a condition of long-standing. Like other outlying districts, western Kentucky felt the burden of competition growing heavier year after year. When it came to a question of renewing the 1920 scale in 1924 under the Jacksonville agreement terms, the operators refused to sign up. To suggestions from their own district organization that a modification be made, the international officials of the United Mine Workers turned a deaf ear.

The result of this stand-pat policy was the loss of the entire district. The operators re-established the 1917 scale, reducing the base pick-mining rate from $1.699 per ton on lump coal to $1.25, the minimum outside day labor rate from $6.06 to $3.56 and skilled and semi-skilled inside labor from $6.59@$7.20 per day to $4.09@$4.45 per day. Under these rates, western Kentucky has been able to become a strong com-competitor of Illinois for business which a few years ago was competition-proof.

In defense of a stand which has cut the percentage of union-mined coal over 50 per cent, the United Mine Workers offer two alleged justifications. Mr. Lewis and his associates grow eloquent in upholding the sanctity of the contract signed at Jacksonville two years ago and vehement in their denunciation of those signatories who have sought their commercial salvation outside of the union fold. Pressed further, the union officials will argue that their stand has had a stabilizing effect upon wages and intimate that to consent to a downward revision would only open the door to further reductions in non-union wages.

The first defense, of course, conveniently overlooks the fact that the operators, when conditions were reversed, consented to an upward revision of the rates in existing contracts. The second defense is problematical. The majority of the union operators would like to see some evidence of consideration of the wage situation in the light of the developments since 1923—something more than a fiat that nothing will be done.



That the union has served a useful purpose in the past is not to be denied. In an industry with the developed capacity for overproduction existing in bituminous coal, some check against a return to the conditions of forty or fifty years ago is necessary. Some of the militancy with which the union fought to prevent the worker from being the helpless victim of a nickel-slashing scramble for business was justifiable.

Such a check is still needed. But a policy which makes it increasingly difficult for operators who recognize the union to survive cannot be upheld. Since the war, and more particularly since the signing of the Jacksonville agreement, a strong reaction against the United Mine Workers has set in. If the union is to escape the fate of its predecessors, it must demonstrate that it recognizes its obligations to the operators with whom it deals. Otherwise the drift to non-unionism will continue at an increasing rate of speed.

"Pittsburgh Plan" Puts 16 Mines Back Into Operation

Movement Advances Slowly in Western Pennsylvania and Ohio with Little Violence of Labor

They loaded out the first car at Banning No. 2

By Arthur R. Friedman
Pittsburgh, Pa.

"THE Pittsburgh Plan," as the effort to resume mine operations in western Pennsylvania and eastern Ohio on approximately the wage scale of 1917 is called, has passed through its initial period of eight months and now, at the beginning of 1926 it is possible to summarize what has been done. In western Pennsylvania the Pittsburgh Coal Co. is alone in the movement, except for the Ellsworth Collieries Co. and the Pittsburgh & Erie Coal Co., but in the Pomeroy Bend region of Ohio four other companies stand with it. There are now 16 mines working under the Pittsburgh arrangement — nine in Pennsylvania and seven in Ohio. The Pittsburgh Coal Co. employs about 1,600 men. The maximum daily production of the company is 6,187 tons.

During the entire period of operating mines under "The Pittsburgh Plan" there has been a minimum of disorder. This has been one of the surprises of the movement. It is a fact which gives the proponents of the idea encouragement for the forthcoming year.

Results of Plan

Two of the outstanding facts about the operation of the plan are: The general lack of active support which coal operators have given the originator of the scheme—the Pittsburgh Coal Co.—and the surprising readiness of union miners to return to work at 1917 wages in fields that have been so strongly organized.

Economic conditions compelled the adoption of the "Pittsburgh plan." The two factors that had been strangling the western Pennsylvania and eastern Ohio coal trade during the past few years were labor and freight rates. In the minds of the operators, one was as bad as the other, and correction of one would not entirely counterbalance the detrimental effect of the other.

The Pittsburgh and the No. 8 Ohio districts were slowly losing their best market, the lake trade, because of the alleged preferential freight rates granted to southern West Virginia and Kentucky fields, and the non-union labor conditions in effect in those districts. Southern fields were selling coal up the Lakes cheaper than it could be mined in western Pennsylvania and Ohio. The two fields found themselves unable to recoup their lake losses in other markets.

Situation at Standstill

There the situation rested for a time. In the words of C. J. Goodyear, commissioner of the Pittsburgh Coal Producers' Association: "When a business concern finds itself unable to sell its goods; when the market price drops and a huge inventory remains; that concern either cuts the price and stays in the market, or it goes bankrupt. The union theorized about the situation. The operators dealt with it in a practical way. They tried alone to handle the situation in 1924, but failed. The union refused to cooperate in 1925."

So the new plan was started. The first "1917" mine was opened by the Pittsburgh Coal Co. on May 3, 1925. The mine was known as Dark Hollow and is situated near Pomeroy, Ohio. A handful of men started to work in the operation which had been shut down for many months. Wide attention was directed to this experiment. The tipple was picketed by union men and union sympathizers, but there was no violence. After the usual cleaning-up period, production was started and it has continued uninterrupted to the present time.

Nearly two months later, after it was apparent that Dark Hollow was likely to continue as a producer, the second mine was started by the company in Ohio. This is known as Thomas mine and was opened on June 17, 1925. On June 27, the third Ohio mine was opened, known as Syracuse. The latter two are also situated near Pomeroy. The three have been working ever since.

A summary of the Pittsburgh Coal Co. mines working in Ohio, giving the approximate number of men at work at the present time and the average daily tonnage follows:

Mine	Opened	Men	Av. Daily Output Tons
Dark Hollow	May 3	207	759
Thomas	June 17	129	418
Syracuse	June 27	156	432

It is evident from this summary that the Ohio mines of the Pittsburgh Coal Co. are producing an average daily rate of 1,609 tons of coal, with 492 men at work.

Opens Pennsylvania Mine

After waiting until later in the summer the company opened its first mine in western Pennsylvania. The growing success of the Ohio operations paved the way for the starting of those in the other state. The location of the first Pennsylvania operation was kept a close secret at first.

Finally, on Aug. 20 the company announced it had started operations at Banning No. 2 mine at Whitsett Junction, eight miles from Fayette City. A total of 36 men went to work the first day. The company claimed all the men were former em-

Digitized by Google

ployees of the company and also former members of the United Mine Workers, and had petitioned the company that they be allowed to go back to work after a long period of idleness. About 100 pickets took up their positions the first day. On the second day, the force of men at work had increased to 52, but there were still 88 pickets at the pit. On the third day the first car of coal was shipped when 66 men were at work.

The first movement toward the establishment of a new union was taken by the men at work at this mine on Aug. 29. The men organized Local No. 1 of a new union, elected officers and prepared to carry on in the same manner as the United Mine Workers.

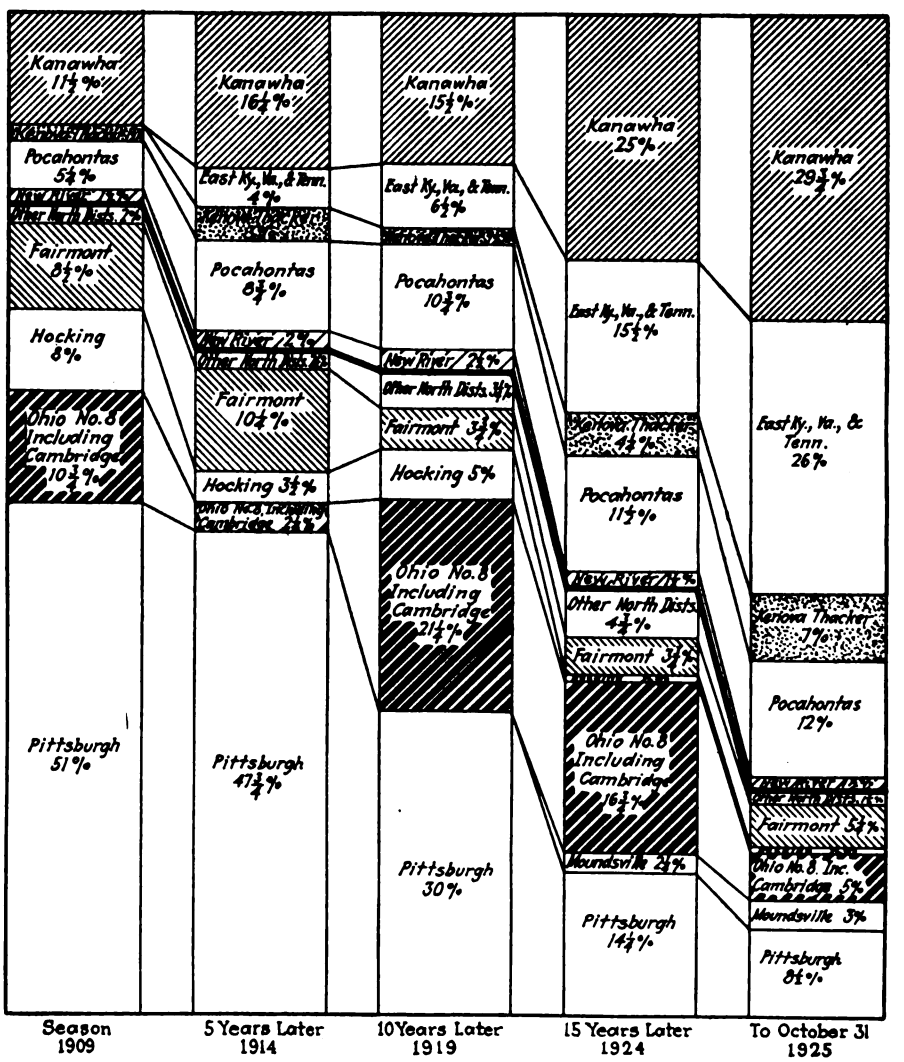
On Sept. 16, the Pittsburgh Coal Co. started its second mine in western Pennsylvania at Banning No. 1, located on the Pittsburgh & Lake Erie R.R. at Van Meter, on the Westmoreland-Fayette county line. This mine is two miles from the first mine started. The first day's force consisted of 29 men. Seventeen pickets were on hand the first day. On the second day the working force had increased to 105 men. By this date, also, 205 men were at work at Banning No. 2 mine, and the company also had shipped 573 tons of coal that day.

SURPASS 1,000 TONS OCT. 3

The first goal of the company, production of 1,000 tons a day, was surpassed at Banning No. 2 on Oct. 3 when 225 men produced 1,188 tons. The mine produced for the week ended Oct. 3, a total of 5,225 tons, while the same week's total at Banning No. 1 was 2,472 tons with 165 men at work.

For the week ended Oct. 10, production from the two mines was 8,711 tons. That date was pay day, also, and the company distributed $26,131.26 representing a two-weeks' pay. At Banning No. 2, 208 men participated in $17,046.51 and at Banning No. 1, 151 workmen shared $9,084.77.

With 107 men at work, the company reopened the third Pennsylvania mine, Midland No. 1, on Oct. 17. This mine is three miles from Canonsburg and 27 miles from Pittsburgh. The company at this time also announced that it had 37 other mines still idle, but that any of them would be reopened upon petition of the men. Two days later, the first coal was mined at Midland with 162 men at work. On the preceding Saturday, Banning No. 2 set a new daily production record of 1,228 tons.



First evidences of disorder were uncovered at Midland, when deputies found 10 sticks of dynamite against the side of one of the mine buildings on Oct. 23. On the night of Oct. 24, a man was killed in a cutting affray when union sympathizers attacked a number of the company workmen. At this time the Pittsburgh Coal Co. issued a statement indicating it would give all protection to its men who were the victims of unwarranted and unjustifiable attacks.

For the week ended Oct. 24, production at the three mines of the company reached 12,669 tons. The company had 557 men at work.

Two more mines were opened in quick succession. The first was Montour No. 10 at Library, in Allegheny County, and a few days later, on Nov. 12, the fifth mine was started in Scott township. This operation is known as the Mansfield mine. It was opened to supply the citizens of Carnegie with coal. By this time the company had 905 men at work.

On Nov. 23, the company announced a new maximum daily production of 3,364 tons from the five mines and on Dec. 1, it was said a total of 1,000 men were at work in the mines. On Dec. 9, the daily rate

Pittsburgh Coal Co. Operations Working In Pennsylvania

Mine	Location	Opened	Men at Work	Maximum Weekly Tonnage	Maximum Daily Tonnage	Date
Banning No. 2	Whitsett	Aug. 20	260	7,192	1,312	Dec. 8
Banning No. 1	Van Meter	Sept. 16	240	4,632	937	Dec. 5
Midland No. 1	Houston	Oct. 17	275	5,780	1,211	Dec. 8
Montour No. 10	Library	Nov. 8	210	3,698	938	Jan. 5
Mansfield	Carnegie	Nov. 12	60	670	180	Dec. 18
Warden	McKeesport	Jan. 4	150	.....	.....	.....
Dickson	Imperial	Jan. 13	74	.....	.....	.....

was again exceeded with a total of 4,069 tons of coal.

On this same day, a woman was killed at Montour No. 10 mine at Library when a driver of the company, stoned by a mob, let his machine run wild and it crashed into the crowd. At almost the same time, a miners' house was dynamited at Midland mine.

On Saturday, Dec. 12, a payroll of $60,043.37 was distributed and the production for that week had reached 20,942 tons. The Dec. 24 pay was $72,535.36, the highest of the entire operating period.

The sixth mine of the company was opened Jan. 4, when Warden mine, at Douglas station, on the Youghiogheny River, was started. A force of 120 men went to work in this plant, which is the most modern of the company's properties. On this same date, the company had a total of 1,244 men at work.

The seventh Pennsylvania mine—Dickson, three miles from Imperial, Pa.—opened Jan. 13 with 74 men. The company's grand total tonnage for the week ended Jan. 9 was 24,820.

In the accompanying table showing operations of the Pittsburgh Coal Co. in western Pennsylvania is included the average number of men at work in recent weeks, the maximum weekly tonnage from each mine, which occurred during the week of Dec. 7 to 12, and the maximum daily tonnage. These tonnages have not changed much since then.

FEW PENNSYLVANIA FOLLOWERS

The Pittsburgh Coal Co. had only one follower in western Pennsylvania—the Boggs mine of the Montour & Lake Erie R.R. which ran for two days beginning Aug. 24—until the first week of November when the Ellsworth Collieries Co., a subsidiary of the Bethlehem Steel Co., opened its Marianna mine in Washington County, on the 1917 scale. This mine now has 175 men at work, but while working conditions are now reported as favorable, this mine found greater difficulty in getting started than any of the Pittsburgh Coal Co. properties. This concern also has men working in its Acme mine at Cokeburg, preparing for resumption of operations, but coal has not yet been run.

The only other mine reported working 1917 scale in western Pennsylvania is Summer No. 2 of the Pittsburgh and Erie Coal Co. at Braznell, in Fayette County. Seventy-five men are at work there.

In the Ohio field since the first stage of the "Pittsburgh" movement, mines of other companies have proceeded under the plan. In that district each of the following companies now has one mine operating: The Stalter-Essex Co., the Vulcan Coal Co., the Blackstone Coal Co. and the Rutland Coal Co.

It is fair to say, after eight months' trial, that the 1917 wage plan in western Pennsylvania and Ohio has had neither phenomenal success nor dismal failure. It has produced coal when nothing else would produce it in a region overwhelmed by non-union competition and the movement is still expanding slowly with hope high for a broader spread during this year.

a Note that the coal statistics of the Geological Survey for a given year include only the mines that had an output in that year. Many mines that operated in 1923 produced no coal in 1924; moreover, many of the mines that did produce in 1924 worked for a short time only. The number of active bituminous mines of commercial size in Pennsylvania was 2,868 in 1923 and 2,122 in 1924.

b Includes also loaders and shotfirers. *c* Fulton, Lycoming, McKean and Venango.

Statistics compiled by U. S. Bureau of Mines.

Records Show 1925 Rivals 1920 as "Coal's Safest Year"

Death Rate per Million Tons Is 3.68—Improvement Over 1924 Was Only in Soft-Coal Mines—Gas and Dust Explosions Are Reduced—Rock Dusting Helps

By W. W. Adams
Statistician, U. S. Bureau of Mines, Washington, D. C.

THE CHIEF POINT of interest in the coal mining industry in the year 1925 from the standpoint of mine safety or accident-prevention, was the marked reduction in the accident-cost of the coal: that is, in the death rate per million tons. An absolute reduction in the loss of life was to be expected because of the idleness of the anthracite mines during one third of the year, but there was a further reduction of about 12 per cent in the combined anthracite and bituminous death rate per million tons during the period of actual operations. The decrease was in the rate for bituminous mines; the anthracite rate was higher than in the previous year.

This net reduction for the industry as a whole was equivalent to a saving of nearly 300 lives. In other words, if the 1924 rate of 4.19 deaths per million tons for the entire industry had continued through 1925, the number of lives lost last year would have been about 300 more than the number actually reported. The estimated 1925 rate per million tons is 3.68. Only 1920 has had a lower rate than this in the whole record history of coal mining in the United States.

The number of fatalities at all coal mines during the half-decade ending with 1925 is shown in Table I.

The fact that fewer lives were lost in 1921 and 1922 was largely due to idleness or part-time operation of many mines during those two years.

In the headpiece is shown an example of one hundred-per cent dusting. This entry in a Phelps Dodge Corp. mine at Dawson, N. M., is treated with dust both wet and dry, and at the right is a battery of V-troughs loaded and ready to dump its contents into the air upon the arrival of the pioneer wave ahead of any approaching explosion.

In 1921 the industrial depression prevailing in many parts of the country had the effect of greatly curtailing the output of coal at bituminous mines; in 1922, the great strike in both the bituminous and anthracite fields closed many of the mines during a large part of the year. Much of the reduction in the number of fatal accidents in those two years was, therefore, simply due to the fact that the mines were not in operation. The loss of life indicated by the foregoing figures resulted in yearly death rates per million tons as shown in Table II.

These figures clearly show the material reduction in the per million ton death rate in 1925 as compared with the rate for 1924. Barring unexpected revelations by the reports for December over and above the two major disasters already known to have occurred, it may be stated that the "accident-cost" of the Nation's fuel supply was lower in 1925 than in any of the last five years. Moreover, except for 1920 when the rate was 3.45 per million tons, records now available indicate that the 1925 rate will be as low as, if not lower than, that of any year in the recorded history of coal mining in the United States.

In this connection it should be emphasized that the per-million-ton death rate represents only the accident cost of the coal; that is, the price paid in human life for the coal produced. The per-million-ton death rate does not indicate the relative hazards of coal mining as compared with other industries of occupations; it does not indicate the hazards of mining in one State or district as compared with those in another State or district; nor does it represent the

SHALL ROCK-DUSTING GET THE CREDIT?

Mr. Adams, being a careful statistician and not a propagandist, scrupulously avoids saying that the steadily expanding program of rock-dusting in American coal mines is to be credited with last year's good showing in the record of accidents. However, he does cite the outstanding case of the June 8 explosion at Sturgis, Ky., where rock dust certainly saved the lives of 130 men. He points out that 1925 had more major explosions than 1924 but that the fatalities were 44 per cent less. In other words the death dealing opportunity was there but in many instances so was rock dust. In September 211 mines producing 11 per cent of the nation's bituminous coal were rock-dusted. This means something.

Table I—Fatalities at All Coal Mines, 1921-1925

Year	Anthracite	Bituminous	Total	Per Cent Increase or Decrease from Previous Year
1921	547	1,440	1,987	—12.5
1922	300	1,679	1,979	— .4
1923	509	1,949	2,458	+24.2
1924	496	1,900	2,396	— 2.5
1925 (est.)	400	1,740	2,140	—10.7

Table II—Yearly Death Rates per Million Tons

Year	Deaths	Rate per Million Tons	Per Cent Increase or Decrease from Previous Year
1921.....	1,987	3.92	+13.6
1922.....	1,979	4.15	+ 5.9
1923.....	2,458	3.74	— 9.9
1924.....	2,396	4.19	+12.0
1925 (est.)..	2,140	3.68	—12.2

risk of mining from the point of view of the miner or the insurance company.

The miner and the insurance carrier are primarily concerned with the probability and degree of the employee's personal freedom from accidental injury or death while in the mine, and the insurance company carrying the risk must have a sound basis for measuring the hazard to which the mine employees are exposed. Probably the best basis for measuring the miner's personal risk or for comparing the relative hazards of mining and other occupations and thus affording a sound basis for establishing equitable insurance premium rates, as between industry and industry, is the accident frequency and accident severity rates based on man-hour or man-year exposure, preferably the former.

Two Distinct Rates

It is indeed possible, that with the increasing mechanization of mining operations and the consequent rise in the average daily production per man employed, that the death rate per million tons might decline while the death rate per man hour might increase. It is essential, therefore, that the two kinds of rates be not confused when the subject of mine accidents is under consideration. The rates represent two distinctly different things.

The 2,140 fatalities in 1925, which include an estimated figure for December to supplement actual returns for the period January to November, may be classified by causes, with comparative figures for 1924 as shown in Table III.

These figures for 1925 are subject to such slight modification as final returns may require.

The marked reduction in the fatality rate per million tons in 1925 as compared with the previous year, that is, from 4.19 to 3.68, was due mainly to the smaller loss of life from explosions of gas and coal dust, particularly those explosions classed as "major." A major explosion is defined as one in which five or more lives were lost. During the year just closed 13 major explosions occurred with an aggregate loss of 262 lives. In the previous year only 10 major explosions occurred but a much larger number of deaths resulted from them; the record showed that 459 men were killed by the 10 explosions. The per-million-ton death rate based exclusively on these major explosions was 0.45 in 1925 as compared with 0.80 in 1924, the decline indicated by the rate for the past year representing a reduction of about 44 per cent. In addition to the 262 deaths from the 13 major explosions in 1925, the records show that 82 men were killed by local or minor explosions, that is, explosions in which less than five lives were lost.

Safe Lamps Save Lives

This type of electric cap lamp is one of those approved by the Bureau of Mines for use in gassy mines. The acceptance of electric lamps underground is widening and no doubt adds something to the safety factor of the whole industry.

Because of the absence of reports it is not possible to state what part was played by rock dust in preventing many of these minor explosions from spreading through larger areas of the mines and thus, with the attending greater loss of life, entering the class of the so-called major disasters. However, an illustrative example of the value of rock dust in confining an explosion to or near its place of origin is afforded by the disaster at Sturgis, Ky., on June 8, 1925, in which 17 men lost their lives.

According to a recent report[1] this explosion originated in an entry which had not yet been rock-dusted. A miner drilled into a strong gas feeder, which was ignited by his open-flame lamp. When the resulting explosion reached the rock-dusted entries it was stopped and the lives of 130 men working in rock-dusted parts of the mine were saved.

The same report states that 211 bituminous mines were using rock dust in September, 1925 and that the output of coal from these mines was about 11 per cent of the entire production of bituminous coal in the United States in 1924. The efficacy of rock dusting, as demonstrated in the explosion at Sturgis, gives substance to the hope that the adoption of rock dusting by an increasing number of mines will prevent the occurrence in the future of such disastrous explosions as have marred the record of past years.

Over a period of years major explosions similar to those listed in Table IV have caused an average of about 10 or 12 per cent of all accidental deaths from all classes of accidents in the coal-mining industry, the figures varying from less than 2 per cent in 1921 to more than 19 per cent in 1924. In 1925 the 13 major explosions caused about 12 per cent of the total number of deaths from all causes at the mines.

Fifty per Cent Due to Falls

Falls of roof and coal usually cause nearly half of all fatal accidents at coal mines. The average percentage over a ten-year period (1914-23) was 48; in 1925 it was 49. The 1,045 fatalities from this cause in 1925 represented a per-million-ton death rate of 1.80 as compared with 1.86 in the previous year. Haulage accidents underground resulted in 345 fatalities and represented a fatality rate of 0.59 per million tons as against 0.61 in 1924. About 17 per cent of all coal-mine fatalities are caused by haulage equipment.

Accidents resulting from blasting or handling of explosives usually account for about 4 per cent, exclusive

Oxygen-Apparatus Crew

These men, at the Consumers Mining Co.'s Harmar mine near Pittsburgh, Pa., form one of the ever increasing number of rescue teams in this country. Not only is the coal industry's defence against explosions being raised higher but more men everywhere are trained in the vitally important business of what do when trouble occurs.

of those major gas or dust explosions in which explosives were the agents of ignition. In 1925 accidents from explosives caused 89 deaths, indicating a per-million-ton fatality rate of 0.15; in the previous year the rate was 0.17.

Electricity was directly responsible for 82 deaths during the past year, the fatality rate per million tons being 0.14 as compared with the same rate for the preceding year. Deaths from miscellaneous causes underground numbered 86 and represented a fatality rate of 0.15, as compared with 0.17. Shaft accidents caused 34 deaths, the fatality rate being 0.06 as against 0.05. Accidents from all causes above ground resulted in 115 deaths and represented a fatality rate of 0.20 as compared with 0.24.

Thus the record for 1925 shows that while the industry operated under certain handicaps during the year, the country's coal supply was obtained at a lower cost in human life than that shown by the record of previous years, with the single exception of 1920.

Low-Temperature Semi-Coking Benefits Coal

Toledo Plant Manufactures Amalgam—Rhode Island Field Prepares to Produce a Carbonized Product—Charring Coal Dust in Suspension Is New Venture

By R. Dawson Hall
Engineering Editor, *Coal Age*,
New York City

THE STRUGGLE for survival in the coal industry may not depend, entirely upon reducing the cost of production and raising the quality of raw coal. It may demand also upon the improvement of coal by processing. Some advances in that direction were made in 1925. During the past year the Trent, McEwen-Runge and the McIntire processes have been showing the most lively progress. Not much has been heard from the Piron and old Ben Coal Corp. plants at Detroit, Mich., and Waukegan, Ill., respectively, so nothing will be said of them in what follows.

The Trent process of making amalgam is still in operation in Toledo, Ohio, where the product is being sold in bulk and in the form of 22-lb. paper-wrapped blocks. Bulk amalgam which is the product shipped without shaping is still on the market. In transit in railroad cars it becomes shaken into mass form. When thrown in the furnace it softens and can be spread, it is said, so as to cover the grate area. It is used industrially and being clean by reason of the amalgam process and being of extremely high heating value because of the oil in the product, it gives, it is reported, a superior heating value and less clinker trouble than unprocessed coal.

The amalgam in packages is being sold in Toledo, parts of Ontario and in Duluth and Superior. It is distributed by the Citizens Necessities Co. From 50 to 70 tons of packages, are said to be produced daily, and the expectation is that package machines will be installed that will increase the output to 300 tons per day. But the ultimate intention is to add three ovens for baking so that some of the oil in the amalgam may be driven off after briquetting in small bulk and the product sold as Superfuel in competition with anthracite.

SHIP SCREENINGS ONLY

The coal used is largely produced from the mines of the company at Middlesborough, Ky., and formerly owned by L. C. Gunter, a leading stockholder. Only the screenings are shipped to Toledo for treatment. Not much has been done recently with the plan for using the amalgam as pulverized fuel.

The plant being built to manufacture Rhode Island anthracite into Superfuel is not yet quite complete. It is designed to produce ultimately 1,000 tons daily in four units. From latest reports one unit is nearly ready for operation and another is two-thirds complete. The plant is operated by the Anthracite Superfuel Co., and is financed by the owners of the Eastern Coal Co., a coal-selling organization of Providence, R. I. Much depends on the success achieved in the operation of the ovens at this plant where the first large scale attempt is being made to turn amalgam into Superfuel. If it is as successful as is expected it is likely that the Moundsville (W. Va.) and Clearfield (Pa.) plants and perhaps the one at Spokane, Wash., may be equipped for the conversion of amalgam into Superfuel. These plants are at present idle, because, it is said, the oil costs are too high and the bituminous content in the product too great to make it possible to place the output in the most advantageous position in the market. An English firm, it is said, awaits also the success of the bake ovens at Providence.

The Moundsville plant had to buy oil from the Atlantic coast and the shipment of the oil in bulk to the plant and back in the amalgam to points in the East make the expense excessive. The coal also has 40 per cent of volatile matter and the addition of oil, without distillation, makes the product of high volatile content. As one addition leading to the production of Superfuel at Moundsville

In the headpiece is shown pulverized coal, highly magnified. At the left are unheated particles pulverized for the McEwen-Runge process and magnified 100 diameters. The parallel lines were ruled on the object glass and were spaced one one-thousandth of an inch apart. The angular shape of the particles can be seen clearly. The center picture shows the particles after they have been heated to 600 deg. F. The coal still retains about 30 per cent of its volatile matter but has become blistered, rounded and opaque. At the right the result of higher temperature carbonizing is shown. The particles have a surface like that of a transparent window of many small panes. This characteristic disappears upon ignition.

Digitized by Google

the unit for the distillation of the raw coal is now being installed. When the successful distillation is accomplished it will be necessary to add an amalgam baking unit.

The Lapugnoy plant in France has a capacity of 500 tons per day. Its first baking unit is planned to prepare 100 tons of Superfuel daily. The briquets, which are not subjected during the latter part of the process to the oxidizing action of the air, are a trifle unclean to handle, but otherwise seem of excellent quality, burning smokelessly. Contracts are reported to have been let in Brazil and India.

The "amalgamation" of coal with oil may be made of increasing value by the use of the practices discovered and known as "selective flotation." The pyrite which has a tendency to float can be scored on its faces by aluminum sulphate and cyanide after which it will be thrown down in the amalgamation tank just as gangue is deposited in a flotation cell. Thus the pyritic content can be lowered to a minimum. Of course, the humic and resinic sulphur cannot be so reduced, and the question what to do with such impurities remains as one of the great unsolved problems.

TRENT PROPOSES SOLUTION

A proposed solution for this metallurgical problem is that advanced by W. E. Trent in a patent dated July 14 of last year. It must be remembered that the function of limestone in a furnace is partly to provide a flux and partly to convert the sulphur in the coke and iron to a calcium sulphide so that it may be removed by slagging. In the blast furnace the contact between the coke and the limestone, the patentee believes not to be sufficiently intimate to effect the elimination of the sulphur in proper degree and so he would grind the limestone to a fineness about that of the coal used in his process and by incorporating it in the amalgam he hopes to obtain in the Superfuel product that intimate contact that he is seeking.

But limestone is a gangue and will not float with coal in making amalgam unless it is dry and oil coated, so the plan is to mix the oil with limestone and stir the mixture in with the wet amalgam. The limestone being covered with oil will float, but the other gangue being wet will sink. Enough limestone will have to be added of course to remove the sulphur in what oil remains after the amalgam is carbonized in the baking process.

The trouble with distillation of coal whether at high or low temperature, but especially at the latter, is that it is difficult to pass heat through a body of coal, not because the carbon is so impervious to heat but because the volatile gases remove the heat as it is received by the coal. When the gases are driven off in part, the coal is left in a cellular condition and that, as is well known, is one resisting the passage of heat, as is well illustrated by the heat insulation afford by the many kinds of cellular brick on the market. Consequently inventors have endeavored to use thin sheets of coal as in the Piron process where they are laid on a conveyor the palettes of which travel over a bed of molten lead.

COAL DUST IS CHARRED

Today the McEwen-Runge process, owned by the International Combustion Engineering Co., is seeking to meet this difficulty with every hope of success by grinding the coal to a dust and by charring it in fluid suspension. Coal dust is readily coked in a mine explosion, though heat is of only momentary duration. It is easy to understand how dust can be charred at a relatively low temperature in a somewhat similar way. A plant for preparing 200 tons of char daily is being constructed at Milwaukee. The char will be used under boilers and the oil from the coal will be drawn off as vapor, condensed, scrubbed and marketed.

The coal will first be broken down in a crusher and passed through a screen. The fine material will then go to a pulverizer and be blown in a pipe to an elevation of about 100 ft. where it will enter a cyclone collector, and be dropped into a hopper from which it will be fed into the "primary" retort which is a big 30-ft. tube or tower of steel, lined with refractory material. This has an internal diameter of 6 ft., 9 in. Here it will come into contact throughout its fall with inert gases which will be fed into the bottom of the tube at a temperature of 600 or 700 deg. F. The gases will lose their heat as they pass upward and finally leave the tube through a pipe in which is placed an exhauster which will vent them to the air.

The temperature of the gases being at all times low, the coal in this primary or "preheating" retort will drive off only inert gases such as water vapor and carbon dioxide. The discharge to the air, therefore, will be gas having no thermal value except that of sensible heat. The coal powder will be not in any sense a char but it will be changed in appearance by the process it has undergone. No longer will it be more or less rectangular. It will have become hollow, rounded and opaque.

The heat for this primary retort will be provided by the hot char which is the ultimate product of a "secondary" retort to be described later. This hot char, however, will not be allowed to come in contact with air that it preheats as that would result in its combustion. In the primary retort, as stated, no coking will take place and the product will neither agglomerate nor stick to the side of the retort but fall freely into a hopper below.

Thence it will pass to the secondary or carbonizing retort, which is of 6 ft. internal diameter. Here the product of the primary tube will fall another 30 ft. meeting on its way inert gases which will enter at a temperature of about 1,500 deg. F. and leave at a temperature of about 600 deg., the average temperature being about 1,050 deg. The treatment of the dust in each tube will be completed in about 35 sec. and the whole process will take only 6 min. So rapidly will the conversion to semi-coke be performed that about 200 tons can be obtained in a day's run.

PIPES CONVEY GAS

The gas which passes off the top of this retort will be taken by pipes to a hydraulic main and thence to a gas cooler, a gas exhauster, a tar extractor, a final cooler, gas scrubbers and a gas holder. Some of this gas may be used for the air preheater of the primary retort thus adding to the heat afforded by the hot char. It also will be used partly to furnish the heat for the secondary retort.

The product can be stored when cooled without fear of firing, and it can be transported in tank cars or wagons or blown direct to boilers for use as pulverized fuel. It can be loaded on locomotive tanks and blown into the furnaces of the locomotives. It can be piped like oil to ships' bunkers and used as pulverized fuel under the boilers. Extensive work in Great Britain is belived to justify the most favorable expectations.

The gas distilled from bituminous coal at low temperatures has a greater heating value than that pro-

Digitized by Google

duced at high temperatures, the thermal value being approximately 750 B.t.u. The gas has a small percentage of hydrogen and a high percentage of methane hydrocarbons. The gas, therefore, should be suitable for delivery to gas companies, or as a substitute for producer gas, water gas, carburetted water gas or some of the many industrial gases, or it may be used in internal combustion engines or be burned under boilers for power generation. Should the installation be a success seven other like units will be erected at the same location.

PLANT GIVES GOOD SERVICE

A plant that has given excellent service is that designed and operated by C. V. McIntire with Messrs. Coverdale & Colpitts, as consulting engineers. The experimental work has been done by the Consolidation Coal Products Co., a subsidiary of the Consolidation Coal Co. This plant has a low-temperature carbonizing retort which may be classified as a stationary, horizontal, externally heated and internally agitated, furnace of cylindrical form and measuring 16 ft. 3 in. in length and 8 ft. 6 in. in diameter.

In the center of the cylinder is an agitator shaft which oscillates through an arc of 270 deg., and to it are attached paddles which move through the coal mass, close to the heated surface. These revolve so that the coal is moved every 30 sec. The cylinder is heated so that the surface adjacent to the coal is kept at 1,200 deg. F. a temperature somewhat above that desired for steady carbonizing but such as has been found desirable when the coal is agitated, as described, every 30 sec.

The gases in the retort above the coal are at a temperature between 650 and 750 deg. F., and the coal itself is believed never to reach any higher temperature than 800 deg. except in the periods of short duration in that part of the coal that rests against the high temperature lining.

The lower part of the retort has modified V- or U-shaped grooved sections of specially resistant iron which are fitted together with flanges to break joints. The upper part is a portion of a cylinder and is constructed of light boiler plate protected by sil-o-cel. This can be lifted bodily off the lower half whenever it is necessary to open the cylinder for necessary repairs or cleaning of the retort.

CARBONIZES 50 TONS DAILY

The product is a fine soft coke too fine to use on an ordinary grate. As it reaches the end of the retort it drops into a hopper where it is cooled by steam but it is found necessary to quench it further with water. Needless to say this char can either be used as a pulverized fuel or made into briquets. About 10 to 12 per cent of volatile matter still remains in the product after it has been subjected to the carbonizing process. With higher temperatures the coke would be harder and more gritty, but that would add to the pulverizing cost. About 50 tons of coal can be carbonized by one of these units in a day.

DAILY PROFIT OF $5,920

Using the high volatile coal of the Fairmont district the process is said to yield per net ton of coal 10 lb. of ammonia as ammonium sulphate, 28 gal. of crude tar, 1,000 cu.ft. of surplus gas and 1,500 lb. of coke. Judson C. Dickerman, assistant director of the Giant Power Survey, whose description has been utilized, states that an 8,000-ton plant after all charges for interest, depreciation and taxes at 15 per cent, on a plant cost of $800 per ton daily capacity, would yield a profit of $5,920 per day. He adds that "the prevailing estimates of practically all the low-temperature carbonizing processes are about $600 investment per ton of daily capacity, against known figures for standard byproduct coke ovens of $1,800 to $2,400 per ton."

The New Caryville Coal Co. Secludes Itself in the Hills of Tennessee

Above is shown the steel tipple of the New Caryville Coal Co., Caryville, Tenn. This company is one of seven affiliated with the Southern Mining Co., the main offices of which are at Williamsburg, Ky. It is unusual to see a modern steel tipple in such a shaded nook. Large trees almost surround the structure.

The lower illustration shows G. W. Pickle, superintendent, (left), and E. M. Denham, chief engineer, aboard the 15-ton monitor ready to ride down the 7,000-ft. plane at the mine of the New Caryville company. Some time ago a salesman wanting to go "up on the hill" boarded the empty monitor but instead of staying on the seat he climbed inside. When the monitor stopped at the top he failed to climb out soon enough and was partially covered with coal before his presence was discovered.

New Types of Preparation Equipment Attack Problem of Cleaning in 1925

Dry Cleaning, Sand-Flotation and Launder Separation Make Further Progress — Several Plants Introduce Quicksand Method — Two Breakers Use Rheolaveur

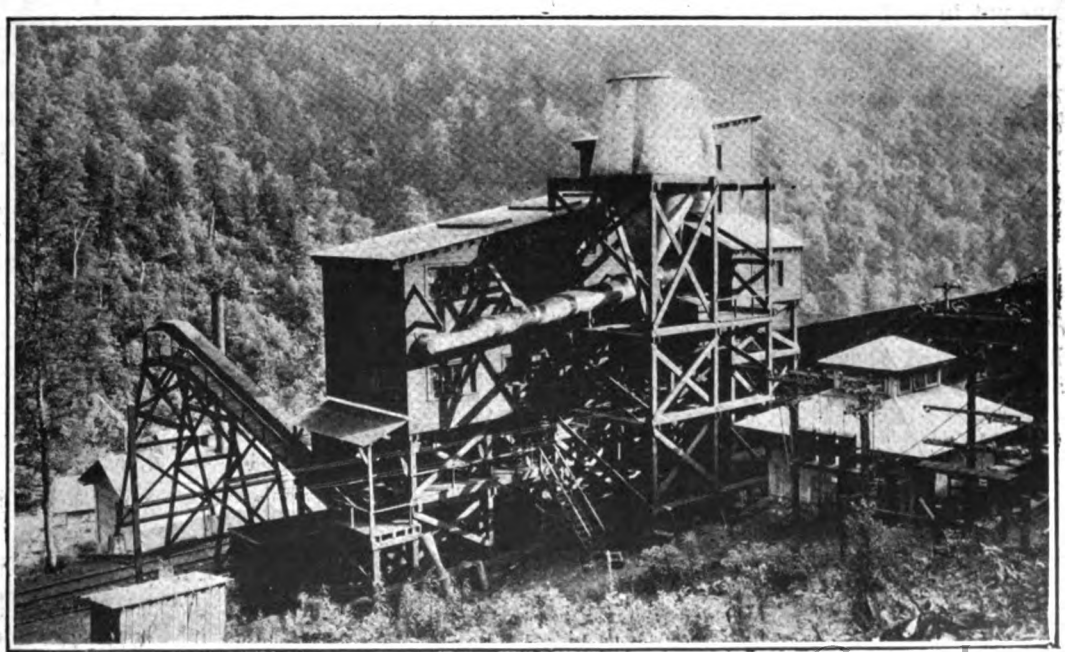
COAL preparation engineers in 1925 showed a disposition to try out various new forms of cleaning equipment, not based on the jigging principle. The most aggressive of the new agents in the coal-cleaning field are the dry-cleaning table, the Chance washer, the Rheolaveur, the Deister table for the larger sizes and the Hydrotator.

Dry-cleaning equipment, as constructed by Roberts & Schaefer Co., has been installed by the Covel Smokeless Coal Co., at Covel, W. Va.; the Gulf Smokeless Coal Co., at Tams and Hotcoal, W. Va.; the Winding Gulf Colliery Co., at Winding Gulf, W. Va.; the Premier Red Ash Co., at Red Ash, Va., and the West Canadian Collieries, Ltd., Blairmore, Alta., Canada. In 1926, it is said a large plant will be constructed for the Algoma Coal & Coke Co., near Northfork, W. Va., and one for the Berwind White Coal Mining Co., at Windber, Pa. This latter will have a capacity of 400 tons per hour.

The West Canadian Collieries plant treats only four sizes ⅛ in. to ¼ in.; ¼ in. to ⅞ in.; ⅞ in. to ¾ in.; ¾ in. to 1⅝ in. Everything below ⅛ in. and over 1⅝ in. is not treated. As the smaller of the two untreated sizes constitutes 19 per cent and the over 1⅝-in. 26 per cent of the tonnage, only 55 per cent of the output passes over the tables or 110 tons per hour as against 200 tons of total tonnage.

During the past year the American Coal Cleaning Corp. has made experiments at the Ohio State University and as a result has now a table that will clean coal that passes through a 4-in. bar screen and is retained on a 2-in. square mesh rotary screen and will do it at a cost slightly less than for the smaller sizes and at the rate of 60 tons per hour. At one plant the range of sizes to be treated has been raised to include coal between 2-in. and 3-in. thus making unnecessary the services of four men on the picking table.

Different Principle Involved



In the older type the coal is separated from the impurities on a single pervious, riffled deck, the impurities which correspond to concentrates in the metal mining being collected on one side and finally discharged from the separator at a point as distant from the feed as the discharge of the clean coal. In the new type the concentrates or impurities are collected in the *central* portion of the deck and the coal discharged on both sides.

As its name implies, the Y-type separator is shaped like the letter Y with the Y set in a horizontal position. The raw coal is fed to it at the base or foot of the Y. This portion contains riffles extending in the general direction of the intersection of the upper portion or arms, and terminating at the central portion which is raised. The sides of the leg of the Y are inclined downward. The arms are practically miniature separating tables, or decks, similar to those constituting the older type separator. The running gear is identical with the older type. The head motion likewise is in the general direction of the riffles.

The coal is received at the base or foot of the Y, the lightest or least dense particles, the upper strata of the mass, is immediately discharged by the force of gravity to either side, and the less dense which then becomes the topmost strata, is discharged farther along the sides of the legs, thus space for more coal is provided and the capacity increased. The heavier or more dense particles, the lower stratum, not having been floated by the air current above the riffles, are retained between them and concentrated in the central portion of the leg of the Y. This portion feeds these lower stratum on to two minia-

Coal Winnowing Plant

The air-cleaning plant of the Covel Smokeless Coal Co. at Covel, Wyoming County, West Virginia. One of the preparation equipments built in 1925. The product is shipped over the Virginian Ry. Much activity in coal cleaning by air has been manifested in Wyoming County, where the early seed planted at McComas has thrived and brought forth abundantly, there being plants at Hotcoal, Tams, Wyco and Winding Gulf as well as at Covel.

Digitized by Google

ture decks forming the arms of the Y, and they are here treated as on the older type of separator. Here what takes place may be termed a recleaning operation for that portion of the product which requires it. The area of discharge of this separator is twice that of the older type, thereby permitting a stream of coal twice the size to be discharged from it in a given time. The coal is retained on the separator only a sufficient length of time to separate it from the impurity after which it is immediately discharged. In addition to separating the impurities from the coal due to an improved system of air baffles and control, the unit also grades the coal into sizes. In other words, the finer sizes are treated and disposed of first and the cleaning operation continued with a steadily increasing sizes toward the intersection of the arms of the Y. This feature has permitted a range of sizes 100 per cent greater than that formerly thought possible.

As a result of these changes the new separator is said to have twice the capacity of the old and to reduce the necessity of fine sizing to an important degree. Aspirators have also been developed to permit the successful sizing of fine coals passing the ⅛-in. screens. It is claimed that the floor space and the height formerly required have both been reduced and the dust-collecting system has been made less extensive. Less middlings are produced and the charges for investment, power, labor and supplies have been decreased.

REDUCES ASH 45 PER CENT

The McComas plant, of the American Coal Co. of Allegany County, has put in aspirators so as to obtain a sized coal running from ⅛ to 3/16 in. Obtaining an ash reduction of 45 per cent by cleaning this coal it was decided that five Y-type separators should be installed, that the two old separators treating the ⅛ to 1/16 in. size should be removed, as also the 1/16-in. screens or about one-third of the entire screening equipment of the plant. These can be used at another installation. These changes will be completed about Feb. 15. The sizes treated will be 3 to 1½ in.; 1½ to 1 in.; 1 to ½ in.; ½ to ¼ in.; ¼ to ⅛ in; ⅛ to 3/16 in., and 3/16 to 0 in. (aspirated). The capacity will be 275 tons per hour.

A dry concentrating plant is being erected for the International Coal & Coke Co., at Coleman, Alta, Canada, having a capacity of 300 tons passing the 3-in. screens. The sizes, 3 to 1⅝ in.; 1⅝ to ¾ in., and ¾ to ⅜ in. will be treated on the older type of pneumatic separators and the ⅜ to 1⅛ in. and the through ⅛ in. will be treated on the new Y type.

The Birtley Iron Co., Birtley, County Durham, England, is erecting a plant at the Wardley Collieries which will screen to five sizes and treat 150 tons hourly pneumatically, only the coal under one inch being subjected to the pneumatic separators of which there are six. Prior to this it had erected a similar plant at Heworth Collieries screening the coal into three sizes and using only coal under one inch. Four pneumatic separators were used. The Premier Red Ash Corp., at Red Ash, Va., has put in a separator to treat nut sizes (2 to 1 in.).

SAND FLOTATION PROGRESSES

The Chance process has made much progress during 1925. Sand flotation has been applied successfully to the washing of bituminous coal, the first plant of that type being placed in operation on Oct. 1. It shipped over 150,000 tons in the three months following. The patentees claim that the yield of coal of prepared sizes has been demonstrated in plants located in the southern anthracite field and that a mixture of buckwheat, rice and barley can be washed in a separate cone to produce steam coal of any desired ash content without change in the preparation standards of the domestic sizes. This method has been adopted at four of the plants erected.

It is stated that the process will produce uniformly low-ash coal in machines of high capacity without loss of pure coal in the refuse. Where the coal is boney or laminated the larger refuse can be and has been crushed, thus releasing the coal from the interlaminated slate so that it can be rewashed in a separate, or in the original, cone. The refuse from two cones can be handled by a common conveyor and slate shaker. The sand sumps and de-sanding shakers have been redesigned so as to reduce sand losses to a minimum, the loss in the case of bituminous-coal cleaning being reduced to less than 2 lb. of sand per ton of coal, according to the patentees. A list of such sand-flotation plants is given in the accompanying table.

The construction of Rheolaveurs during 1925 at no American plant reached a stage making operation possible except at one plant of the Hudson Coal Co. where, it is said, coal has been washed by this process. The Glen Alden Coal Co. during the latter part of the year commenced the reconstruction of its Loomis breaker, but this work has been delayed by the strike. A 3,000-ton Rheolaveur unit is being erected and as soon as this unit is in successful operation another of equal size will be added, thus entirely replacing the original equipment.

At the Hazleton shaft of the Lehigh Valley Coal Co. a unit capable of cleaning 2,000 tons in 8 hr. is under construction. Other plants which, it is said, will be erected in 1926 are those of the Montevallo Coal Co., at Aldrich, Ala. and of the American Smelting & Refining Co., at Cokedale, Colo., both bituminous plants.

Experiments have been made at coal mines with the Hydrotator, a settling tank in which the solids are kept sufficiently in motion for stratification by revolving water jets. Trials of the availability of the process for coal washing have been made at the Oak Hill Colliery, Minersville, Pa., and at a mine in Alabama. Developments in other industrial fields have been quite active, however.

Concentrating tables have, hitherto, been used only for the cleaning of small sizes from ⅝ in. to dust.

Sand Flotation Plant Construction Dur ing Year 1925

Plants Erected	Type	Cones Installed Ft.	In.	Sizes Washed
Anthracite				
Madeira, Hill & Co.	Breaker	4 —	13 6	Broken to barley (incl.)
St. Clair Coal Co.	Breaker	3 —	13 6	Egg to barley (incl.)
Repplier Coal Co.	Breaker	2 —	13 6	Egg to barley (incl.)
Northumberland Mining Co.	Breaker	2 —	13 6	Egg to barley (incl.)
Shamokin Coal Co.	Breaker	2 —	12 0	Egg to barley (incl.)
South Penn Colliery Co.	Breaker	2 —	7 8	Egg to barley (incl.)
Winton Coal Co.	Breaker	1 —	15 0	Egg to barley (incl.)
Moosic Coal Co.	Breaker	1 —	15 0	Egg to barley (incl.)
Suffolk Ant. Colliery Co.	Washery	1 —	15 0	Egg to barley (incl.)
Harleigh Coal Co.	Washery	1 —	15 0	Stove to barley (incl.)
Coleraine Coal Co.	Washery	1 —	13 6	Stove to barley (incl.)
John Ames Coal Co.	Washery	1 —	13 6	Stove to barley (incl.)
Hickory Run Coal Co.	Washery	2 —	12 0	Stove to barley (incl.)
Bituminous				
Rockhill Coal & Iron Co.	Tipple	2 —	10 0	4½ in. to ¾ in. (incl.)

The hourly capacity in output of clean coal is usually rated when operating on coal containing not more than 25 per cent of refuse, as follows:

Diameter of Cone, Ft.	Tons per Hour	Diameter of Cone, Ft.	Tons per Hour
7.5	50	13.5	125
12	100	15	150

Table for Washing Coarser Sizes

It has always been assumed that tables were only suited to coal of sand size. This table washes nut-sized coal, and, it is said, does it effectively.

The larger sizes have been cleaned either by jigs, by dry methods of mechanical concentration or by hand picking. The Plat-O coal washer has in the past year been devised to clean large coal and to do it in full view of the operative.

Six Launders Employed

The washing operation is carried on in six launders, three on a side, set at an angle to the center line of the machine, which is also in the line of motion. These launders have an upward inclination of 1¼ in. per foot, with the exception of the last 15 in. at the refuse discharge end of each launder where this inclination is increased to 1½ in. per foot.

The deck of the machine is supported and operated on dust-proof, self-oiling slipper bearings and is reciprocated by a self-oiling head-motion similar to that used for tables of this type in the preparation of fine coal.

The decks of these machines are constructed throughout of cypress, and lined with heavy linoleum similar to that used as deck covers on coal and ore tables. All portions of the interior of the washer subject to wear are covered with heavy rubber. That on the washing launders is corrugated, the corrugations running transverse to the forward travel of the refuse. The corrugations are of the saw-tooth type with a long, easy slope in the direction of the travel of the material and a short, abrupt shoulder. These saw-teeth facilitate a rapid advance of the refuse, the steep upward slope of the washing launders holding back the clean coal. Wash water boxes, launders, and spray pipes are provided for supplying the necessary water for the washing of the coal.

The washer deck is reciprocated at a speed of 135 to 140 r.p.m. with a length of stroke of 2¾ in. The feed is delivered to the machine at the head end, or highest point, just back of the triangular wash-water box. The tendency of the material being washed is to travel in a direction parallel to the line of motion, but due to the angularity of the launders to this direction of travel the solids are given a circular or panning motion and the water a pulsating or jigging action.

After the coal has been washed in the first or upper set of launders it is rewashed in the second and third sets. In the first launders a large portion of the heaviest and coarsest of the refuse is removed together with a small portion of the lighter slate. In the second launders but little of the heavy refuse is left, while in the third launders the final washing has practically nothing to remove but slate and bone coal.

The refuse from each of the launder operations passes off at the forward ends of the washing launders through openings leading to the general refuse launder running along under the center of the deck. The clean coal is discharged on each side of the machine at the lower end.

The washed material as it passes from one launder to the next flows over a short length of brass screen which drains off the water into the adjacent wash-water box where it is used in the washing of the same coal. Fresh water may be added from spray pipes on the edge of the washing launders or driven up through screen-covered openings so that it passes through the bed of the refuse as it moves up the slope.

Washes 15 Tons Hourly

The capacity of the washer is approximately 15 tons per hour, and the wash-water requirements are 400 gal. (1¾ tons) of water per ton of coal treated. For continuous operation 2 hp. is required. If an individual motor drive is used a 3-hp. motor should be supplied for the purpose. The washer is in over-all dimensions 5 ft. 3 in. wide, 16 ft. 6½ in. long and 5 ft. 9¾ in. high to the top of the wash-water box. One of these washers has been operating at the plant of the Potter Coal & Coke Co. at Greensburg, Pa. Others are to be or have been installed in the Donetz coal field in Russia.

Concentrating tables for fine coal made further headway in 1925. The Lehigh Coal & Navigation Co. installing thirty Deister Concentrator Co.'s units at its new Lansford breaker, twelve of these having rubber deck-covers and riffles of molded rubber. They will be used for the treatment of buckwheat Nos. 1 and 2. An installation was made by the same company for the American Smelting and Refining Co., at Rosita, Mex. Vibrating screens are entering the Eastern fields, despite the greater dampness of the Eastern coals. Such screens have been installed for the Alabama Coal Corp., the De Bardeleben Coal Corp., at Empire, Ala., and the Alabama Fuel Co., at Overton, Ala.

Markets and Production in 1925 and Forecasts by Our Correspondents in Leading Coal Fields—Diagrams and Tables of Spot and Weighted Average Prices of Coal by Producing Districts

Midwest Market Had Quiet Year; Northwest Docks Regain Lost Ground

Except on Eastern Coals, Price Spread Is Narrow —Sharp Advance in Smokeless Sends Consumers Back to Midwest Coals—Labor Problem Is Vexing

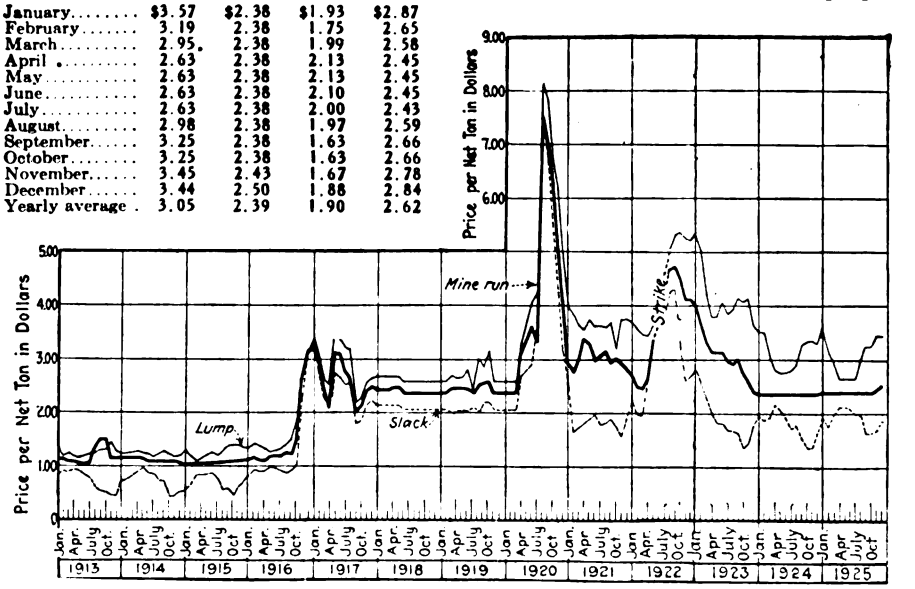
By H. A. Requa

The year just closed was an uneventful period in the coal industry of the Middle West and Northwest. There was less spread in prices last year, perhaps than ever before, though some outside coals did fluctuate, which will be referred to later. But considering local coals—from Illinois, Indiana and west Kentucky — the twelve-month period showed little variation. This is true of both steam and domestic coal. Much the same situation prevailed at the coal docks on Lake Superior and Lake Michigan, where dock operators were engaged over the year in battling for their old markets against the inroads of all-rail coal from West Virginia and Kentucky. Eastern coals moving into the Middle West had frequent ups and downs, but as the Middle West is primarily interested in its own coals these variations did not cut such a tremendous figure.

Anthracite cut but little figure in the Midwest and Northwest market last year, principally because those interested in this fuel made their purchases early in the season while hard coal was plentiful. The docks still have large reserves, which they are selling, as the demand occasions, at reasonable prices. Some retail dealers also have some left, which they are holding for pet customers.

Right after the first of the year business was brisk and prices were firm, largely due to a spell of very cold weather all over the Middle Western and Northwestern states. About the middle of January the weather moderated, and the market tapered off until the latter part of February, when more cold weather brought a little impermanent relief. From then on until in April the market was uniformly poor.

After the first of May business picked up a little, owing to improved industrial conditions. Business lagged during the summer until late in August. About that time the public began to think there might be something to the anthracite strike talk, after all, and it might be a good idea to buy the family and factory coal supply for the winter. A much better market resulted, and from then on prices and production figures began gradually to climb. In October and November prices reached the top for the year, but tonnage figures kept on climbing. Indiana, Illinois and western Kentucky mines produced record tonnages, and many a dock company at the head of Lake Superior wired to Toledo or Cleveland for an extra cargo or so of coal.



During the late fall and early winter months prices were at their best, but there was no runaway market on account of the anthracite strike, which surprised many engaged in the coal industry. They did not take into consideration that coal was being produced in such great quantities that a fuel shortage was impossible. The end of the year saw the Middle West and Northwest so full of coal that operators, in order to maintain their prices, were faced with the necessity of curtailing production sharply, and this, like wise men and sound merchants, they did. The end of the year saw the temperature over the whole territory around zero, but with adequate coal supplies at a very reasonable price available everywhere.

Normally a large annual tonnage of smokeless coal moves to the Middle West and Northwest, very much to the disgust of Midwest mine operators, who feel the market belongs to them. Last fall, on account of a real or fancied fuel shortage in New England, the smokeless people shipped their coal East and either utterly abandoned their friends of years standing in the Middle West or else charged them around $6.50 f.o.b. mine for prepared smokeless coals, although this same coal had been selling all spring and summer at prices ranging from $2.75 to $3.50. The Middle West was prepared to pay some advance on account of the hard-coal situation, but a boost of $3 per ton or more seemed a little unreasonable to them, especially as the Illinois, Indiana and west Kentucky producers kept their prices steady, with increases, if at all, not greater than 25c. or 50c. per ton. The dock operators, too, were farsighted enough to keep their prices down on all grades of smokeless coals. Much to the joy of Midwest operators, countless buyers gave up trying to purchase smokeless coals and came back to the local product. There is no doubt about it, the smokeless advance in price cost West Virginia many a good account. It is the opinion of disinterested observers that the smokeless people

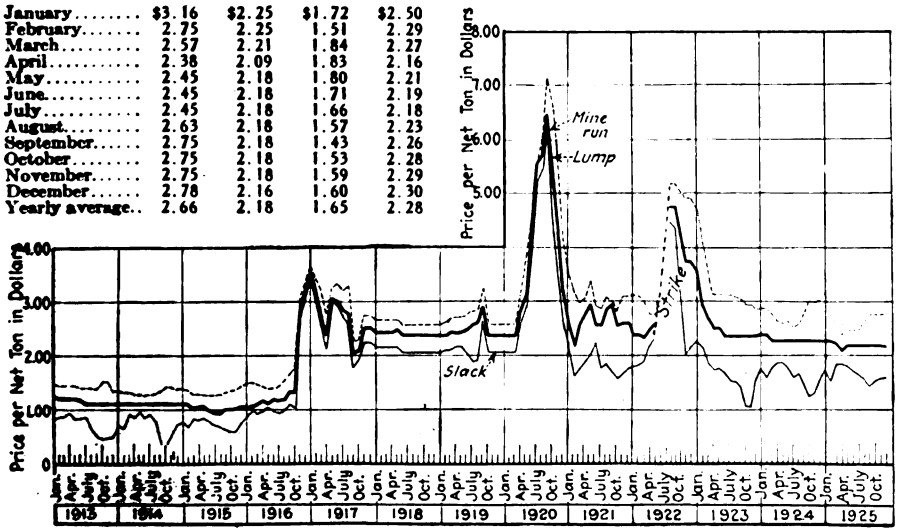
will have to spend much sales energy before they begin to get back the accounts they have lost, especially as Middle Western operators are more closely in touch with the trade and intend to bend every effort to keep the business they have regained.

Dock operators, thanks to their aggressive efforts and business sagacity, have had a good year. In obtaining supplies for their docks last year they bought, as a rule, quality coal and gave it careful and excellent preparation. Comparatively speaking, dock prices have been very low, with the result that dock operators have won back in a large measure the business they had lost during the past three years to all-rail coal. Another consideration in favor of the dock operators has been the fairly prosperous condition of the territory they serve. For instance, the agricultural situation in Wisconsin, Minnesota, South Dakota and North Dakota has been good. The paper and pulp mills have run nearly every day, and business in the iron-ore districts has been brisk. Taken all in all, 1925 has doubtless proved a satisfactory season for the coal docks.

From a labor viewpoint, 1925 has been quiet. There was, to be sure, a little flurry in Illinois over the wages to be paid to the crews handling mechanical coal loading devices, and in Indiana there was some slight disturbance over the question of co-operative coal mines and even of non-union operation in the southern section. Labor, of course, plays a tremendously important part in the Middle Western coal industry and it is perhaps largely due to organized labor that so many mines in Illinois and Indiana either dropped out or went frankly broke in 1925. The percentage of Illinois and Indiana mines that can actually show an operating profit for 1925 is negligible. This is entirely due to the labor situation, as it can hardly be expected that an Illinois coal mine paying a union miner, say $8 per day for certain work can compete with a Kentucky mine paying a non-union miner only $4 per day for the same class of work. Therefore Illinois and Indiana operators cannot possibly hope for an even break against Kentucky and West Virginia producers until these differences are adjusted.



Spot Prices, F.o.b. Mines, on the Chicago Market, of Bituminous Coal from Central Illinois

As the Jacksonville agreement with the United States Mine Workers does not expire until April, 1927, it is expected that the Middle West mine operators, such of them as remain, will devote 1926 to setting the stage for the "big show" next year, when the marshaled forces of organized labor will meet with the inexorable forces of supply and demand. In the meantime, operators are waiting for some Moses to come and lead them out of the wilderness of their difficulties, or maybe it would be more fitting to say they are waiting for a super Babe Ruth to spring up and put in a few good, wholesome swats for them. They don't need any Colonel Mitchell to tell them there's something wrong, either.

Northwest Coal Dock Business Above Average in 1925

Coal receipts at Duluth-Superior docks during the 1925 season showed an increase of 651,829 tons over 1924 and were 104,108 tons above the average for the past eight years, according to the U. S. Harbor Engineer's office at Duluth.

Bituminous receipts last season totaled 8,882,569 tons, an increase of 1,151,691 tons over the 1924 figures. Anthracite receipts came to 790,132 tons, a decrease of 491,862 tons as compared with the previous season.

Receipts of coal by months during the 1925 season were as follows, in net tons:

	Hard Coal	Soft Coal	Total
April	171,372	550,014	721,386
May	214,006	1,026,333	1,240,339
June	151,939	1,295,190	1,447,129
July	139,992	1,362,574	1,501,866
August	51,636	1,243,053	1,294,689
September	51,603	968,658	1,027,261
October	.....	1,242,816	1,242,816
November	3,284	976,978	980,262
Total for season	790,132	8,882,569	9,672,701

Comparative statement at close of season for past eight years:

	Hard Coal	Soft Coal	Total
1918	1,609,473	9,721,440	11,890,913
1919	1,795,257	7,079,840	8,875,097
1920	1,637,477	7,393,219	9,030,696
1921	1,844,642	8,320,207	10,164,849
1922	566,362	5,138,934	5,705,296
1923	1,419,984	11,268,337	12,688,321
1924	1,289,994	7,730,878	9,020,872
1925	790,132	8,882,569	9,672,701

Average total received during the past eight years 9,568,593.

Comparative shipments from Duluth-Superior coal docks during the calendar years 1925, 1924 and 1923, as compiled by the Western Weighing and Inspection Bureau, were as follows, in carloads:

	1925	1924	1923
January	27,693	25,984	13,683
February	17,666	17,188	13,969

Late Pick-Up in West Marks Year Of Ordinary Achievement

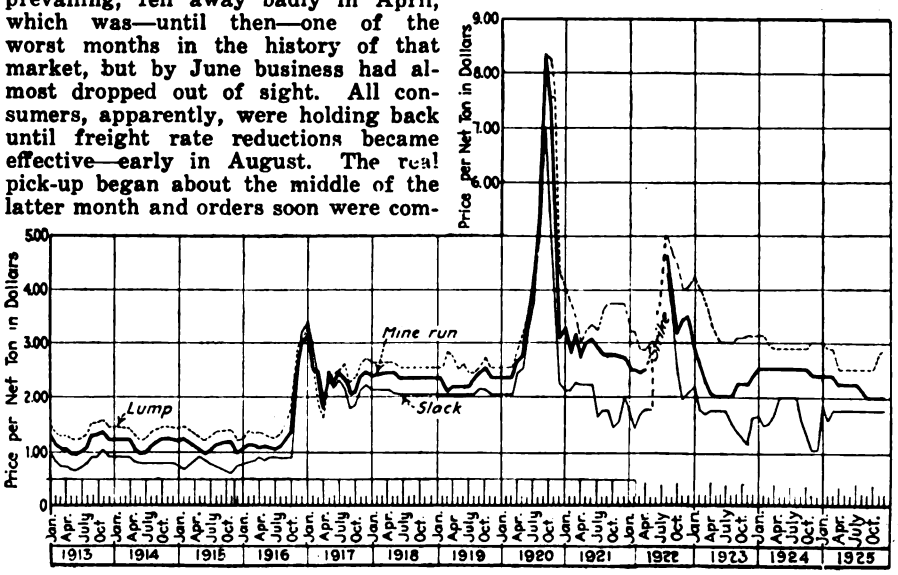
Output in Kansas Higher Than in 1924, Colorado About the Same, but Arkansas and Oklahoma Slump, Due to Labor Trouble—Lower Costs Sought

Just an ordinary year fittingly describes the developments of 1925 in the market regions served by Western and Southwestern mines. Output in Kansas, according to unofficial figures from authoritative sources, reached about 6,000,000 tons (which is about 1,500,000 tons more than in 1924) and Colorado's total just about equaled that of the preceding year. The increase in Kansas was due largely to reduced production in Arkansas and Oklahoma, where labor difficulties curtailed operations. Prices at the year's end were not far from the levels prevailing at the outset, and except for pronounced dips during the spring the market was without notable features.

Several cold spells last January rescued the market from the doldrums, but business dragged in February and the first break in the $5 price for Kansas lump took place March 1, when shaft lump was quoted at $4.50. By the middle of that month it was down to $4, with shading of from 50c. to 75c. as April approached. Except for a fleeting flurry due to cool weather late in April the market was sluggish until late August, when fall demand began to appear and prices advanced slowly until Kansas lump again reached the $5 level about Nov. 1. The fall and winter demand thus far has been spasmodic, dependent on the thermometer, and purchases have largely been only for immediate needs.

In Utah prices were unusually steady throughout the year, rumors of an advance to encourage summer storage having come to naught. Working time was down to two days a week from May until September, when conditions began to improve with the early appearance of fall weather. The late fall and early winter were unusally mild, however, and at the year's end the mines were averaging only half time or less.

Colorado lump and nut, which at the beginning of last year were $5.25 and $4.25 respectively, with a stiff cold spell prevailing, fell away badly in April, which was—until then—one of the worst months in the history of that market, but by June business had almost dropped out of sight. All consumers, apparently, were holding back until freight rate reductions became effective—early in August. The real pick-up began about the middle of the latter month and orders soon were coming in strong and from a much broader stretch of territory than usual, yet prices advanced only moderately, reaching $6 for lump and $5 for nut on Nov. 1, since which date there has been no change.



One of the most beneficial developments in the Colorado trade during the last year was a revision in the miners' wages, the workers agreeing to return to the 1917 scale, which is about 33 per cent less than the Jacksonville scale. Much dissatisfaction came to light when an attempt was made to introduce drastic changes in the mining laws in an effort to standardize practice, but the difficulty eventually was ironed out when the most objectionable features of the proposed changes were eliminated by a compromise between the operators and the chief mine inspector.

Oklahoma and Arkansas mines had a hard time throughout the greater part of the year, production being so restricted and uncertain as to have little effect on market conditions. The

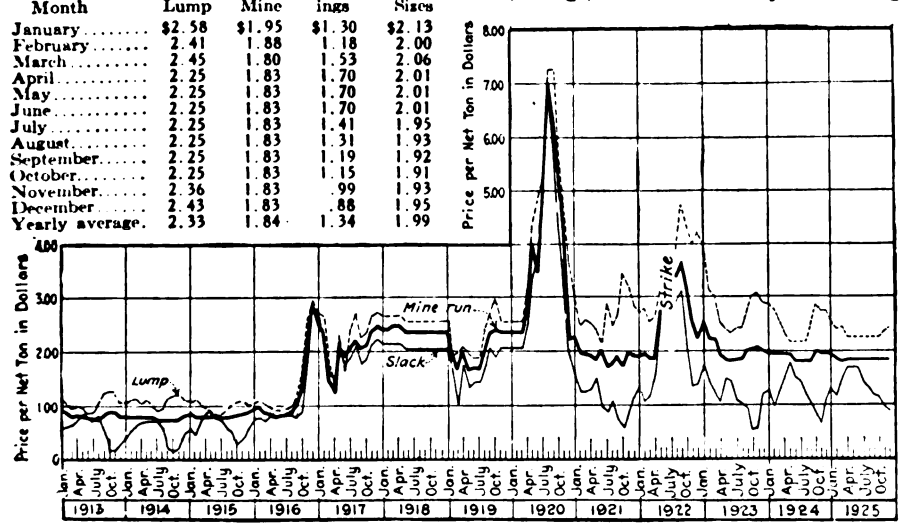
McAlester (Okla.) field began early in the year to slide from the 1924 scale, followed soon by the Wilburton, Hartshorne and Henryetta fields. The defection of the first three did not create much of a stir, but when Henryetta left the fold the union began active opposition. After several clashes between union and non-union men the Governor sent national guardsmen into the district to maintain order. When, in August, the Arkansas mines also began to slip the union leaders called a strike in District 21, embracing both states, effective Sept. 1. The response was almost unanimous, but many of the men later returned to work. Nevertheless, as the year came to a close the output of the two states was far below normal and the strike was still in effect.

Efforts to extend the 1917 scale into Kansas were met with prompt and vigorous opposition by union men, and with the state benefiting from trade formerly supplied by Oklahoma and Arkansas, new mines were opened in the autumn and some operations that had been idle since 1921 or 1922 resumed. Leon Besson, state inspector, announced in November that 100 more mines were operating than at the same time in the preceding year. Most of these are shovel mines, which incidentally, are said to be yielding bigger profits than shaft mines.

Early in December it was stated that a commission had been directed by John L. Lewis, president of the international union, to investigate conditions in the Southwest, and there were rumors that a general strike might be called in furtherance of the union cause in District 21, but Kansas operators incline to the belief that the strike will not materialize.



In Missouri, with no strike, high operating costs have curtailed production to such an extent that the state's influence is negligible.

Operators still decry high production costs due to high wages, and look for little relief while the Jacksonville agreement remains in force.

Cincinnati Market Has Year of Thrills

Start Is Quiet but Hectic Movement Follows—New Freight Traffic Record Set—West Virginia Coals Active—Southeast Kentucky Prices Hold Their Own

By Harold W. Coates

Almost all of the thrills that can be experienced in a coal man's year are written into the chronicle of 1925 so far as the Cincinnati market is concerned.

December of the year preceding (1924) had been rather fitful and hectic, but, following the shutdowns and slack time over the holidays 1925 dawned with a marked right-about-face. For a week or two it looked as if equilibrium would be recovered. Distress coal was cleaned up and "no bills" in the Russell, Stevens and De Coursey yards in Kentucky and at Portsmouth, Ohio, virtually disappeared.

Nobody, however, kept an eye on the barometer. Production in the non-union fields went on apace and by the time February rolled around many of the mines were balancing in red and the wholesalers here were cramped into a position where no one could make any money. Even zero weather failed to help. Prices were soft and crumbling in every direction. Slack was hardest to move and the low spot of the year, 65c. a ton, was reached here.

Overproduction Bare

The next sixty days witnessed all sorts of attempts to curb the overplus of coal. Most operators expected the other fellow to apply the remedy and kept their own mines working. Again the reservoirs were filled with "no bills" and consigned coal and the situation by April 1 resulted in loaded equipment being backed clear to the mouths of the mines of southern West Virginia and southeastern Kentucky.

May saw the situation still in bad shape with overproduction the bugaboo. The general idea was that the opening of the lakes might change the situation. Hazard operators declared against ruinous prices and placed their coal on a basis by which it would be advanced 15c. a ton each month until the opening of the fall business. Railway contracts for straight mine-run let in this period at $1.50@$1.60 in Kentucky and 10c.@15c. higher in West Virginia helped to give a little body to the market. Lake movement also added its influence, so that when the first rumble of trouble in the ranks of the English miners was carried to this market there was enough momentum already started to carry the values to a slightly higher and more satisfactory level.

Anthracite Strike Helps

In July, when the word came that the hard-coal miners intended to take a "vacation," the first firm ground for business of the year appeared. August saw the first of the fencing around to get under cover and an assured supply on the part of the big industries, and this helped the situation tremendously.

For the first half of the year there had been a tremendous "weeding out" process so far as the wholesale trade of Cincinnati was concerned. Several of the smaller firms that could not stand the gaff of a long pull against the current gave up the ghost. Consolidations put others out of the running. By midsummer the Florida lure caught others and the local coal trade contributed several who joined the "gold rush" to the South.

When September rolled around the stocks at the head of the lakes were moving out from the docks at such a rate that lake buyers became a large factor to this market. Production was on in full blast and week after week all records for the volume of loaded cars passing through the Cincinnati gateway were broken until in October over 16,000 cars—3,350 destined for the lakes—moved through in one week.

Mid-October saw a car shortage figuring for the first time since government control. The Chesapeake & Ohio cleared its situation by leasing open tops from the idle hard coalers in the East. The Louisville & Nashville, without any interlocking system to the north of the Ohio River, found itself in difficulties that were ironed out only through the good offices of the American Railway Association. This, however, caused another price stiffening.

Late November saw the "close of the

lakes" playing its old time havoc through the overplus of coal moving there or standing being thrown upon Northern markets until it affected the whole of the price fabric and caused general recessions. The balance of the year was devoted to a feeling-out process with large users taking sparingly rather than be caught with large stocks at a period when it seemed as if the anthracite trouble would be adjusted. With all its ups and downs the market closed for 1925 with a general advance of 50c.@$1 on all grades over the closing prices of 1924.

Smokeless Erratic

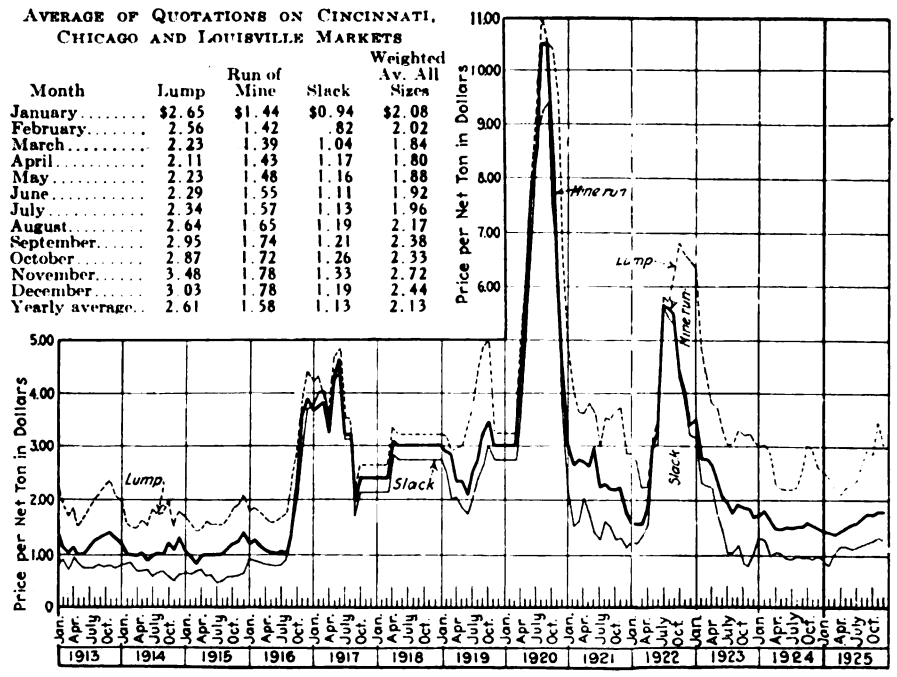
Smokeless had a changeable year; starting off at $4@$4.25 for lump and egg, $2@$2.25 for mine-run and $1.10@$1.15 for slack, it dropped by April 1 to a $3 circular price with some selling spot lump at $2.75 and with mine-run at $2 and screenings at $1.50. June saw a slight recovery with the quotations for the next month running $2.75@$3 for lump, egg down to $2.65@$2.75, mine-run at $2 and slack at $1.25@$1.35.

This level was maintained until toward the middle or last of August, when there came a rush of dallying retailers to build up reserves, and this demand automatically raised prices to $3.75@$4 for lump. In September seaboard and New England demand for egg and nut sizings sent these above the level of lump, with egg at $4.50@$5; nut $3@$3.50; mine-run, $2.50, and slack, $2@$2.25. The best period of the smokeless year came around Nov. 1, when spot egg touched $7.50 top; lump, $6.50, and nut, $7, under buying pressure from the East and tide. All rail freight rates to New England also entered into this. Mine-run at $2.50 and screenings at $1.90@$2 had the more even keel of the low-volatile list. Close of navigation threw tonnage on the Chicago and inland markets in sufficient volume to cause a break down to $3.50@$4 for lump, $3.75@$4.25 for egg, with a slight recovery for the end of the year.

West Virginia high-volatile coals labored much under the same conditions, starting off the year with a range of $2@$2.50 on lump, some of the large Logan County producers having held arbitrarily to a $2 top for their good coal for months previously. Egg was priced $1.75@$2; mine-run, $1.25@$1.35, and slack 75c.@$1. By April the down curve reached $1.75@$2.25 for lump; egg, $1.40@$1.75; steam mine-run, $1.15@$1.25; gas up to $1.40, and slack 90c.@$1. The first betterment was in July, when for the first time in months the price of lump passed the $2 mark, mine-run moving up to $1.25@$1.50 and slack to $1@$1.25. Lump held above the $2 mark until the end of the year, with $3@$3.50 recorded in October. Egg, under new demand because of the anthracite strike, reached $2.75@$3; some mine-run sold up to $1.75 and screenings up to $1.40.

Kentucky Picks Up

The Hazard, Harlan, Elkhorn and Big Sandy fields in southeastern Kentucky did not have such a bad year after weathering the first three or four nerve racking months at the beginning of the year, when block dipped from $2.75@$3 to $2@$2.25; egg from $2 to $1.40@$1.65 and mine-run from $1.50 to a low of $1.15. The 15c. per month advance that went into effect in May looked to be a hard matter to maintain during the deadly dull summer months but the Kentucky operators at least seemed to be moved by some spirit to meet a bad situation and met it determinedly. Throughout most of the year prices on block and egg held 15c.@25c. better than those of West Virginia, with mine-run and screenings on about the same level. Specialized coals from this district have been making their presence felt. Some of these have moved right in the trail of smokeless when the market was going in the right direction; $4.50 spot, top, was the price in October for some of this coal, which is sold on a quality argument.



River Trade Satisfactory

River business, which takes in a sweep many miles up river and down, as a whole has been satisfactory. Neither the stage nor the weather has been severe and a healthy tonnage has been moved from the Logan County loading points with a slight diminution from the Kanawha field. With deepening of the river channel completed from Point Pleasant to Louisville the movement of coal should increase from now on in leaps and bounds.

Pittsburgh Trade Hard Hit by Inroads Of Non-Union Neighbors

Jacksonville Scale Diverts Business to West Virginia and Kentucky—Bessemer and Westmoreland Do Well —Connellsville Coke Region Busy at the Year's End

By B. E. V. Luty

If there were no coal miners' union the coal and coke trades of western Pennsylvania might have presented many interesting developments during the year 1925. As it was, the course of affairs was closely related to conditions produced by the United Mine Workers. These conditions were: (1) A high wage scale for the Pittsburgh coal district, making the cost of production much above that in the nearby non-union coal fields; (2) the anthracite suspension beginning Sept. 1, bringing about a heavy demand for Connellsville coke as a substitute for anthracite.

The Pittsburgh coal district is most commonly defined as the district having a uniform freight rate on lake coal shipments. This definition was ironical in 1925, as the district was unable to capture any lake trade, being underbid by other districts—non-union. A little Pittsburgh district coal did go into the lake trade, but it was produced at mines controlled by lake interests.

The distribution area of Pittsburgh coal was reduced, generally speaking, to a territory smaller than would be made by the points to which freights are the same from the district and from competing non-union districts. In other words, some non-union coal competed with Pittsburgh coal when it had considerably higher freights to pay. There were times, indeed, when Fairmont (W. Va.) coal stood at such f.o.b. mine prices that it could be delivered into the City of Pittsburgh on equal terms with Pittsburgh coal, but naturally it did not sell, as the preference of buyers was for the local product.

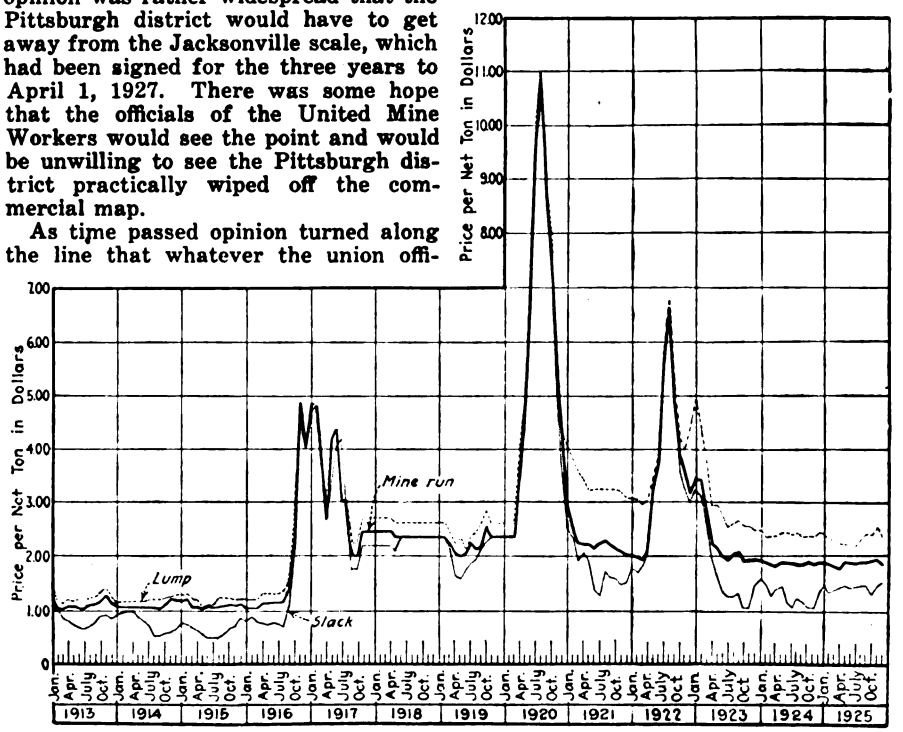
Roughly speaking, operation of the Pittsburgh district during 1925 averaged only 20 to 25 per cent of normal, whereas demand for coal in general would indicate normal production.

Much of the lost business went to West Virginia and Kentucky, but nearby regions had slightly better business than usual—the Bessemer district, particularly the portion north of Butler; also Westmoreland County. The Connellsville region got some gas-coal business, but not a great deal.

At the beginning of the year the opinion was rather widespread that the Pittsburgh district would have to get away from the Jacksonville scale, which had been signed for the three years to April 1, 1927. There was some hope that the officials of the United Mine Workers would see the point and would be unwilling to see the Pittsburgh district practically wiped off the commercial map.

As time passed opinion turned along the line that whatever the union officials might do eventually, they would do nothing until they had a settlement of the anthracite scale, which was to expire Sept. 1. Producers anxious to give their men an opportunity to work at such wages as could be paid were indisposed to try the matter out as long as the anthracite contest lay ahead. The Pittsburgh Coal Co., however, after closing the last of its union mines in the district in May, began in August to open mines on the scale of November, 1917, representing about a 25 per cent reduction. By November it had five mines in operation, without any violence, on this basis, and early in December production at the five mines ran 20,942 net tons in a week. This, however, was very small in comparison with the company's normal output, for in 1923 the company had 50 mines operating in the district, producing in the year 12,521,575 tons.

Steam mine-run coal in the open market averaged under $2 in the first nine months of the year, and a shade over that in the last three months. Youghiogheny gas coal averaged 10c. to 15c. a ton more than steam coal.



Coke Has Bright Start

The Connellsville coke region opened the year under very favorable auspices, having a large tonnage of coke sold to blast furnaces for the first quarter at very favorable prices—$3.25 and up to $4. By the end of the quarter blast-furnace activities were becoming marked for a decrease, and demand for Connellsville coke fell off rapidly. The region's coke, being beehive, performs chiefly the function of taking the peak of the load. When coke requirements fall off beehive production decreases sharply and byproduct production but little. Accordingly Connellsville coke

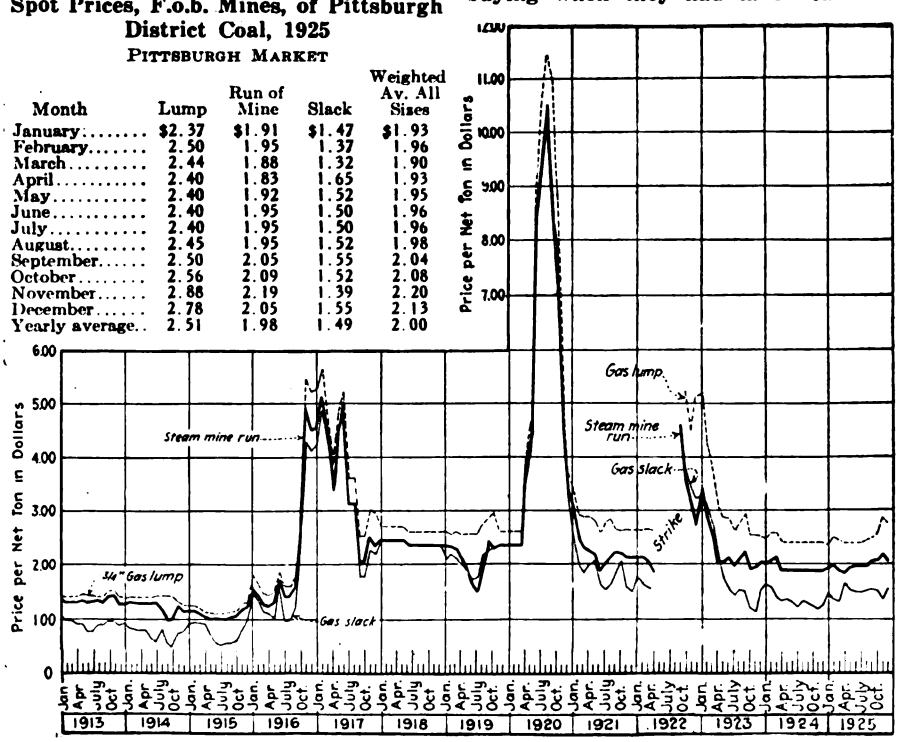
production dropped to a low level for June and July, while shipments of coal to byproduct ovens decreased only slightly. Coke sold at less than $3, or at less than full cost of production. Those who operated merely felt they were losing less thus than by closing and losing overhead.

In August a little buying of Connellsville coke developed, in anticipation of an anthracite suspension Sept. 1, but the product went at low prices. Even in September there were sales at low prices to the end of the year. Then, about the middle of October, the market became very active. Eastern distributers bid against each other and ordinary run-of-oven furnace coke sold at up to $9. In a few days the market reacted, until a little pre-holiday movement took the price up to about $6.

Seek Domestic Market



The Connellsville region makes practically no crushed coke as a regular operation, but various arrangements were made to prepare coke for domestic use, even to breaking coke with sledges. Some of the conveyors used in discharging ovens were rigged with crusher rolls, whereby "yard crushed" coke was produced. The various descriptions of prepared coke sold at $1 and at times even $2 above ordinary run-of-oven coke.

The merchant ovens of the Connellsville region were producing about 45,000 net tons of coke a week in July and August, representing requirements of their regular trade. These requirements increased to, say, 55,000 or 60,000 tons in the closing months of the year, when the merchant-oven production was running about 100,000 tons weekly. Thus it is a fair guess that the region supplied to the East 40,000 to 45,000 tons weekly of coke, prepared and run-of-oven, as an anthracite substitute.

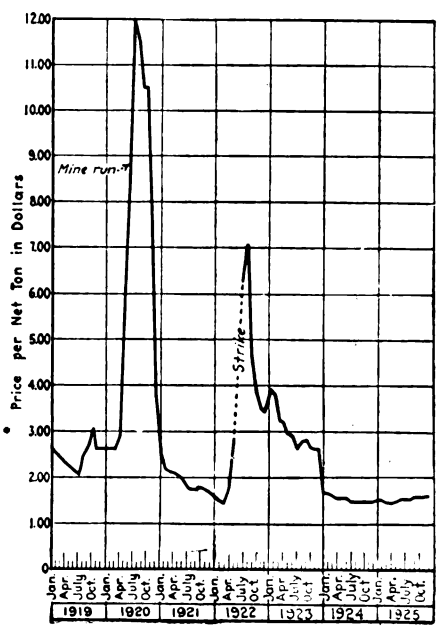
New England Market Colorless Until Anthracite Cloud Appears



Output Easily Meets Moderate Demand for Hard-Coal Substitutes—Coke and Foreign Anthracite Preferred to Screened Bituminous—Better Selling Foreseen

By G. G. Wolkins

But for the anthracite strike the colorless state of trade in New England that marked 1925 to the beginning of August would have carried through to the end of the year. Production was ample during the whole twelve months; while operators wrestled with "unauthorized" wage scales the market was almost uniformly competitive, and except for possibly a fortnight in November wholesalers everywhere were under pressure to move coal. It was only in the autumn months that the clouds lifted and bituminous interests rushed to meet a mildly broadening inquiry for anthracite substitutes. Output increased, but even at the apex in early November all were aware that the current flow was more than sufficient. Mine labor kept at work as steadily as work offered, and it was only a matter of days when tonnage came forward in such volume that prices had to give way. The public was shown that northeastern consuming territory was anything but panic-sticken over the interruption in supply of its preferred household fuel.

The strategy of public officials here was timely, and effectively brought to bear. The merits of screened low-volatile were overemphasized, a flaw in procedure that promptly induced pyramiding, but Governor Fuller and his associates are none the less to be complimented for their firm stand at the right time. The buoyant upswing soon corrected itself; retail dealers stopped buying when they had taken on comfortable reserves, and when householders bought they bought sparingly. Operators who traded on a runaway market with a 3,000,000-ton anthracite shortage to support it paid for their experience, and in late December were still trying to place coal held at junction points that had been shipped in advance of sale. The blunt truth is that only a moderate proportion of householders felt called upon to use bituminous to help out; a much larger number turned to coke, foreign anthracite, foreign briquets and oil—all substitutes they preferred to soft coal—and far more than half the usual consumers of anthracite will have anthracite in their cellars to the end of the heating season. It is easy to see why the public is lukewarm either as to bituminous supply or a possible anthracite settlement.

Frequent cargoes of foreign coal are a factor in keeping supplied the less forehanded user. Welsh anthracite in sizes approximating our own had the call for several weeks until the supply was practically sold up, but Welsh large colliery screened, Welsh dry steam,

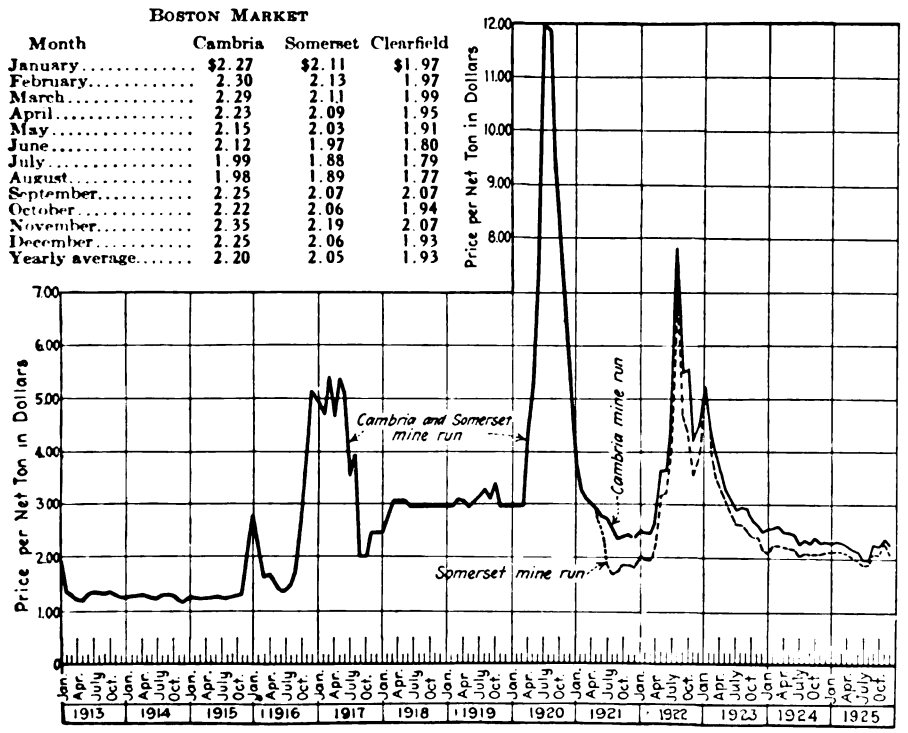
Westphalian nuts, French nuts, Welsh, Scotch, French, and Westphalian ovoids have all been shipped in comprehensive tonnages, and for those retail buyers attracted by lower prices the dealers have furnished lumps and run-of-mine through usual channels from Hampton Roads. Splints and other hard high-volatiles loaded over shaked screens also have come in for a considerable share in distribution, and if one in the trade may judge from surface indications there is not the least anxiety here for the remainder of the winter.

Bituminous displaced crude oil in a large number of plants, industrial and otherwise, during 1925. Final figures are not yet available, but gains in the use of bituminous in this field alone accounted for a relatively large tonnage.

Light oils continue to be competitive, especially in the larger cities. The perfect oil burner, we are told, is yet to be developed, and many of those using light oil in their residences regard it as a luxury fuel. The coal trade is not now greatly troubled by the inroads of petroleum.

From Pennsylvania, Maryland and the northern districts of West Virginia the traffic all-rail averaged higher than in 1924, but the weightier share of the increase was owing to prepared coal that began moving in volume early in August. For lump and egg sizes the range moved steadily upward from $2.50 per net ton at the mine until $6.50 was attained at first hands for high grade low-volatile. Later the market eased off to $4.50 for the same grades, less favorably known coals selling down to $3, but until the slump occasioned by renewed anthracite parleys in December there was reasonably steady demand throughout consuming territory. On the other hand run-of-mine lagged all season—not less in December than in April—and $2.50 was a high price for any select coal at any time in 1925. The area in New England open to all-rail delivery was even more drastically circumscribed than during the year previous, and only because of remunerative prices on prepared in the last quarter were mining losses less than expected.

Spot Prices, F.o.b. Mines, on Boston Market, of Mine-Run Coal from Smokeless Fields of West Virginia



As in years prior to 1915, the water route from Hampton Roads is now the main avenue of supply for New England. Pocahontas and New River are the preferred grades of low-volatile, and while mining in the smokeless districts is uninterrupted the steam market here turns largely on the relation of demand to supply from those important sources. Industrially, 1925 was a year of meager returns. The paper, shoe and machinery trades were in continual conflict with fitful, not to say fickle markets, but the trend was toward economies and more flexibility as to kind and rate of production than was formerly the practice. Great textile units that for scores of years never omitted a dividend did so in 1925, and there were consolidations, widespread changes in class of output, and less wasteful merchandising—all improvements in method that ought to bear fruit. But it meant moderate, even restrained buying in 1925, an attitude shared of necessity by railroads and other utilities. A five-year option granted by producing interests to one of the railroads was a symptom of the none too optimistic view held by operators as they envisage the market forward to 1930.

From the beginning of the year the smokeless operators made it evident that $4.50 per gross ton f.o.b. vessel at Hampton Roads was the level they hoped to see maintained. Several times the price seemed pegged at that figure, only to yield to excess output invariably induced by an apparently firmer spot market. Potential production was always there to be reckoned with, and stiffly as groups might hold to a given level the stress of pier accumulation obliged them at times to eat their dish of crow. Until August there was but one short interval—in February—when it could fairly be said that the market even touched $4.50 for No. 1 Navy Standard, but toward the end of summer, when anthracite troubles were foreshadowed, the trend was upward, although not without setbacks when buyers could operate to their advantage. The producers' policy was not well enough articulated to keep surplus coal

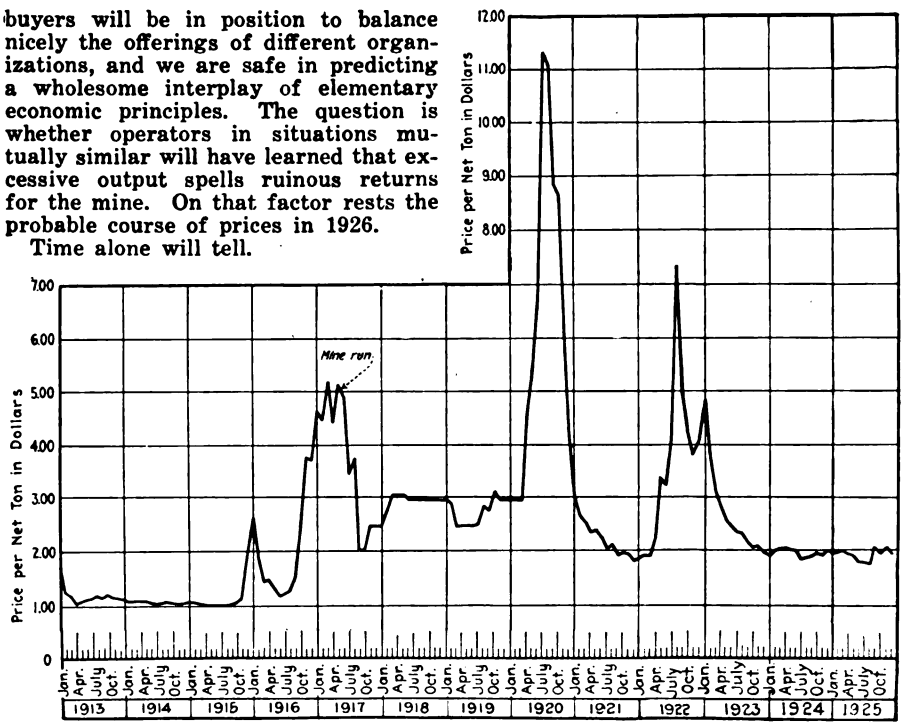
in the ground, and substantially there were but two interludes—in September and two months later—when spot prices rose to $5.25@$5.50, in each case only to recede to a range 75c. lower almost the instant temporary pier shortages were overcome.

A consistent demand for prepared sizes opened the way for slack in increasing quantities. The larger steam users profited, slack having sold at from $1 to $1.40 per net ton at the mine, with contracts closed at prices not far from the minimum. Complaints were general that run-of-mine was unduly slack, but to the end of the year there was little or no improvement.

Mergers to the Fore

A few mergers were effected, and rumors are afloat that others are in process. Successive seasons of low prices are opening the minds of operators to the same economies that have been forced on New England textiles, and it is not unlikely that 1926 will exhibit progress toward concentration among bituminous interests.

For delivery inland from Boston and Providence the prices of smokeless coals on cars eased from $5.60@$5.75 per gross ton early in the year to $5 late in June. After an interval long enough to serve mill and utility buyers with winter reserves at the low price of the season the market advanced by regular stages to $6.50 in September, prices for the remaining months seesawing between $6 and $6.50 according to the pressure on rehandlers to make room for arriving cargoes.



Boston retail prices were at a minimum, $5.75@$6 per net ton delivered within a wide radius, until September, when developed inquiry for household heating developed. In December $8.50 was the accepted figure for run-of-mine for steam use, with $11 the quotation for "lumpy run-of-mine" and $12 asked for "lumps" when desired for domestic use. The lion's share of the tonnage was placed at the low figures prevailing during spring and summer, dealers observing their usual policy of throwing away possible profits on bituminous and relying upon anthracite to see them through.

1925 a Drab Year

Bituminous in 1925 was visited with a few enlightening prospects. There were heavy gains in tonnage; the number of domestic heating plants permanently secured to bituminous was large; a beginning was made toward economies in distribution; promiscuous and wasteful dumping on the market was resorted to in much less degree; the great market to be opened by the all-rail cross-hauled route from lower West Virginia was proved more or less a will-o'-the-wisp; new emphasis was laid upon the normal—and economically cheaper—rail-and-water route; moreover, it was shown that the vast acreage of available bituminous is a buttress for the public in a campaign that any group seeks to wage against the general welfare.

The trade enters the new year hopefully. Houses will be put in order, and there will be competitive selling to a degree not equaled in 1925. Because of the wide scope of possible output buyers will be in position to balance nicely the offerings of different organizations, and we are safe in predicting a wholesome interplay of elementary economic principles. The question is whether operators in situations mutually similar will have learned that excessive output spells ruinous returns for the mine. On that factor rests the probable course of prices in 1926.

Time alone will tell.

Coal Aplenty at Low Prices All Year In New York Market

Anthracite Scarce and Dear in Later Months, but Large Supply of Substitutes Prevents Suffering—Coke Gains Popularity—Hard-Coal Expected to Come Back

By R. W. Morris

At no time in 1925 was there any unusual activity in the coal markets at New York. During the first quarter of the year domestic sizes of anthracite moved slowly although the Northern coal fields were tied up by a strike of some 12,000 mine workers and there were other so-called outlaw strikes in other sections of the hard-coal fields. These interruptions created a shortage of steam coals, which resulted in better prices.

During the last four months of the year New York felt the effects of the complete tie-up in the hard-coal regions. There was no suffering, however, because of the plentiful supply of substitutes and the efforts made by various bodies, including the New York State Fuel Commission, to educate consumers in their use. Notwithstanding the heavy use of various substitutes it is believed that anthracite is so well entrenched in the New York market that when hard coal again flows freely most of the market will be regained.

The soft-coal situation was not entirely unlike that of the anthracite market with the exception of the lack of coal. Soft coal was plentiful at all times but prices were at rock bottom nearly the entire twelvemonth.

With an inactive market for anthracite domestic sizes as the year opened independent operators had difficulty in moving egg and pea sizes and the harbor was dotted with many boatloads of independent product, some of which had been loaded since the previous November. Retail dealers were delivering small orders because of weather conditions. In the last half of January there was a reduction of 25c. in the prices of broken and egg and a similar advance in the price of pea coal by one of the companies.

Early in February cancellations were received and sellers settled down to a

quiet time until April 1, when it was expected the large companies would announce the usual spring reductions. Stove coal held the lead in demand, with occasional spurts by egg and chestnut sizes.

About the middle of March new spring prices were announced by the various companies and a new price for No. 1 buckwheat was included. The new quotations had been discounted by individual operators, many of whom had been selling their coal for a few weeks previous subject to these figures. Stove coal was in such heavy demand that some of the smaller producers found it necessary to pro-rate either egg or chestnut sizes with orders for stove coal.

An "early-buying" campaign by operators and retailers in April resulted in a slightly better market. Egg coal moved in better shape. There was heavier booking of orders and consumers began to fill their bins. Toward the end of May buying eased off again and retailers soon filled their yards.

Some stimulation resulted as the time for the beginning of the wage conferences drew near. Boats were loaded and held for future buyers. Independent broken coal in boats was quoted on a basis of $9.20 at the mines, and stove coal under the same conditions was quoted at around $10.25, some quotations for independent coals going as high as $10.75.

Demand became so strong that some independent operators soon began to refuse orders and the larger companies were pro-rating their supplies among regular customers. Buyers got busy the latter part of August and quotations went as high as $11.25 for stove, $11 for egg and $10.75 for chestnut.

Although the miners stopped work on Sept. 1 consumers showed little interest. Retailers put in orders, and prices for independent output became stronger. Retail prices advanced to $15.90 and later to $23.50 in some of the boroughs of Greater New York. Some middlemen had coal in bottoms which they offered at $15@$16.25 alongside, fresh-mined coal being offered at $12.50@$14 at the mine. Stock chestnut coal was offered around $11 f.o.b. mine. Rice and barley were not quoted by many dealers and shippers.

Relax Smoke Laws

Early in September at the solicitation of the New York State Fuel Commission the various municipalities suspended so-called anti-smoke ordinances in order to permit house owners as well as other coal consumers to burn soft coal until such time as hard coal flowed freely again. This action increased the use of mine-run coals considerably.

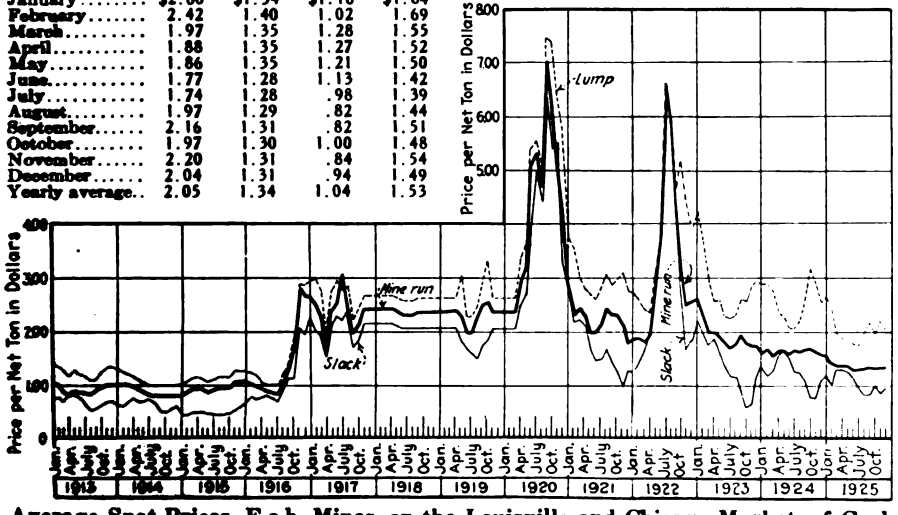
Coke was in good demand the last three months of the year and while domestic hard coals were quoted at around $23.50 by those dealers who were able to make deliveries, coke was quoted at $13.50.

There was no activity in the bituminous market at New York when the year opened. Pool 1 coal from central Pennsylvania was quoted at $2.65@$2.90 with the other pool coals quoted in proportion. Demand depended almost entirely upon weather conditions, which were anything but satisfactory to the coal industry. Buyers were looking for bargains and in many instances it was a "buyers'" market. The tidewater market improved slightly, however, and some industrial contracting was reported.

The situation at New York in March was near the rocks, but some hope was seen in the discussion soon to be staged at Cleveland between operators and miners' representatives as to a possible modification of the terms of the Jacksonville agreement. Non-union operators had been able to sell their product at less than the quotations of the union operators and obtained the bulk of the trade. Offers of contract coal had been reported at $3 for pool 1, and at $2.15 @$2.35 for pools 9 and 71.

Later on when consumers were expected to increase standing orders for immediate consumption they used coal from reserve stocks. Some contracts were reported as having been made at current market prices, extending from July 1 to March 31, 1926.

Soon after the beginning of the anthracite strike extra efforts were made to induce the use of screened bituminous coals in this market, but they were only partly successful.



New River and Pocahontas coals came into the market freely and were used in large quantities on Long Island.

Several cargoes of German byproduct coke were landed at New York at a reported price of $12 per gross ton, alongside.

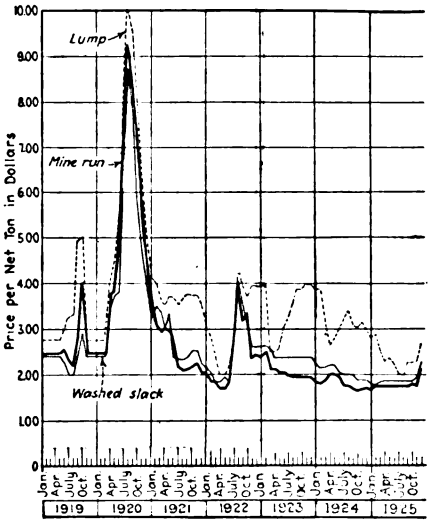
Birmingham Trade Has Fairly Good Year

Commercial Movement Gains Impetus After Weak Start—Bunker Trade Finishes Strong—Domestic Demand Drags—Coke Industry Makes Big Strides



By H. B. McLaurine

Taken as a whole, the Alabama coal industry enjoyed a fairly satisfactory market during the year just closed. During the first nine months demand for commercial fuel was sufficiently large to move output with reasonable promptness and without undue solicitation by agents and brokers. In this connection it should be stated, however, that during the greater part of this period such activity as prevailed was accentuated to some extent by the fact that production was restricted materially by inability of producers to dispose of lump and other domestic sizes, so that active mines were operated only two to four days per week to provide contract requirements and take care of spot business actually in hand. The resultant output closely approximated trade absorption, and very little surplus steam product was accumulated at any time.

During January and February the bunker trade was above normal; demand fell off in March, and the usual dullness prevailed through the summer months. Buying of commercial coal was satisfactory during this period, cement plants and textile industries proving large and consistent consumers, augmented by the railroads, which used in excess of the normal tonnage. Ice plants, ginneries, oil plants and the lumber industry proved good seasonal customers. Industrial and railroad contracts were renewed under satisfactory conditions. A severe and prolonged drought throughout the South forced capacity operation of steam power plants for a long period in the latter part of the summer and fuel consumption in this category was very heavy.

Demand for bunker coal revived in September and gradually became more active through the last quarter, consumption through October, November and December proving heavier than during any previous like period in recent years. General industrial demand waxed exceptionally strong in the last quarter, coking coals and well-prepared steam product being featured in the buying. Coke plants without their own source of supply of coal were hard pressed at times to keep ovens going at capacity warranted by the unusually strong market for all grades of coke. Not only was home consumption heavy but demand from other markets was abnormally large, due in a measure to the anthracite strike, and production and movement exceeded peace-time records.

The market for domestic grades was draggy and unsatisfactory during the greater part of the year. The previous winter, one of the mildest in recent years, left dealers with large stocks on hand and there was little but spot buying to support the trade during the first quarter, when the weather was very unseasonable. At the beginning of the coal year the yards still had considerable stocks and dealers were slow and indifferent about making contracts for further stocking during the spring and summer. A fairly good tonnage was booked by the mines, however, the bulk of deliveries being stipulated for late summer months. These were held up, however, and comparatively little coal was deliveried on these contracts, the largest percentage of cancellations ever known being recorded. Buying during the last four months of the year was sporadic and at no time was demand

Digitized by Google

active for any great period. Business was booked only in sufficient quantity to move current production without harmful delay.

Mine quotations on steam and domestic coal during the year maintained unusual stability, suffering only slight decreases during periods of more or less depression. Steam prices registered substantial gains and domestic prices were practically the same at the close of the year as at the beginning.

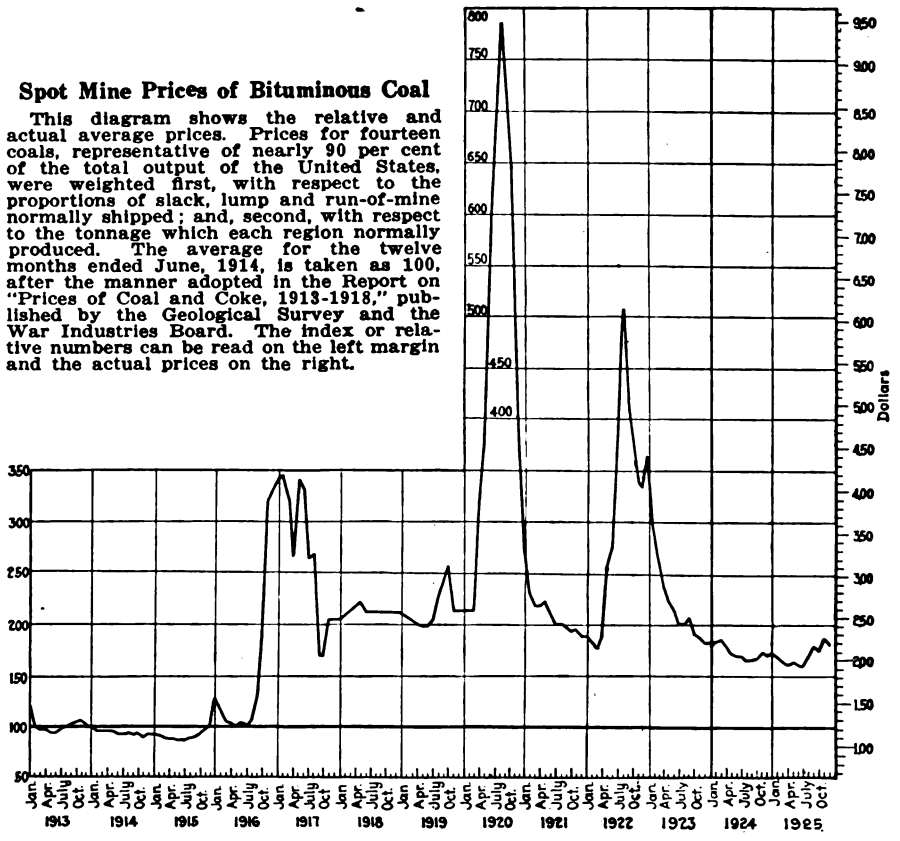
The domestic market during the first quarter of 1926 will be controlled by weather conditions, but as neither dealers nor consumers are buying beyond anticipated requirements for the immediate future, indications are that yards will be practically clear at the beginning of the new coal year, April 1.

General opinion prevails that industrial prosperity has an impetus that will carry it well into 1926 and prospects therefore are good for an active steam market during the first quarter at least.

Alabama's coal production for 1925 is expected to closely approximate the 20,000,000 ton mark. Free from labor troubles and unhampered by union affiliations, with the rigid wage scales which played havoc with operations in some of the states farther north, Alabama operators were able to take advantage of the developments in demand in highly competitive markets. Weekly production at the high point in December was on the basis of 27,500,000 tons per annum.

There were occasional slumps in the coke market during the first nine months, but demand was sufficient at all times to move the available tonnage of commercial and domestic product without undue effort or delay. Demand was exceptionally heavy during most of the last quarter. A great deal of foundry coke was shipped to Pacific coast points and the distribution was over a wide range of southern and southeastern territory. Domestic sizes were bought in quantity for use in the North and Northwest in the early part of the year and during the last quarter there was a more extensive movement to these sections, and also, due to the strike in the anthracite coal field, to Eastern points, some of which was bunkered on transatlantic liners.

Sales would have been much heavier had not freight rates been almost prohibitive; besides, there was a strong disinclination on the part of Southern carriers to allow equipment to move to distant destinations. Quotations ranged from $4.50@5 on foundry grades at the beginning of the year to $6@6.50 per ton during the last quarter. Egg and nut sizes during this period ranged from $3.25@3.50 to $4.75@5.50 per ton. Quotations on gas coke ranged $3.50@4 to $6@$6.50 per ton as the year closed.



Rate Cuts Aided South

In the efforts to reach northern markets during the last quarter Alabama ovens were opposed by Middle Western plants, which objected to reductions in rates from the Birmingham district. Some adjustments, nevertheless, were allowed by the Interstate Commerce Commission.

Coke production for the year probably was close to 4,750,000 tons, though no figures for estimating purposes are yet available. Coke manufacturing facilities in the district have been materially increased in the past twelve months. The Alabama Byproduct Corporation added twenty-five Koppers ovens to its coking plant and the Republic Iron & Steel Co. completed an entirely new plant of fifty-seven ovens and the necessary equipment and facilities for handling the byproducts. The Woodward Iron Co. practically rebuilt forty of its Koppers ovens. Work will

Spot Mine Prices of Bituminous Coal

This diagram shows the relative and actual average prices. Prices for fourteen coals, representative of nearly 90 per cent of the total output of the United States, were weighted first, with respect to the proportions of slack, lump and run-of-mine normally shipped; and, second, with respect to the tonnage which each region normally produced. The average for the twelve months ended June, 1914, is taken as 100, after the manner adopted in the Report on "Prices of Coal and Coke, 1913-1918," published by the Geological Survey and the War Industries Board. The index or relative numbers can be read on the left margin and the actual prices on the right.

FOREIGN MARKETS — Reviews by Our Correspondents in London, Paris and Berlin Recording Economic Progress in Europe as Reflected in the Basic Industries of Coal and Coke

British Trade Suffers Gradual Decline

Business Picks Up When Subsidy Makes Price Cut Possible—Rising Production Costs a Handicap—Modern Machinery May Hold Partial Solution

By C. H. S. Tupholme

Difficulties were plentiful in the path of the British coal trade in 1925, and, notwithstanding improved business in the late fall and early winter, the outlook of the trade is indeed gloomy.

On the whole, business has declined gradually this year. In August and September, following the government subsidy, buyers, who already had fairly heavy stocks on hand, waited until the British operators reduced prices. After a somewhat protracted resistance the producers did so, and business increased. Prices are now lower all round; best Admiralty, which at the opening of the year, stood around 28s. @30s., has fallen to 23s.

Shipments, of course, have declined, as shown in the following table of tonnage shipped from the ports of Cardiff, Swansea, Newport, Barry, Port Talbot and Penarth, during the first ten months of 1913, 1924 and 1925:

Coal Shipments from Welsh Ports

(In Gross Tons)

Coal and Coke 1913	1924	1925
32,711,312	26,193,212	21,757,206
Patent Fuel		
1,009,980	815,713	844,603

Certain customers of the coal fields have been lost and will not be re-won. The most important of these is the British Navy, which before the war took 1,750,000 tons, and now requires only 350,000 tons. This is due, of course to the conversion of large numbers of ships to oil fuel.

The one bright spot is the anthracite branch, which still enjoys comparative prosperity, but though demand is good and prices are satisfactory, production has not increased; output in 1925 was lower than that for any of the three previous years, due to the strike in July and August. Further, the costs of mining and preparing anthracite have tended to increase. The total output of the Welsh collieries in the last few years is given in the subjoined table, from which it will be seen that anthracite has represented approximately 10 per cent of all coal produced in the last two years:

Output of Welsh Coal Mines

(In Gross Tons)

Year	Total Output	Anthracite
1913	56,830,000	4,833,000
1923	54,321,000	4,873,000
1924	51,085,000	4,971,000
1925	45,000,000*	4,500,000*

*Calculated from output to end of November.

High production costs are the chief handicap of the British coal trade. Hitherto the quality of Welsh coal has enabled it to command a price of several shillings above that of its competitors in the world markets, but this advantage is slipping because of the reduction of mining costs in other countries, especially on the Continent, where cheap labor plays such an important part—that is to say, cheap when reckoned at British money value. Some of the British coal fields have been able to lower their costs, due largely to more easily workable seams, but Wales has not shared in this reduction owing to the fact that the mines are on the average much older than in other parts of Britain. The effect of these factors is seen in the figures of coal sold by the various fields, South Wales losing trade to the tune of six million tons, the bulk of this being in the steam divisions.

The causes of the decline in the sales of Welsh coal is easily traceable. The mines being older, the seems are deeper and the distances from the pits to the working faces are longer. (It may be remarked here that so far conveyors have done little to reduce the distance.) In addition, though working hours are shorter, the output per worker is lower. In 1913, for instance, 233,090 men were engaged on surface and underground work in Wales, and the output per worker for the year was 243 tons, eight hours constituting a work day. In 1923, when 252,617 men were engaged, the output was 215 tons per man, the day being seven hours. In 1924, 250,065 men were employed and the output was only 204 tons. The figures for 1925, which are not yet available, must be substantially less. These figures are all the more significant when it is remembered that with the increased use of underground machinery, considerably more coal cutters and conveyors were in use in 1924 than in 1913.

Lower output and higher wages have more than doubled working costs, and, where it was possible in 1913 to make a comfortable profit on low-priced coals, the operators between May 1, 1924, and April 30, 1925, suffered an average loss of 5½d. per ton. From May 1 to July 31 the loss rose to 1s. 2.09d. per ton. At this point the government subsidy came into operation, and since then the average loss has been 10½d. per ton over and above the amounts recoverable under the subvention scheme. The amount of this subsidy paid to the Welsh mines in August was £349,232; in September it had increased to £401,185, a total of £750,417, which is about 2s. 7d. per ton of output for those two months.

These figures, it should be borne in mind, are averages, for while the anthracite mines have made certain profits, some of the collieries producing steam coal have been sustaining losses as great as 2s. to 3s. per ton. This constitutes one of the gravest industrial problems ever encountered in Great Britain. As announced some time ago, the subsidy of ten millions sterling has already been exhausted,

and Parliament was asked to vote another nine millions to tide the industry over until March, when it is expected that the commission now inquiring into conditions in the industry will have concluded its investigation.

Neither the commission nor the subsidy will solve the problems of the coal-mining industry, in my opinion. The solution of these problems must come from within the industry itself, and no amount of assistance from the taxpayer or commissions will avail the industry anything. What will happen when the subsidy is exhausted and the commission issues its voluminous report, which it is fairly safe to predict will be ignored by all except paper economists, it is difficult to say, but in some quarters an industrial upheaval is held to be inevitable.

As far as the outlook of the industry is concerned, everything turns upon whether working costs can be reduced. British mines are taking more interest in machinery and also in the possibilities of utilizing electrical power to the utmost. This is shown by the attention given to such subjects as machine cutting and automatic substations in discussions and in the technical press and the proceedings of societies made up largely of coal-mining engineers. Though mechanical devices are largely looked to for a partial solution of many of the British coal mining problems, there is still enormous prejudice on the part of labor against such devices.

French Market Aided by Franc's Fall; Imports from Britain Drop

Industrial Revival Near Year's End Quickens Demand After Long Spell of Dullness—Severe Weather Stiffens Domestic Trade—Output Exceeds Pre-War Rate

By Victor Truant

In 1925 the French coal industry was ruled more by the fluctuations of exchange rates and by the rates of wages than by the sacrosanct law of "supply and demand." Low consumption caused a rather inactive market during the first part of the year; French coals would have been even more neglected if the appreciation of sterling, compared with the franc, had not formed a protective barrier, which caused the British coal to suffer first.

During the greater part of the year up to October the inland market for French coals remained quiet. Industry, which was working at slow speed, consumed little coal, all the while the competition of British and Belgian fuels was more or less acute according to the exchange value of the French franc, but when, in June, sterling exceeded the level of 100 francs, French coals began to get the better of the struggle and gradually pushed back the British coals.

Lower Prices Necessary

This struggle could not be carried on by French coal owners without some concessions in prices, especially in the areas where competition was keenest, and the consequence was that prices named were less and less advantageous to the French collieries. In order to improve the situation the operators considered reducing costs by revoking the supplement to the super-wage. The government stepped in and succeeded in having the supplement maintained at 20 per cent by granting the two following compensations to the French collieries: (1) Reinforcement, as from July 25, of the interdiction except by special permit of importation to France of German coals purchased on the free market; (2) reductions in rail rates on French coals shipped to destinations in the West or Middle West of France.

It is not likely, however, that these measures would have improved the situation much if the industrial revival due to the fall of the franc had not manifested itself since the end of October.

The prices of industrial sorts were practically unchanged last year, having now been at the same level for three years, a unique occurrence in mining history. The only modification which the prices of these coals were subjected to was a small increase (of a few decimes) when the tax on business transactions was transformed into a tax on production and import.

French Imports Fall

The market for domestic coals has developed quite differently. It must be borne in mind that the output of French domestic coals is far from sufficient to cover the requirements of the country, making it necessary to resort to British, Belgian, Dutch and even German house coals. The high level attained by sterling last year, however, reduced purchases of British coals. As to German sized coals, this class of fuel constitutes but an extremely small part of the reparation deliveries.

The share of Belgian coals in the consumption of Parisian households has always been very important. But the fact that, after the fall of the French franc, Belgian producers exacted payment in Belgian francs, while payment in French francs was customary and as per contract, has cooled relations, with the consequence that the demand for Belgian coals by Paris coal merchants has momentarily decreased. Owing to the threatened severity of winter, however, it is not likely that Paris merchants will be able to preserve this attitude very long.

The Nord and Pas-de-Calais coal owners generally are following the selling methods of the Belgian producers, so that there is an almost constant difference between the prices of the sized products of both countries.

During the first eleven months of 1925 France received from the Ruhr 7,456,400 tons of indemnity fuels, a monthly average of 677,858 tons. During the first two months, however, France was still transferring to Luxemburg a part of the tonnage received by her 763,000 tons in January and 747,600 tons in February. During the same period the O. R. C. A. (Office de Reparation des Cokes Allemands à da Grosse Métallurgie) received 2,948,000 tons of coke, which, of course, is included in the above figures.

From January to the end of October, 1925 (the latest statistics available), French collieries produced 39,869,000 tons of coal and lignite, as against 37,430,000 tons during those months of 1924. It is estimated that the output for the entire year will total nearly 48,000,000 tons, or 7,000,000 tons more than in 1913. As the production of the collieries situated in the part of Lorraine previously annexed to Germany will represent nearly 5,200,000 tons, the output of France within her 1913 limits last year exceeded by about 1,800,000 tons that of 1913.

Production Increases

The collieries of the Nord and Pas-de-Calais—some of which (notably Liévin) have not yet been entirely reconstructed—produced from January to the end of October, 1925, 23,802,000 tons of coal, an increase of 2,522,000 tons over the corresponding period of 1924.

Coke output by French collieries in the first ten months of 1925 totaled 2,510,000 tons, compared with 2,159,000 tons during those months of 1924. Production of coke-oven plants independent from the collieries, together with that of metallurgical works, was about 2,400,000 tons.

Of patent fuel the French collieries produced, from January to the end of October, 1925, 2,989,000 tons, as against 2,685,000 tons during the same period of the previous year. The plants outside of those attached to collieries are producing about 160,000 tons per month.

Coal imports during the first ten months of 1925 totaled 15,248,000 tons, as against 21,129,000 tons during the same period of 1924. The apparent decline of 5,881,000 tons from the preceding year is partly explained by the fact that the shipments from the Sarre—4,228,000 tons during the first ten months of 1924—were included in last year's figures, whereas in the last year this territory ceased to be considered separate from France proper in the customs returns.

Of the imports Great Britain supplied 8,335,000 tons compared with 11,122,000 tons during the same period of 1924; the United States, 180,000 tons instead of 317,000 tons, but Germany was responsible for 4,582,000 tons, as against 3,523,000 tons.

France imported 4,190,000 tons of coke from January to the end of October, 1925, as against 4,650,000 tons during the same period of 1924. Germany supplied only 3,523,000 tons, compared with 3,905,000 tons a year previous. Patent fuel imports were 1,036,000 tons, while they totaled 803,000 tons during the first ten months of 1924. Belgium supplied 555,000 tons instead of 318,000 tons; 144,000 tons came from Great Britain, instead of 103,000 tons and Germany's share was

Digitized by Google

reduced from 378,000 tons to 315,000 tons.

Inclusion of the Sarre in the customs returns for France explains why French exports of coal totaled 3,691,000 tons for the first ten months of 1925 compared with 1,813,000 tons during the same period of the year before. Coke exports decreased from 420,000 tons to 370,000 tons.

In October, 1925, the French collieries employed 305,318 men—216,513 underground and 88,805 on the surface—as against 302,771 men in October, 1924 (214,221 and 88,550, respectively).

At this writing industrial activity has caused a revival in the consumption of industrial coals and severe weather has considerably increased the consumption of domestic coals. The latter are advancing steadily, and if cold weather is prolonged, it would not be surprising to see the prices of domestic coals reach and even exceed their war and post-war record level. As to French industrial coals, they will certainly be increased in price during the first quarter of 1926 due to high fiscal charges.

German Coal Output Climbs in 1925

Market Nears Overproduction State—Prices Steadiest of Any Year Since War—Strikes Give Way to Conciliation—Imports Shrink—Exports Gain

By H. O. Herzog

The outstanding feature of the German coal market in 1925 no doubt was the transition from a state of shortage of supply to one almost approaching overproduction. The beginning of the change was noticeable more than a year ago, but was then looked upon as only a passing phase. The year just closed, however, revealed that this condition is likely to persist for some years to come.

During the period of shortage up to the end of the Ruhr occupation measures were taken in all fields to increase the capacity of the mines and when, after the collapse of the passive resistance of the Ruhr, the operators succeeded in largely restoring the pre-war working time and pre-war working conditions the mines were ready to produce on a larger scale than theretofore. Had it not been for the syndicates, which in time checked the tendency toward expansion, even at the risk of endangering their own position against the advance of progressive operators, a state of overproduction doubtless would have resulted. In fact the renewal of the syndicates during the past year met with considerable difficulties. The Ruhr syndicate could be extended only under pressure from the side of the government and at considerable concessions to the members in the way of individual freedom of action, which, especially in the matter of export, has resulted in a considerable loosening of the rigid framework of the syndicate organization.

Private Initiative Helpful

When the almost disastrous business depression which held Germany under its sway during the whole year is considered it is astonishing that the coal production of 1925 shows no diminution compared with 1924 but even a considerable increase. This fact is due no doubt, to the reorganization of the sales machinery, of the syndicates on the lines of up-to-date business methods and the freedom given to private initiative.

Total German coal production in 1925 up to the end of November (December figures not being available at the time of writing) was as follows:

German Coal Production
January-November, 1925

(In 1,000 Metric Tons)

	1925	1924	1913 Germany Present Size	1913 Germany Within Pre-War Frontiers
Bituminous coal	121,362	107,596	130,048	175,945
Brown coal	127,077	112,025	79,742	79,742
Coke	24,577	21,332	26,986	29,470
Patent fuel				
Bit. coal	4,547	3,390	5,090	5,382
Brown coal	30,711	26,515	19,684	19,684
Totals	308,274	270,858	261,550	310,223

Production figures by months show slight fluctuation except for a decrease of about 10 per cent from May to June, due to curtailment of syndicate rations. Reserves at pitheads, which at the beginning of 1925 had accumulated to approximately 8,000,000 tons, kept at that total up to the early months of the fall and at the end of the year were estimated at between 5,000,000 and 6,000,000 tons.

Coal prices remained almost stationary throughout the whole year, the first time since the beginning of the war. The level at which they have settled lies about 25 per cent above that of 1913-14. Ruhr fat run of mine, which is the key grade of the schedule of prices, kept at $3.57 per metric ton, and furnace coke, the key grade of coke, at $5.71 up to September, when it was reduced to $5.55.

Labor conditions in coal mining on the whole were satisfactory. The strike fever has greatly abated and in the last year boards of conciliation were able to settle all disputes, chiefly by a policy of compromise. In general it may be said that the past year contributed a good deal to the consolidation of labor conditions.

Wages during the year showed a slight upward tendency. The average pay of all classes of mining labor in the Ruhr in January, 1925, was $1.50 per shift, in other fields somewhat less. In the Lower Silesia field, where the lowest wages prevail, $1 per shift was paid in January, 1925. The wages of a getter, the highest paid category, were in January $1.78 in the Ruhr and $1.14 in Lower Silesia. By the end of the year these wages had increased by about 10c. on the average all categories of mining labor.

The 7-hour day in mining, which the revolution instituted and the collapse of the passive resistance in the Ruhr obliterated for the time being, is still the chief bone of contention in the labor situation, but demands for its restitution are advanced with visibly less ardor. With German industry heavily taxed and still burdened with the sins of neglect committed during the inflation period there is little chance that working hours will again be shortened in accordance with the demand of labor.

Nothing signifies the change in the coal situation more strongly than the changed attitude of operators toward the reparation tribute of coal. It will be remembered that only a few years ago the size of this tribute was felt to be exorbitant. Operators now would gladly see restored a reparation supply as large as that which was indirectly the cause of the Ruhr occupation. The quantity, which is now settled under the Dawes plan, in 1925 was considerably below that of 1924, when it totaled about 7,000,000 tons of coal and 2,700,000 tons of coke. Exact figures for the last year are not yet available. The estimates are generally accepted.

The year 1925 was conspicuous for the shrinkage of coal imports, chiefly at the expense of Polish Upper Silesia. The facilities given this formerly German field for import into Germany under the terms of partition have ceased, with the result that the imports there have greatly diminished. The following figures represent the coal imports into Germany from January to October, 1925 (later figures not being available at the time of writing), with those of the three preceding years attached for comparison:

German Coal Imports, January-October

(In 1,000 Metric Tons.)

	1925	1924	1923	1922
Bituminous coal	6,476	10,912	21,806	9,327
Brown coal	1,863	1,650	1,246	1,880
Coke	61	309	1,265	222
Patent fuel				
Bit. coal	37	132	125	20
Brown coal	125	65	46	30
Totals	8,562	13,068	24,488	11,479

The chief countries of origin were Great Britain and Polish Upper Silesia. But whereas imports from Great Britain retained a level of about 400,000 tons monthly and even showed a tendency to rise during the later months of the year, shipments from Upper Silesia, which in 1924 averaged 500,000 tons per months had in October, 1925, dropped to 2,381 tons.

At the beginning of 1925 exports gave promise of considerable expansion but later on showed signs of weakness, with the result that last year's figures probably were not equaled. Comparative figures for the first eleven months are as follows:

German Coal Exports, January-October

(In 1,000 Metric Tons)

	1925	1924	1923	1922
Bituminous coal	11,601	12,680	975	4,801
Brown coal	27	25	11	13
Coke	3,033	497	214	785
Totals	14,661	13,202	1,000	5,599

Digitized by Google

A striking feature is the increase in exports of coke, which since 1924 have increased over 500 per cent. The chief countries of destination of exports were Holland, which alone absorbed 5,681,743 tons, or about 40 per cent of the total; France, with 1,354,964 tons or 11½ per cent; Belgium, with 1,136,877 tons, or 10 per cent. As regards coke the chief destinations of exports are Luxemburg and Alsace-Lorraine, showing that the German supply of coke is gradually dropping into the old channels.

To the German coal sales fraternity the year just past was almost disastrous. The large increase in the number of coal dealers compared with prewar times and the establishment of co-operative societies, which have taken in hand the supply of coal to large groups of consumers, reduced the quantity of coal handled by individual firms of the trade to such a degree that cutthroat competition resulted, which in numerous cases led to bankruptcy, chiefly in the case of firms which sprang into life during inflation times. The trade owes enormous sums to the syndicates which are bound to sustain considerable losses if the deflation crisis, now in full swing continues.

Canada's Coal Industry Held Back By Labor Unrest

Nova Scotia Disturbances and U. S. Anthracite Suspension Prove Unsettling Influences—Output Falls Below 1924 Total—Recovery Sets in Early

By S. J. Cook

Chief of the Mining, Metallurgical and Chemical Branch, Dominion Bureau of Statistics, Ottawa, Canada

Canada's coal output in 1925 dropped below the total reported in the preceding year, due largely to losses sustained through labor troubles in the eastern maritime provinces in the earlier part of the year. Production amounted to a little better than 13,000,000 tons, as compared with 13,638,197 tons mined in 1924. Depression during the first three or four months of the year, always noticeable, carried the output to a lower mark in April than had been reached in several years. On the other hand, the recovery in 1925 set in earlier than in most other years, for from May to December there was an upward trend in the output curve.

Nova Scotia mines, in which output losses were greatest, produced only 3,900,000 tons of coal in 1925, compared with 5,557,441 tons in 1924, and yielded first place among the coal-producing provinces to Alberta. Distressing conditions prevailed at the Nova Scotia collieries during the earlier months; lack of continuity in employment precipitated labor troubles; strikes and general unrest followed by actual want drove many miners to migrate and created one of the most difficult industrial situations that has occurred in Canada in many years.

Following a general election in which the defeat of the party in power was brought about, the coal-mining situation became the chief topic of interest. The new government appointed a royal commission with wide powers of inquiry; the men returned to work on a temporary agreement pending the findings of the royal commission, and the output of coal grew steadily until the close of the year. It is considered that the commission has done its work thoroughly; great in hope and expectations, those interested await the publication of the report.

Western mines made a better showing in 1925 than in the preceding year when labor troubles in District 18 restricted output. Restoration of coal shipments to Winnipeg and other Eastern points marked an advance in marketing over the previous year, when much of the advantage won in 1923 was lost. Attempts to ship coal east from the western provinces in 1925 did not meet with great success, though some experimental shipments were made with a view to determining solid trainload costs of transporting coal from Alberta to Ontario.

Alberta's output of 5,700,000 tons placed that province in the premier position among Canada's coal-producing areas, and marked an increase in output that was very gratifying. In 1924 Alberta mined 5,189,729 tons of coal.

British Columbia coal mines operated fairly steadily in the face of very considerable difficulties. In 1925 these mines produced 2,753,000 tons of bituminous coal; in 1924 the output totaled 2,193,667 tons.

New Brunswick contributed 203,000 tons of bituminous coal and Saskatchewan added 459,000 tons of lignite to the total for Canada. Production statistics by provinces for the past two years are shown in the table accompanying this article.

Total imports of coal into Canada during 1925 totaled about 16,780,000 net tons, compared with 16,828,578 tons during the preceding year. From the United States Canada obtained in 1925 more than 16,150,000 tons, including 3,250,000 tons of anthracite and 12,900,000 tons of bituminous coal. Imports from the United Kingdom added another 635,000 tons, of which 70,000 tons was bituminous and the remainder anthracite.

More coal was exported from Canada during 1925 than in the preceding year; it is estimated that exports totaled upward of 840,000 tons in 1925 as against 775,246 tons in 1924.

Employment in coal-mining during the year fluctuated greatly in the eastern area, where about 12,000 men usually are at work; during the summer months the number dropped to about 3,000. In the western fields the number of coal miners at work varied from 11,000 to nearly 18,000 at different times during the year; employment was much more continuous than in 1924.

Approximately $146,000,000 capital is invested in Canada's coal mines and the value of the output has at times reached a total above $82,000,000 annually, but in 1925 was $49,000,000.

Output and Value of Coal in Canada by Provinces in 1924 and 1925

Province	1924 Tons	1924 Value	1925 Tons	1925 Value
Nova Scotia	5,557,441	$22,280,554	3,901,000	$16,068,000
New Brunswick	217,121	932,185	203,000	805,000
Saskatchewan	479,118	886,668	459,000	865,000
Alberta	5,189,729	18,884,318	5,706,000	19,600,000
British Columbia	2,193,667	10,601,998	2,753,000	11,686,000
Yukon	1,121	8,265	.....	.....
Totals	13,638,197	$53,593,988	13,022,000	$49,024,000

News Of the Industry

Harrisburg and Washington Hold Attention in Hard-Coal Difficulty; Pro- and Anti-Pinchot Bills Appear

Harrisburg and Washington replaced New York City as centers of interest in the anthracite strike situation last week, following the second break in joint conferences at the Union League Club on Jan. 12. The next day the Pennsylvania Legislature met in special session pursuant to the call issued by Governor Pinchot after the operators had rejected his eleven-point "peace" program. Two bills drafted by Attorney General George W. Woodruff and sponsored by the state administration were presented to the House on the opening day and two anti-administration measures on coal were offered in the Senate.

The first administration bill would amend the Public Service Commission law by including anthracite producers in the category of street-car companies, telephone, gas and other public utilities subject to the jurisdiction of the commission. Enactment of the measure, it is asserted would give the commission wide investigatory powers over the business of the producers and would make prices open to complaint and attack before the state board. Anthracite producers, as defined in the bill, include "all persons, partnerships, unincorporated associations or corporations engaged in the production, preparation and making ready for market of anthracite coal for domestic use and in the sale of such coal."

Would Regulate Retail Trade

The second administration bill requests the Governor to negotiate compacts with anthracite-consuming states to provide for the regulation of retail trade in hard coal. This bill declares the anthracite business to be "affected with a public interest." All compacts under the terms of the proposed law would be submitted to the General Assembly for ratification. The consent of Congress, of course, would be necessary before these interstate compacts were valid.

Governor Pinchot, in discussing these bills, said:

"For many weeks we have read in the newspapers the daily story of the strike of the anthracite operators against the public. Yesterday came the breakdown of the negotiations because the operators refused to do as the miners had already done — make real concessions from their original position in the interest of reaching a settlement. The matter now comes before the Legislature of Pennsylvania for its action. I shall do my best to press the bill which recognizes anthracite as a public utility. That is the next step."

One of the anti-administration bills, introduced by Senator George Woodward, of Philadelphia, calls for the amendment of the miners' certificate law. Under existing law, enacted in 1889, applicants for certificates must have had two years' experience as miners' laborers and must pass the scrutiny of an examining board of nine miners. This law, it is asserted, creates a union labor monopoly because only union members can be employed as helpers and so qualify for a certificate.

The Woodward amendment would waive the two years' experience in the anthracite mines and grant certificates to applicants who answer "intelligently and correctly at least twelve questions in the English language pertaining to the requirements of a practical miner." The examining board is reduced from nine to three, with only two signatures necessary to validate a certificate. This examining board would consist of a miner, an operator or mine superintendent and a mine inspector.

The second bill, fathered by Senator Patrick F. Joyce, of Luzerne County, would repeal the anthracite tonnage tax law of 1921. "It is the opinion of the Legislature," reads the preamble, "that the existing tax on anthracite coal and its consequent effect on the price thereof to the public is one of the chief elements entering into the continuation and prolongation of the strike, and that the repeal of the said tax would hasten the end thereof."

The Woodward bill was given favorable consideration by the Senate committee on mines and mining, but no action on the Pinchot proposals was taken by the House committee. In the opinion of many observers, the Governor's regulatory program is foredoomed to failure. Some also express the opinion that the Legislature will take no final action on the Woodward bill, which already is being bitterly attacked by the miners.

At the session on Jan. 18 three additional measures were introduced in the House. As an offset to the Woodward bill Representative John E. Stavitsky, of Luzerne County, a member of the United Mine Workers, offered an amendment to the present law which would make illegal the employment of uncertified miners, prevent the sale or transfer of certificates and change the make-up of the examining boards along lines suggested by the Woodward bill.

The two other measures were resolutions aimed at a termination of the strike. One would create a Presidential commission to sit in the region and make binding findings. Pending the promulgation of its report, miners would be ordered to work at the old wages. The second resolution proposed a commission of six state legislators and three commissioners named by the Governor to invite operators and miners to resume negotiations.

A flurry over the possibility of federal intervention developed late last week when five Congressmen from the anthracite district conferred with Secretary of Labor James J. Davis. Following the conference, however, the Secretary stated that there had been no change in the attitude of the administration at Washington. Earlier in the week the operators had announced that they would respond to any invitation from the President to confer on the situation. On behalf of the miners, however, it was stated that they would acquiesce in no suggestion from Washington that their differences with the producers be submitted to arbitration.

More Coal Bills in Congress

The collapse of the Union League Club conferences also encouraged the introduction of more coal control bills in Congress. Senator Royal S. Copeland (New York) introduced a resolution on Jan. 15 to authorize the President to take such steps as might be necessary to bring about a speedy resumption of mining, and the next day, when immediate consideration of the proposal was refused, introduced a resolution directing the President to take over and operate the anthracite mines during the present "emergency" and to continue such operation and supervision "for the duration of the present strike," but not beyond June 1, 1928.

In the discussion on the floor of the Senate on the Copeland proposals on Jan. 16, it was argued that a Constitutional amendment would be necessary before Congress could take effective action. This idea was pressed by Minority Leader Robinson. Senator George W. Pepper (Pennsylvania) declared that the Copeland resolution of Friday would aggravate the situation and characterized it as a "legislative sob." Senator James A. Reed (Missouri) commended the "hands-off" policy of the administration as in consonance with the law.

Senator Tasker L. Oddie, chairman of the Senate committee on mines and

Wage Cut and Abolition of Check-Off Demand Urged by Nova Scotia Royal Coal Commission

That the Nova Scotia miners should accept a 10 per cent wage cut from the 1924 scale, as demanded by the operators (the British Empire Steel Corporation) a year ago; that there should be semi-annual wage revisions; that the company acknowledge the United Mine Workers; that the "check-off" system of collecting union dues be abolished are among the findings of the royal commission appointed by the Nova Scotian Government to probe the coal-mining industry.

The results of the inquiry which was conducted by Sir Andrew Rae Duncan, of England; Major Hume Cronyn, London, Ont., and Dr. H. F. McPherson, Antigonish, Nova Scotia, and lasted two months, were made public last week.

It is recommended that the corporation-owned houses be sold to the miners and the corporation's private police force be abolished. A two-year wage contract is suggested as a means of stabilizing the industry, and sanitation and roads in the mining district should be cared for by the municipalities and government.

Coking plants are recommended throughout the country, so that Nova Scotian coal may have a wider market.

mining, explained that he was not pushing his bill forward at this time because he felt it would embarrass a situation "already full of embarrassment." On Monday of this week, however, the Senator conferred with the President. At the conclusion of the Coolidge conference, Senator Oddie stated that he had been given no assurance that the administration would indorse his bill. Later the Senator also called on Secretary Hoover. The Oddie bill has been under study by the Department of Commerce for several weeks, but no report has as yet has been made public.

Representatives John J. Boylan and Sol. S. Bloom (New York), authors of bills for emergency operation of the mines by the government, criticised the House committee on interstate and foreign commerce for its failure to order early hearings on the various coal bills which have been referred to it. On Jan. 18, Representative Boylan made public a letter from Representative W. F. Oldfield, Democratic whip, indorsing the Boylan measure.

Complete indorsement of the position of the union subscale committee was given Mr. Lewis and his associates at a meeting of the full scale committee at Hazleton, Pa., on Jan. 14. At that meeting the international president pledged the full resources of the organization in supporting the strike. Demands from some of the local unions that maintenance men be withdrawn were turned down by the committee, which also scouted the idea that any operators would attempt to reopen the mines without an agreement. On Sunday Mr. Lewis began a speaking tour of the region.

"Woeful Waiting" Region Attitude

In the anthracite region civic organizations, peace committees, self-appointed mediators, the miners and the operators alike appear to have assumed an attitude of watchful waiting. New peace plans are met with apparently no concern by either the public or the contending factions. The general atmosphere is one of coma. The agencies which in the past strived so desperately to bring about a settlement have given up in disgust. All appear to be awaiting the arrival of some inspired peacemaker who can give the miners what they want without refusing the requests of the operators.

The suffering among the strikers continues to increase as the relief organizations, due to lack of funds, are forced to curtail their work. Strike benefits are not being paid. Relief in the form of a few dollars every fortnight is distributed by the district unions. It is not organized relief, however, and does not succeed in its purpose.

The residents of the region are at their wits' ends to obtain hard coal to heat their homes and prepare their food. Substitute fuels are lacking and anthracite is doled out under supervision that makes it practically unavailable. It is necessary to supply proof of illness in the home, in many instances, before retailers will deliver coal from their depleted stock piles.

"Bootleg" coal, selling as high as $17 a ton, can be obtained from questionable sources. In many cases it is unburnable.

The corner grocer who has carried the striking miner on his books is himself looking vainly for credit. The big department stores and business houses are pleading for extensions on their own credit accounts. A demoralization of the entire region is threatened.

British Labor Would Nationalize Mines

An elaborate plan for the nationalization of power production and the entire coal industry of Great Britain has been laid before the Coal Commission as a panacea for the ills of these industries in the future. The Miners' Federation, the Central Trades Council and the Labor members of Parliament support it. The scheme calls for a distribution of government stock to recompense the mine owners for the value of their properties, a special compensation commission to decide how this stock should be redeemed—possibly from a sinking fund created by profits from the government industries. Three permanent commissions would be appointed, one to control general policies of power and transport, one to control operation of the mines and the third to regulate prices and distribution.

Cosgrove-Meehan Takes Over Dilltown Mine

The Cosgrove-Meehan Coal Corp. acquired the entire holdings of the Dilltown Smokeless Coal Co., at Dilltown, Indiana County, Pa., last week, the deal involving $575,000. The purchase included 1,378 acres of coal lands, the mine and its equipment and the housing for employees at Dilltown Heights. The Dilltown operation now has a daily capacity of 1,000 tons and this will be increased. The mine will be known as Thermal No. 15 of the Cosgrove-Meehan Corp. and this added production will make the corporation one of the largest in the central Pennsylvania field, with operations at Johnstown, Portage, Barnesboro, Foustwell, Boswell, Cosgrove and Acosta, in Pennsylvania, and at Marion, Johnson City, Pittsburg, Paulton and Panama, in Illinois.

The negotiations were closed by John C. Cosgrove and Harry Meehan for the purchasing company and Earl E. Hewit, general manager at Dilltown. The mine, which is served by the Buffalo, Rochester & Pittsburgh and the Pennsylvania railroads, was opened twelve years ago and produces an excellent grade of Miller seam coal for domestic uses. The mine is electrically equipped, has shaking screens and picking tables and lends itself readily to loading prepared sizes of a hardness making them strongly competitive with anthracite. The workings are self-draining. There are fifty houses, with electric lights and water. Mr. Hewitt will remain as manager.

Organize Company to Mine Virginia Anthracite

W. H. Manss, of Baltimore and Chicago; Alexander Armstrong, formerly Attorney General of Maryland; W. O. Pierson, vice-president of the Union Trust Co., Baltimore; Charles H. Holtzman, Collector of Customs, Baltimore district; J. W. Edelen, president of the Enterprise Fuel Co., all of Baltimore, and E. C. Searls and W. Milnor Roberts, of Chicago, have organized the Great Valley Anthracite Corporation to develop hard coal mines in Virginia.

The new company has an authorized capital stock of 15,000 shares of no par value common, soon to be increased to 50,000 shares and $300,000 of 7 per cent bonds.

Mr. Manss is president, Mr. Searls vice-president in charge of operation, Mr. Roberts vice-president, Mr. Armstrong secretary and general counsel, and Mr. Pierson, treasurer.

The Great Valley Corporation plans the expenditure of approximately $125,000 in developing the initial unit in Virginia and expects to begin production early next summer. The property is located on New River adjacent to the Norfolk & Western and the Virginian Ry.

The Consolidation Coal Co. in the near future will construct about 1,300 miners' houses at its mining plants in southern West Virginia and eastern Kentucky.

Nation's Lawmakers Expect Negative Result From Pinchot Venture

By Paul Wooton
Washington Correspondent of *Coal Age*

The special session of the Pennsylvania Legislature is being watched with more than academic interest by the lawmakers on Capitol Hill who are concerned with coal. The fact that the state is working on the anthracite problem provides an effective bar to the consideration of any coal legislation by Congress pending the outcome of that effort.

Few expect more than a negative result from the Pinchot venture. However willing the people of New England may be to have anthracite declared a public utility, there is little expectation that Pennsylvania will place its major industry under drastic regulation largely for the benefit of other states. The keystone in the Keystone state is coal. The steel industry there rests not on native reserves of iron ore but on the state's superb coals.

It is thought certain a majority of the legislators will see that any regulation prescribed for anthracite sooner or later would have to be applied to bituminous as well.

Interest in the anthracite situation is enhanced somewhat by the circulation of a rumor on Capitol Hill that Governor Pinchot has encouraged President Lewis of the United Mine Workers to hold out against the demands of the operators by giving assurances that he could put through his anthracite legislation. The idea also is in circulation that in the event of failure to obtain satisfactory results at Harrisburg Mr. Lewis would bid again for federal intervention by renewing his threat to call out the soft-coal miners.

Federal Intervention Still Remote

The success which has followed its hands-off policy makes it seem certain that the executive branch will resist, more strongly than ever, any pressure intended to bring about intervention. While the failure of the Pennsylvania Legislature to do anything would be the signal for renewed efforts on the part of some members of Congress to obtain action, the chances are against success. By that time the winter will have been so far advanced that the problem will be less acute. The leadership in Congress is not convinced that the failure of the mine workers and the operators to reach an agreement makes their controversy a national issue. Apparently they are standing with the administration against a political settlement of a dispute that should be settled within the industry.

Despite the effort of Representative Boylan, of New York, to establish that the shortage of anthracite is responsible for much of the pneumonia and influenza, the preponderance of complaints reaching Washington seems to be coming from the rich and from the very poor. The former want anthracite regardless of cost because of its convenience, while the prevailing complaint of the latter seems to be the presence of soft-coal particles in the air which settle on freshly washed clothing as it hangs on the line. Mr. Boylan, however, says the effort to use substitutes is resulting in an "unbelievably high" death rate from asphyxiation and that "it is a question who appears in a more culpable light—Nero fiddling while Rome burned or the American Congress talking and debating comparatively trivial matters while our people freeze and die." He has introduced a bill proposing that the President "take temporary control of any or all anthracite mines and proceed with the mining of such coal until the emergency has passed."

Until recently the sponsors of the campaign for the use of substitutes were somewhat in doubt as to what would happen if the weather should get really cold. After two weeks of genuine winter weather, which prevailed recently throughout the anthracite-using region, their doubts as to that point have been set at rest. Substitutes now are available in abundance in all markets and prices of bituminous coal are lower than they were last October. A generally held opinion in Washington is that the public has won the strike and that with the country almost buried in soft coal there is no excuse for anyone's being cold.

Pittsburgh Coal Co. Opens Dickson Mine

"All's well at the Dickson mine" was the latest report of the Pittsburgh Coal Co., following the reopening of the seventh mine of the company in western Pennsylvania on the 1917 wage scale. This mine, located three miles from Imperial, in Allegheny County, on the Montour R.R., was started on Jan. 13 with 74 men at work. The division manager is Harry M. White and the superintendent is John Pasco.

Warden mine, near McKeesport, which was opened slightly more than a week ago, now has close to 200 men at work. The company also announced that there was a total of 1,410 miners at work at the seven operations of the company, following the reopening of the Dickson mine. This is the greatest number employed at any time since the first mine, Banning No. 2, was opened on Aug. 20, 1925.

Last week six mines loaded a total of 24,820 tons.

Pittsburgh Coal Co. Promotions

William Lauder, of Elizabeth, has been promoted to the position of general superintendent of mines of the Pittsburgh Coal Co., officials of the company have announced. He was formerly division manager in charge of the Youghiogheny River valley section. Howard Burns, of Corliss has been named division manager to succeed Mr. Lauder and will establish his headquarters at West Newton. Mr. Burns formerly was mine inspector for the company.

Standards Board Approves Rock Dusting

The American Engineering Standards Committee has just approved as "Recommended American Practice" a safety code for rock-dusting of coal mines, developed under the sponsorship of the American Institute of Mining and Metallurgical Engineers, in close cooperation with representatives of the various national bodies interested, including state officials having regulatory power over the field in question, coal operators, labor, inspection, insurance, manufacturers of mine equipment, and the U. S. Bureau of Mines. The latter, as a leader in mine safety work, has conducted extensive investigations and experiments under the direction of Dr. George S. Rice, before advocating this method.

The chairman of the sectional committee for the formulation of the code is Howard N. Eavenson, consulting engineer.

The code prescribes the rock dusting of mines producing bituminous coal or lignite, whether gaseous or not, as they are liable to dust explosions. It specifies the kind and amount of dust to be used and the parts of the mine to be dusted. The methods of applying the dust and instructions for its sampling also are given.

The practice of wetting coal dust produced by coal undercutting machines and the drenching of the cars with a water spray while they are in transit are recommended as effective and economical ways to keep down the dust from these sources.

It has been conservatively estimated that about two-thirds of the fatal and serious accidents at the bituminous coal mines of this country could be prevented by the universal adoption of this safety method.

A report by Edward Steidle, supervisor of the co-operative coal mining courses at Carnegie Institute of Technology, who has been making a study of this subject in connection with the Bureau of Mines investigations, presents data on the increase in the use of rock dusting during the past year, which emphasizes the importance that coal mine operators place on the prevention of explosions. During 1924 only one company in America practiced rock-dusting on a large scale, but at present no less than 211 mines are rock dusted. However, this represents only about 4 per cent of the total number of bituminous mines in the United States.

Bain Off Advisory Committee

Dr. H. Foster Bain, former director of the U. S. Bureau of Mines and now executive secretary of the A.I.M.E., has sent in his resignation as a member of the advisory committee of Secretary Hoover, relating to reorganization of the Mines Bureau. It is probable that the vacancy will be filled by a representative of one of the several industries with which the Bureau deals and which is now unrepresented on the committee. There will be a meeting of this committee in late January, when Secretary Hoover will ask the committee to continue to function.

Gas Explosion in Open-Lamp Mine Kills 91 Men at Wilburton, Okla.

Ninety-one men are known to have lost their lives and three others are missing in an explosion in the Degnan-McConnell Coal Co.'s No. 21 mine, at Wilburton, Okla., early in the morning of Jan. 13. It is considered probable, by the authorities on the ground, that the blast was caused by the ignition of gas by men wearing open-flame lamps, State Inspector Edward Boyle having barred electric safety cap lamps from Oklahoma after a battle he carried into the courts.

Mr. Boyle blamed the accident upon incompetence of firebosses and ignorance of men employed since the region was converted to a non-union basis following a long struggle last summer.

This Group Helped Form Rescue Teams at the Wilburton Mine

Damaged Top Works of the Degnan-McConnell Mine

He had not yet entered the mine, however, when he made this charge. "Jim" McConnell, owner of the mine returning from Illinois, where he had gone to attend the funeral of a friend, at once issued a denial.

"Every gas man in the mine held a certificate," Mr. McConnell declared, "and the majority of the men who were at work had been there some time."

One hundred and one men, including A. P. Thomas, of Hartshorne, Okla., a mine surveyor, went into the mine at 7:30 on the morning of the explosion. Two inspectors had finished their rounds an hour and a half earlier and had reported no gas. Within an hour from the time the first cageful of men had descended the 200-ft. shaft and started down the long slope running from the bottom, the explosion occurred. It started a fire down the main slope and sent up a great column of black smoke from the shaft, drawing the inevitable crowd. Rescue crews from McAlester, Hartshorne, Haileyville and Krebs rushed to the scene, entering the mine under the direction of J. B. Hynal and W. H. Fleming, of the U. S. Bureau of Mines. They soon found 16 bodies. The Salvation Army opened a lunch station at the mine. A Red Cross official and state troops arrived that night.

Eight men were brought out alive the night of the 13th, but two more, Cecil McKinney, white, and Beryl Holland, negro, were found wandering through the workings the next morning, both suffering from shock and exhaustion. The negro was so badly frightened he could not talk. Several negroes had refused to do rescue work underground the day of the explosion because it was the 13th, even though superstition was dealt a severe blow by the fact that the first eight men saved all had come out of the 13th east entry.

Union men throughout the country made much of the fact that experienced miners who were on strike in the Wilburton region were barred from aiding in the rescue work by an injunction issued against strikers by Judge R. L. Williams several months ago forbidding them to enter company property.

Charles Buffo, superintendent of the Rock Island mines at Hartshorne, had teams in the mine from the first and William and Steve Ogilvie also were in charge of crews that alternated in the rescue and search work below the surface. Two weeks ago there was a squeeze in the mine, Superintendent W. H. Powers said. Work in the mine was stopped while airways were driven around it to provide ventilation for a section of the mine. A recurrence of this squeeze may have had something to do with the explosion, Powers said. Groping for another possible cause, State Inspector Boyle suggested that possibly a miner might have found an unfired shot, missed the night before, and touched it off.

Chief Owner of the Mine with National Guard Officers

"Jim" McConnell, of the Degnan-McConnell Coal Co., rushed home to Wilburton, Okla., from Illinois immediately after the explosion and helped direct rescue work while answering criticisms leveled at the company by the United Mine Workers, who last summer lost their grip on the Wilburton field.

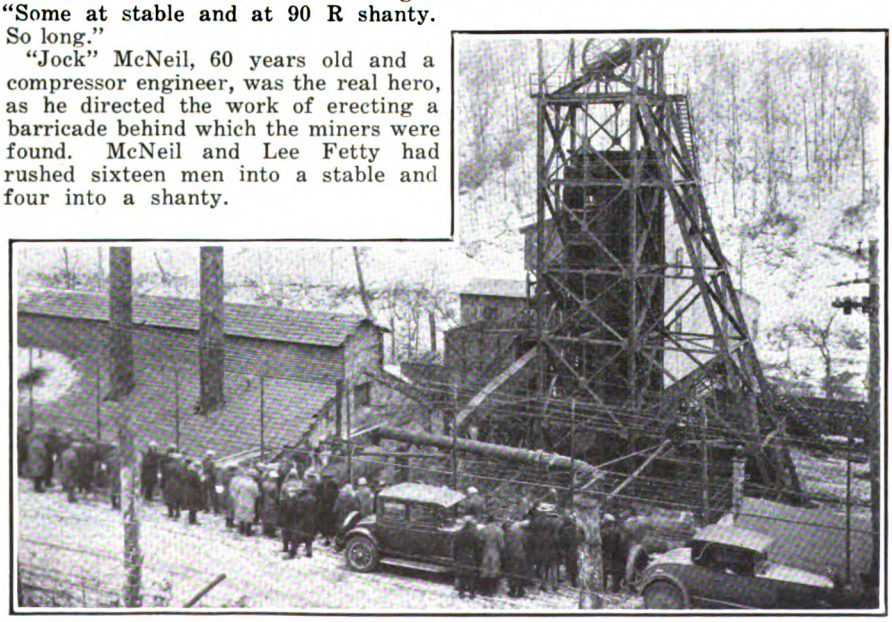
Good Barricades Save Lives of 20 But 19 Die In West Virginia Blast

Twenty miners saved their lives after an explosion Jan. 14 in the No. 8 mine of the Jamison Coal & Coke Co., near Farmington, W. Va., by using their knowledge of how to build barricades and by keeping their heads. Nineteen men died, however, and about $75,000 damage was done to the interior and equipment of the mine. The mine was not rock-dusted although the company had previously planned to begin rock-dusting on Jan. 15. A naturally moist condition in part of the mine was credited with reducing the force of the explosion, which was unofficially said to have been caused by an arc from a trolley nip igniting a body of gas. This, however, remains to be proved. The mine operates on a closed-light basis.

Thirty-nine men were in the mine at 10:20 p.m., when the blast occurred, starting, apparently, about 1½ miles from the shaft bottom. Eight men working near the bottom escaped at once. Rescue crews from various northern West Virginia coal companies soon penetrated the workings searching for the rest of the night force under the direction of William Riggleman, of Fairmont, a state mine inspector. Robert M. Lambie, chief mine inspector, was soon on the ground. While the force of the explosion hardly reached the outside and therefore did no damage to the shaft and top works, it was early realized that the loss of life might be heavy because only the first eight men came out. By 5 o'clock the next morning four bodies were brought out, including those of William E. Myers, of Fairmont, and his son Herbert.

Hope for the remaining men was steadfastly held, however, as the rescue workers penetrated deeper and deeper without finding many more bodies. This belief was strengthened, when the searching party at 5:45 o'clock Friday evening, Jan. 15, came across a board bearing what was intended as the entombed miners' farewell message: "Some at stable and at 90 R shanty. So long."

"Jock" McNeil, 60 years old and a compressor engineer, was the real hero, as he directed the work of erecting a barricade behind which the miners were found. McNeil and Lee Fetty had rushed sixteen men into a stable and four into a shanty.



Fred W. Lukins

The "farewell message" on the board led the searchers to the imprisoned men 23 hr. after the men had sealed themselves in. The board is now one of the cherished possessions of the company.

The investigation of the disaster was started Jan. 16, with Chief Lambie in charge. The coroner's jury will meet Jan. 29, at Charleston. The mine is expected to resume work next week.

Something brand new in West Virginia coal mining will be tried, Mr. Lambie said, when work will be started next Monday to sink holes 10,000 ft. in advance of the present development of the Jamison mine to force the gas out by means of a vacuum. These will be extended to points 8 ft. below the coal so that the underlying as well as the overlying seam of coal may be tapped. It is believed that this will solve some of the problems incident to the mining of this gas coal.

Mr. Lambie says that the rescue trucks for the purchase of which Gov. Howard M. Gore managed to have the Legislature appropriate $20,000 saved the day. They rendered quick service.

Top Works of the Jamison Coal & Coke Co.'s No. 21 Mine Were Little Damaged by the Jan. 14 Explosion

Fred W. Lukins Dead at 70; In Coal Trade 40 Years

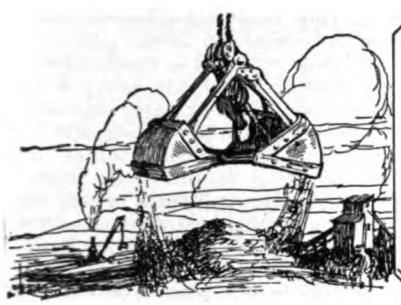
Fred W. Lukins, for four years ending in 1920, president and a director of the Southwestern Interstate Coal Operators' Association, died Jan. 14, at Springfield, Mo., after a two months' illness following an attack of typhoid fever. He was 70 years old. Last year he severed his connection with the coal industry and retired to his ranch near Chadwick, Mo.

For forty years Mr. Lukins was engaged in mining and selling coal in Illinois and Missouri. In Illinois he was general manager of the O'Gara Coal Co., with headquarters at Virden, Ill. From 1914 until he moved to his ranch Mr. Lukins had lived in Kansas City, Mo., where he operated the Farmers' Fuel Co. and the Waverly Coal Co., with mines in Missouri.

In 1917 Mr. Lukins was elected a director of the National Coal Association, the only connection with the coal industry he retained after his retirement last year. In 1923 he was a member of the bituminous coal operators' special committee of the National Coal Association, which represented the coal industry before the U. S. Coal Commission.

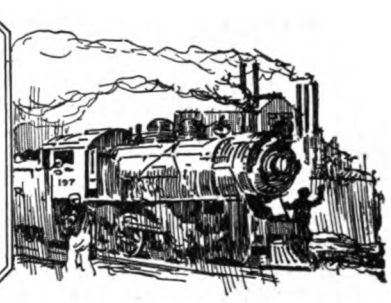
Bureau of Mines Abolishes Urbana (Ill.) Station

The University of Illinois station of the U. S. Bureau of Mines, Ceramics Building, Urbana, Ill., was discontinued Dec. 31, 1925. According to word received at the Bureau, this is part of a general movement of the Department of Commerce to cut down expenses.



The University of Illinois office was first opened as a mine-rescue station in 1908. In 1917, during the war, it was changed to a mining experiment station and had remained the same since. L. D. Tracy, superintendent of the Bureau, has held that office since December, 1922. He was preceded by C. A. Holbrook, now dean of the School of Mines, State College, Pa., and J. J. Rutledge, now chief of the Bureau of Mines of Maryland. Experiments and investigations have been carried on by the Bureau since it was first installed and nine bulletins and seven technical papers have been written and published on material gained through these investigations and experiments.

Three Tennessee Companies In $30,000,000 Merger



The Tennessee Products Corp. is the name of a new company formed Jan. 16 by the merger of the Bon Air Coal & Iron Co., Nashville, Tenn., with the Chattanooga Coke & Gas Co. and the J. J. Gray, Jr., properties, of Rockdale, Tenn. The new organization will have a capital stock of $30,000,000, an increase of $10,000,000 over the capital of the Bon Air company.

James R. Offield, president of the Bon Air company, took an active part in bringing about the merger. William Wrigley, Jr., Chicago capitalist and father-in-law of Mr. Offield, is nominally interested in the consolidation.

Production And the Market

Demand and Prices for Soft Coal Stronger; Anthracite Substitutes Spurt

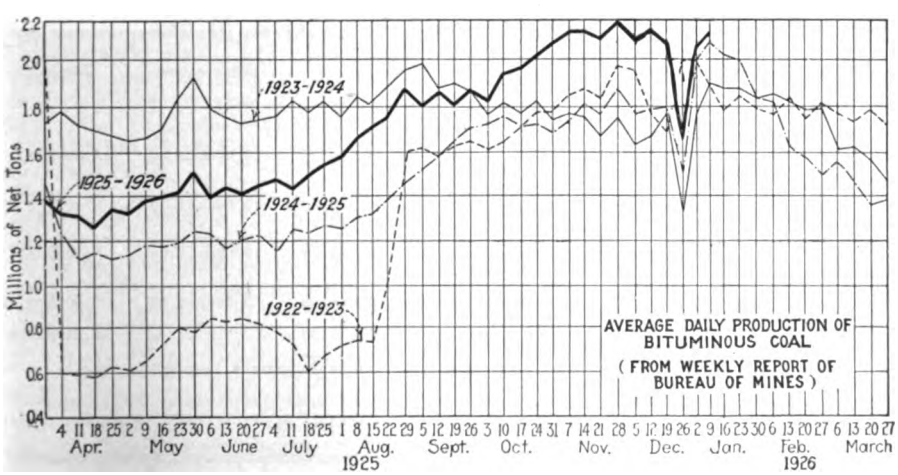
Whatever conflicting emotions or conditions may pervade the coal market—and in the complicated conditions of the last year there have been many—an unfailing stimulus to action is cold weather such as has been fairly widespread during the last week. No doubt a few snowstorms, with an occasional blizzard, would not be amiss in the trade's scheme of bigger and better business, but these are not without their serious drawbacks in the shape of disarranged transportation and inadequate equipment.

Another development responsible in some degree for the renewal of activity in soft coal was the abandonment, at least temporarily, of the policy of watchful waiting when the hard-coal peace negotiations were broken off. While the influence of demand from this direction is growing in importance it has not thus far had a very great effect on the coal trade as a whole since the anthracite mines suspended operation, because an unusually large number of consumers laid in a comparatively large proportion of their winter needs before the strike began.

Heavy Output Counterbalances Demand

The improvement in the market situation is reflected in much greater firmness in prices rather than in any notable advances. That quotations have remained comparatively stationary in the face of recent betterment in conditions is due to a rebound in production, which is again close to some of the high marks of past years, following the usual dip caused by curtailment of operations during the holiday weeks. The quick response of output to the temperature, with the inevitable result that prices just as rapidly get no better, has in the last few months been a recurrent cause of chagrin to those hit hardest by the depression that set in soon after the signing of the Jacksonville scale. The splendid performance of the railroads since output began to hit the high spots has played an important part in stabilizing prices and enabling operators to move their product without delay.

As general business conditions are sound and industrial operations are beginning to hit their stride again after the holiday lull, prospects are brighter than for some months.



Revival in Demand for Coke

With the abrupt termination of anthracite peace negotiations, indefinitely postponing settlement of the strike, renewed strength marks the demands for hard-coal substitutes, particularly coke, the price of which has been steadily on the upgrade since the parley broke up.

Bituminous coal output during the week ended Jan. 9 is estimated by the Bureau of Mines at 12,883,000 net tons, a total exceeded but once since late in 1920, 12,914,000 tons having been produced in the week ended Dec. 12 last. The revised total production for the calendar year 1925 is 522,967,000 net tons. Production of anthracite during the week ended Jan. 9 was about 47,000 net tons, compared with 64,000 tons in the preceding week, according to revised figures.

Coal Age Index of spot prices of bituminous coal on Jan. 18 stood at 181, the corresponding price being $2.20, compared with 180 and $2.18 on Jan. 11.

Dumpings of coal at Hampton Roads made a sharp rebound during the week ended Jan. 11, the total being 433,560 net tons, compared with 339,761 tons in the preceding week.

Estimates of Production

(Net Tons)

	1924–1925	1925–1926
BITUMINOUS		
Dec. 26	7,546,000	8,431,000
Jan. 2 (a)	10,810,000	10,667,000
Jan. 9 (b)	12,590,000	12,883,000
Daily average	2,098,000	2,147,000
Coal yr. to date (c)	359,814,000	409,805,000
Daily av. to date	1,514,000	1,719,000
ANTHRACITE		
Dec. 26	1,029,000	32,000
Jan. 2 (a)	1,255,000	64,000
Jan. 9	1,785,000	47,000
BEEHIVE COKE		
Jan. 2	257,000	293,000
Jan. 9	265,000	299,000

(a) Revised since last report. (b) Subject to revision. (c) Adjusted to equalise number of days in the two years.

Midwest Spurts a Little as Mercury Dips

A little spell of zero weather came to the rescue of the Middle West coal market early last week. The results were felt immediately in a better demand for domestic coal, as many dealers who had small reserves on hand rushed to cover and booked fairly heavily. The cold wave lasted only two or three days, but many operators accumulated quite a number of orders.

Steam coals have been offered much more freely in the last week and prices have slipped to a slight extent, although not enough to make much difference. This weakening came about entirely through better production. It is possible to move screenings and mine-run at a fairly reasonable price, but not even the most enthusiastic observer could say that the demand was strong. The industrial situation continues to be very satisfactory.

What little anthracite was in this territory is about used up. The cold weather brought this interesting fact to light in an unexpected demand for certain sizes of coke, southern Illinois coals, Indiana Fourth Vein coals and Pocahontas coals.

Labor difficulties in southern Indiana, where operators of co-operative properties locked horns with the United Mine Workers, apparently have been settled for the time being, but many people close to the situation are watching that field with some anxiety.

Seasonable weather is moving domestic sizes of coal in the Williamson, Franklin and Harrisburg fields. All mines are behind on shipments of lump, and egg is moving freely. The nut sizes, however, are slow and steam is heavy with a slight increase in demand as cold weather came on. Railroad tonnage is good and shaft mines are working five and six days a week. Car supply is good. Strip mines have had open weather and are working regularly six days a week and finding a good market, although their prices vary. In the Duquoin and Jackson County fields similar conditions prevail. There have been no changes in prices in any of these fields.

In the Mt. Olive field business is fairly good on domestic and steam is slow. Railroad tonnage is good. Working time is four and five days a week. In the Standard field there is a better movement but nothing to justify higher prices and most mines have "no bills," sometimes of domestic sizes but always of steam sizes. Railroad tonnage is reported light. The mines are getting four and five days a week. Prices are unchanged.

In St. Louis domestic business is reported to be good for middle-grade coals and Standard is moving fairly well, as is steam of the cheaper grades in smaller lots. The anthracite tonnage is cleaned out. There is a fair supply of smokeless and a fairly good demand. Coke is moving well. Country domestic is unusually good for middle and cheaper grade coals as well as for coals from

Coal Age Index of Spot Prices of Bituminous Coal F.O.B. Mines

	1926			1925
	Jan. 18	Jan. 11	Jan. 4	Jan. 19
Index	181	180	181	174
Weighted average price...	$2.20	$2.18	$2.19	$2.11

This diagram shows the relative, not the actual, prices on fourteen coals, representative of nearly 90 per cent of the bituminous output of the United States, weighted first with respect to the proportions each of slack, prepared and run-of-mine normally shipped, and second, with respect to the tonnage of each normally produced. The average thus obtained was compared with the average for the twelve months ended June, 1914, as 100, after the manner adopted in the report on "Prices of Coal and Coke: 1913-1918," published by the Geological Survey and the War Industries Board.

western Kentucky. Local wagonload steam is unusually good. Carload is fair and country steam is quiet. No change in local prices.

Small Orders Help Kentucky

Continued cold weather with snow on the ground has resulted in better retail business in Kentucky. Not much big business has been in the market, however, as many big concerns stocked heavily early in anticipation of high prices and short supplies on account of the anthracite situation. Inventory being fairly well over, more business is coming in, but not in especially large lots.

Industries are consuming steadily, even more brick companies running in bad weather than a few years ago.

Prices as a whole are little changed. In western Kentucky some operators are holding firmly for $2.25 a ton for block, but it can be had as low as $1.85; lump and egg, $1.75@$2; nut, $1.35@$1.50; mine-run, $1.25@$1.50; screenings a shade weaker at 75c.@$1 10. Eastern Kentucky prices show best block at $2.75@$3.25; egg and lump, $2@$2.50; nut, $1.75@$2; mine-run, $1.40@$1.75; screenings, 90c.@$1.10.

Mines in eastern Kentucky are running on a fair schedule as a whole, a few being down for the time being, while western Kentucky is making a fair showing, and probably has had some business thrown to it from southern Indiana, where a number of mines have had labor troubles. Car supply is good in all sections, the railroads having performed well this winter.

Movement Picks Up in Northwest

Movement of coal from Duluth-Superior docks has improved substantially during the last ten days, thanks to colder weather and shipments on orders previously placed for January delivery. Retailers and industrial consumers are still buying largely on an immediate-requirement basis, however.

The market is firm and unchanged for all bituminous coals. With the heavier movement of prepared sizes of bituminous coals the docks find themselves better supplied with screenings to cover orders on their books. Public utilities and mining companies are ordering mine-run and screenings mainly. Domestic coke is in active demand at $8.50 and briquets are being offered at $9.

Iron foundries and other plants over Minnesota and northern Wisconsin are operating more extensively than a year ago. Orders from iron mining companies on the Minnesota ranges have been bulking heavier since the beginning of the year due to mining and stripping programs having been broadened as the result of a brighter outlook in the iron and steel trade.

Car-lot shipments of anthracite were completely suspended last week. Remaining stocks, consisting of nut and egg, are held almost exclusively by three of the dock companies and they are being reserved for their retail yards at Duluth and Superior. Former anthracite consumers are getting along with Pocahontas and other smokeless bituminous coals, domestic coke and briquets.

Bituminous stocks on the docks as of Jan. 1 are estimated at 4,900,000 tons and it is figured that they will be ample to cover all needs up till the opening of navigation.

Milwaukee consumers of anthracite find that the small amount of hard-coal still on the docks belongs to those who contracted for it early in 1925 and must go to them when their bins require refilling. Pocahontas is being used as a substitute, and thus far the supply has been sufficient to meet the extra demand. But the coke makers seek direct business with the consumer, and have placed restrictions on sales to dealers, indicating that their stocks are being seriously reduced by the heavy demand from former consumers of anthracite. Thus far no restriction has been placed by retailers on the amount of coke that can be ordered by consumers at one time. Prices remain unchanged.

Southwest Trade Keeps Time with Mercury

The Southwestern market continues to dance to the weather man's fiddling. A week ago, with the thermometer under 20 deg., it was doing a fair imitation of the Charleston. This week, however, with the temperature again above freezing, its tempo is considerably slower. Kansas lump is especially slow and is quoted 25c. lower by some operators. Others, however, maintain the standard midwinter price of $5 a ton. Kansas nut is short and steam coal is easy.

The Arkansas market remains dull, but a better demand is expected late in January. The demand for screenings is good, but production is limited by the greatly reduced demand for lump, which has caused a cessation of work in many mines.

In Colorado the movement of domestic coal is not up to expectations; there is a large surplus of unbilled coal on track, particularly nut, which is not very encouraging. The slump is attributed, of course, to the mild weather, particularly in Kansas and Nebraska, which has prevailed for the last ten days. While the stocks in retailers' bins are getting low they are ordering only for immediate use. Apparently only severe weather will bring about a change. There has been no change in prices, there is a surplus of labor and transportation has been uninterrupted.

Utah operators find business very "spotty"; one week it is fairly good and the next things are quiet. Last week many of the mines averaged from four to five days working time as a result of a cold snap on the Pacific Coast and in the Northwest. This week the working time will be around half time. The domestic market is taking more domestic lump than anything else, and nearly everyone seems to be buying from hand to mouth. Industrials taking much coal at this time are comparatively few; the metal industries are consuming more than any others. Slack is easier again, but unless another cold snap comes in some part of the territory soon there will be a scarcity as a result of the short working time. Schedule prices are firm and there is little "cutting" outside of slack. Business in December was unusually quiet, that month being more open last year than for a long time, a big contrast to December, 1924, when the temperature stayed below zero for about two weeks. There is an abundance of labor.

Cincinnati Market on Firmer Ground

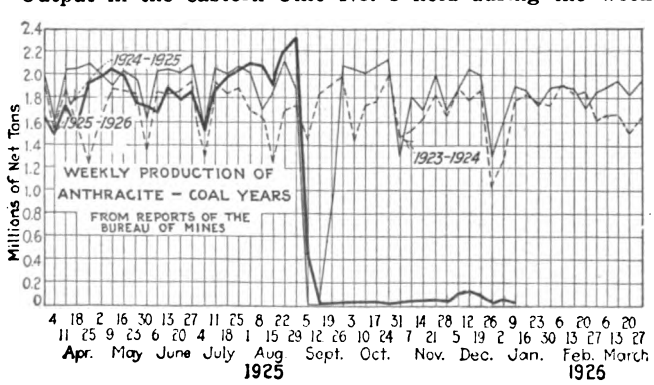
The Cincinnati market struck a much firmer footing during the past week than had been its lot for a month or more. There was no tremendous advance in prices, but the tone of solidity was marked. Colder weather was the prime cause, aided by the breaking off of negotiations between the anthracite operators and the unionists—which has been a cause of timidity in certain quarters.

The cold weather showed that retailers were not as well supplied with coal for immediate delivery as was imagined. This reduced accumulations in secondary reservoirs, between here and the west and between here and Detroit, which allowed new loads to move in. Smokeless felt immediate effect, with lump moving up to a $4 basis. Demand from the East with prices around $5 for stove and egg has caused shippers to keep only contractual tonnage moving West—most of this set around $4.25. Mine-run stiffened to $2.50, but screenings went lagging, some dipping down to $1.50 and a range of $1.75 on spot.

In the high-volatile lines there was a more even swing to demand, southeastern Kentucky tonnage again being held around $3 and up to $3.50 for the better grades. Egg was firm at $2.25 for the best and $2 for off grades with mine-run $1.40@$1.75. Slack and screenings ran 90c.@$1.25. West Virginia was hampered a bit when a large-tonnage producer announced that the price on lump had been reduced from $3 to $2.50, but the most of the other concerns named $2.75@$3. With the exception of screenings the range was pretty much that of Kentucky, and on these the lowest price was around $1.

Retail business profited by the cold snap, repeat orders coming in in healthy volume. River business was interfered with because of the cold, sleet and frost, few tows braving the weather.

Movement through the gateways of the Cincinnati district, as shown by the American Railway Association, showed interchange of 12,187 cars of coal, an increase of 3,026 compared to last week, and of 814 compared to the same week last year.



Owing to changeable weather the domestic trade at Columbus has been rather spotty during the last week, and prices at the mines remain unchanged. Retailers have normal stocks for the time of the year and are buying from hand to mouth. Householders are placing "second orders" and these are about half the size of the original orders. Smokeless and splints continue to be the favorite varieties and a good business is reported. A considerable tonnage of Kentucky block also is being sold. Retail prices are steady at former levels. There is practically no distress coal in domestic sizes on the market.

Dullness characterizes the steam business, utilities and steel plants being the best purchasers. Screenings broke considerably during the past week, especially those from the high-volatile fields. Prices were as low as 75c. a ton and high-grade screenings were sold at a sacrifice.

Output in the southern Ohio field is about 25 per cent of capacity. Some mines are in position to start operations should market conditions warrant.

Cold weather has done much to bolster up the eastern Ohio market, although prices have been soft on Ohio coals. West Virginia and eastern Kentucky coals for domestic use are strong, Pocahontas lump bringing $4.25 f.o.b. mine in Cleveland. Retailers have been moving considerable coal during the week for heating purposes and buying has been more active in the steam trade, although not in sufficient volume to create any stir.

Output in the eastern Ohio No. 8 field during the week ended Jan. 9 was 295,000 tons, or about 42 per cent of potential capacity. This was 78,000 tons over that of the preceding week—a five day week—but 12,000 tons under the corresponding week a year ago.

Hard to Move Output at Pittsburgh

Demand in the open market at Pittsburgh is hardly sufficient to support the rate of production, so that coal in general, apart from a few descriptions, is very hard to sell. Demand is slightly better for what is euphoniously called "nut" coal since the trouble two to three months ago with "egg" coal, which in many cases was too large. What is now called nut runs up to 2-in. and sometimes to 3-in. It has been bringing about $2.50 for the eastern market. Slack is rather a drug on the market and prices have softened a trifle farther. Steam slack in the Pittsburgh district is $1.30@$1.40, with the lower figure predominating, while gas slack, recently quotable at $1.50@$1.60, is now not over $1.50.

The straight bituminous trade at Buffalo is as flat as ever. A few members of the trade, wholesalers or operators, especially if they have some fair contracts, are doing fairly well, but the average shipper continues to complain. There still is some scarcity of slack, but prices remain about as before, with gas lump fairly strong.

Hard-Coal Impasse Spurs New England Trade

The breakdown in anthracite negotiations has already given the New England market for steam coal a slight impetus. Run-of-mine has not been much affected, but prices are firmer for screened sizes of all the grades considered likely substitutes. Smokeless egg and stove have mounted within a few days from $4 to nearly $6 per net ton at the mine, and several shippers are sold ahead to such an extent that they are declining business for the present. Most of the increased demand is due to a temporary shortage of substitutes in the larger centers of population; it can hardly be attributed to any special situation in this territory, although here too both the wholesale and retail trade practically ceased purchasing the latter part of December, when it seemed certain that an anthracite adjustment would be reached early in January.

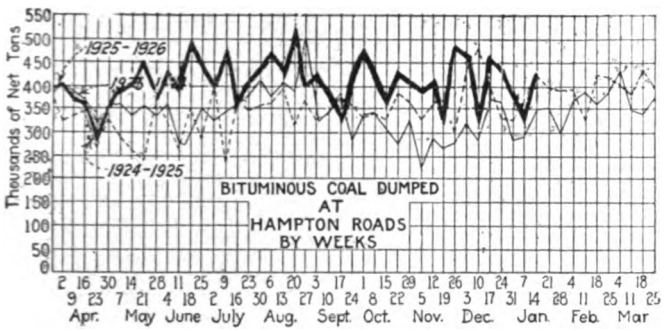
For the same reason a better inquiry for imported fuel has developed. Remembering experiences in 1902, when certain factors netted serious losses on foreign coal that was purchased too late in the season, there is a disposition to insist on early loading or no purchase. More than a few of the larger retailers are without substitutes other than coke and run-of-mine bituminous, and now that they are beginning to hear from that portion of the public who take second fills at about this time they realize how strong is the preference for some form of anthracite. For ovoids, whether from Rotterdam, Swansea or Rouen, there is fairly active demand.

At Hampton Roads the spot price level is not specially changed from a week ago. There are more orders, and it is quite possible that the enhanced price of prepared may permit shippers to build up the price of mine-run. Thus far $4.75@$5 represents the market range for No. 1 coal, with occasional sales up to $5.10. On cars, Boston, the $6.50 asking figure is firmer. An active inquiry comes from small retail dealers in more remote places who have overstayed in the hope that anthracite mining would be resumed.

Demand Climbs in Atlantic Coast Markets

Demand and quotations for soft coal at New York reached the high point for nearly a year following the ending of the hard-coal wage negotiations. As soon as the announcement was made there was a flurry in demand and quotations for most grades advanced 10c. to 25c.

Low volatile mine-run coals are in most demand; a large tonnage going into apartment houses and office buildings. Screened coals apparently are not in favor.



Smokeless egg coal is quoted at $5@$5.25 and nut at $5.25@$5.50. Broad Top prepared coals are quoted at $6.90@$8.

There is a better demand for high-volatile domestic coals with prices ranging from $2.75 to $3.20.

It was expected late in the week that early this week a couple of cargoes of British and German coal and coke would arrive in this harbor.

At Philadelphia following the cessation of hard-coal wage negotiations there was a quick response in the soft-coal market. The coke market sold up so quickly that the anthra-

Digitized by Google

cite retailers fell back upon bituminous coal to help out. Houses handling sized Pennsylvania coals were soon sold up, with lumpy mine-run in next demand and close to being sold up at this time. There has been a gradually increased use of soft coal by the anthracite domestic trade, which is learning how to use it, and to like it.

Stirred by present conditions the general trade is coming into the market, causing a general increase in spot prices.

There has been a marked increase of New River and Pocahontas fuels to this territory recently and some houses are sold up for several weeks on the sized coals. Nut, which could be had for $4.75 a few days ago, is now commanding $6, with every likelihood that it will go higher. Demand for Fairmont sized gas coals also has gained rapidly and the same is true of the high-volatile Pennsylvania coals.

Following a sharp let-down of shipments to Baltimore territory and a shortage in the harbor during the holidays, the movement has regained full headway and prices show no distinct change from recent levels. Best grade steam coals are $2@$2.35 and there is no trouble in placing orders in almost any direction. Because of their use as a substitute for anthracite—and this use is increasing as the supplies of anthracite in cellars diminish—prepared sizes continue firm. Any real activity, as a matter of fact, is confined to these sizes. The effect of cheap European coal, especially German reparation coals released through France, is more and more apparent in the export trade. Thus far this month there has been but one shipment of coal to leave this port on foreign consignment, and that of 10,518 tons cargo to Cuba.

In Birmingham buying of commercial coal, while not specially active, is in satisfactory volume, inquiry and bookings improving some as the year advances and consumers' stocks dwindle. High quality washed coals continue most active, with a large tonnage of coking grades in demand from the ovens. Contract coal is moving well, the railroads taking about the maximum quotas. Bunker demand has eased off some, but inquiries continue to come in for extra requirements.

The weather has been more propitious for the domestic trade than last year and the mines have a steady run of orders, especially for high-grade product. Lower and medium grades, while not as active, are not sluggish, and there is no surplus of even the lower qualities. Dealers are buying in limited quantities and orders are for prompt movement.

Quotations for all grades are firm with prospects of buying being sufficient to maintain stability for some time.

The coke market has stiffened somewhat, with better inquiry and larger bookings for points in the Northwest following the advent of cooler weather. Prices have not shown any change in the last week, spot foundry grades being quoted $6@$6.50 per ton; egg, $5.25; nut, $4.75@$5 per ton ovens. Gas coke is in slack demand at $5.50@$6.

Scramble for Hard-Coal Substitutes

At New York a lively spurt in substitutes, but chiefly affecting coke, followed the discontinuance of anthracite wage conferences last week. The announcement had scarcely been made before orders began to reach the wholesale offices and in some cases were received in such volume that further orders had to be refused if delivery time was limited.

Coke prices advanced from about $10 for beehive product, f.o.b. ovens early in the week to $13 on Thursday. The following day they had fallen back to $12.50 with most manufacturers sold up for the present. This is an advance of from $6 to $7 in a few weeks.

Anthracite users are ready to put in their usual supply of coal to tide them through the first three months of the year and not now being able to get hard coal are compelled to resort to coke or some other substitute.

There are a few cargoes of buckwheat No. 1 in the harbor that are being quoted at around $11.25 alongside. Some retail dealers have small tonnages of domestic coals on hand which in some instances are quoted at $28.50 per ton. Early last week a cargo of byproduct coke which was afloat in the harbor was quoted at $16.25.

When the wage conference broke up there was an immediate scramble in Philadelphia for all kinds of substitutes, but especially coke. Offers of coke which had been disdained in the morning at $8.75 a ton, were eagerly grasped at $1 and more higher late in the afternoon. The coke market continues to rise, $12 at the oven having been reached on beehive fuel. The prediction is freely made that the price will touch $15 in a week or ten days. Low temperature for several days has brought the public actively into the market for coal of any kind.

Baltimore's anthracite trade, that was, is merely biding time. Dealers, busy selling soft coal and other substitutes, realize that by the time the strike is settled much of the late winter market will have been absolutely lost.

At Buffalo the city house-coal consumer is fairly tranquil. He thinks that he has passed through the worst of it, or at least is on the way. He has tried most of the substitutes, smoked his house up with soft-coal lump and will have no more of it. He has used coke and likes it, though agreeing that it is too high and wants hard coal to come back, though if coke comes down he may stick to it. Coke is selling well and it at once became very scarce when the hard-coal peace conference broke up. There was some show of advancing the price, but as a rule it remains at $12 delivered at the curb. Since the collapse of hard-coal peace negotiations the market for smokeless has been restricted in this market. Splints and Kentucky block will soon be sold in larger quantities as a result.

Connellsville Coke Stiffens Sharply

A week ago Connellsville coke had been showing some hardening tendency, run of oven being $4.75@$5 and prepared coke or "yard crushed," $7@$8. It continued to stiffen gradually and when news of the anthracite impasse came the market went up very sharply, being now quotable at $7.50@$8.50 for run of oven and $10.50@$11 for yard crushed.

The bulk of the prepared coke of the region is made by the installation of crushing rollers on top of Covington conveyors, which are the regular equipment for machine-drawn ovens. A little regularly crushed and sized coke is made, which commands still higher prices. It seems that the bulk of the coke from hand-drawn ovens is going out on blast-furnace contracts, and such hand-drawn coke as may be left can be broken by sledges. The region will be able to prepare nearly all the coke it makes, beyond that required to fill contracts with blast furnaces and foundries.

Blast-furnace requirements are no longer a factor in the market situation as the furnaces are covered by contracts, chiefly through the quarter. Contract requirements probably run between 60,000 and 70,000 tons a week and the limit of possibility of merchant-oven production probably is 140,000 tons weekly or thereabouts.

Foundry coke is quotable only on differential, as there are no offerings. This would make it about $8.50@$9.50.

The *Courier* reports coke production in the Connellsville and lower Connellsville region in the week ended Jan. 9 at 110,800 tons by the furnace ovens, a decrease of 3,800 tons, and 118,980 tons by the merchant ovens, an increase of 12,580 tons, making a total of 229,780 tons, an increase of 8,780 tons.

Foreign Market And Export News

Trade Picks Up Slowly Following Holiday Lull In British Coal Market

In the British coal market business has been slowly resumed since the holidays. Fresh inquiry from the Continent is very limited, but there is an expanding demand from South America. Moderate inquiry proceeds from Italy and Spain, though buyers are slow in concluding business, in the hope of obtaining concessions. A tendency to price reaction was stayed by the two-day holiday loss of output, amounting to 300,000 tons. Best Admiralty large is irregular. Dry coals are meeting very little demand owing to the lull in anthracite. In Monmouthshires block vein large is a good spot. Supplies are well sold forward and prices are holding strong. For spot loading smalls are steady. Patent fuel is quieter but unchanged. Coke is slow for export but a good business passes inland.

The January inquiry at Newcastle-on-Tyne is quite good for all grades, but business is not being closed very quickly. Sellers are holding for full recent prices, and the indications point to them being at least maintained. The coke market is very steady, and the home trade is much more active than for some time past. Prices are nominally unchanged.

Production by British mines during the week ended Jan. 2, according to a special cable to *Coal Age*, totaled 4,050,000 gross tons, compared with a total output of 3,965,000 tons in the preceding week.

Slight Change in Situation At Hampton Roads

Last week business at Hampton Roads showed little change from the previous week, except that shipping was flowing through easier channels following a stormy period and the bunker trade was improving. Foreign business has been normal and coastwise trade holding its own.

Continuance of the anthracite strike was expected to bring higher prices, but no effect has been felt. Domestic coal has not advanced as yet, although there are rumors that the anthracite situation will provide the impetus for a boost in soft coal.

French Demand Strong for All Grades; Prices Advance

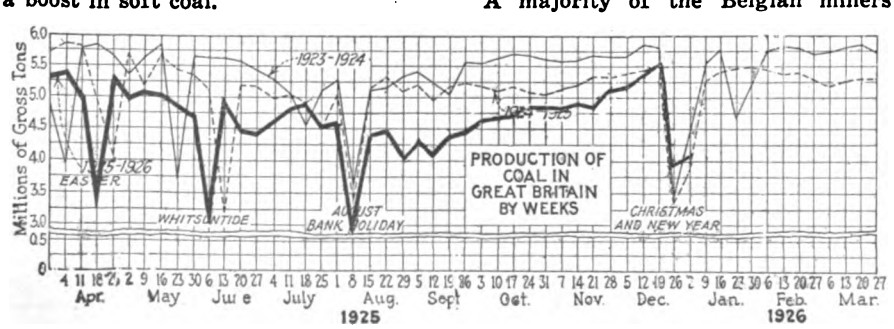
Demand in the French coal market was on the increase during the whole month of December both for industrial and domestic coals. This was due to the desire of French consumers to cover as much as possible of their requirements before the increase in prices expected on Jan. 1. The justification for this policy was revealed when the Nord and Pas-de-Calais collieries decided to raise their prices as from Jan. 1, 5 to 6 fr. per ton and the price of ovoids 15 fr. per ton. Many collieries, however strictly limited themselves to the delivery of tonnages due on contracts. As rolling stock has been scarce the collieries were sometimes put to the necessity of heaping up tonnages at the pit-head that were impatiently awaited by customers.

The prices of the Belgian domestic coals sold to France are 3 to 5 fr. per ton higher for January, due to the lower value of the French franc as compared with the Belgian.

Negotiations between the French authorities and the Kohlensyndikat are still in abeyance. Resort to arbitration is now being spoken of.

Canal freight rates are high, at 30 fr. Bethune-Paris.

During the first 27 days of December, the O. R. C. A. received from the Ruhr 201,785 tons of reparation coke.



Belgian Industrial Call Better; Domestic Demand Eases

Industrial coals in the Belgian coal market show some improvement for half-bituminous, quarter bituminous, steam-raising coals, as well as for coals used by central electric works.

In domestic coals, except for anthracitic sorts, activity has rather slackened; but this perhaps is due to an insufficient supply of rolling stock.

Briquets are rather weakly held, and so also are ovoids. The prices of both sorts of patent fuel are sustained, however, owing to the rise of pitch. When the present price of briquets, which varies from 95 to 105 fr., according to grade, was first quoted, the pitch was worth 240 fr. per ton, while it is now quoted at 330 fr. About 10 per cent of pitch is used in the manufacture of briquets.

A majority of the Belgian miners have voted against a general strike and it is believed that the miners will accept the operators' proposals of a reduction of wages and continue pourparlers to draw up a new agreement.

News Items From Field and Trade

ALABAMA

The new washery of the Black Diamond Coal Mining Co., at Adger, in the Blue Creek field, has been completed and placed in operation. This property was leased from the Tennessee Coal, Iron & Railroad Co., and the old Adger and Johns slopes, which had been idle for a number of years, are now producing a good daily output.

The Tennessee Coal Iron & Railroad Co., Birmingham, is about to begin construction of a $100,000 recreation park at Fairfield.

ILLINOIS

The two Bell & Zoller mines, at Zeigler, broke their record for a day's movement of freight-car loads of coal on Dec. 28, when 882 cars were moved out of Zeigler. The Illinois Central handled 447 cars, the Burlington 296 and the Missouri Pacific 79.

The Kathleen mine, at Dowell, has purchased a crusher to salvage clear coal from the inferior rock coal which heretofore has gone to waste. Thousands of tons of this inferior fuel are now piled near the mine. The clear coal salvaged will be marketed. The mine is now working steadily.

With 3,600 acres of land in Schuyler County, lying east of Rushville, under six and twelve months' option, the United States Fuel Co., of Pittsburgh, Pa., through its representative at Rushville, has given promise that work will begin at an early date in opening up prospects for strip coal mining. The company maintains offices at Danville. The company's representative has stated that they believe Schuyler County to be a rich field for this development and it is the intention of the company to ship seven large steam shovels to Schuyler County as soon as they can be removed from other fields. It is also said that the Soo railroad is making plans to secure leases upon coal lands lying north and east of Rushville. Other companies will try to lease land north of Rushville, lying west of the Burlington tracks.

INDIANA

Preliminary articles of dissolution for the Paxton Coal Co., of Sullivan, were filed recently with Secretary of State of Indiana. Will H. Hays, formerly of Sullivan, but now "czar" of the moving picture industry, was secretary of the company; Joseph Hill, of Chicago, was president, and Joe Akin, Sullivan, treasurer.

IOWA

An investigation which it is hoped will result in a clear-cut definition of the causes for discrimination against Iowa coal by consumers and the taking of steps for their eradication, has been begun by Governor Hammill's agricultural and industrial commission. A subcommittee composed of F. L. Maytag, of Newton; A. M. Huntington, of Cedar Rapids, and Morgan Lewis, of Albia, has been appointed to conduct the investigation and report to the committee at a meeting Jan. 30 at Ames. Coal operators, mine union leaders and state college experts appeared before the subcommittee in the first hearing at Ames Jan. 16, when it was reported that heating plants installed in a number of large Iowa industrial concerns are of Eastern manufacture and not scientifically adapted to use Iowa bituminous coal.

KANSAS

Leland Norris, of the Dunkirk Coal Co., one of the best known members of the younger generation of operators in the Pittsburg district, has taken on another activity as a diversion. Andrew Mitchell, one of his mine employees, having shown notable skill as a boxer, Mr. Norris has become his "Jack Kearns" and expects to promote him into fast company if he maintains the stride he has so far struck. Before becoming an operator in his own right Mr. Norris was for several years a field scout for the Crowe Coal Co.

The coal mine three miles south of LaCygne, in Linn County, in what is known as the Pleasanton field, which was formerly owned and operated by the Kansas Coal Co., has been purchased by interests headed by A. R. Rush, LaCygne banker, and operation resumed. The mine had been idle for more than a year.

Only one-fifth of the Kansas operators had made their report for the last quarter of 1925 to James Sherwood, state mine inspector, on Jan. 11 and he prepared to take steps to speed them up so he can compile the department's annual report.

The Western Coal & Mining Co. with its six Kansas mines had a total output larger than for the preceding year and smashed two production records. Its total output for 1925 was 902,347 tons, compared with 877,514 in 1924. It employed only 1,041 men in 1925 compared with 1,321 in the previous year. Developments now under way will add 400 to the number of employees for 1926. At mine No. 20 on June 30 the Kansas daily hoisting record was broken when 1,558 tons were brought to the top. This mine produced 304,210 tons of coal in 1925, which is more than ever before obtained from one Kansas mine in a year.

J. F. Klaner, Pittsburg coal operator, will leave Jan. 16 for Alaska to look after his fox ranch, which occupies an island of 14,000 acres.

Emile Turpin, operator of a coal mine near Scammon, and Miss Margaret Cassidy, also of Scammon, were married Dec. 12, but kept the event a secret until Jan. 11 and then made announcement of it.

The Bunker Hill Coal Co., capital stock $10,000, has been incorporated by W. W. Garrett, Arma, president; Joe Schaub, Arcadia, secretary and treasurer; Charles Harbort, Mulberry, and Frank Harris, Arcadia. The company plans to operate a steam shovel near Arcadia.

The Diamond Coal Co., capitalization $10,000, is to operate a steam shovel near Pittsburg. The incorporators are H. J. Feiden, president; R. D. Wilson, secretary and treasurer; William and Hilton Whetstone and J. R. Bennett, directors.

The executive board of District 14, United Mine Workers, has set Feb. 2 as the date for the run-off election on whether to retain headquarters in Pittsburg or move to Arma or Frontenac, both of which had offered inducements of a building to be used by the organization offices. Frontenac led in the election Dec. 29 but fell 393 votes short of a majority of all the ballots cast.

KENTUCKY

The Main Jellico Mountain Coal Co., of Williamsburg, is decreasing its capital from $500,000 to $50,000.

Louis A. Powell, manager at Louisville for the Malcolmson coal interests, is one of the incorporators of the new Crescent Hill Golf Club, which has arranged for a nine-hole course on property of the Louisville Water Co.

The Speaks Coal Co., Whitesburg, is making extensions to its plant and is installing new machinery.

The "Robert G. Ingersoll," one of the largest coal tow boats on the Ohio River has been equipped with a radio receiving set for use in receiving weather and radio reports of river stages, which are now broadcast from the Crosley W. L. W. station at Cincinnati. Heretofore it was necessary for river captains to land and get such information by telephone. With a

Digitized by Google

rapidly changing stage of water such information is very necessary.

Since the Kentucky Legislature started operations, on Jan. 6, Governor Fields has advocated certain tax changes, but some newspapers charge him with sidestepping a tonnage tax on coal, especially the *Courier Journal* and *Louisville Times*, which have been arguing for a coal tonnage tax for years. The *Herald* and *Post* are upholding the Governor, holding that a tonnage tax in Kentucky, which ships most of her coal into districts competing with untaxed coal, would work a hardship on the entire coal industry of the state.

Harry A. Brooking, mine agent and Southern sales manager for the King-Kentenia Coal Co., with headquarters at Harlan, has been retained in the taking over of the Kentenia's business by the Midland Coal Sales Co.

The New Duane Coal Co., on Lots Creek in the Hazard field, has been bought by C. L. Ryly, Lexington, who owns several mines in eastern Kentucky, including the Happy Coal Co., at Carr's Fork, and the No. Four Superior, at Lennut Lots Creek. The consideration was not made known. It also was reported that the Black Hawk Coal Co. at Carr's Fork had been sold. For some time these mines have been operated under a receivership, the Louisville Trust Co. having been named receiver.

The annual banquet of the Hazard Coal Operators' Exchange is to be held in Lexington, Feb. 24.

"Safety First" was the slogan at the recent organization of the Kentucky River Mining Institute at Hazard by 150 leading coal operators and those closely identified with the industry throughout the Elkhorn-Hazard field. Officers named were: President, George P. Fitz, of the Ajax Coal Co., Lott's Creek; vice-presidents, D. T. Mitchell, of the Ashless Coal Co., Lothair, and Henry Pfenning, of the Southeast Coal Co., Seco; treasurer, Richard Samuels, Jr., of the Imperial Elkhorn, Sergent. A secretary is to be appointed later. J. E. Johnson, president of the Hazard Coal Operators' Exchange, Lexington, presided over the meeting. Regular meetings will be held each month and will rotate from Hazard to Whitesburg.

NEW YORK

Grant B. McLaughlin, well-known Buffalo coal salesman, has been made a vice-president and general manager of the Factory Fuels Corp., which takes the place of Wesley P. Montgomery & Co. Mr. Montgomery has become resident manager of the North American Coal Corp., a consolidation of several Cleveland companies.

OHIO

The Redfield Coal Co., with an operation near Redfield, it is announced will resume operations following a lengthy suspension owing to lack of demand. The Redfield mine of the Harmeyford Coal Co. also is being prepared for operation in the near future.

The Columbus Ry., Light & Power Co. will furnish power to the Scioto Traction Co., under a contract just signed. The Scioto Valley power plant at Rees, south of Columbus will be closed. The Scioto company will build a switch from its line to the immense power plant located on Walnut Creek, Groveport. This switch together with the line running to the large power plant on the Scioto River, south of Columbus, under construction by the Columbus Ry., Light & Power Co., will connect the two large power plants of the company and permit of the transfer of coal from one plant to the other by the traction line. This will mean that the coal for the two plants, amounting to several hundreds of thousand tons yearly, will come to Columbus over the C. & O. and the Hocking Valley railroads. The N. & W. will be cut out of this large tonnage. The agreement will take effect as soon as the necessary lines can be built.

A notice has been issued for a meeting of stockholders of the Peerless Elkhorn Coal Co., at the office of the company, 150 East Broad St., Columbus, for the purpose of dissolving the corporation. This company, which was a subsidiary of Hatton, Brown & Co., Inc., has been absorbed by that concern and will pass out of existence. The concern controlled several mines in Kentucky. F. G. Hatton is president and George F. Schwartz secretary of the company.

The George M. Jones Co., of Toledo, owner of Webb Mine near Steubenville, which was closed following a fire in which nine miners lost their lives, has resumed operations. The fire was extinguished by the Ohio mining department.

An effort is being made by creditors and former members of the Southern Ohio Coal Exchange, which went into the hands of W. W. Metcalf as receiver more than a year ago, to compromise the claims and settle up the receivership. Suits to collect about $14,000 have been brought against the individual operators and operating companies to collect claims, on the assumption that since the exchange was not incorporated the liabilities are individual. Other claims to the amount of $37,000 have been made but no suits filed. There are about $10,000 in dues to be collected. In the meantime W. D. McKinney, secretary and manager of the exchange, is functioning in a way, collecting data on operations in the southern Ohio field and serving the operators in other ways.

Walter A. Jones, one of the ancillary receivers of the Wayne Coal Co., of Pittsburgh, denies the report that the offices of the company will be removed from Pittsburgh to Columbus. While that matter had been considered, no action was taken and for the time being at least, the offices in Pittsburgh will be maintained. The company has 16 stripping operations distributed in various Ohio fields, the largest number being in eastern Ohio. A large operation is located at New Lexington. All of the operations are being worked and no change in the policy of the company has been made under the receivers. Fred E. Butcher, a mining engineer of Danville, Ill., is a receiver with Mr. Jones.

More than 250 miners of the Paisley Coal Co. at Oca notified company officials, Jan. 14, that they would go on strike unless paid in cash instead of by check. The company adopted the check-paying system because of the risk of hold-ups. Officials said the system would be continued or the mine would be shut down. The miners assert that they lose a day's work going to nearby cities to have the checks cashed. A half dozen other companies, employing about 1,000 men, have served notice that hereafter the miners will be paid by check. The miners have called upon the United Mine Workers' district organization to protest.

The Indian Run Coal Co., of Charleston, W. Va., has opened a branch sales office in Cincinnati in the First National Bank Building, with James C. Layne, Jr., in charge. Mr. Layne formerly was manager of the coal department of Eaton Rhodes & Co. Later he opened his own office to market Man o' War Fuels, which business he will take along with him to his new position.

Coal companies and wholesalers of Cincinnati, Kentucky and West Virginia are again prominently represented on the Cincinnati Chamber of Commerce with the re-election of George Kearns of the Kearns Coal Co. as secretary for another term.

The annual meeting and banquet of the Cincinnati Coal Exchange will be held at the Business Men's Club Feb. 2. At a meeting of the directors the following committee appointments were made: Employment, E. C. Harper (chairman), W. I. Donnelly, E. Fitzgerald and John Emslie; Entertainment, J. B. Ratterman (chairman), R. A. Dickson, Elmer Weirhake and Dan Pritchard; Membership, John F. Glaser (chairman), Fred Heitzman, John A. Emslie, Ernie Howe and Fred Legg; Publicity, R. A. Colter (chairman), Joe Tuohy, James A. Reilly and R. P. Gillham; Trade Rules, C. R. Moriarity (chairman), D. E. Elland, Thomas R. Morgan, T. H. Richardson and W. P. Slaughter; Transportation, W. J. Magee (chairman), John Callahan, T. T. Wright, John Metcalf and Ernie Howe.

C. A. Cabell has been elected president of the Carbon Fuel Co., succeeding John Thomas, who died last December. Mr. Cabell resides in Charleston and divides his time between there and Carbon, W. Va. At present he is sojourning in Florida. W. J. Magee, vice-president in charge of sales, recently returned from a hunting trip in northern Mississippi.

PENNSYLVANIA

The Oliver & Snyder Steel Co. has officially announced some changes in the operating personnel of the Oliver coal and coke plants in Fayette County, the changes already having been made effective. John H. Lane now is general superintendent in complete charge of Oliver Nos. 1, 2 and 3 mines and coke works at Oliver, Redstone Junction and Thaw. Charles H. Hinsey is chief mining engineer and assistant general superintendent of Oliver Nos. 1, 2 and

Digitized by Google

Mining Town of Slab Fork, West Virginia

This picture, showing the well-kept homes of the miners employed by the Slab Fork Coal Co., and the company building at the left, was taken from the Virginian Ry. bridge. The Virginian serves this territory.

3 mines. J. F. Delehunt is superintendent of No. 3 mine and coke works. Clyde G. Brehm is chief electrician and assistant to the general superintendent. Thomas W. Keighley is superintendent of the Nos. 1 and 2 mines and coke works.

J. F. Joy, formerly president of the Joy Machine Co., manufacturer of the Joy loading machine, has gone to Russia as an efficiency engineer for the Russian Soviet Government. He expects to remain for several years. Mr. Joy's home was in Pittsburgh for some years.

P. J. Walsh, until recently general superintendent of the Consolidated Coke Co., is now general superintendent of the G. Corrado coal interests with headquarters at Connellsville.

C. E. Cowan, of Greensburg, chief engineer of the Jamison Coal & Coke Co. and consulting engineer of the Lincoln Gas Co., has been appointed consulting engineer for the Snowdon Coke Co. also.

The Weirton Steel Co., as part of its $15,000,000 improvement program at the plant at Weirton, W. Va., has awarded a $2,250,000 contract to the Koppers Co., of Pittsburgh, for the construction of a battery of 49 byproduct coke ovens. These ovens, added to the battery of 37 now in use at the plant, will give the steel company a total of 86 ovens. Construction of the new battery, which will be of the Becker type, will start immediately and be completed in about eight months. When the full 86 ovens are in operation the company will produce approximately 1,700 tons of furnace coke per day from 2,500 tons of coal. The new battery of ovens will include apparatus for the recovery of byproducts.

Negotiations have been concluded whereby Guy Corrado, Connellsville coal operator, takes over 1,200 shares of stock in the Indian Creek Valley Ry. held by the estate of the late Charles F. Hood of Connellsville. The balance of the 1,400 shares is owned by the Baltimore & Ohio R.R. The railroad, which consists of 21 miles of main trackage, connecting with the Baltimore & Ohio at Indian Creek, terminating at Jones Mills, taps a coal field of more than 50,000 acres of Somerset coal with 18 working mines and maximum daily tonnage of 885 cars.

John Crawford, of Pt. Marion, has resigned as superintendent of the Poland mines of the Poland Coal Co., of Pittsburgh. His successor has not yet been appointed.

S. C. Reynolds of Houston, Pa., made an address on modern mining methods at the quarterly meeting of the Pittsburgh Coal Mining Institute Jan. 16, in the auditorium of the Chamber of Commerce. Other addresses on mining problems were given. A question box, conducted by W. L. McCoy, was a feature.

UTAH

H. H. Calvin, for several years general sales manager and later special agent for the United States Fuel Co., Salt Lake City, and son of Vice-President Calvin of the Union Pacific R.R., is now head of a stationery and office supply company in Los Angeles.

VIRGINIA

December coal production in Virginia reached the highest point so far attained in the history of the field. Output for the calendar year will approximate 12,500,000 tons, which is about 1,000,000 tons more than was produced in any previous year.

WEST VIRGINIA

The Bethlehem Mines Corp. held a safety meeting in Barrackville Jan. 14, when William McCoy, of Pittsburgh, Pa., chief inspector of the Bertha-Consumers Co., spoke on safety. The films "Play Safe," "An American in the Making" and "Our National Parks" were shown.

A school of instruction of the Clarksburg District Mining Institute began to study the West Virginia state mining laws at its session Jan. 12 in the Traction Building, Clarksburg, under the direction of Charles Bashere, general superintendent of the Cambria Coal Co. The class will continue its study of the mining laws at future sessions of the class.

J. W. McCarthy, who was arrested in Pasadena, Cal., on Jan. 8 after forfeiting his bond in the federal court for the southern district of West Virginia on a charge of using the mails to defraud, has been indicted by the Kanawha County Grand Jury on a charge of obtaining by fraud nine cars of coal from the Coal State Coal Co. The mail fraud transactions charged against McCarthy had to do with his activities as a coal broker.

The sixteenth annual banquet given to its employees by the United States Coal & Coke Co. was held at Gary Jan. 16 with 235 present. Officials expressed gratification over the excellent record made at the company's mines in 1925, when 6,262,884 tons of coal was produced with only 15 fatalities. Mine No. 6 has produced over five million tons since the last man was killed. The Gary operations had an output of 1,500,000 tons per fatality and Lynch produced 1,400,000 tons for each death in the last six months.

A series of changes in the state mining districts of West Virginia went into effect Jan. 15. District No. 6 constitutes a new district, extending from Dakota to Morgantown, with Thomas Jarrett, of Weston, in charge. C. D. M. Kramer, of Clarksburg, goes to Weston. William Moore, of Morgantown, has been transferred to District No. 25, composed of parts of Boone, Kanawha and Logan counties, and V. E. Sullivan of Charleston, goes to Morgantown. W. B. Riggleman remains in the Fairmont district. The Clarksburg district has been renumbered and will be known in the future as No. 4 instead of No. 3. Other new assignments are as follows: First, C. W. Stuart, inspector, Thomas; Second, W. H. Sandridge, inspector, Grafton; Fourth, Evan L. Griffiths, inspector, Clarksburg; Seventh, V. E. Sullivan, inspector, Morgantown; Eighth, A. E. Lafferty, inspector, Moundsville,

The Blue Ridge Coal Corp., of Charleston, has been granted permission to increase its capital stock from $200,000 to $300,000 and similar permission has been granted to the Export Coal Co., of Charleston, for an increase in capital stock from $150,000 to $250,000.

CANADA

Sir Henry Thornton, president of the Canadian National Rys., has advised Premier E. N. Rhodes of Nova Scotia that the railway would take approximately 120,000 tons of banked coal in an endeavor to relieve the unemployment situation in the Cape Breton mining district. He stated that the usual requirements of the systems were from 500,000 to 700,000 tons of coal and though it was distinctly against the company's interests it was prepared to take 20 per cent of this amount in banked coal if it would relieve the distress.

Premier Brownlee, of Alberta, held

Digitized by Google

a conference Jan. 7 with Premier Ferguson of Ontario respecting the bringing in of coal from the Alberta mines. He was assured by Mr. Ferguson that as soon as the Alberta government was able to obtain from the federal government a special reference of Alberta coal rates to the Dominion Railway Commission the Ontario government would co-operate with Alberta in a joint representation of the case. During his visit to Toronto Premier Brownlee held several conferences with representatives of public bodies and commercial organizations and found them all desirous of obtaining coal from Alberta provided special freight rates could be obtained.

Traffic

Ohio-Inner Crescent Rates to Indiana Not Unreasonable

Examiner Burton Fuller of the Interstate Commerce Commission has recommended dismissal of Docket 16138, Indiana State Chamber of Commerce vs. Ann Arbor R.R. et al. The complainants alleged that the rates on bituminous coal to all points in Indiana from coal mining districts in Ohio and from the Inner Crescent region were unreasonable and unduly prejudicial to complainant's members and localities and the traffic thereto and unduly preferential of their competitors.

The examiner, after a lengthy recital of the evidence submitted, is of the opinion that the freight rates on coal complained of are not responsible for the depressed condition of the mining industry in Indiana and recommends that the commission should find that the rates assailed are not unreasonable or unduly prejudicial, and the complaint should be dismissed.

Penna. P. S. C. Asks to Intervene In Lake Cargo Rate Case

The Pennsylvania Public Service Commission announced on Jan. 9 that it had petitioned the Interstate Commerce Commission for the right to intervene in the lake cargo coal rate case. Intervention is sought in the case of the Pittsburgh Coal Producers' Association and others against the Ashland Coal & Iron Co. and others.

The Pennsylvania Commission asks that the case be reopened for re-argument and reconsideration. The petition sets forth that the rates allowed on bituminous coal shipments from Pittsburgh to the lake ports are unjust, unreasonable and unduly discriminatory, unduly and unreasonably preferential and prejudicial and in violation of the Interstate Commerce law. Twenty-nine of the facts used in the I.C.C. report are picked out for consideration by the petitioner as the basis for its appeal.

Rates on coal from points in Illinois to points in Nebraska and Kansas are alleged to be unreasonable in a complaint filed Jan. 11, with the Interstate Commerce Commission in the case of the Illinois Coal Traffic Association, of Chicago, vs. the Arkansas Valley Interurban Railroad Co.

Industrial Notes

E. M. Staehle, formerly in charge of industrial advertising for the Westinghouse Electric & Manufacturing Co., East Pittsburgh, Pa., has resigned to become eastern representative of the Keystone Mining Catalogs. Mr. Staehle, who succeeds Edward B. Day, will have his headquarters at the offices of the McGraw-Hill Co., Tenth Ave. at Thirty-Sixth St., New York, which recently acquired the Keystone catalogs and directories.

C. V. Root recently joined the **Electric Service Supplies Co.,** Chicago. He is to cover the Chicago territory in the interests of floodlighting. **G. R. Scott** will cover the states of Minnesota, North and South Dakota, Iowa and eastern Nebraska. **Chas. J. Brickley** will cover the State of Wisconsin and upper Michigan. **L. S. Belding** will cover Ohio and part of Michigan. **J. F. Carper** has joined the Steam Railroad Department of the company.

The Simplex Wire & Cable Co., of Boston, Mass., has opened a branch office in the Union Trust Building, Euclid Ave. at East Ninth St., Cleveland, Ohio. Wm. H. LaMond will be manager of the new office.

The Aldrich Pump Co. of Allentown, Pa., has purchased the entire line of centrifugal pumps manufactured by the **Earl Gear & Machine Co.** of Philadelphia, Pa., adding it to the Aldrich line of reciprocating power pumps.

Obituary

Frederick Parker Wright, general manager of the Crescent Coal Co., of Bevier and Nashville, who was 75 years of age, died at Bevier, Ky., Jan. 10. Born in Massachusetts, he was taken to Chile in his childhood, staying there until the Civil War, when he returned to the United States and later served as an officer in the Union Army. His early work included a part in the building of the New York water works system and coast defenses on Long Island. He was vice-president of the West Kentucky Coal Operators Association and the West Kentucky Coal Bureau. He is survived by his wife, Mrs. Lillian Massey Wright, and one son, Douglas M. Wright, the latter of Nashville.

James Duncan, 65, moving spirit and for the last four years active head of the Mt. Olive & Staunton Coal Co., St. Louis, which is controlled by New York capital, died in New York City Jan. 9. He also was president of the Alton & Eastern R.R., Litchfield & Madison R.R., Duncan Foundry & Machine Works and the Illinois Stoker Co., as well as a director in many other railroad, manufacturing, mining, oil and banking corporations and he was interested in many concerns both in Illinois and in Oklahoma.

Charles Bailey Odle, 75, the oldest coal salesman in the St. Louis territory, died at his home in St. Louis, Mo., Jan. 9. He had been selling coal for 43 years and his territory extended all the way from Texas, Louisiana and Mississippi to the Canadian border, having traveled the South when Illinois coal was his principal fuel. For the past twenty years he had been associated with the Southern Coal, Coke & Mining Co. and was active in calling on his trade in Illinois and Missouri until four weeks ago, when he became ill. He formerly was associated with the Consolidated Coal Co. of St. Louis for many years.

Delavan C. Shoemaker, 43, president of the Shoemaker Coal Co., Chicago, died in that city Jan. 6. After leaving high school he spent two years in railroading and three years in the steel industry, taking up traffic work in 1908 with the City Fuel Co., which later became the Consumers Co., remaining with that company until 1920, when he became vice-president of the Republic Coal & Coke Co. Shortly thereafter he organized the D. C. Shoemaker Coal Co., of which he remained president until his death. He was one of the organizers and was first president of the Chicago Wholesale Coal Shippers' Association.

Alexander Reid, Jr., 41 years old, one of the principal owners of the R. & C. Coal Co., of Mineral, Kan., died in Pittsburg hospital the night of Jan. 9, after four transfusions of blood, supplied by relatives, failed to stem the ebbing tide of life following an operation several days earlier. A brother, John Reid, furnished a quart of blood for the last transfusion that was made. Mr. Reid was engaged in the coal industry in Cherokee County from his youth.

John Lindblom, 58 years old, one of the owners of the Purity Coal Co., Des Moines, died Jan. 10 at his home in that city, following a stroke of apoplexy. He was born in Sweden, came to America in 1886 and settled in Des Moines in 1890. He became interested in the Maple Block High Bridge mines with A. W. Carlson. He also was a partner with Oscar L. Olson in the Purity Coal Co. He is survived by his wife.

Association Activities

The annual meeting of the **Indiana Coal Producers Association** was held in Indianapolis Jan. 12, in the offices of the Patoka Coal Co., Michael Scollard, the association secretary, reported that the past year was the most successful in its history. All branches of its work have been maintained in a condition of healthy activity. The personnel of the officers remains unchanged: Fred S. McConnell, president; Hugh B. Lee, vice-president; Michael Scollard, secretary; R. H. Sherwood, J. T. Moorman and Wick Dixon, executive board. The organization's office is at Terre Haute.

New Companies

The Sandlick Coal Co. with a capital of $140,000 has been incorporated at Whitesburg, Ky., by P. F. Gorman and James P. Lewis.

The Brown Coal Co., Pittsburg, Kan., has been incorporated by Louis M. Brown, Homer Brown, I. N. Brown, Miss Mabel Brown and Mrs. L. A. Kooney, all of Pittsburg, to operate a deep mine near that city. The capitalization is not announced.

The Wilson Noland Coal Co., Russellville, Ark., with a capital of $15,000, has been incorporated by Albert L. Wilson, president; J. L. Noldan, vice-president, and Reece A. Caudle, secretary-treasurer.

The Trio Coal Co. has been incorporated in Madisonville, Ky., with a capital of $30,000, by E. B. Hamblett, Tom Logan and others, and has acquired the property of the Finley Coal Co., the daily output of which will be increased from six to twenty-five cars.

The Morrisonebo Coal Co., Madisonville, Ky., has been incorporated by J. N. Stinehour, W. T. Spilman and G. C. Beckwith.

Coming Meetings

Hazard Coal Operators' Exchange. Annual meeting Jan. 22, at Lexington, Ky. Secretary, J. E. Johnson, Lexington, Ky.

American Wood Preservers' Association. Annual meeting, Jan. 26-28, 1926, at Cleveland, Ohio. Secretary, E. J. Stocking, Chicago, Ill.

Midwest Power Conference Jan. 26-29, at Furniture Club of America Rooms, 666 Lake Shore Drive, Chicago, Ill. Secretary, G. E. Pfisterer, 53 West Jackson Boulevard, Chicago, Ill.

Coal Club of Philadelphia. Annual meeting, Jan. 28, 1926, at the Bellevue-Stratford Hotel, Philadelphia, Pa. Secretary, C. K. Scull, Philadelphia, Pa.

Northeast Kentucky Coal Association. Annual meeting, Jan. 28, 1926, at Ventura Hotel, Ashland, Ky. Secretary, C. J. Neekamp, Ashland, Ky.

American Institute of Electrical Engineers. Annual convention, Feb. 8-12, 1926, at Engineering Societies Bldg., New York City. Secretary, F. L. Hutchinson, 29 West 39th St., New York City.

American Institute of Mining and Metallurgical Engineers. Annual meeting, Feb. 15-17, 1926, at Engineering Societies' Building, New York City. Secretary, Dr. H. Foster Bain, 29 West 39th St., New York.

The Rocky Mountain Mining Institute. Winter meeting, Feb. 23-25, 1926, at Albany Hotel, Denver, Colo. Secretary, Benedict Shubart, Boston Building, Denver, Colo.

New England Coal Dealers' Association. Annual meeting at the State Armory, Worcester, Mass, April 7 and 8. Secretary, E. I. Clark, 141 Milk St., Boston, Mass.

COMPLETE LUBRICATION SERVICE

The VACUUM OIL COMPANY'S STANDARDS *include:*

EXPERIENCE:

1. Fifty-nine years of specialization in manufacture of high grade lubricating oils.
2. Seventeen producing plants.
3. More than 200,000 visits a year to industrial plants.
4. The most complete compendium of lubrication information in the world.
5. A field force of 400 men equipped to advise industry.

Countless

There are almost countless types of machines and engines operating in industry today. We have had practical experience with the lubrication requirements of each type. We offer you a complete lubrication service based on knowledge of all industrial machinery and all operating conditions.

"Everybody talks about the weather—but nobody does anything about it!"

MARK TWAIN'S criticism might at one time have been truthfully applied to the Coal industry—but no longer. Thought and talk and discussion are producing sound, conservative plans, destined to bring about profitable operation through lower production costs.

Coal Age, in a recent editorial, discussed this problem as it concerns transportation. "No niggardliness is more expensive than to use cars smaller than roof conditions make necessary...many mines are still struggling along with equipment that was modern a quarter century ago...a modern car reduces gathering charges, gives the miner a better opportunity for loading, and lowers main-haulage costs."

Many operators have reached this same conclusion and have corrected conditions by ordering Hockensmith cars, specially designed to meet the requirements of their specific installations. A word from you will bring our representative, who will tell you of how Hockensmith cars will fit into your economy plans—and help to carry them out.

This maximum capacity composite type car for use in cross over dumps, was designed and constructed for a large Western Pennsylvania Mine.

Coal by Flume

IN NEW ZEALAND they are setting the world a pace in the transportation of coal by flume through hilly country. The Westport Stockton Coal Co., Ltd. has built such an "airline" five and three quarters miles long from a mine to the railroad where the coal is sized and shipped while the water, originally drawn from a conservation reservoir in the hills, is allowed to flow into the river which is its natural outlet to the Pacific. The story of the enterprise is in next week's *Coal Age*.

THE FLUME, a wooden trough lined with cast-iron sheets, traverses deep gullies on high trestles and bores through four tunnels. Its construction was a job fraught with many difficulties and entailed a good deal of expense. But the saving in the cost of hauling the output of the mine down through the rough country to the railroad is great. About 150 tons of coal per hour can be moved at a speed of 8 or 10 m.p.h. There are places in this country, notably in the anthracite fields, where fluming of coal has been talked of but never practiced. The New Zealand installation may inspire Americans to action.

DOWN IN ALABAMA during the past year there have been some notable improvements in coal mining plants. Some companies have been spending money in order to save it. The DeBardeleben Coal Co. is one of these. A description of what it has done at its Empire Mine will appear in next week's issue. Prof. H. S. Newins, of Pennsylvania State College, tells *Coal Age* readers some interesting things about how coal companies are growing at least a part of the 2½ million cords of wood they use annually.

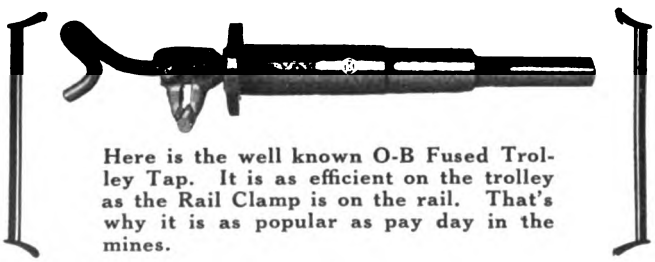
A Clamp for the Return Circuit, too!



HOW are your contacts on return circuits? Are your ground power lines for portable equipment as good as the trolley side? They should be on a fifty-fifty basis, in fact.

The new O-B Rail Clamp has been developed to meet this need. It makes an efficient connection. It is out of the way of dragging equipment. It is on tight or taken off in a jiffy—with a turn of the handle.

It will make your return and trolley connections equally good.

A post card will bring the details—write it today.

OHIO BRASS COMPANY, Mansfield, Ohio
Dominion Insulator & Mfg. Co., Limited,
Niagara Falls, Canada

Here is the well known O-B Fused Trolley Tap. It is as efficient on the trolley as the Rail Clamp is on the rail. That's why it is as popular as pay day in the mines.

Back to Generated Power

PARTICULARLY in those regions where water for power plant operation can be obtained only with difficulty, the purchase of energy for coal mine operation became popular some years ago. Most mines in fields where the operations are fairly close together are today thus energized. Southern Illinois and southern West Virginia exhibit excellent examples of this practice.

No one has any quarrel with the electric transmission of power—it represents the easiest, cheapest, most convenient and most flexible method of conveying energy from one place to another that is known today. The cost of purchased current however varies not only with the total volume of current consumed in any pre-agreed interval of time such as a month or half month but also with the maximum demand or peak load imposed by the mine on the power system. Roughly the price paid per unit of current varies inversely with the volume and directly with the peak.

Many mines produce, besides their marketable product, a grade of coal that is either entirely unmarketable or whose production cost is higher than their marketable value. Improved stokers and the perfection of furnaces adapted to the utilization of powdered coal renders these fuels readily available for use at the mines, where no freight has to be paid on the inert content of the fuel and where, in most cases, the problem of ash disposal is not particularly difficult or costly. Several coal mine plants are now utilizing powdered mine refuse with excellent results.

Again, failure of power supply at a coal mine is always an expensive and sometimes a dangerous contingency. To guard against the ill effects of such failures many mines have found it necessary to install auxiliary or standby units, usually consisting of an internal combustion engine and generator. Such machines can be started promptly and will generate enough power to operate the fan and in most cases the man hoist, either or both at reduced speed. Handy as these mahcines have proved, however, they nevertheless raise the f.o.b. cost of the mine product.

Taking into account, therefore, the increasing power requirements of the present-day mine, the possibility of utilizing low-grade fuels, and the greater efficiency of modern steam generating and steam consuming equipment it is not surprising to find that some mines are forsaking the use of purchased current and are building modern power plants of their own. This practice is gaining its chief headway where several mines in fairly close proximity to each other are owned and operated by one company. In most cases the inter-mine transmission lines and other equipment already installed can be utilized without change other than connection to the new source of power.

The purchase of energy from an outside source has taught the mine managements to avoid excessive peak loads, as these show up adversely on the monthly power bills. This lesson in economy should not be forgotten when the power used is generated in the company's own plant.

A Public Bond

ANTHRACITE WAGE PARLEYS, twice ended in hopeless deadlock, were resumed at Philadelphia this week at the request of the miners. It would be heartening to believe that that request presages a recession from the stubborn attitude which wrecked the two preceding joint conferences. The circumstances surrounding the conference which broke up Jan. 12, however, are against such a belief. That conference, too, was called at the request of the union. But the weary days of bickering which followed revealed Mr. Lewis and his associates as unyielding as ever in their granitic opposition to the only workable plan for permanent peace proposed.

In the recent conference, the miners put forward the discredited Pinchot program unalterably rejected by the operators weeks before negotiations were resumed. In this new conference, the union spokesmen press for consideration of the Lynett plan. That plan, too, has been placed in the discard by the employers' committee, but that fact will not deter Mr. Lewis and his associates. Indeed, it was intimated before the Philadelphia sessions got under way, that the miners had nothing else to present. If that be so and if the United Mine Workers is still as unwilling to concede anything to the public demand for permanent peace, this third conference might just as well not have been called.

The Lynett plan is not without its admirable features—salvaged from earlier schemes which failed to win acceptance. It offers an immediate resumption of mining. Both the public and the operators want this. It offers a five-year contract. There is much to be said in favor of a long-term agreement. The inflexibility of wages which the plan seems to provide after the second year, however, may well cause the operators to pause. The coal industry has had the lessons of a contract which takes no heed of changing economic conditions unrolled before its eyes in the plight of the bituminous operators breaking under the Jacksonville compact.

But, even were the anthracite producers ready to escape present losses by gambling on the future, there still remains a fatal defect in the proposals outlined by Mr. Lynett. That defect is the failure to give any guarantee for permanent peace. True, Mr. Lynett has suggested that a study be made, but the recommendations growing out of that study are binding upon neither party to the contract. In the light of the history of anthracite wage negotiations since 1920, the public is in no mood to accept promises that something may be done in the uncertain future to prevent suspensions of

Digitized by Google

production. The public wants a definite assurance of an uninterrupted supply of coal. Arbitration when direct negotiations fail is the only way yet suggested by the wisdom of man which will give that assurance.

There are public rights in the present controversy which neither operator nor miner may dismiss without inviting disaster. Both sides have appealed persistently for public support and sympathy. In effect, if not in words, the anthracite operators have asked the public to put up with the discomforts and the inconveniences of the strike as the price the public should pay to outlaw future strikes. The public is carrying out its part of the bargain in good faith and, for the most part, with good humor. The operators can afford to do no less.

Studies of Lung Diseases and the Coal Miner

IN R. R. SAYER'S new bulletin on "Silicosis Among Miners" the coal mining fraternity will find only sources of congratulation. The coal miner seems not only not to be subject to the disease but also to acquire a modified immunity from it. "Men," says Dr. Sayers, "who have worked in certain coal mines for several years seem to be less susceptible to silicosis than the average man. According to some investigators, animal experiments indicate that coal dust has this effect."

The use of the word "certain" seems, however, to be more than the scientist's habitual caution. A tabulation shows that in Colorado, Indiana and Missouri the average coal miner is less susceptible to tuberculosis, so called, than the general population and still less so than metal miners. In Illinois the average coal miner is shown to be a trifle more subject than the general public to tuberculosis, but the difference is so slight that it may prove nothing. However, in the northern part of Illinois is a number of mines where much brushing is done because the coal is thin, and perhaps—this is merely supposition—this may explain why Illinois rates are being less favorable than those of the other states named. But Missouri is also a thin-coal state with much rock brushing and bottom lifting, so here again a question arises. What gives the Missouri coal miner his low tuberculosis rate? Perhaps the nature of rock brushed or lifted.

Influenza is less rife among coal miners than among the general public in Colorado and Illinois. In Indiana and in Missouri, a state with low coal and much brushing, this disease is far more prevalent, the ratio in Missouri being roughly two to one and in Indiana seven to four. Pneumonia among coal miners in all four states is less prevalent than among the general public. Where much rock work has to be done and much free silica is in the rock, and especially where the work is done by machine drills, the coal miner doing the same kind of work as the metal miner is subject in that measure to his risks.

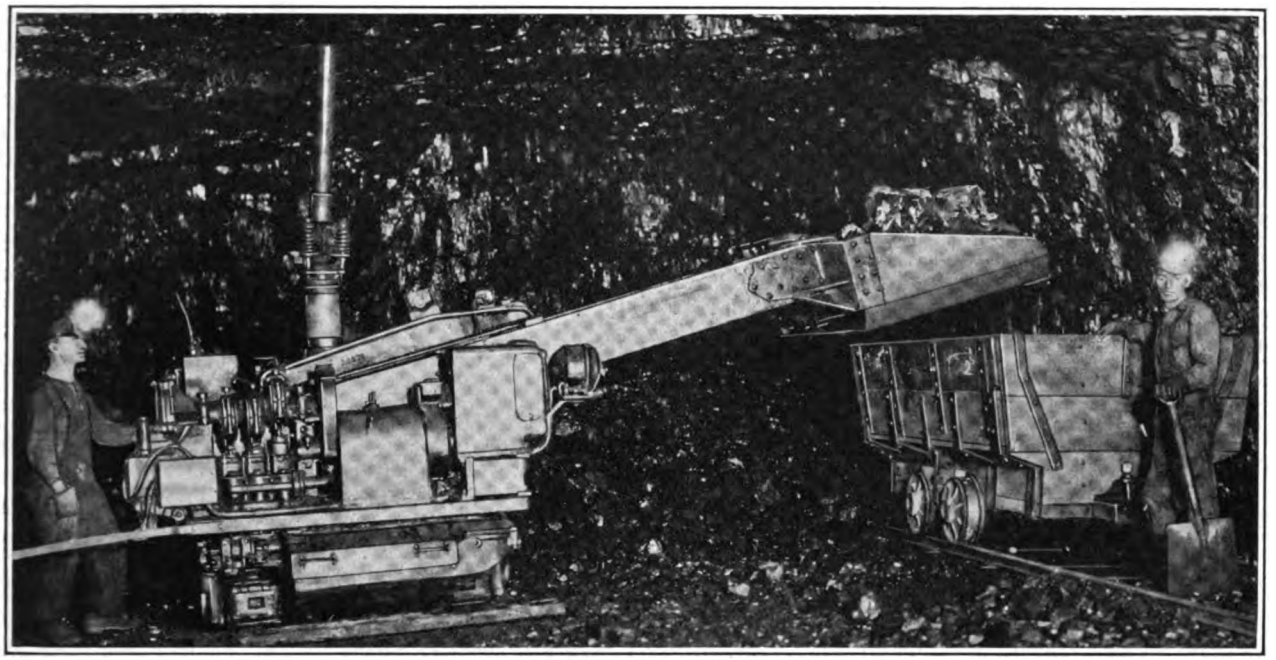
Waning of Coal as Heating Fuel

AS BEARING upon the question of the future use of coal for heating purposes, it is estimated by a real-estate expert that around 25 or 30 per cent of the buildings in New York have changed their heating fuel from coal to petroleum, a change that has come about in the last two years. Most of the new apartment houses are installing petroleum heating systems, thereby avoiding the very considerable problem of disposing of ashes. Of the older buildings, the Equitable Building, as an example, has changed entirely to petroleum as a fuel for heat and power. This is a tendency which coal producers must visualize squarely in planning the future marketing of their product. Apparently the only way that it can be partially checked is by a substantially lower price for coal.

Cheaper Coal and Larger Tonnage

AS THE RESULT of coal shortages and resulting high prices, consumers have learned to burn their fuel more economically. In consequence, the demand for coal has not progressively increased at its former rate. Will decreased prices, due to lower wages and greater mechanical efficiency in mines, secure the business that has been lost? There are many reasons to believe that they will, though there are some factors which may interfere.

If regulation of public utilities should take into consideration lower fuel costs as a basis for reducing rates on power, some reduction may actually result; not much, however, since the greater part of the gross revenue of power companies is allowed by the bodies that regulate them because of the interest cost on installation and the cost of its maintenance, and not because of the expenditure for coal. Hence, it appears likely that there will not be sufficient lowering of electricity rates to greatly stimulate thereby the coal industry.



But there are new possibilities in the development of heating by steam. Private garages that are now unheated will doubtless in time be provided with artificial heat. When that is done, the car will be ready at all times to start out without the delays which are so aggravating to motorists who have a cold garage. Private greenhouses are a less important example of fields that may be expanded. They are more numerous in European countries than in the United States. Both the purchase and culture of greenhouse flowers are extravagances so long as coal is costly; but with a decrease in cost of heating the demand for coal will increase. The farmer, also, may gradually forsake the stove and heat his whole house with a furnace; if a lower price for coal should offer an incentive.

Lowered coal costs will inevitably in short, result in increased coal sales; and, concurrently, general industrial expansion will eventually aid the curve of coal output to move upward.

Public Responsibility for Mine Safety

ACCIDENTS in coal mines are a matter of public as well as private responsibility; accordingly it becomes essential to ascertain what means can be taken to make mines as safe as possible. In order to avoid needless multiplication of effort, it is best to have the work performed by a single, adequate staff of men such as that of the U. S. Bureau of Mines. Since foreign nations have similar problems, it is well to arrange for co-operation, so as to make the information of one nation available to all. This is being done; Great Britain is now co-operating with the United States; and in time France, Belgium and Germany may pool their efforts with ours in a common endeavor to prevent the toll of life that mining coal levies.

Big Wyoming Mine Now Completely Mechanized

Acme Gets Nearly 200 Tons per Day from Loading Machines in Wide Work and 160 Tons in Entries—Ideas in Haulage and Shooting Are Perfected

By Harry N. Taylor
President Sheridan-Wyoming Coal Co.

CONVERTING the Acme mine, a 3,500-ton operation in Wyoming, from a hand-loading operation to one completely mechanized even to its drilling was accomplished last summer by the Sheridan-Wyoming Coal Co. with a sufficient degree of success to make the story of the mine's performance since then interesting to the coal mining fraternity. In a 47-ft. seam of coal the middle 11 ft. is mined with certain changes from the shooting and haulage system previously used so that today eight Goodman shoveling machines load the entire output of rooms while four Joys handle all coal mined in entries and room necks and put in part of their time in rooms. During last November the Goodmans averaged 196.75 tons per day and the Joys 160.8 tons. It is hoped, with further experience, to raise these outputs. More machines are to be added soon so that the daily capacity of the mine can be increased about 1,000 tons.

After the company had fully decided to install machines in the mine, the next step was to prepare the operation for mechanical loading. As no large mines in northern Wyoming were completely equipped with mechanical loaders, there was no opportunity to profit by the experience of others. As a result, it was necessary for the management to work out a system suitable to the loaders that were to be installed.

The chosen mine employed about 275 loaders. The bed has an average rise to the northwest of about 2 per cent. This pitch is not regular, and in some places frequently runs as high as 6 per cent. The work is laid out so that the rooms are driven to the rise, thus avoiding trouble from water.

Horses were formerly used for gathering at the face, and as gathering locomotives were to serve some of the loaders, it was found necessary to rearrange practically all the panel entry and room track in the mine. Twelve-foot room switches had formerly been used. It was found that it was necessary to lengthen these to 16 ft. on account of the longer wheel-base used on gathering locomotives and loading machines. It was decided to lay the mine out in three machine sections, putting four machines in each section, with a foreman in charge of that particular group of machines. Heavy steel and trolley wire were extended into these sections, and a 25-car parting installed in each panel.

In order to expedite the work of installing the machines, the mine was closed down, and all hand-loading was stopped. The work of rearranging the track, extending the haulage, and putting in partings, was begun on June 1. It was decided to install two types of loaders—eight Goodman power shovels for loading room coal, and four 5 BU Joy machines for driving entries and room necks.

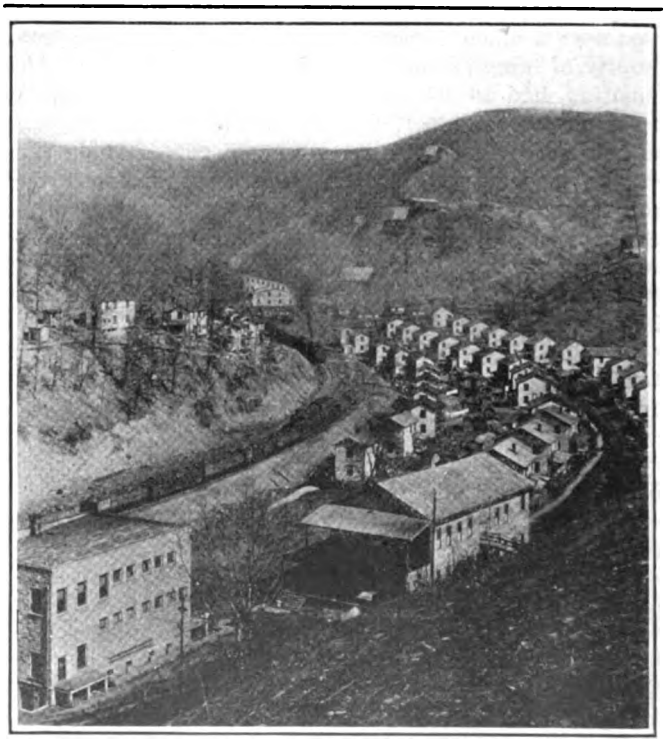
It was decided also, after a fair trial, that the best method suited to existing conditions for serving the loading machines was to put a 5-car parting in each room—as shown in Fig. 1. It also was found that the quickest and most effective means for changing cars at the loader was to keep a horse or mule at this parting. As soon as a car was loaded, it was dropped down onto the parting where the grade is suitable, and

In the headpiece is shown the type of loading shovel that is used in the rooms. Eight men normally constitute the crew, including undercutter machine men, locomotive driver, shot-firers and the like. During the month of November last these machines averaged almost 200 tons per shift each. By enlarging the mine cars on hand this increased production was handled efficiently.

Digitized by Google

Entry Driving

All narrow work is driven with this type of machine which is well adapted to operation in close quarters. One advantage of machine loading is that these machines are able to dig standing shots or those that have been shot so lightly that the coal is not broken down and rolled out on the floor as is necessary for best results with hand loading. Caterpillar mounting makes it possible to operate these machines anywhere without the aid of tracks.



extend the transmission lines. This mine has two well equipped fireproof generating stations underground. Station No. 1 is located on the main slope, 4,000 ft. from power house, and No. 2 station 8,000 ft. from it. Together they have a total capacity of 750 kw.

In order to be well prepared to take care of all mechanical difficulties, the company sent its master mechanic, Mr. Shott, to the factories where both types of loading machines were built. Mr. Shott spent a month in these factories, and actually worked in assisting to assemble the loaders and familiarized himself with everything pertaining to the construction of the machines. The Sheridan-Wyoming Coal Co. considers it thus made a good investment, as the men at the mines have little trouble in locating and correcting any mechanical difficulties that arise.

The tonnage produced by the different machines, no doubt, will be of much interest to many readers. While all of our machine operators are practically new men on this class of work, the tonnage obtained so far is fairly satisfactory. Taking November, for instance, the production per machine in room work averaged 196.75 tons per day. Machines engaged principally in loading entry coal naturally do not produce quite so high an output, 160.8 tons per day being the average. It is well to mention here that about one-third of the coal loaded by these latter machines is taken from rooms. As there is not enough narrow work to give them a full day's run in their district, and they usually finish out each shift loading room coal.

This company has a well equipped machine shop, which enables it to perform practically all of the ordinary repair work that is necessary around a coal mine. This shop contains one 20-in. lathe for ordinary work, one 36-in. lathe for turning down locomotive wheels, a drill press, power saw, grinder, air compressor, electric and acetylene welding outfits, as well as an acetylene generator, and a 30-ton press.

Adjoining the machine shop are the car and blacksmith shops where the company builds all its own pit cars. Equipment in this shop is complete in every detail for doing this class of work. Repairs to all electric equipment—such as rewinding armatures, and the like—usually is performed in the machine shop. Also, a room adjoining one of the generator stations in the mine is fitted up for light repair work. Both the machine and car shops are equipped with independent motors, thus eliminating line shafts and economizing in power.

Hard-Burly Mine of the Hardy Burlingham Mining Co. in Kentucky

This view of the mining town of Hardburly, Ky., shows the village and in the background the outcrop of the Hard-Burly drift mine high on the hillside. The modern four-track tipple may also be seen. Here shaker screens, picking tables and loading booms comprise the preparation equipment. Run of mine slack, nut, egg and block sizes are shipped from this mine which is served by the L. & N. R.R.

Siberian Mining Advances Despite Handicaps

Frigid Temperatures and State Regulations Made Coal Operations Primitive in Kuznets Basin But New Methods Are Now Improving Output per Miner

By Alfred Pearson, Jr.
Toledo, Ohio

COAL MINING in Siberia suffers many limitations, by reason of conditions both natural and state-imposed. These are responsible for practices that will seem peculiar to the American reading this article descriptive of the Kemerovo mines in the Kuznets basin near the city of Tompsk. But when it is considered that winter brings such extremes of low temperature that mechanical ventilators cannot be used at coal mines unless the developed area is huge, and that legal restrictions intended to make mines safe often merely make trouble, it is easier to be sympathetic with Russian methods such as are now finally giving way to big-scale practices. These, no doubt, will remedy the primitive haulage and hoisting schemes of Russia and will bring up the tonnage per man to a level comparable to that in countries where the industry is less hamstrung.

The coal in most Russian mines pitches steeply. This makes machine cutting difficult or impossible. Therefore, in comparing the man efficiency of Russian mines with that obtained in other countries, it is necessary to use pick mining as a standard. During the period in which I helped direct operations at the Kemerovo mines in the Kuznets basin, we tried chain cutting machines on all grades and found the maximum operating limit to be 35 deg. when cutting down the pitch, 40 deg. up the pitch, and 45 deg. across the pitch; with 35 deg. the limit of practical application.

The system of mining is, in general, a form of longwall. The step system on steep pitches offers such a good opportunity for the use of explosives that I believe machines should not be used on steep pitches except in narrow work.

Kemerovo mines, owing to the byproduct plant operated in conjunction with them, are now the keystone of the Kuznets basin arch. These mines have been producing for nearly twenty years. The coal is from the middle measures and is all of a medium-volatile grade. The top seam, or Kemerovo, is the coal wanted primarily for the ovens. It is from 12 to 15 ft. thick. An analysis shows 1 per cent sulphur, 10 per cent ash, 30 per cent volatile matter, and a heat value of 7,200 calories per kilogram (12,960 B.t.u. per lb.). The roof is a weak clay shale, and the bottom, clay. The seam is divided into four benches. The top bench is uniformly about 7 ft. thick and contains only about 9 per cent ash.

Originally only this bench was mined because its quality is above that of the other coal. In the course of some experiments it was discovered that, as loaded into railroad cars, the lower grade coal was no worse than the higher grade. Investigation revealed that so much of the top got mixed with the coal during mining operations that when it was shipped it contained 16 per cent ash. Detailed analyses of the various benches showed that the worst of the lower coal was the bottom bench, which is about 3 ft. thick. A mixture of all the coal above this stratum showed only 10 per cent ash. Since that time about 1 ft. of coal has been left up to hold the roof, and, by using 10-ft. props, practically all the good coal is recovered without seriously degrading it. The average, however, runs too high in ash, so the next seam is mined to reduce the ash content and make a cokeable mixture.

The system of mining followed in working the Kemerovo seam (Fig. 2) is typical of Russian practice. Slopes have been held in small favor in Russia, so this mine was opened by a circular shaft 16 ft. in diameter and 300 ft. deep, notwithstanding the fact that the coal outcrops under the surface drift and lies on a pitch averaging 45 deg. The drift is about 80 ft. thick.

This is the second part of an article the first installment of which appeared in the Nov. 26, 1925, issue of *Coal Age*. The author was in charge of mines for the soviet government in the region he describes during a period following the war.

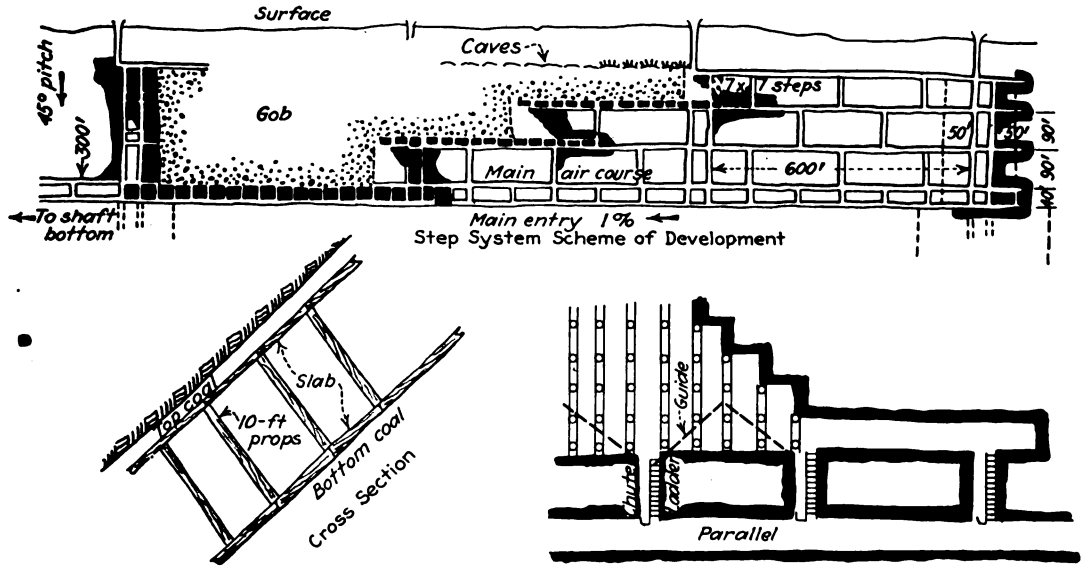

FIG. 2
Kemerovo Workings

This shows the details of the mining method followed in working these pitching measures. About one foot of coal is left up to protect the top as well as nearly all of the bottom bench as this is high in ash. Props approximately 10 ft. long are used. These are set on a rounded wooden slab are capped with another slab. Although the timbering is heavy the quality of the woods available for this purpose is poor.

Top Works

Here is shown the central mine tipple and headframe at the Kemerovo property which Mr. Pearson operated for a time. In the foreground is the dynamite house. Safety law limits the storage of explosive. The building must be 300 ft. from any other building, must be surrounded by an earth barrier and be protected by a lightning rod on a pole. The author is shown standing at the left with his mine superintendent.

It consists of 7 ft. of soil, 20 ft. of gravel and about 10 ft. of clay, the remainder being a layer of gravel and one of sand, these strata being of about equal thicknesses.

The shaft is concrete lined to its full depth and has steel buntons. The cages travel on two 120-lb. steel rails laid on one side like a railroad track. The shaft bottom is midway between the second and third beds of coal in a hard, fine-grained, gray sandstone. It will be seen that, should it ever be deemed desirable, a broad gage mine car, could be used only in connection with skips. This is because of the small size of the shaft. The side guide construction makes a skip design extremely difficult.

The bottom layout is cramped, 15-ft. radius curves being used. The main tunnel is lined with concrete in some places 2 or 3 ft. thick and reinforced. A cross tunnel is driven in both directions to the two coal beds.

In the plan adopted after the mines came under my direction, a main haulage line is laid in the third bed protected by the sandstone top from the squeezes and fires which are a real menace in the second bed. Cross tunnels are driven every 1,000 ft. and the track in the two beds withdrawn following extraction of the coal. With this plan the entry in each bed becomes a panel haulage way. It is accompanied by an air course on 40-ft. centers.

Driving Upcast Chutes

A pair of upcast chutes are driven from the entry to the top of the coal seam on 40-ft. centers. One upcast is divided to provide a manway and a timber chute, the other is used for coal. These places as well as all other narrow work are timbered with 3-piece sets of round timber. Usually a 10-ft. crossbar is used, the posts being battered in the typical entry form.

These pairs of upcasts were originally 300-ft. apart from center to center, but this spacing was later changed to 650 ft. One of these passages was continued through the gravel to the surface, and is now used for air, men and timber. At suitable intervals parallels are driven on the strike, off of these upcast chutes.

Originally the parallels were driven on 90-ft. centers, this distance having been chosen to correspond with the roof break. Recently this distance was cut to reduce the size of the gangs of men employed. The top parallel is driven just under the gravel. A 650-ft. panel is developed before any extraction is begun. Next, a companionway is started parallel to, and 25 ft. away, center to center, from the other strike entries and connected by cross cuts on 35-ft. centers, beginning at the top horizontal section separated by the parallel. This place is not timbered like an entry, but instead is temporarily supported by props. It is kept ahead so as not to be affected by work in the pillar area. After sufficient advancement is made in the companionway, men are started working up the pitch, in effect, widening the chute. Each man is allotted from 7 to 10 ft. of face and is kept a definite distance ahead of the next miner, thus maintaining a series of steps on an angle of 45 deg. across the panel.

Explosives Too Expensive

Although these steps offer ideal places for "bumping off" the coal, very little use is made of explosives, for the reason that their high cost offsets their advantages. Approximately double the output per man could be obtained by shooting the coal. When the top shows signs of working, the line of props immediately behind the face is boarded up and a hole shot in the roof of the back entry to allow the gravel to run into the excavated area.

The timber available is of poor quality. Poplar, pine, and balsam comprise the supply. Props are set in rows extending up the pitch. These rows are on 6-ft. centers, and slabs are used as caps and sills. The coal from the faces descends by gravity to the chutes, and is there run into small buggies, which are trammed by hand to the main chutes. As soon as the roof has settled, work is started in the panel below, and so on until the whole face is in operation.

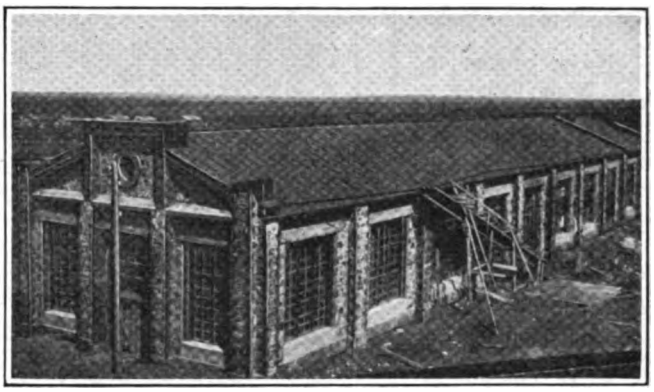
The second seam, which is 30 ft. thick is reached through 50 ft. of clay. Soft top, the fact that the coal fires readily, and the adverse conditions encountered made it a difficult mining operation. The development work is similar to that employed in the upper bed, but in extracting the pillars special methods have to be used. Originally the full bed was extracted by widening the chutes at the bottom and working overhand but the coal squeezed to one half its normal thickness and heated so badly that this method had to be abandoned. It was found necessary to work the coal simultaneously

Digitized by Google

on about 50-ft. centers, in order to make extraction rapid enough to prevent the squeezing and heating.

The present method is to drive two or even three chutes on 50-ft. centers, then start working on the strike, taking out the full bed between the chutes. The area is back-filled as soon as possible by another crew, the miners meantime working in the opposite place. The next slice of 7 ft. is taken out over the backfilling and the process repeated until the next backfilling is necessary. This is a tedious and expensive method, but as yet represents the most practical plan offered. These methods were developed by the Russians.

Recently an attempt has been made to apply the square-timber set, the idea being that a more rapid extraction could be attained, resulting in the elimination of some of the backfilling. Better timbering would also assure safer working conditions.



The backfilling proved to be a difficult problem. At first the gravel was drawn from above, the same as in the other bed, but so much was used that the layer of clay was broken and the mine flooded. This caused great expense and resulted in several accidents, so galleries were thereafter driven in the gravel, tapping the bed at frequent intervals, with the idea of not straining the clay. This is really a sop to the miners and the public rather than a sound operating practice. Breaking of the clay is inevitable, therefore it is extremely doubtful if flooding can be entirely avoided.

New Method Works Well

An effort is also made to mine the hanging wall immediately over the excavations. This looks like a possible solution of the problem. Fig. 3 illustrates the old method.

In actual practice it was found that on account of its softening effect on the coke, only a limited quantity of the product of the No. 2 bed could be added to the mixture. An analysis of the coal indicates a trace of sulphur, 6 per cent ash, 35 per cent volatile, and a heating value of 7,200 calories per kilogram (12,960 B.t.u. per lb.).

Fortunately, it was found that the third bed would provide the necessary hardness in the coke if 10 per cent or more of that coal was added to the mixture. This bed is 6 ft. thick, has an excellent roof and analyzes 12 per cent ash, 23 per cent volatile, 7,200 calories per kilogram (12,960 B.t.u. per lb.). It presents no difficult mining problems and the system followed is essentially the same as that employed in the top bed.

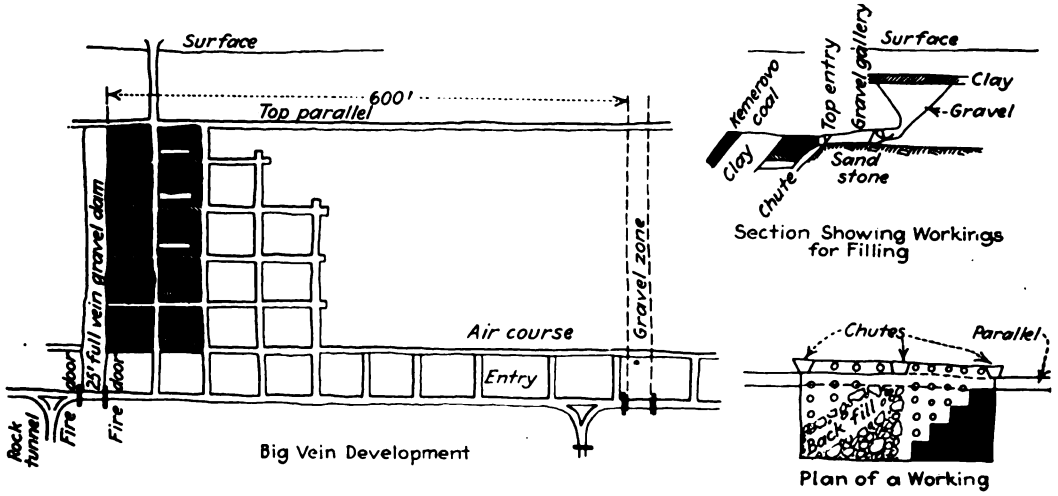
Shop Building at the Kemerovo Plant

This general mine and repair shop was still under construction when this photograph was taken. It is of brick and stone with concrete sills and a tin roof.

Underlying these beds and within reasonable tunnelling distance of one another there are known to be ten other beds of coal of commercial thickness, but of unknown quality.

Development of Kolchugina Mine

Fifty miles south of Kemerovo, Kolchugina Mine works four, and has developed four more beds supposed to lie about 1,000 ft. under the Kemerovo coals. The beds lie on a maximum pitch of 20 per cent, and are reached by a 400-ft. shaft. Kolchugina coal is all high volatile and low ash. The beds worked are all about 5 ft. thick. The mine was first developed by driving entries on the strike on 600-ft. centers, with cross entries on the maximum pitch, on which are operated endless-rope hauls of German design. These are impractical in that cars can be caged only at the top and bottom. The upper levels have to serve the cars onto the level below, thus in some instances the cars are caged and recaged four times. The hauls are now being redesigned to extend the full height and permit the caging of cars at intermediate points. For efficient operation the mine should be equipped with electric hoists.



At first the bed was worked by driving stalls up the pitch, the pillar then being drawn back. The coal was loaded into sleds which were pulled by hand to the entry. There it was dumped and loaded into pit wagons which had been lifted off the tracks so as not to interfere with through traffic. The sleds held one-third ton and the wagons one-half ton.

The working plan has been changed since to develop

FIG. 3

Plan of Workings

These beds pitch steeply. This complicates mining operations especially as the lower bed squeezes, heats and fires readily. Because this coal is prone to this firing it is necessary to provide gravel-filled zones or dams at regular intervals to arrest the course of a fire if one should start. Gravel for this purpose is procured from the surface drift above the subterranean outcrop.

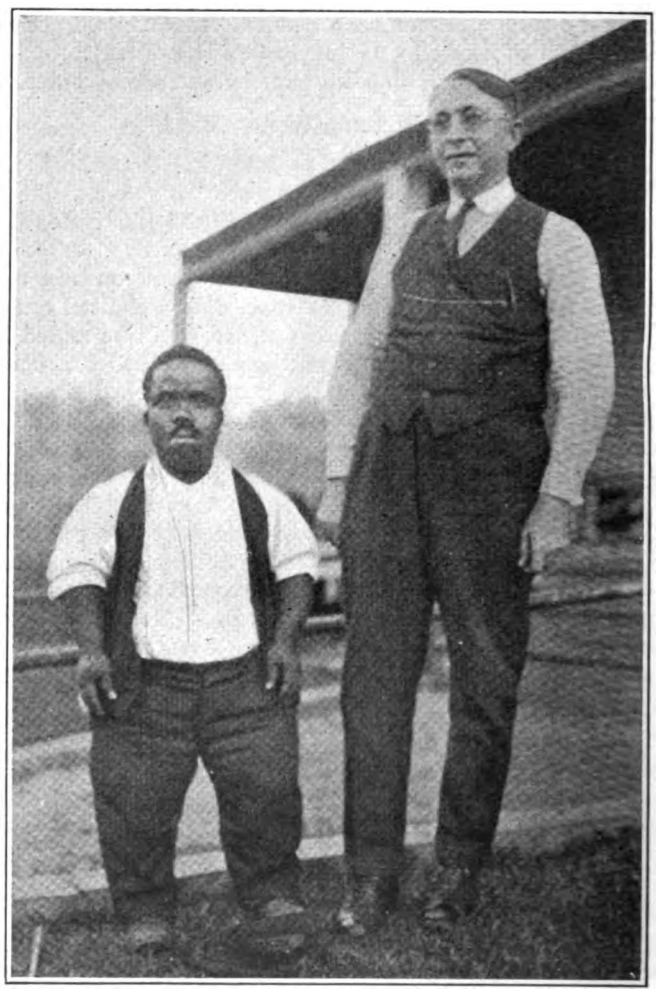
Water System in Mine Village

There are problems of keeping water liquid in the frigid Kuznets region. Here is shown a pump house and tank inclosed within a log structure. Distribution through the village cannot be made in pipe lines. It is difficult to sink them below the frost zone. Therefore the water is delivered by this type of "tank wagon" — a barrel on sled runners.

a V-shaped face in steps. This was a natural modification of the step system applied to lighter grades, and reminds one of the V-system developed in West Virginia. This new system has the advantage that it concentrates a sufficient production to warrant the installation of a rope and thus stop the sledding of the coal.

Future development will space the flat entries on wider centers, the stalls will be driven on the strike, and chain cutting machines used.



Seventy miles south of Kolchugina the lowest measures are worked. These coals are high quality sub-bituminous. The beds are 60 ft. thick and are worked like the thick beds at Kemerovo. The full thickness of the measure is extracted to a height of 15 ft. for a distance of about 60 ft. This area is then backfilled while the face is advancing, as in the Kemerovo bed. Following the backfilling a 15-ft. slice is worked above it. Extreme care is exercised in timbering. The face is advanced and backfilled alternately, the process being repeated until four steps have been started. These four steps are then continued and back filled until the entry is worked out.

NEW SYSTEM WOULD CUT COSTS

In view of the hardness of the coal and the excellent roof I was not impressed with the need for the backfilling, but believe that if the square-set system were adopted and the thickness of the slices reduced, the cost of getting out the coal would be reduced in substantial degree.

The only other mines operating in this field are those on the Trans-Siberian R.R. There are but two, and both are old plants from which most of the coal has been worked out. So far as mining methods are concerned, nothing is to be found differing much from those already described. The conditions at these mines are difficult for the reason that the measures are badly distributed, and the beds pockety. These two plants operate in the same bed as that worked at the Kolchugina mine.

In my opinion the Russian government is even now ready to grant concessions on a basis that will permit profitable operation. Coal mining offers to Americans as good an opportunity as any Russian industry, and the Kuznets basin is the preferred location. No doubt an American organization with American equipment would be successful in mine operation. Old plants however, should be avoided. A full staff of foremen and a few key workers to train the natives will be needed if American methods are attempted.

He Fits A Thin Seam

In most other pursuits of life, a man of Sam Snider's stature would work at a decided disadvantage. But Sam is at no disadvantage as a coal loader in the Mulga (Ala.) mine of the Woodward Iron Co. Sam's height of 42 in. admirably adapts him to this mine, in which he can stand erect with comfortable assurance of not bumping his head. The average working height of about 54 in. is to him like that in a 7-ft. seam to the average man. Sam is thirty-four years old. The weigh sheets indicate that he is a better loader than the average. E. D. Clark, superintendent of the Mulga division of the Woodward Iron Co., is shown standing beside Snider.

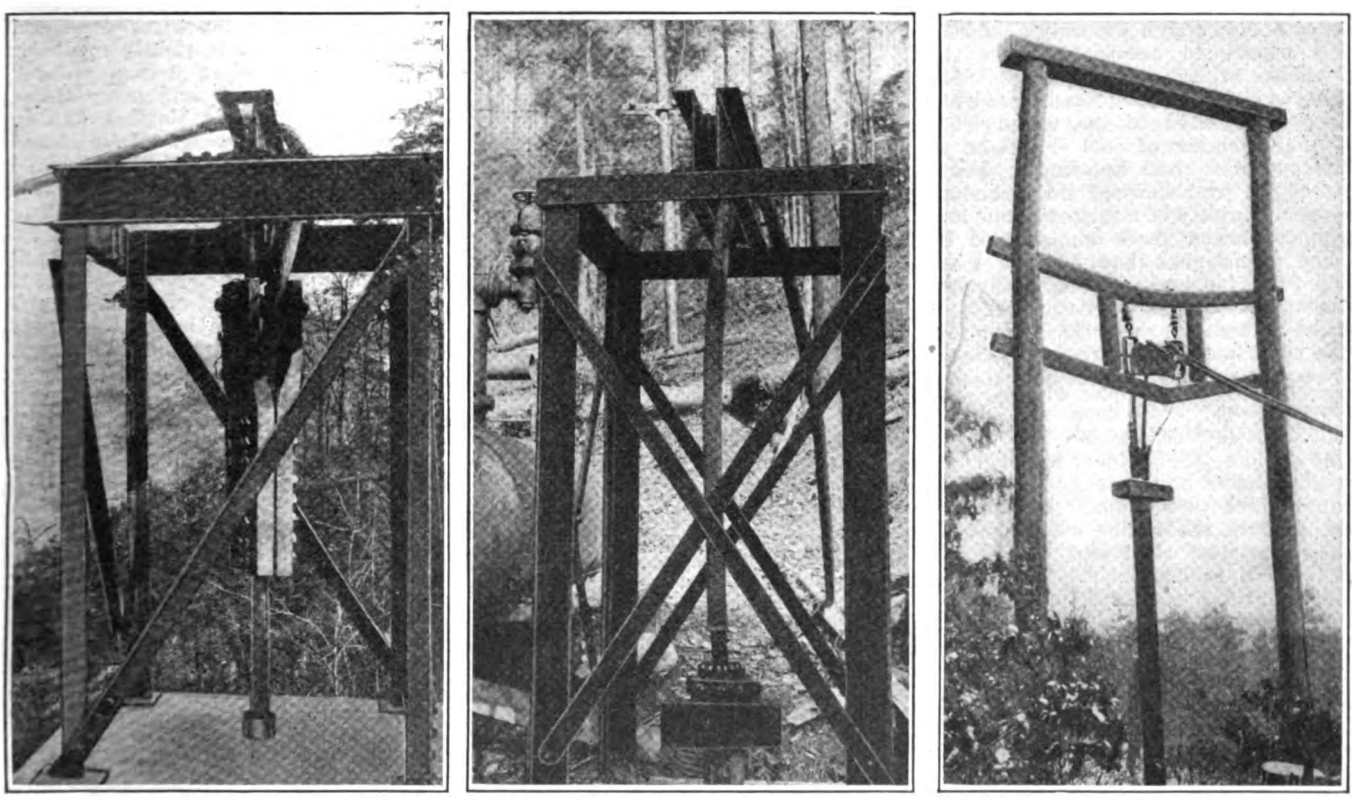
Cable Suspensions of Steel Prove Their Worth

NO STANDARD form of suspension for borehole cables has ever been generally adopted. Home-made cable clamps are more common than factory types, and there are about as many types of home-made clamps as there are mines using them. Even at one mine two or more methods of clamping can sometimes be seen; nevertheless, progress has been made in many mining regions toward more substantial construction.

An example is the Mulga mine of the Woodward Iron Co., at Mulga, Ala. Here two 2,300-volt cables are carried into the mine through separate boreholes located several thousand feet apart. One of these cables supplies power to a 600-kw. converter equipped with full-automatic control, and the other serves a hoist which handles mine cars on a rock slope leading from the normal mine level down to the coal deposit of a displaced area.

In the accompanying layout of illustrations, the one at the left shows the clamp and suspension of the substation cable. This borehole is 385 ft. deep. The clamp, which is 42 in. long, is made from 2x7-in. mild steel. Through the center is a circular groove which, in each side, is slightly less than a semi-circle and whose radius is about equal to that of the cable. This insures a uniform clamping.



The other cable suspension of the Mulga mine is shown in the center picture. This borehole is 275 ft. deep and the cable is a three-phase No. 4 B. & S.; insulated for 5,000 volts working pressure. At this borehole the weight of the cable is taken by the casing, which extends about 12 in. above the concrete.

Sitting directly on top of the casing is a 6-in. grooved steel clamp. On top of this is a collar over which the individual wires of the armor are turned back about 4 in. A smaller clamp securely holds the ends thus turned back around the outside of the collar. The upper end of the collar has rounded corners so as to prevent sharp bends in the armor wires. The channel-structure clamp, at the top of the steel frame, serves only to hold the cable in a fixed position above the borehole.

Wooden Support Breaks

As a contrast to these apparently-everlasting suspensions of the Woodward Iron Co., the third photograph shows a wooden suspension at a coal mine in another state. Here, two 750,000 circ.mil., single-conductor, rubber-covered cables are held by individual clamps and by resting over a round block of wood. The wooden frame of the suspension broke down after five years service allowing the weight of the cables to be taken by the clamps alone, which, at the time the picture was made, were resting on the end of the casing.

The idea of the clamp and roller suspension for this class of cable appears to be a good one. The clamps are attached by messenger to the end-frames of the roller, thus tending to hold the roller, or round block, from being pulled to one side. The chief trouble with the installation appears to lie in the fact that steel cross-pieces were not used. Perhaps the poles were set farther apart than necessary. Although costing more, a complete steel structure usually is to be preferred for this sort of installation.

Two Successful Borehole Cable Supports and One Failure

At the left is a substation cable suspension at Mulga, Ala., that is equal to its job. This borehole is 385 ft. deep. The clamp holding the 2,300-volt armored cable is 42 in. in length. Through the center there is a machined groove to insure uniform clamping.

In the center illustration is shown another borehole at Mulga. The depth of this hole is 275 ft. Here the armored wires are cut turned back over a collar and clamped. The collar rests on a short clamp which sits on top of the casing.

The right-hand picture is by way of contrast. The wooden crossarms supporting these cables broke after five years of service. When the photograph was made the cable's full weight was taken by the clamps resting on the wooden block at the top of the casing. The advantages of the steel suspension is apparent.

Union Pacific Coal Co.'s Code of Standards—VI*

Mine Ventilation (Continued)

In the event that any structures such as tipples or other inflammable buildings in the vicinity of the mine mouth catch fire, the mine ventilating fan should be stopped in order that the smoke may not be drawn into the mine and circulate around the mine workings, causing injury or death to employees. All men should then be withdrawn from the mine without delay.

Where fans are remote from the mine entrance, and are electrically driven, they should be stopped by pulling the power switch, whether the switch be at the main power plant or at some other distributing station.

Some responsible man delegated in writing by the mine superintendent, should be instructed to do this.

Where mine fans are steam or electrically driven and are in close, or reasonably close, proximity to the main intake then, likewise, some responsible person should be designated in writing by the mine superintendent, to stop them.

Standards for Weighing Coal

1. The weighman (company weigh boss) must be bonded in the sum of $500.

2. Art. 2, Sec. 3,552, Coal Mining Laws of the State of Wyoming "The weighman employed at any mine shall subscribe an oath or affirmation before a justice of the peace or other officer authorized to administer oaths, to do justice between employer and employee and to weigh the output of coal from miners in accordance with the provisions of Art. 1 of this act. Said oath or affirmation shall be conspicuously posted in the weigh office and any weigher of coal or person so employed who shall knowingly violate any of the provisions of this act shall be deemed guilty of a misdemeanor and upon conviction shall be punished by a fine of not less than $25 nor more than $100 for each offense, or by imprisonment in the county jail for a period of not to exceed 30 days or by both such fine and imprisonment."

Note—Oaths to be made in duplicate, one copy of which is to be filed with the mine superintendent.

3. Art. 4, Sec. 3,553.—"At every mine where the miner is paid by weight it shall be the duty of the weighman and check-weighman to examine and balance the scales each morning and in no case shall coal be weighed until such scales are tested by the United States standard weights and found correct, etc."

Note—Eight 50-lb. weights shall be kept at each pit scale for the testing of the same.

4. As provided in Sec. 3,552, Art. 4: "It shall be the duty of the state mine inspectors to inspect scales upon their regular visits."

Note—It shall be the duty of mine officials to insist upon this inspection.

5. Each pit scale platform shall have at least a ¾-in. clearance, and this shall be closely watched during the working shift to see that nothing lodges in the recess that may cause the scale to bind.

6. Whenever it is believed that any scale does not function properly, it shall be the duty of the weigh boss to immediately notify the superintendent who in turn will cause the scale inspector to make the proper examination and repair.

7. The counterpoise of any scale beam, that contains shot, nuts, etc., for balance, shall be so constructed that it will be inconvenient to add or remove any of these small weights.

8. No equipment should be allowed to stand on any scale except while being weighed.

9. No one except the weigh boss and check-weighman or properly accredited officials shall be allowed within the weigh room while coal is being weighed.

10. When a scale is not in use the beam catch shall be kept closed.

Track Scales

11. Under no condition must track scale weights be altered in order to obtain a check with the bulletin.

12. The weighmen shall keep the beams of all railroad track scales clean and free from rust, familiarize themselves with the construction of scales and make inspections at such intervals as are necessary to determine if scales are in proper working condition, and that scale pits are clean and dry

13. Scales shall be properly balanced before using, and the beam fastened by means of the catch while equipment is being moved onto or off the scale platform.

14. Cars must be stopped on scales and uncoupled at both ends while being weighed.

15. Equipment should not be allowed to stand on scales except while being weighed.

16. Locomotives and other equipment not to be weighed, shall be passed over the dead rail.

17. Salt must not be used in removing ice and snow from the mine scales.

18. The responsibility for the accurate functioning of all scales shall rest with the company scale inspector, who shall make the circuit of all districts at least once each month, examine each scale and file at the general office a report of his inspection.

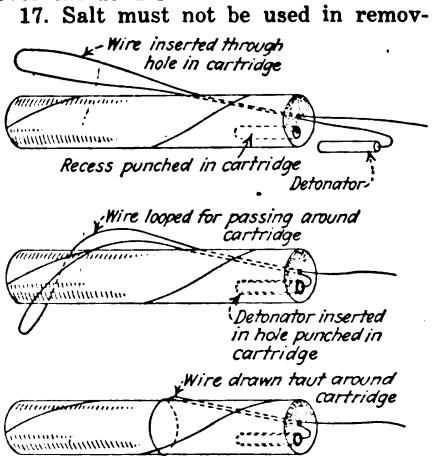

Fig. 29—Method of Using Detonator

This approved practice is suggested by notes obtained from a "Blasters Handbook." Delay detonators should be inserted after the cartridge has been slit, the cartridge should be closed and tied around the detonator.

When Employing Explosives

Don't

—use more than three sticks of permissible explosive in any one hole.

—force a cartridge into a hole.

—slit the cartridge and tamp tight as this is detrimental to the cushioning effect.

—ever tamp with an iron bar unless copper tipped; a wood bar is preferable.

—hurry in seeking the explanation of a missed shot.

—drill, bore or pick out a charge which has failed to explode, but drill and charge another borehole at a safe distance from the missed one.

—carry blasting caps or electric detonators in your pocket.

—try to withdraw the wires from an electric blasting cap.

—keep electric blasting caps, or blasting machines in a damp place.

—leave the lead wires connected to any blasting machine. Disconnect them immediately if it becomes necessary to return to the shot.

—return to any shot under a ten minute interval.

—loop or tie the wire connections. Scrape the ends of the wires clean and bright and twist them tightly together.

—drag the leading wires around. Always coil them up and carry them.

—insert an electric blasting cap in any cartridge carelessly. Have closed end of the detonator pointing toward the bulk of the cartridge (See Fig. 29).

—store or transport electric blasting caps with high explosives.

—worry along with old, broken leading wire or connecting wire.

—operate blasting machines half-heartedly. They are built to operate with full force. They must be kept clean and dry.

—shoot from the trolley circuit.

Employment

1. Employment may only be obtained by application at the employment office at Rock Springs. This applies only to Rock Springs, Reliance, Winton and Superior.

2. No person will be employed for work in or around the mines who has not attained the age of 16 years.

3. No person will be employed for work within or around the mines of this company who has passed the age of 50, without authority from the general superintendent.

4. Blindness in one eye, or apparent impaired sight or hearing disqualifies anyone for employment with this company.

5. Heart trouble, disease of the lungs, hernia, loss of a hand, foot, or other serious physical defect shall be a bar to employment.

6. Since every person employed around a coal mine possesses poten-

*This is the sixth of a series of articles giving the Code of Standards put into effect by the Union Pacific Coal Co., at its operations in Wyoming. The first five articles appeared in the issues of Dec. 17, 24, 31, Jan. 7 and 14, and the remainder of the code will be published in a future issue in this form that permits of easy filing.

Digitized by Google

tialities for accident or disaster, peculiar to the industry, it is imperative that each new employee be physically and mentally alert, as not only his own life but the lives of many others may be sacrificed or jeopardized by his actions. Therefore the foregoing five articles have been established as a guide in the employment of labor.

Copy of General Office Bulletin No. 2

The following important points to consider in the event of mine catastrophe by fire, explosion, flood, etc., were prompted by observations at a mine explosion:

1. Cut power off the mine from all sources.
2. Notify the general office.
3. Organize and enforce a checking system for all men entering the mine.
4. Organize for handling the crowd so that they cannot endanger themselves or the workers.
5. Thoroughly examine the fan and provide against overloading its motor or transformers as a result of short circuiting of air, by placing a competent man in charge of fan and motor.
6. The fan must not be reversed except on order of the official in charge.
7. Electric lamps should be made available in quantity, for the workers, together with proper charging facilities.
8. Provide telephone communication between important surface points and prepare portable telephone sets for underground extensions with sufficient wire for advance.

Note—For this purpose take a desk phone or any other instrument available.

9. Arrange for water supply from all possible sources in the event of failure of usual supply lines.
10. Arrange base on top for lumber, brattice cloth, nails, pipe, fittings, hose, buckets and tools.
11. Provide shelter for man checkers, telephones, lamps, temporary morgue, workers, food dispensary and consulting place for shift leaders.
12. Obtain ample supply (at least three) of accurate and up-to-date maps of mine workings.
13. Establish base for rescue apparatus recharging, repair and storage.
14. Arrange for proper rest and food for apparatus men.
15. Arrange with railroad agent for handling and nearby spotting of U. S. Bureau of Mines rescue car.
16. Assign a man to transmit hourly bulletins to the general office and to prepare statements for the press.

Greasing of Wire Rope

1. Distinguish between a lubricant and a preservative in the selection of material for greasing.
2. A lubricant such as black oil has little or no value in the treatment of wire rope.
3. The proper oil should be a preservative which not only penetrates to the hemp center of the rope (in order to saturate it and prevent absorption of water) but also thoroughly coats the inside wires of each strand.
4. Main haulage rope shall be greased at least once each week and panel slope ropes twice each month.
5. Ropes are to be greased by passing them through "V"-shaped troughs, this to be done at the end of the shift and the rope allowed to lie over night in the slope off the drum. Those portions that cannot be passed through the grease box, but must remain on the drum shall be painted.
6. A preservative such as is made by the Wire Rope Lubricant Co., Newark, N. J., is recommended for this work.
7. Sockets must be annealed and reset every four months. A record of annealing and resetting of sockets is to be kept by the mine superintendent, same to be signed by the party doing, or having charge of the work.

Note—Where it has been the practice to make rope sockets locally, this will be discontinued as it is possible to purchase equipment of this kind fully as good as that made locally at a considerable saving.

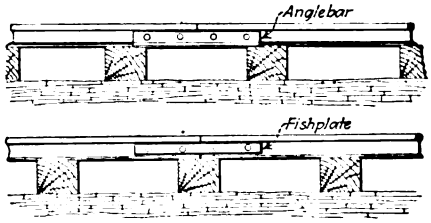

Fig. 30—Two Forms of Rail Joints

The suspended joint is used with angle bars but the bars are supported at each end by a tie. Fishplated joints are made directly over a selected tie, as shown in the lower illustration.

Wire Rope

Important Precaution.—In the manufacture of wire rope, great care is exercised to twist the wire in the strands and the strands in the rope under uniform tension. If the ends of wire rope are not properly secured the original relation of tension, as manufactured, will be disturbed and maximum service will not be obtained due to the fact that some strands are carrying the greater portion of the load.

When cutting steel wire rope it is highly essential to place three sets of seizings each side of the cut to prevent disturbing the uniformity of the rope. The placing of proper seizing requires considerable practice and, therefore, it is advocated that the average user of wire rope exercise great care when placing seizings and for safety use a greater number than specified.

Unless a serving mallet is used, there is no advantage in making more than 10 wraps of wire per seizing.

Use annealed iron wire of the following sizes for seizing:

Diam. Rope	Wire Diam.	Birmingham Wire Gage
⅜ and ½ in.	0.047 in.	18
⅝ in.	0.054 in.	17
¾ in.	0.063 in.	16
⅞ and 1 in.	0.080 in.	14
1⅛ and 1¼ in.	0.105 in.	12
2 in. and larger	0.135 in.	9

Note—From Roebling's Hand Book, "Wire Rope and Wire."

Rope Inspector's Report

Mine .....Location .....
Date.....Date of last inspection.....
Diameter of rope.....Length.....
Gross weight of trip hauled.....tons
Slope angle .....
Manufacturer of rope .....
Kind of rope, lay, strand, steel, etc.....
.....
Condition of socket .....
Date socket was last annealed.....
Condition of rope.....
.....
Date rope was installed.....
Probable remaining life of rope.....
Has rope proven satisfactory to date?.....
If not, how and why has it failed.....
.....
Date last greased .....
Date rope was turned....Date removed....
Total life of rope.....Tons hoisted.....
Cost of rope .....
Cost of rope per ton carried.....

Note—This report to be made monthly and in triplicate, one copy to be forwarded to the general office, one to local superintendent, and one filed with the master mechanic having charge of the inspection.

Mine Track Standards

1. The mine superintendent at each property must see that each foreman and assistant is supplied with copies of track data and turnout diagrams.
2. Each mine employee that may have supervision of track work in any way shall familiarize himself with these track rules.
3. In cases where data are insufficient, or there may be a doubt as to their meaning, the engineer of the property will supply the information.
4. Safety is, in each case, the first consideration and all installations must be made with this in view. All switches, frogs, guard rails or other track equipment where a person may be liable to receive injury, are to be properly blocked or guarded. This to apply to both inside and outside track.

Switch throws are to be of the "parallel" type with a ground throw. No new installations are to be made with switch stands.

Track Clearance

1. The minimum clearance to be maintained at all points on all haulage roads or track where switching is done is to be 2 ft. 6 in. from track rail to rib or nearest timber. This is to be regarded as the standard clearance for all tracks of the Union Pacific Coal Co.
2. Room necks are to be so turned and track so laid as to give a clearance of not less than 2 ft. 6 in.
3. Parting tracks are to be provided with the standard clearance above named.
4. Opposite all switch throws on any track at any point the track must be given not less than standard clearance.
5. Panel slope tracks are to be so laid as to give the proper standard clearance on both sides of the track for the entire length of the panel.
6. On long straight runs where locomotive or rope haulage are employed the standard clearance will be required on one side only but this clearance must not alternate from side to side of the track.

Ties

1. Ties must be laid on all haulageways (locomotive, rope and mule) at intervals not to exceed 2-ft. centers. (This implies 60-lb. steel on main slopes, 40-lb. steel on locomotive haulageway, 20-lb. steel in rooms.)
2. Where ties of uneven length are used they should be aligned on the ditch or low side of the track.
3. Standard square ties in graded lengths shall be provided for each turnout where 40- and 60-lb. steel is used.
4. Joint ties should be selected that have an extra wide face where a choice is possible.
5. Ties removed that cannot be used for other purposes should be loaded and sent out of the mine at once.
6. Where fishplates are used, a selected tie shall be placed directly under the joint. (See Fig. 30.)
7. Where splice (angle) bars are used the rail joint shall be suspended between two ties. (See Fig. 30.)

Problems In Underground Management

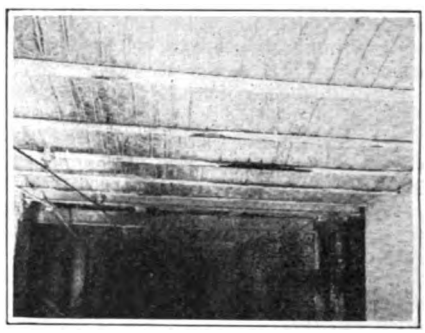
Longwall Face Protects Mine Against Explosions

As a result of tests to determine the effect of release of pressure on the development of coal-dust explosions in mines, made by the British Safety in Mines Research Board in co-operation with the U. S. Bureau of Mines, at the Eskmeals Experiment Station, England, it has been made clear that there is less danger of a coal-dust explosion developing from a given source of ignition at a longwall face than at a "dead-end" or cul-de-sac.

The results obtained have an important application to actual coal mining conditions, as they show clearly that branch roads near the point of ignition of an incipient coal-dust explosion, by affording release of pressure, retard and may prevent the development of the explosion. Again, the course of a partially developed explosion may depend upon the arrangement of the mine roadways and branching passages, a knowledge of which will indicate the positions in the mine at which the most stringent measures should be taken against the accumulation of coal-dust or the occurrence of a source of ignition.

PRESSURE RELEASE NEAR ORIGIN

The nearer means of release of pressure are to the origin of the explosion the greater are their effects, the tests demonstrated. When an explosion has partially developed, a branching passage ahead of the flame tends to accelerate it, while one behind tends to check it. If a source of relief of pressure is provided in the path of a developing explosion, the effect is to increase its speed of travel until the opening is passed, after which the explosion is retarded.



Most of the experimental work on the development of coal-dust explosions that has been conducted in England has been concerned with the character and mode of deposition of the dust, with the nature of the means of ignition or with the condition of the interior of the explosion gallery, whether unobstructed or provided with restrictions at certain points. No systematic work has been conducted to determine the arrangement of the gallery most favorable to the initiation and development of a coal-dust explosion, but, with few exceptions, the experiments have been conducted in a straight continuous tube open at one end and closed at the other. At the Experimental Mine of the U. S. Bureau of Mines some work has been conducted with regard to explosions originating in wide places, on the effect of side-openings from the main entry and on the propagation of flame from the mouth towards the interior of the mine, but, in general, the study of coal-dust explosions has been with regard to their development when traveling from a closed to an open end.

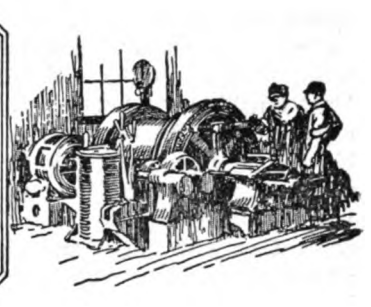
TO CONTINUE EXPERIMENTS

In Safety in Mines Research Board Paper No. 14, just issued by the British Mines Department, is recorded the results of these preliminary experiments, carried out in the 7½ ft. diameter gallery at Eskmeals, to determine to what extent the development of a coal-dust explosion was aided or retarded by release of pressure, either at the origin of the explosion or at some point in its path, such as would be given in a roadway of a mine by openings to side galleries or drifts. The experiments will be continued in the 4-ft. diameter gallery that is being constructed at the new British Experimental Station at Harpur Hill, near Buxton, and a parallel investigation will be made in the Experimental Mine of the Bureau of Mines at Bruceton, Pa. Such trials and tests should yield much information of value to the coal industry.

Overcast Construction Method Makes 15 per Cent Saving

A new, concreted construction of overcasts, which avoids the use of wooden forms and thereby effects a saving of about 15 per cent in the overall cost, is being used in the Harmar mine of the Consumers Mining Co., Harmarville, Pa. The side walls are formed by 8x8x16-in. hollow tile blocks which on the outside are plastered with a 2-in. coating of sand-cement mortar. As indicated by the accompanying illustration the roof consists of a series of concrete arches between 6-in. H-beams laid laterally on 30-in. centers across the top of the walls.

This Economical Construction Makes Strong Overcasts



First, wire meshing is cut to the proper length and bent to the required spring. After this has been slipped between the H-beams it is covered with roofing paper after which a 2-in. concrete arch is poured. When this has set another layer of concrete is poured to fill the spandrel openings and make a flat surface above the beams. The arch effect thus obtained is quite as strong as flat concrete provided with reinforcing.

In the construction of these arches wire meshing is placed between and rests on the lower flanges of the H-beams. It is curved to about a 6-in. spring. The meshing is covered with a heavy roofing paper over which is worked a 2-in. layer of cement mortar. After this mortar has set from 12 to 24 hr. concrete is poured over the arches to a depth of about 4 in. as measured from their crests. This arch construction imparts the same strength to the roof that reinforced wire mesh within the concrete gives to a flat roof construction.

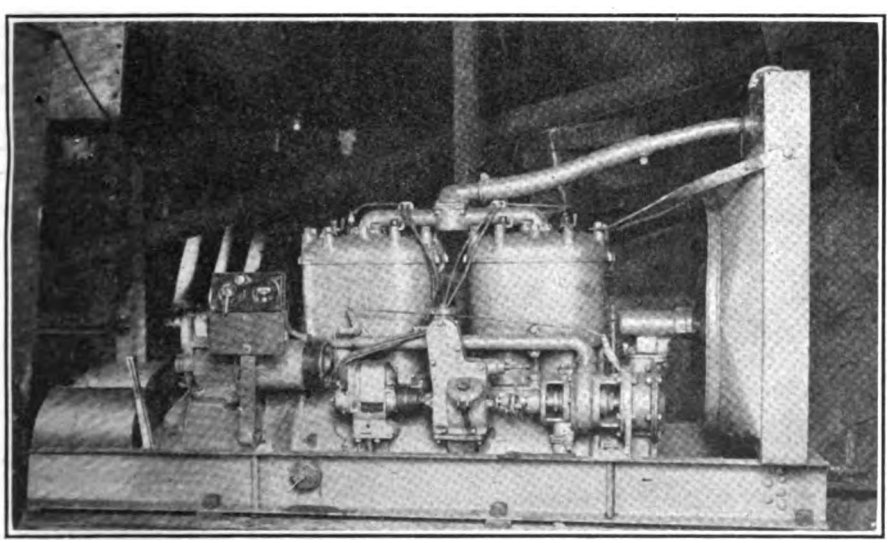
Practical Pointers For Electrical And Mechanical Men



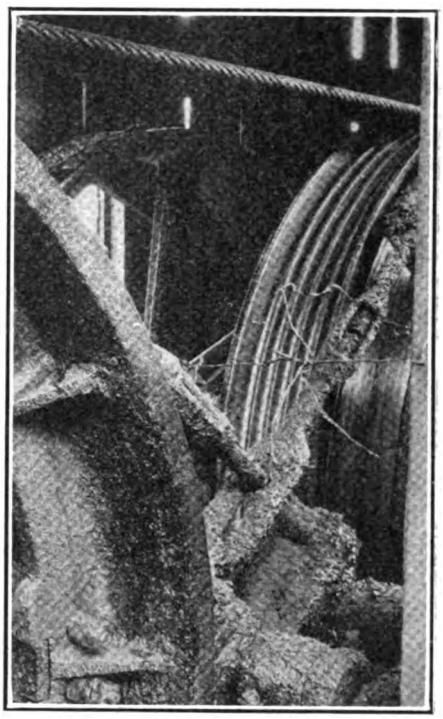
Gas Engine Makes Reliable Stand-by Fan Drive at Coal Mine

Mine ventilating fans driven by steam engines are not immune to shutdowns, but nevertheless are seldom fortified by auxiliary drives. On the contrary, fans which are driven from purchased power and are used to ventilate gassy mines, generally are equipped with standby power. If a fan stops because of trouble with the local steam equipment, the engineer usually can tell at a glance, whether it can be started again in a few minutes or whether the repairing will be a matter of hours. When an interruption to purchased power occurs, the man at the mine is truly, "in the dark," as to when service will be restored. Phoning the power company may bring some information, but this phoning takes time.

Recently, purchased-power drives, in place of steam, were installed by the Montevallo Coal Mining Co., at Aldrich, Ala. After the change had been made the officials found it advisable to arrange for an auxiliary source of power to insure continuous ventilation.

The fan, an 8-ft. x 30-in. unit, is normally driven by a 75-hp. induction motor. The standby is a 75-hp. gasoline engine equipped with electric starter and fan-cooled radiator. This engine, a four-cylinder model operating at 1,200 r.p.m., is belted to a friction-clutch pulley mounted on the fan shaft, between the housing and the pulley of the electric-motor drive.

In case of a power failure the engine is started without load, and the friction clutch then is engaged slowly until the fan and engine are brought to the same speed. By quick work it is possible to get the engine into action before the fan loses its inertia.



Standby Gasoline Engine in Mine Fan House

The Montevallo Coal Mining Co., at Aldrich, Ala., regularly drives the main fan by an electric motor operated from purchased power. The engine, which has a rating of 75 hp. at 1,200 r.p.m., is belted to a friction clutch pulley on the fan shaft.

Life of Blocks Prolonged By Greasing Brake

Greasing the brake drums in order to prevent the burning of the friction blocks is a practice rather contrary to theory. To maintain a given braking effort during a given time and through a given distance, requires the dissipation of a definite quantity of heat. In order to obtain a braking effect there must be friction between the blocks and the drum, so why, the average man would ask, grease the drum and thereby lessen the coefficient of friction? That must necessitate a tighter application of the brake. Regardless of this, the four brake bands on the incline machine of the New Caryville Coal Co., Caryville, Tenn., continue to be greased regularly with "black strap."

Incline Machine at Caryville

The four brake drums are thoroughly greased at regular intervals in order to prolong the life of the friction blocks. Many years' experience at this mine has proved the advantage of this unusual practice.

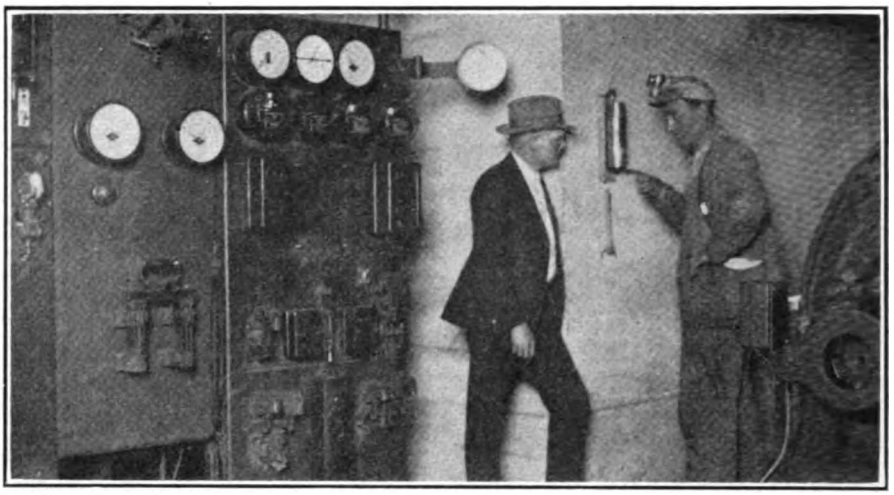
GREASE ADDS LIFE

The men in charge at the mine state that the friction blocks will last but a short time if operated dry, but have an average life of two years if greased regularly. The blocks are made of wood. Black gum has been found best for the purpose. The machine controls two 15-ton coal monitors operating on an incline 6,000 ft. long.

Theory based on natural law will explain any result which may be attained in actual practice but only

Digitized by Google

where all conditions are known and taken into account. Experience omits none of the conditions and so has the "last word" in any argument. In the case at Caryville, the burning of the blocks may be prevented by a change in the conductivity or radiating power of the wood by virtue of the saturation with oil. Aside from the difference in life of the friction blocks, greasing has the advantage of reducing chatter and noise.



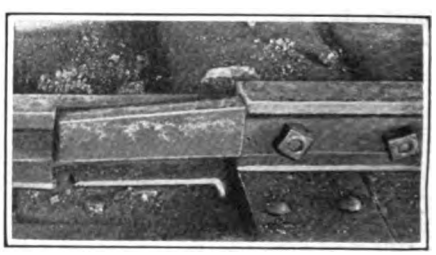
Substation Changed with No Loss of Time

Located approximately 9,000 ft. from the drift mouth and under 350 ft. of cover is the only substation of the Nuttallburg (W. Va.) mine, of the Fordson Coal Co. The original equipment consisted of a 300-kw. synchronous motor-generator set with manual motor control and a reclosing generator breaker. Over a year ago this substation was converted to full automatic by the addition of switching, and relay equipment. The change was made without shutting down the mine, the work being done between midnight Saturday and 7 a.m. Monday.

MAKE USE OF OLD PANELS

Two of the old panels were left in place and parts of them were used in the automatic layout. At the direction of C. B. Loche, a special feature was added to the regular equipment as proposed by the manufacturer. This consists of a relay to disconnect and short circuit the synchronous field during starting. This feature, according to Mr. Loche, causes the motor to come up to speed more quickly, and with less disturbance. The relay is operated by virtue of the differential action between two coils, one connected to the generator brushes and the other in series with the synchronous field. As the machine comes up to speed the current in the first coil increases, and that in the second decreases.

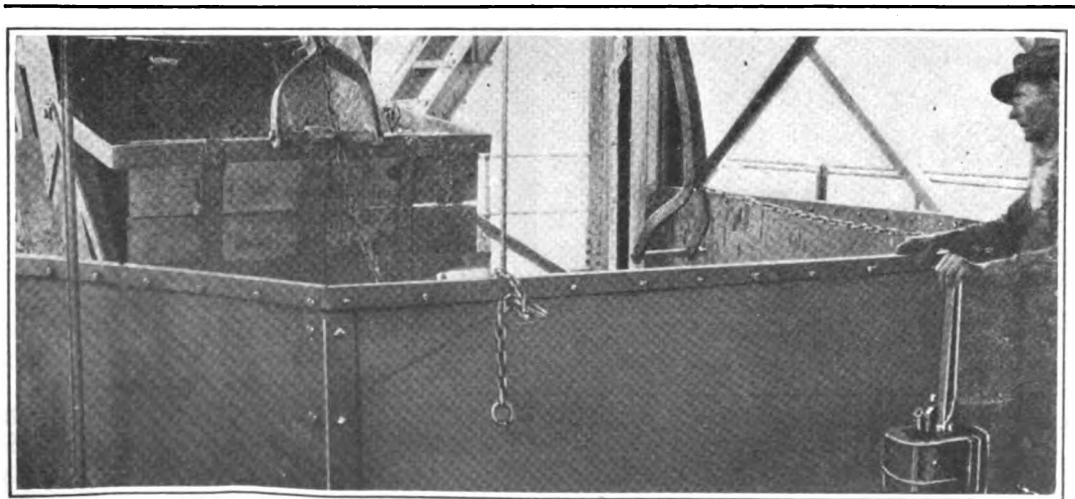
That the automatic control of this substation has been entirely satisfactory, is proven by the fact that, from the time it was changed to automatic, the salary of an operator has been saved. Starting and stopping of the motor-generator is controlled by a 30-amp. time switch mounted on the base of the alternating-current panel.



Automatic Substation Inside a Fordson Mine

This 300-kw. unit was converted from a manual equipment, so now it is made up of parts from several manufacturers. In the photograph are C. B. Loche (left), electrical engineer of the Fordson Coal Co. and J. H. Boyer, foreman of the Nuttallburg mine.

Device Eases Mine Cars Onto the Scale



Frequent hammer blows should be avoided wherever possible in the operation of any equipment. Failure of materials is more commonly due to repetitions of relatively small stresses than to a single stress beyond the ultimate strength. Mine-car scales usually are subjected to severe shock due to the wheels "dropping on" as they pass over the open rail joint. The old familiar "clickety-click" of cars moving onto the scale, is absent at the Mulga mine of the Woodward Iron Co., at Mulga, Ala.

The scheme used for easing cars over the open rail joint is shown in the accompanying photograph. As the car wheel rolls down the inclined extension piece it engages and is picked up by the rail on the scale platform. The end of this rail has one side of the ball planed off to make room for the extension piece. No noise or shock results as the car comes on the scale.

This Arrangement Reduces Bumps at the Scale

When this device is employed mine cars passing over the rail joint when being moved onto the scale are not subjected to the usual bumping.

Dumping Controlled on the Spot

This arrangement, besides saving the wages of one man, has other advantages. No time is lost in signaling between the dump and hoist house. The operator works by noting the position of the cages rather than by an indicator.

Book Reviews

Devine Exposes Shortcomings Of Coal Industry

By R. Dawson Hall
Engineering Editor, *Coal Age*

Knowledge of the bituminous coal industry sinks but slowly into the minds of the public. Data laboriously collected at much expense and tossed in the lap of hard-working people who have their own daily living to get fail to be read and digested. However, some small portion of them do receive consideration, of that there is plenty of evidence, and so the book by Dr. Devine may be welcomed by the industry and the public, especially in so much as the author was well known not to have nourished the kindliest of feelings toward the industry in former years. His present volume records his reactions to painstaking investigation.

Many unfortunate points of view still remain. He believes that any man or corporation that has obtained by purchase an excellent piece of coal should be compelled to pay not alone a tax on the profits of his operation but a differential tax that would give him no advantage over his competitors. He believes that the operator should be handicapped by this impost so that he would be at no advantage in the race for business. He would have the public be the gainer and would arrange that no good fortune should accrue to the producer as the result of his perspicacity and good judgment. With such a provision the tendency would be to use no care in the purchase of coal lands but to rely on Washington to protect any injudicious investment that might be made. There would then be no investments that from the investor's point of view could be classed as injudicious.

Dr. Devine's little book, termed by him briefly "Coal" and more copiously "Economic Problems of the Mining, Marketing and Consumption of Anthracite and Soft Coal in the United States," published by the American Review Service Press, Bloomington, Ill., is full of statements that condemn the operators and defend the union, as well as statements that do just the reverse.

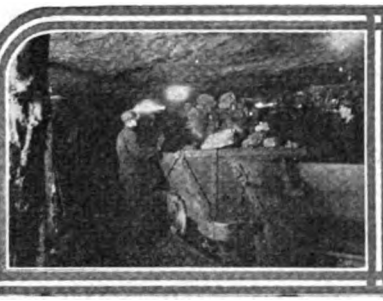
He says that the anthracite operators are "self-confident, sophisticated, not a little arrogant," and declares that "to the unsophisticated mind" the failure to increase output despite a growth of population in the natural and established markets of anthracite "certainly suggests a deliberate policy on the part of the anthracite combination that there shall never be enough anthracite to go round." Nevertheless, the operators will almost forgive him for this quite general, though unfounded belief, because he adds: "A policy of holding back rather than glutting the market is not to be condemned off-hand. It is the policy which cotton growers, wheat growers, tobacco growers and manufacturers carry out when they can and lament their inability to carry out when they cannot. Only very foolish persons destroy their profits by overstocking the market" and again: "What is so difficult in the case of farm products and would be difficult also in the case of soft coal, has been perfectly feasible in the case of anthracite; so easy that it would have seemed childish not to do it; so easy that the substance remains even after the successive means by which it was accomplished, one after another, have been declared illegal and as far as court decisions go have been destroyed—though in calling it easy I do not mean to suggest that it did not call for imagination and initiative."

Praises High Standards

We are much surprised to see the following favorable comment from such a source as Dr. Devine: "The historical fact is that anthracite coal producers in their own province were pioneers in this sound policy [of standardized quality] and to this their prosperity is in part, though not wholly, to be attributed. The standards of quality have been maintained in the face of temptations to a contrary short-sighted policy of adulteration when coal is scarce and demand brisk."

We cannot avoid quoting further because it augurs ill for those engaged in the present controversy: "It is not inconceivable that the anthracite which is not mined in the next generation or so may never be mined. In that case the owners of reserves, their unearned increment evaporated can only lament the golden eggs they might have gathered."

But quotation may go to too great lengths and briefly it should be said that in 448 pages (5 x 7½ in.) and with several badly printed but valuable charts, Dr. Devine tells the story of anthracite and bituminous coal broadly and in a well balanced manner and then in the end lays down what all parties to the controversy can do to better conditions. The reviewer would not write those recommendations quite as the Doctor has done, but no one can doubt the intellectual honesty of the author. The price of the book is $3.



Herrin Coal Seam Near Duquoin, Ill.

Many persons believe that Illinois coal lies on a dead level without any interesting structure. As a matter of fact, the Illinois coal fields have a varied structure and are not by any means regular. Thus in the Kathleen mine the contour which intersects the shaft is marked 140, whereas at a distance of 4,000 ft., less than a mile, contour 310 is crossed without a fault in the whole distance to account for the rise. The 170-ft. rise is made on the steep slope of an anticline. The average grade is 4.25 per cent and at many points the inclination is much steeper. On the eastern side of the slope is a complicated series of nine faults.

A publication of the State Geological Survey on the "Structure of Herrin (No. 6) Coal Seam near Duquoin," by D. J. Fisher, issued at Urbana, Ill., contains a study of the whole field including portions of Franklin, Jackson, Jefferson, Perry, Washington and Williamson counties. The faults of the fields other than those already mentioned are found in one group near Hallidayboro, one west of Royalton and one west of Weaver with one east of Duquoin.

The Herrin coal from a point two miles north of Royalton to a point over two miles north of Mulkeytown is so split that neither part of the seam is workable. The area thus made valueless in one direction almost east and west is ten miles wide. A smaller area lies between Royalton and Hallidayboro. The split in the seam in places is not far from 100 ft. thick.

News Of the Industry

Anthracite Operators and Miners Start Third Attempt at Agreement, This Time Meeting in Philadelphia

A third attempt to effect a new anthracite wage agreement was started at the Bellevue-Stratford Hotel, Philadelphia, Pa., on Tuesday afternoon, Jan. 26. The resumption of the joint conferences was undertaken at the request of John L. Lewis, who asked Chairman Alvan Markle to call the negotiating committee together again to consider a plan suggested by E. J. Lynett, publisher of the Scranton *Times*, as a basis of negotiation. This plan, making no provision for arbitration of disputed points and pegging wages at the 1923-25 basis for five years unless a voluntary agreement to change was effected at the end of the second year, has already been rejected by the operators.

Both sides entered the renewed negotiations clinging resolutely to the positions which have twice caused the conference to break off in a hopeless deadlock. The operators still insist that some provision to prevent future strikes must be incorporated in a new agreement. The union officials still publicly denounce any suggestion that the workers accept arbitration. As a result, the conference, after wrangling for several hours the first day without making any progress toward an agreement, adjourned at 6:30 p.m. to meet again Wednesday, Jan. 27.

Wrangle Over Publicity

At the outset of the Tuesday conference the miners proposed that the sessions be opened to the newspaper reporters. The operators offered an amendment that the publicity representatives of the two sides prepare a statement each day from the stenographic report of the conference, with the understanding that nothing important in the record be omitted from this statement. The miners rejected this amendment. The original motion was then put, the miners voting yes and the operators no, defeating the motion.

Mr. Lewis then offered the Lynett plan and placed in the record the first letter of Maj. W. W. Inglis commenting on this plan. Major Inglis countered with his later communication to Mr. Lynett and, with his letter to Chairman Markle, reiterated the operators' objections. Mr. Lewis moved that the Lynett plan be accepted as a basis for negotiations. The operators voted no on this, killing the proposal. The conference then adjourned for the day.

The call to reconvene the joint conference came as the climax of a week of exciting developments in which the scene of action shifted between Washington, Harrisburg, the anthracite region, New York and Trenton. As told elsewhere in this issue of *Coal Age*, the halls of Congress again echoed with the demands of Congressmen that the government "do something." New Jersey also stepped into the picture for legislative action when Governor A. Harry Moore, in his inaugural address on Jan. 19, recommended the creation of a tri-state commission with power to condemn anthracite coal-bearing lands and to construct another railroad from the region to tidewater. Governor Pinchot's legislative program for regulating the industry was blocked when the House mining committee voted an indefinite postponement of action on the bill to make anthracite coal mining a public utility and made a negative report on the bill authorizing interstate compacts.

Pinchot Bills Get New Chance

Later, however, the Pennsylvania House leaders experienced a change of heart. At a meeting on Jan. 25 it was announced that the bills would be reconsidered. The same evening the Senate committee on mines and mining took action on the Woodward bill to amend the miners' certificate law. The Senate committee struck out the Woodward proposal to repeal the requirement for two years' experience, but changed the law to permit that experience to be acquired outside of the state.

The New Jersey executive, in urging a tri-state commission, condemned the national administration for inaction which permits "a few powerful men" to "snap their fingers in the face of what we are pleased to believe is the greatest government on earth." This inaction, he declared, forced state action, but regulation of anthracite as a public utility was not the solution of the problem.

"With the co-operation of New York and Pennsylvania," said Governor Moore, "a tri-state commission could be set up with power to condemn—acting through the state courts of Pennsylvania—a sufficient amount of lands containing coal to set up competition against the trust. These lands could be leased on very moderate royalties to operators willing to develop the mines in competition with the trust.

Bills to cover Gov. Moore's recommendations, it was later announced, would be introduced Feb. 1.

Adverse action on the Pinchot administration bills by the Pennsylvania House committee on mining followed a public hearing at Harrisburg on Jan. 20 at which the proposals were opposed by representatives of the operators and retail coal men. The attack was led by Walter Gordon Merritt, counsel for the Anthracite Operators' Conference, who told the committee that the Pinchot legislative program was neither feasible nor constitutional. Any attempt by the Public Service Commission or any other agency of the state to control prices would find that agency "as helpless as a child in the face of economic conditions." John T. Brady, Philadelphia & Reading Coal & Iron Corporation: J. A. Kelly, Hudson Coal Co., and Wellington M. Bertolet, Pennsylvania Retail Coal Merchants' Association, also spoke against the bills. "No one," read the Associated Press report of the hearing, "appeared in support of the measures."

The cavalier treatment accorded his recommendations moved Governor Pinchot to a long denunciatory statement, made public Jan. 21, in which he accused the House committee of sharp practice. The Governor contended that proponents of the measures had not been given sufficient notice to prepare statements in support of the bills, but that they had been led to believe that consideration of the measures had been postponed until Jan. 27.

Lynett Offers Plan

The Lynett plan, first published in the Scranton *Times* on Jan. 18, came to the fore last Thursday when Major W. W. Inglis expressed his opinion of the program. The plan itself reads as follows:

(1) The miners resume work immediately.

(2) A five-year contract dating from the time of signing the agreement.

(3) The wages in effect under the last contract to continue during the term of the new contract, unless changed as hereinafter provided.

(4) At the instance of either party, given in writing sixty days before two years have elapsed from the signing of the contract, a conference may be called for the consideration of changes in the agreement on the subject of wages only; the miners to remain at work until the end of the five years' contract, whether the conciliators agree upon a change of wages or not.

(5) One year before the contract expires representatives of the coal operators and miners to meet to devise an arrangement whereby work may be continued at the mines at the expiration of the contract and during the negotiations for a new agreement.

Major Inglis directed his objections to the fourth and fifth paragraphs. "As to paragraph 4," he wrote, "it would appear that after two years no question

Digitized by Google

as to adjustment of wages could be raised by either party; the wages would be fixed for the last three years of a five-year period, although it would be in this latter period that conditions are most in doubt. The provision that the miners are to remain at work whether or not agreement is reached is one for which we have all along contended, and which has been opposed by Mr. Lewis on all occasions.

"We appreciate and welcome your interest in bringing about a settlement. We are already converted to the necessity for some such plan as you suggest with provision against deadlocks, and this can be done without sacrificing any of the miners' rights or interests. The need seems to be to convince Mr. Lewis of this fact."

Mr. Lynett interpreted this reply as an acceptance of his program and conferred with President Lewis of the United Mine Workers, who announced that he was ready to resume negotiations with the Lynett plan as the basis of discussion. A statement from Philadelphia on Friday, however, made plain that the operators had no intention of accepting the Lynett basis. "The Lynett plan," said this statement, "did not contain anything that had not been threshed out in previous conferences. For this reason it does not afford a basis for a renewal of negotiations."

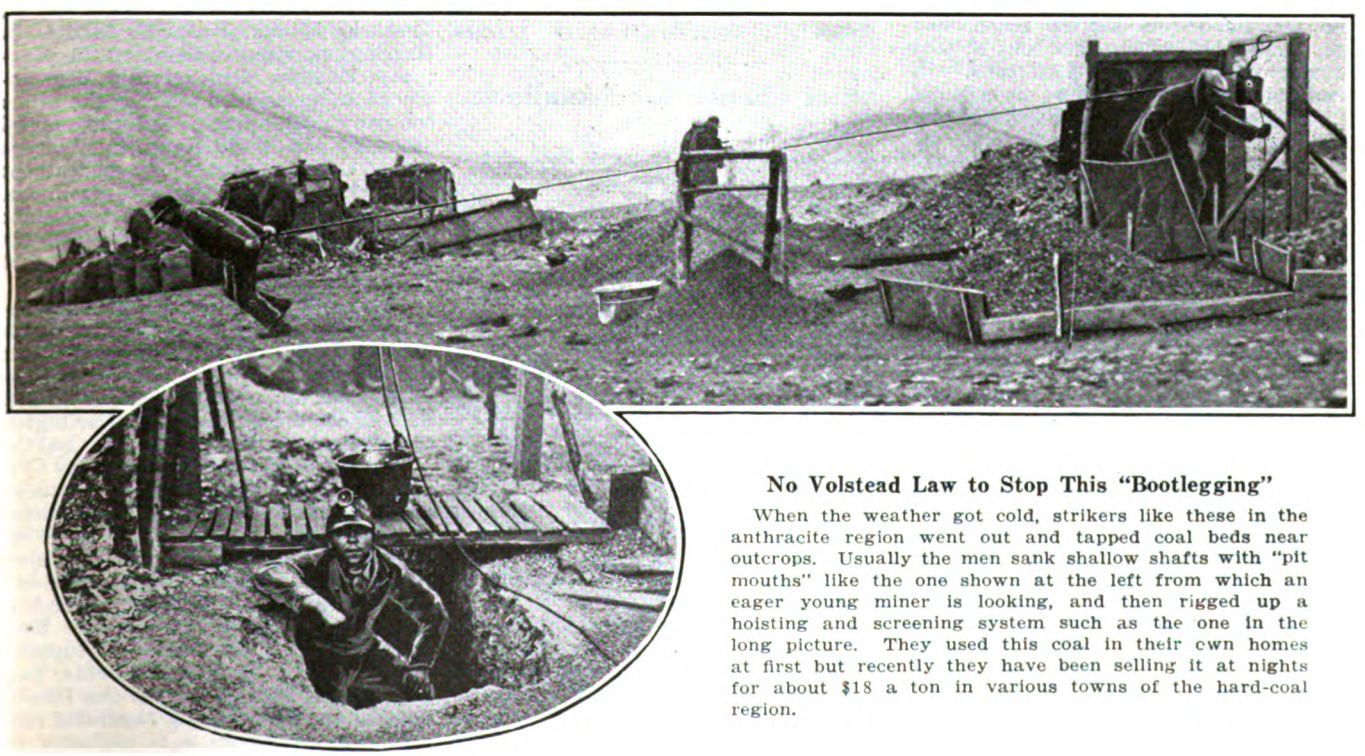
Inglis Answers Lynett

Major Inglis further amplified his position in a second communication to Mr. Lynett, in which he reiterated the objections raised in his first letter. "Your editorial [of Jan. 20]," said Mr. Inglis, "states that 'your plan eliminates arbitration altogether.' Mr. Lewis' letter of Jan. 22 confirms this understanding, while the operators are firmly of the opinion that this feature in some form is absolutely necessary in any workable contract.

John L. Lewis
President of the United Mine Workers

"To now say that I accepted your plan and that the operators conference have repudiated my acceptance is far from the fact. Neither I nor anyone authorized to speak for the operators could have accepted your plan because, as you admitted, it amounted to a five-year contract with no means whatever for avoiding just such deadlocks as the one from which we are now suffering."

To this Mr. Lynett retorted that the reply of the chairman of the operators' negotiating committee was "a weak and puerile repudiation of the expressed and implied approval of *The Times*' plan for settling the strike." Nevertheless, Mr. Lewis held to his desire for a resumption of the joint conferences, and Alvan Markle, chairman, accordingly issued a call for a meeting at Philadelphia on Jan. 26. The operators followed this with a reiteration of their refusal to accept the Lynett plan as a basis of discussion.



Central Penna. Producers Urge Reopening of Lake Rate Case

The Central Pennsylvania Coal Producers' Association on Jan. 25 filed with the Interstate Commerce Commission a petition for re-argument and reconsideration of the Lake cargo coal rate case, supporting the case of the Pittsburgh Coal Producers' Association against railroads carrying coal to the lower Lake Erie ports for transshipment to destinations beyond. The Pittsburgh operators contend that the present rate structure gives preference in rates to West Virginia and Kentucky coal as against Pennsylvania coal.

The Central Pennsylvania Coal Producers' Association stated in the petition that it represents miners and shippers of bituminous coal in the Lake cargo origin freight rate groups of Reynoldsville, Freeport, Blairsville, Indiana County, Bellwood, Vintondale, Altoona, Spangler, Cherry Tree and Clearfield.

The Northern West Virginia Coal Operators' Association will enter a protest with the Interstate Commerce Commission against reopening the lake coal-carrying rate case. Petitions against reconsideration already have been filed by the Michigan Public Utilities Commission, the Minnesota Railroad and Warehouse Commission; Brackett's Coal Statistical Organization, Fairmont, W. Va.; By-Product Coke Corp., Chicago; Northern States Power Co., Minneapolis; St. Paul Association of Business Affairs, Wisconsin Steel Co., Connelisville coke shippers, numerous shippers in West-Virginia and Kentucky and several railroads.

Progress is being made in the statewide safety campaign, according to Robert M. Lambie, of Charleston, chief of the West Virginia Department of Mines. It is reported that 7,000 miners attended the first eighteen meetings that were held in the state.

No Volstead Law to Stop This "Bootlegging"

When the weather got cold, strikers like these in the anthracite region went out and tapped coal beds near outcrops. Usually the men sank shallow shafts with "pit mouths" like the one shown at the left from which an eager young miner is looking, and then rigged up a hoisting and screening system such as the one in the long picture. They used this coal in their own homes at first but recently they have been selling it at nights for about $18 a ton in various towns of the hard-coal region.

Soviet Spends $2,000,000 in U. S. for Mining Machinery

American coal mining machinery valued at $2,000,000 was purchased for Soviet mines in the Donetz basin by the technical commission which has returned to Moscow after purchasing equipment in America, Germany and England. The figure is given in the report of the Commission, received by the Russian Information Bureau at Washington, D. C. With the aid of the new equipment it is planned to increase coal production in the Soviet Union 43 per cent this year.

The report states that the bulk of the equipment purchases made abroad, including 150 of the 196 coal-cutting machines, came from the United States. Other American equipment bought included electric mine lamps of the latest type, automatic appliances for drawing mine cars, automatic appliances for closing mine doors, etc. Part of the equipment has already been shipped. The terms of the principal purchases were 60 per cent cash and 40 per cent after five months.

The report adds: "The acquirement of highly-improved American coal-cutting machines of Jeffrey and Sullivan manufacture is particularly important for the Donetz basin. The Sullivan Machinery Co. will send a special instructor to the Soviet Union to supervise the installation. The coal-cutting equipment, the first to be employed in the Donetz mines, effects an enormous increase in operating efficiency, each machine taking the place of 25 coal hewers."

British Output and Exports Of Coal Wane in 1925

Output by British coal mines during 1925 was nearly 25,000,000 tons lower than in the preceding year. Up to Dec. 12, with ten or twelve working days to be accounted for, British mines had produced 237,150,300 gross tons of coal during the year. The final total will run below 250,000,000 tons, as against 273,260,900 in 1924 and 282,354,900 in 1923. For 16 of the first 20 weeks of the year production ran beyond 5,000,000 tons per week, but beginning with the 21st week that figure was not reached again until the end of November, when anticipation of the holidays caused workers to turn out heavier tonnage.

In 11 months 46,185,067 gross tons was exported, or 10,300,000 less than during the corresponding period of 1924 and 27,000,000 below the unusual export of 1923. Of the decline in 1925, 8,300,000 tons represented the lower takings of only four countries—Germany, Netherlands, Belgium and France.

Values show the position even more unfavorably, the proceeds for 11 months of 1925 amounting to £46,201,851 at a quotation of £1 8d. while the corresponding period of 1924 gave £66,507,781 at £1 3s. 6½d., and 1923 had £92,659,201 at £1 4s. 1d. In two years the decline in the value of export coal alone reduced the offset to British imports by over $230,000,000.

Philadelphia Engineer's Office Seeks Coal Bids

Bids for approximately 15,000 gross tons of semi-bituminous coal will be received by the U. S. Engineer's office at Philadelphia until noon, Feb. 17. The coal is for use on the floating plant for the maintenance and improvement of existing river and harbor works during the period April 1, 1926, to March 31, 1927.

Kentucky Coal Output Gains 10,000,000 Tons in 1925

Coal output by Kentucky mines in 1925 totaled 53,217,065 net tons, according to an estimate by W. H. Jones, chief of the state Department of Mines. These figures, based on reports received up to Jan. 15, 1926, indicate an increase of nearly 10,000,000 tons in production over the preceding year. Output by counties during the last three years was as follows, in net tons:

	1923	1924	Estimated 1925
Bell	2,276,098	1,859,055	2,239,443
Boyd	119,688	125,142	48,365

Slim Chance for Woodlock

Senate leaders last week took up consideration of a request that President Coolidge withdraw the nomination of Thomas F. Woodlock, of New York, as a member of the Interstate Commerce Commission.

The Senate Interstate Commerce Committee on Jan. 23 again questioned Mr. Woodlock, who received a recess appointment last spring after the Senate twice had failed to act upon his nomination. Opposition is based largely upon his statement that he has voted the Republican national ticket since 1916. Under the law a Democrat must be appointed to fill the place to which Mr. Woodlock was named.

Unofficial polls of the Senate are said to have disclosed that it is doubtful whether Mr. Woodlock's nomination could be confirmed.

A favorable report on the nomination of Charles W. Hunt, of Iowa, to be a member of the Federal Trade Commission was voted Jan. 21 by the Senate Interstate Commerce Committee.

Penna. Compensation Claims In 10 Years $108,690,846

The workmen's compensation system in Pennsylvania completed its first decade on Jan. 1 and coincident with the event the bureau of workmen's compensation of the State Department of Labor and Industry issued its annual report for 1925. It was the first state report issued this year, and it contains a summary of the work of the past ten years, prepared by William H. Horner, director of the bureau.

The report shows that in 1925 176,392 accident cases were reported, including 2,022 fatal cases. Of these fatalities, 792 occurred in the mines of the state, 831 in industrial plants, 319 among the public utilities companies and 80 were attributed to state and municipal agencies. Compensation payments were authorized in 80,261 cases and the total amount of compensation incurred in these cases was $12,748,266, $5,397,192 of this being in fatal cases.

Since the compensation law became effective, on Jan. 1, 1916, 1,836,681 accidents have been reported to the bureau. Of this number, 24,699 were fatal.

From Jan. 1, 1916, to the first day of this year a total compensation liability of $108,690,486, covering 692,863 cases, has been incurred by the employers or their insurance carriers, $54,374,855 of this being in fatal cases. In fatal and permanent disability cases the total amount provided by the agreements and awards is $75,645,325. Of this total $37,785,380 has been paid, leaving unpaid obligations amounting to $37,859,945.

Kentucky Utilities to Buy Power Company

C. F. Richardson, president of the West Kentucky Coal Co. and the West Kentucky Electric Power Co., and L. B. Herrington, vice-president of the Kentucky Utilities Co., recently consummated an agreement whereby the latter company will purchase all the capital stock of the West Kentucky Electric Power Co. As a part of the deal the Kentucky Utilities Co. gets from the coal company a large tract of land bordering the Ohio River near Sturgis, where there is an abundance of good coal and water.

The Kentucky Utilities Co. also contracted to furnish all electric power used in the operation of the coal mines and other enterprises of the West Kentucky Coal Co. and agreed to buy all of its coal for the Paducah and Earlington plants from the West Kentucky Coal Co.

The mines of the West Kentucky Coal Co. are the largest in western Kentucky and are heavy users of power. Besides supplying the coal mines, the West Kentucky Electric Power Co. furnishes electric service to Earlington, Morton's Gap, Wheatcroft and Sturgis, and to the transmission system of the Kentucky Utilities Co. It also supplies water to the cities of Madisonville, Earlington and Sturgis and to the Illinois Central and Louisville & Nashville railroads.

Hands-Off Policy Wavers in Congress; Coal Legislation Unlikely to Pass

By Paul Wooton
Washington Correspondent of *Coal Age*

Sentiment in Washington early last week seemed to indicate that it was not certain that Congress would continue indefinitely to follow the President's policy of non-intervention in the hard-coal strike. When the second deadlock in peace negotiations between the operators and union leaders came and it was recognized that the Pennsylvania Legislature would do nothing there was insistent demand on each side of the Capitol for action. Now that conferences have been resumed, however, it is probable that action will be deferred awaiting the outcome.

Charges by Senator Reed, of Pennsylvania, that retail coal dealers are profiteering caused the District of Columbia Committee of the Senate to launch into an investigation of coal prices in Washington.

Senator Oddie, one of the administration regulars, plainly is becoming impatient. He is doing his best to conform to the administration policy but is being accused of strangling his own child in committee. He recognizes that there would be little opportunity to pass his bill without administration support, so is loath to add needlessly to the agitation by opening hearings. He does feel, however, that the executive branch in giving him no indication of what it thinks of his bill is leaving him to hold the bag.

Senator Borah made this point in the course of the debate in the Senate:

"In my opinion the fault of the situation lies here in the Congress rather than with the President. I think it up to the Congress of the United States to find the power if it exists; if it does not exist, to provide by a change of the instrument under which we live that it may exist, to the effect that people cannot seize the great natural resources of the country, without which we cannot live, and conduct them as if they were purely private affairs. It is impressed with a public service, and the government has the right to impress upon it the stamp of a public service. In time we will have to take that position in order to protect the people of the United States."

Freight Rates Attacked

Senator Reed and Senator Willis, of Ohio, told the Senate that freight rates are unduly preferential to the non-union mines. This led inter-mountain Senators to urge them to support the Gooding bill, prohibiting departures from the long-and-short-haul clause of the Interstate Commerce Act.

Senator Sackett, of Kentucky, denied that the long-haul rates to the lakes are lower but that the Southern mines gradually have been able to acquire some lake business and have been able to afford an opportunity to the people of the Northwest to buy coal on a competitive basis.

Senator Reed also had this to say:

"It has been intimated that the present situation is a conspiracy between the operators and the miners to force a higher price on a long-suffering public. The very consideration of the situation in the hard-coal region shows the absurdity of that suggestion. The miners' suffering, the suffering of those people who are dependent upon them, and the suffering of all the community which owes its livelihood to this industry is so much greater than any possible increase in wages over the next five years could compensate for that it is obvious that the men have not entered into any such conspiracy. The losses of the operators during this period of suspension are so much greater than any possible increased profit during the next few years could compensate them for that it is equally obvious that they are not conspiring by that small profit to overcome the enormous present losses. The suggestion disproves itself."

Profiteering Charge Sifted

The Pennsylvania Senator's remarks as to profiteering on the part of retailers was prompted by a letter he received from the Clinton Block Coal Co., of Pittsburgh. In the letter exception was taken to an example cited by Senator Copeland where soft coal had cost $17 a ton in Richmondville, N. Y. The Clinton company pointed out that nut and egg coal is selling for $3 at the mine in the Pittsburgh district. The freight rate was added to show that the Richmondville retailer's margin was $10.

Regret is expressed, however, that the Pennsylvania Senator should have attempted to defend coal producers by accusing retailers generally of profiteering. Such tactics have been resorted to by each branch of the industry in the past to the damage of all. Past experience has shown that it breeds popular suspicion when such charges are made by those who supposedly know the inside of the business.

In subsequent remarks Senator Reed, in pointing out the spread between the mine price and the price charged the ultimate consumer in the District of Columbia, failed to state that he was comparing net ton run-of-mine with a delivered gross ton of prepared fuel and that the business is accompanied by unusual risks in that a sudden end of the strike would leave the retailers with unsalable stocks.

Despite talk at the Capitol, it is apparent that any legislation which may be taken up will have a slim chance to get through. With the end of winter not far away and with consumers imbued as never before with a determination to get along, it is doubtful if any coal bill can be put on the statute books even were it to be given the administration's support.

Coal specialists in Washington are divided as to the probable duration of the strike. Some think the men are so anxious to see the mines resume operation that they are willing to leave the settlement to arbitration. Unless Mr. Lewis recognizes this sentiment, they believe, the anthracite miners will demand autonomy, so that their own union may carry out such a program.

Others feel that the strength of the union is being underestimated and that the men still are loyal to the Lewis leadership and will make no concessions in the near future.

Nova Scotia Wage Parley To Begin Feb. 1.

Negotiations preliminary to drawing up a new wage scale and working agreement between the British Empire Steel Corp. and the miners of District 26, United Mine Workers, which were held in abeyance pending the result of the Duncan Royal Commission report on the coal industry of Nova Scotia, will be entered into on Feb. 1, when a joint meeting of the Corporation and United Mine Workers executives will be held at Glace Bay.

The date was set by the union officials to follow the annual district convention of mine workers at Sydney, C. B., beginning Jan. 26, at which the commission's report was to be discussed.

These Illinois Mines Lost Much Business in 1925

Although the 79 mines in the Fifth and Ninth Districts of Illinois, reporting to the Coal Operators' Association, have shown an increase in tonnage during November and December of 249,942 tons as compared to the same months in 1924, nevertheless these mines lost on the year's business 1,003,771 tons when compared with the preceding year.

Forty of the 79 mines worked an average of 36.12 per cent and stood idle 63.88 per cent of the time during the year. Thirty-nine of the mines were idle the entire year. Considering the 79 mines together, they have worked 18.3 per cent of possible working time during the year. In 1923 these 79 mines produced 12,823,138 tons. The 1925 output when compared with that of 1923 shows a loss of 3,256,095 tons.

West Virginia's 1925 Output Breaks All Records

Coal output in West Virginia in the calendar year 1925, according to a preliminary estimate, totaled more than 112,000,000 tons, the largest in the history of the state. Production by some of the fields was approximately as follows: Northern West Virginia, 24,000,000 tons; Pocahontas and Tug River, 25,000,000 tons; Winding Gulf, 9,000,000 tons; Williamson, 10,000,000 tons; Logan, 18,500,000 tons. Gains over 1924 in the New River district were about 2,700,000 tons; in the Kanawha field, 2,000,000 tons; Coal River, 800,000 tons; Logan, 2,500,000 tons.

* The term "coal" as here used includes lignite, and the production stated for the world is simply the total of quantities reported, no attempt being made to reduce the statistics for inferior coals to an equivalent tonnage of coals of higher rank. Where possible, however, coal and lignite are shown separately.

a/ Estimate included in total. b/ Includes a small quantity of asphaltite. c/ Exclusive of the output of the State of Falcon (about 8,000 tons), for which estimate is included in total. d/ Includes entire output of Upper Silesia for January-May inclusive: for June-December, inclusive, only that part of the province allocated to Germany. e/ Includes the output June-December, inclusive of that part of Upper Silesia allocated to Poland. f/ Russia in Asia included under Russian Europe. g/ Data for operating year, Oct. 1, 1923, to Sept. 30, 1924.

Annual World Production of Coal, 1911-1924

(In Metric Tons)

Year	Production (In Part Estimated)	Per Cent Produced By United States	Year	Production (In Part Estimated)	Per Cent Produced By United States
1911	1,189,000,000	37.9	1918	1,333,000,000	46.3
1912	1,249,000,000	38.8	1919	1,173,000,000	42.8
1913	1,342,000,000	38.6	1920	1,319,000,000	45.3
1914	1,207,000,000	38.7	1921	a 1,134,600,000	40.4
1915	1,193,000,000	40.5	1922	a 1,225,500,000	35.3
1916	1,291,000,000	41.5	1923	a 1,359,900,000	43.9
1917	1,356,000,000	43.6	1924	a 1,354,300,000	38.3

a Revised from earlier reports to conform with more accurate information on certain of the warring countries.

Engineers Adopt Ambitious Public Service Program

Dean Dexter S. Kimball of Cornell University was elected president of the American Engineering Council at the annual meeting of the Council in Washington, Jan. 13 to 15. Dean Kimball, past president of the American Society of Mechanical Engineers, succeeds former Governor James Hartness of Vermont. Gardner S. Williams, of Ann Arbor, Mich., and Irving E. Moultrop, of Boston, were named vice-presidents. Mr. Williams being re-elected. Dr. Harrison E. Howe, of Washington, was re-elected treasurer, and Lawrence W. Wallace, of Washington, was again chosen executive secretary, a post he has held since the organization of the Council.

At its Washington meeting the Council approved a public works bill to be introduced in the Senate by Wesley L. Jones, of Washington, and in the House by Adam M. Wyant, of Pennsylvania. This measure would change the name of the Department of the Interior to the Department of Public Works and Domain. Four assistant secretaries are provided for, and numerous transfers to the new department of boards, bureaus, commissions and officers are made.

Plans for an organized attack on the problems of industry and agriculture, aiming to wipe out waste and to forestall possible economic disaster through dwindling labor supplies and crippled production, were framed. Five years would be required to carry out this program of research, continuing on a more extensive scale the "Assay of Waste" conducted by the Council in 1921 under the presidency of Herbert Hoover, Secretary of Commerce.

The Assembly of the Council adopted recommendations of the administrative board declaring "that the government should not trespass upon the field of industry unless it can be satisfactorily shown that the government can better engage in that business than private enterprise can."

It was voted to postpone action on the giant power report until further consideration could be given to it.

Future fuel supplies for the nation's industries and homes must be won through reforestation, Dean Mortimer E. Cooley of the University of Michigan, past president of the Council, said in an address at the closing session of the Assembly.

A large and distinguished gathering of engineers, public officials, economists and men of science attended the annual dinner of the Council at the Chevy Chase Club on the evening of Jan. 14. Vice-President Williams presided. The principal speakers were Secretary Hubert Work of the Department of the Interior, and Daniel R. Crissinger, Governor of the Federal Reserve Board. Secretary Work declared his agreement with the essentials of the public works bill. President Kimball also spoke.

The National Safety Council has moved its offices in Chicago to 108 East Ohio St. The transfer was made Jan. 1, 1926.

A.I.M.E. Will Discuss Coal Washing and Ventilation

When the 133rd session of the American Institute of Mining and Metallurgical Engineers meets, Feb. 15-18, at the Engineers' Societies Building, New York City, an outstanding interest will be the discussion of the progress and theory of mine ventilation, to which two sessions are to be devoted. Air-sand flotation, where coal floats on a sand stratum suspended in the air, is one of the interesting developments. It will be presented for the first time at this session.

The meeting on that subject, with G. S. Rice in the chair, opens Feb. 15 at 9:30 a.m., and after his report and that of E. A. Holbrook, the secretary, Graham Bright will report for the subcommittee on fans and L. W. Huber will speak on "Mine Fan Characteristics." Ole Singstad will make an address on the New York-New Jersey Vehicular Tunnel. The afternoon session will be steered by R. R. Sayers, who will open with a report on the proposed activities of the subcommittee on physiological studies and an address on "Permissible Limits of Toxic and Noxious Gases in Mine and Tunnel Ventilation."

A. C. Callen will report on the present and future activities of the subcommittee on the physics of ventilation, and G. E. McElroy will discuss the report of the British Institution of Mining Engineers on the "Theory of Ventilation." Frank Haas will present a report on the present and future activities of the subcommittee on coal-mine ventilation, for which discussion is being prepared by E. A. Holbrook, J. W. Paul, D. Harrington and others. B. B. Gottsberger will make a report similar to that of Mr. Haas but in regard to metal mining, and G. E. McElroy will discuss that subject.

On Tuesday under C. M. Lingle's leadership a report will be made by H. N. Eavenson for the coal and coke committee. On Wednesday R. H. Sweetser will preside at a meeting in the course of which T. M. Chance will describe the "Mt. Union Sand Flotation Plant for the Preparation of Bituminous Coal." Thomas Fraser will describe the newly developed "Air-Sand Process of Cleaning Coal." A. C. Fieldner will deliver an address on the "Relation of Ash Composition to the Uses of Coal" and A. C. Noe one on "Coal Balls." "The Explosibility of Coal and Other Dust in a Laboratory Steel Gallery" will be discussed by V. C. Allison.

The committee on education will meet at luncheon at 12:15 and a round-table discussion led by E. A. Holbrook will follow. The industrial relations committee at 2 p.m. will canvass the question of "Employee Stock Ownership" under the direction of C. A. Meissner and the leadership of George E. Roberts, of the National City Bank. H. N. Eavenson will discuss "Coal-Mine Subsidence" in the ground movement and subsidence meeting, also at 2 p.m. W. E. Fohl will assemble a committee at the same moment to study the methods for the drilling of oil and gas wells through coal beds.

On Monday evening a smoker will be held at the Mecca Temple Mosque and on Wednesday the annual banquet is scheduled. On Thursday the members will motor up the Hudson River, across the Bear Mountain bridge and back. The ladies will have a continuous program of entertainment throughout the meetings. It may be added that all those interested in the matters discussed by the various committees of the A. I. M. E. to which reference has been made are welcome to attend and take part in the proceedings.

Straw Briquets Seen As Minor Rival to Coal

Straw compressed into briquets under 833 lb. pressure per square inch in laboratory experiments at the Kansas State Agricultural College, Manhattan, Kan., has proved to have about one-half the heating value of coal and may partly supplant it as a fuel in midwestern homes, according to W. H. Sanders, professor of agricultural engineering of the college.

Professor Sanders has invented a machine that can be constructed at little cost, operated on the same principle as a hay baler, which has had fair success in this undertaking. Professor Sanders says that under tests at the college engineering department it was found that 70 per cent of the heat content of the straw was utilized.

Would Probe Coke Prices In New York State

Investigation by the State Coal Commission of the price of coke and the marketing thereof in New York State is provided for in a resolution introduced in the State Senate at Albany Jan. 20 by John J. Dunnigan, Democrat, of the Bronx, New York City.

The resolution recites that "It is charged that the price of coke at the ovens both inside and outside the state is $12 a ton, whilst the freight rate from ovens in the City of Troy to the City of New York is $2.39 per net ton with comparative freight charges to and from other points. Despite this cost of $14.39 or thereabouts to the dealer, the latter is retailing coke in bushels in New York City and Westchester at 70c. or at a rate per ton of from $22 to $28, thereby realizing a profit of from $8 to $14 on the ton. It is obvious that such a charge to the consumer is exorbitant and is permissible only because the retail business is unregulated and unrestricted."

The resolution was referred to the Committee on Finance.

Resumption of dividend payments on the preferred stock of the Consolidation Coal Co. was announced Jan. 20. Directors declared a dividend of $1.75 a share, payable Feb. 20, to stockholders of record Feb. 10. This dividend was due to have been paid June 1, 1925. A total of $3.50 in dividends is overdue on this issue.

December Coke Production Highest On Record

Output of byproduct coke in the United States during December, according to reports by the operators to the U. S. Bureau of Mines, amounted to 3,760,000 net tons, an increase of 203,000 tons, or 5.7 per cent, compared with the preceding month. During the month of December, the daily output increased to 121,305 tons, a gain of 2,729 tons, or 2.3 per cent, compared with the November rate. The coke plants operated at about 91 per cent of capacity. With the inclusion of the new plant at Troy, N. Y., and the rebuilt plant at Chester, Pa., the total number of byproduct plants now in existence is 80, of which 74 were active during the month. The current output is the highest on record for any month.

Beehive coke production continued to increase during December, the total being estimated at 1,307,000 net tons, an increase of 94,000 tons, or 7.7 per cent, compared with the month of November.

Production of all coke amounted to 5,067,000 tons, the byproduct plants contributing 75 per cent, the beehive plants the remainder.

Monthly Output of Byproduct and Beehive Coke in the United States*

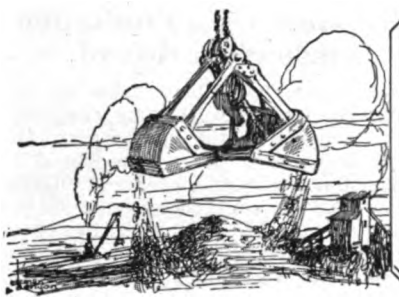
(In Thousands of Net Tons)

	By-product Coke	Bee-hive Coke	Total
September, 1925.....	3,185	746	3,931
October, 1925.....	3,402	1,006	4,408
November, 1925.....	3,557	1,213	4,770
December, 1925.....	3,760	1,307	5,067
1923 monthly average....	3,133	1,615	4,748
1924 monthly average....	2,833	806	3,639
1925 monthly average....	3,332	893	4,225

* Excludes screenings and breeze.

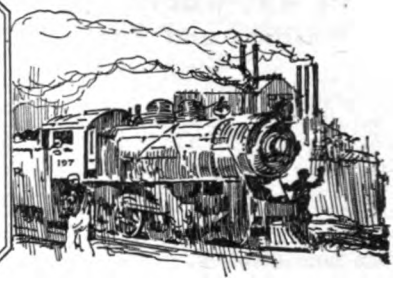
The total amount of coal consumed in both beehive and byproduct coke plants amounted to 7,465,000 tons, 5,403,000 tons being consumed at byproduct plants, and 2,062,000 tons at beehive plants. This December total is 435,000 tons greater than the monthly average for 1923.

Estimated Monthly Consumption of Coal in Manufacture of Coke



(In Thousands of Net Tons)

	Consumed in By-product Ovens	Consumed in Beehive Ovens	Total Coal Consumed
September, 1925.....	4,576	1,177	5,753
October, 1925.....	4,888	1,587	6,475
November, 1925.....	5,111	1,913	7,024
December, 1925.....	5,403	2,062	7,465
1923 monthly average....	4,523	2,507	7,030
1924 monthly average....	4,060	1,272	5,332
1925 monthly average....	4,787	1,371	6,158



Of the total output of byproduct coke during December, 1925, 3,118,000 tons, or 82.9 per cent, was made in plants associated with iron furnaces, and 642,000 tons, or 17.1 per cent, was made at merchant or other plants.

Removal of coal from deposits on public lands without having obtained the necessary rights under the Minerals Leasing Act is made a misdemeanor in a bill proposed by Representative Sinnott, chairman of the Public Lands Committee. The bill was introduced at the request of the Interior Department.

Production And the Market

Strong Demand Absorbs Soaring Coal Output; High Coke Prices Rouse Criticism

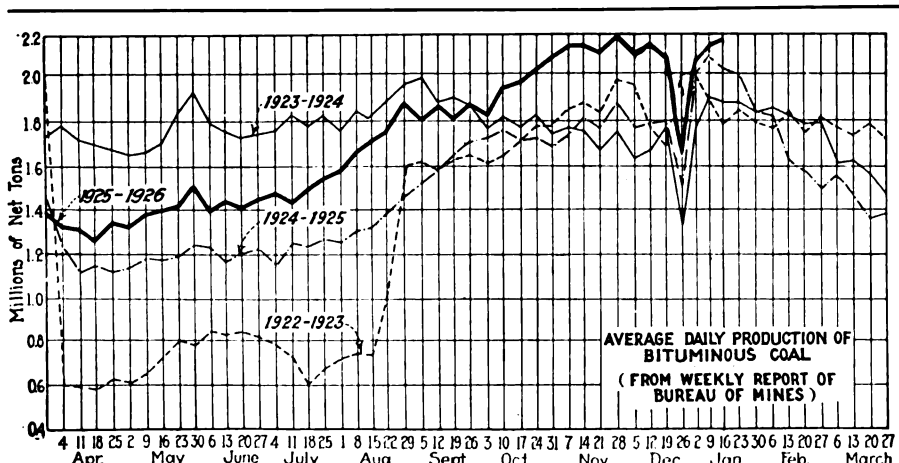
The temper of the spot bituminous coal market as January draws to a close shows a sharp territorial division. In the Middle Atlantic and New England states activity is largely controlled by developments in the anthracite strike controversy. In the states farther west the weather is the dominant factor. This is true not only of the domestic business but also is highly influential in the trend of open-market industrial buying.

The bulk of the business, however, does not appear in the spot market. It shows up when production figures are made public. This under-cover purchasing, either on contract or through channels so silent that the same relationship might just as well exist, and the heavy shipments from captive operations account for the record outputs during the present month. Output in the week ended Jan. 16, according to the Bureau of Mines, totaled 13,073,000 net tons. Revised figures for the week preceding were 13,030,000 tons.

Buying Reaches Record Proportions

When it is remembered that the maximum record, made in the week ended Oct. 25, 1919, was only 13,344,000 tons and that the 13,000,000-ton mark was passed just twice in the six years following, the record of the current month becomes significant. Part of this heavy output, of course, represents the substitution of bituminous coal for anthracite, but this substitution does not cover the major increases. These must be credited to a sustained industrial demand that gives real substance to the reports of national prosperity and holds out hope for better things to the bituminous coal trade.

There is still, however, a slight maladjustment between prices and demand, except in cases where the former are rigidly maintained as a matter of principle and trade stability. Gambling on the weather in the West and on the turn of the anthracite negotiations in the East, both buyer and seller have at times overplayed their hands. Reluctant purchasers of West Virginia low-volatile lump and egg have paid for their tardiness in higher prices. Over-eager shippers of screened coal from the Appalachian field have found slack backing up on them. "No bills" are still the rule at Middle Western mines and the Southwest and the Far West do not escape.



Price Bulges Not Unmixed Evil

But the price situation is not without its compensations. The extra demand put upon low-volatile West Virginia coals in the territory opened up by the emergency all-rail rates has reacted to the benefit of the sorely distressed central Pennsylvania field. A number of consumers, rebelling against $6 and $7 Pocahontas and New River lump on the one hand and $12 and $13 coke on the other, have turned to Pennsylvania for relief. Some of the high-volatiles also have enjoyed a wider market because of price differentials.

More criticism is leveled at the coke ovens than at any other factor in the trade at the present time. The critics are a unit in denouncing current quotations as distinctly out of line. When blast furnaces controlled by coke producers are banked so that the coke tonnage may be diverted to the domestic market at sky-rocketing prices, even the best friends of the coke people are convinced that the ovens are injuring their own future.

Coal Age Index of spot prices of bituminous coal on Jan. 25 stood at 178, the corresponding price being $2.16, compared with 181 and $2.20 on Jan. 18.

Dumpings at Hampton Roads dropped to 407,625 net tons the week ended Jan. 21. The total the preceding week was 433,560 tons.

Mid-West Pins Hopes on Weather

Middle Western producers are hoping that the week-end cold snap will quicken a sluggish trade. Illinois operators are holding to established prices in the face of badly broken running time and a heavy accumulation of "no bills." The market on screenings again has declined despite curtailed output. Some Indiana operators are so well sold up on lump that they will accept additional orders only when the buyer will take smaller sizes as well. Western Kentucky prices have slumped in sympathy with a further weakened demand.

From the standpoint of the Chicago trade, the smokeless shippers are the only ones who are benefiting from the situation arising out of the anthracite strike. Nevertheless Pocahontas lump is still offered freely in the Western market. West Virginia bituminous operators are making bargain-counter offers on large lump in order to keep their mines going to take advantage of Eastern demand for the smaller prepared sizes. Slack, too, is backing up on some of these shippers.

There is little activity in the eastern Kentucky fields. Prices have been helped somewhat by complaints of car shortage, but no great buying pressure has been exerted.

Reports from the southern Illinois mining fields show that there has been a slight increase in the movement of lump coal since colder weather set in, but egg is still draggy and nut and screenings are distinctly slow. There seems to be ample transportation facilities to take care of current demand.

During the holiday period there were further curtailments in operations at the shaft mines in the Franklin, Williamson and Saline County districts. The past few days, however, have witnessed a slight improvement. Stripping mines still have the better of the argument in so far as steady running time is concerned although the snow and ice last week slowed up work at the pits.

Light railroad buying has been taking toll of the deep mines in Jackson and Duquoin, as well as in the Franklin and Carterville fields. There is still a large accumulation of unbilled coal at the mines—a handicap under which Perry and Jackson Counties have labored for many months.

Mt. Olive domestic sizes have been in better demand the past few days, but steam trade is backward. Prices on prepared coals in the St. Louis market were cut from $2.75 to $2.50 ten days ago and there are reports that one or two southern Illinois producers have started shading prices.

The market on Standard screenings is down to $1@$1.10, with demand very light. Mines relatively free of "no bills" are holding 2-in. lump to a $2.10 minimum. The domestic demand, however, is concentrated on 6-in. coal. Railroad buying is light. Mines doing 50 per cent or better in the

Coal Age Index of Spot Prices of Bituminous Coal F.O.B. Mines

	1926			1925
	Jan. 25	Jan. 18	Jan. 11	Jan. 26
Index	178	181	180	173
Weighted average price	$2.16	$2.19	$2.18	$2.09

This diagram shows the relative, not the actual, prices on fourteen coals, representative of nearly 90 per cent of the bituminous output of the United States, weighted first with respect to the proportions each of slack, prepared and run-of-mine normally shipped, and second, with respect to the tonnage of each normally produced. The average thus obtained was compared with the average for the twelve months ended June, 1914, as 100, after the manner adopted in the report on "Prices of Coal and Coke: 1913-1918," published by the Geological Survey and the War Industries Board.

matter of running time are the fortunate exceptions to the general rule.

In the St. Louis local market, domestic demand has recovered from the holiday slump. The poorer sections of the city are buying some Standard coal, but the bulk of the tonnage moving through retail channels is of higher grade. There is a fair demand for smokeless coal and a brisk call for coke. Medium grades are moving to the country trade. Illinois, northwestern Missouri and Iowa are in the market for western Kentucky coals. Carload steam demand in St. Louis territory is weak.

Higher Temperatures Hurt Kentucky

Mild weather on the heels of the holiday lull has hit the Louisville market a sharp blow. Eastern Kentucky appears to have suffered more in the slump than the western part of the state. Some eastern block has been quoted as low as $2.40, although the general range has been $2.50@$2.75, with some well-known brands commanding as high as $3.25.

The heavier demand for prepared coal prior to the recent slump is reflected in the market on screenings. Large industrial consumers are playing a hand-to-mouth buying game, relying upon stockpiles to beat any brief bulges in prices and replenishing their reserves on the downward dips of the market. Producers are hopeful that the heavy industrial consumption of fuel will force the steam plants to buy more freely. The industrial purchasing agents, however, seem to be acting on the assumption that the price trends the rest of this coal year will be a repetition of those of preceding years.

Despite some anxiety in recent months, the car situation on the whole has been favorable. Labor, too, is plentiful and apparently contented. There has been some slowing up in strip-pit mining because of weather conditions, but that is expected at this time of the year.

Dock Operators Marking Time

It has been largely a case of marking time on the part of the docks at the Head of the Lakes since the middle of the month. Mild weather has taken the edge off the consumers' desire to purchase coal. Both the retailers and the steam coal buyers in Minnesota, northern Wisconsin and North Dakota, who received substantial shipments during the first half of January, are niggardly in placing additional orders.

Retailers justify their policy on the ground of credit conditions. For their part, dock operators are not inclined to force the situation as they, too, are watching collections closely. As a result, there are fewer past due accounts on the books than for several years.

Notwithstanding the tendency toward shipments in small lots, the total movement has been comfortably large. Prompt service by the railroads has made it possible to keep the trade supplied. Nevertheless, the docks are making special efforts to reduce the accumulation of coal carried. These stocks are estimated at 4,900,000 tons. Only two dock operators have any anthracite on hand. That tonnage is confined to a limited quantity of chestnut, reserved for consumers with base-burner stoves.

The movement of Pocahontas coal for domestic purposes has been steadily increasing. Reserve stocks, however, are liberal and the market is easier, although prices have not been cut. In view of the failure of anthracite operators and miners to come to an agreement, it is felt that there will be no occasion to shade these quotations, which stand at $8.50, f.o.b. docks, on lump, egg and nut and $5 on mine-run. Kentucky screened lump is $6@$6.50; stove, $6@$6.25; dock-run, $5.75@$6, and screenings, $4.25.

Dock managers and retail dealers report the fuel situation in Milwaukee unchanged. There is plenty of bituminous coal, and consumers are having no difficulty in procuring coke and Pocahontas. The local coke plant is allocating to dealers in order to insure proper distribution under the circumstances, and so far as can be seen there is no likelihood of any hardship for the public on the score of fuel shortage.

Mercury Helps Southwest Markets

Again winter has come to the aid of Southwestern operators. Business is beginning to pick up in Arkansas, and Kansas lump, the price of which had begun to break, again is held steady at $5. Production has been steady through the season. While the winter has been mild, low temperatures have cleared tracks of "no bills" periodically and stacked up orders sufficient to carry operators well into another period of warm weather.

In the late domestic depression, when Kansas lump was quoted off 25c. by some operators, screenings were advanced to $2.50 by many, with a tendency, as lump began to move, to revert to $2.35.

Colorado mines still struggle under the handicap of retarded domestic buying induced by unseasonable temperatures in Missouri River territory. For the field as a whole the running time does not exceed 80 per cent. There is a surplus of unbilled domestic loads on the mine tracks awaiting buyers. The steam coal market, too, is backward. Prices remain unchanged.

Utah Has Good Demand from Pacific Coast

The coal business is improving in Utah following the first real snowstorms of the present winter season. Stove coal was in greater demand than any other size immediately prior to the coming of the snow, but this size is expected to give way now to furnace and domestic lump. Some of the producers are behind on their stove orders. A good demand from the Pacific Coast contributed to a considerable extent to the scarcity.

Slack, too, has been none too plentiful, but with the increased working time at the mines, which the more wintry weather will make possible, this situation is expected to improve at once. There is plenty of coal on hand at some of the mines, if not all, and many "no bill" cars on the tracks, including various grades of coal. Prices remain steady, the car situation is satisfactory and there is an abundance of labor at the mines.

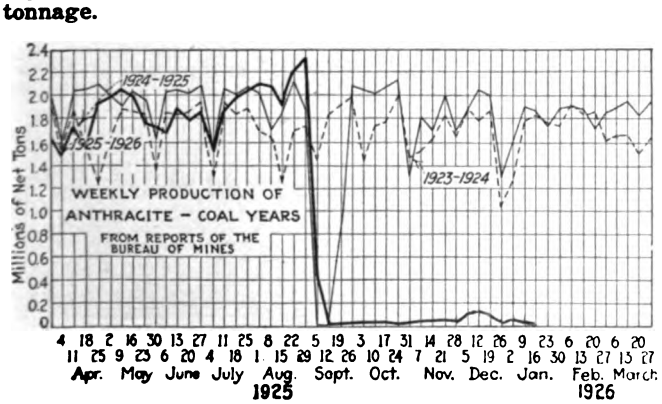
Cold Snap Saves Cincinnati Trade

A cold snap the latter part of the week arrived just in the nick of time to save the price list in Cincinnati from what might have been positive embarrassment. For four or five days the values had been melting under the influence of a stoppage of trade caused by warm weather. The crumbling of the market started even before that. Detroit and northern Ohio markets were gorged beyond capacity and radical price drops naturally followed. Distress stuff went overboard first, demurrage tonnage followed. Slack and run-of-mine bore the brunt with some reductions on egg, stove and smaller prepared sizings.

Overproduction, of course, played a part, but not in the movement through the Cincinnati gateways. The report of the American Railway Association showed only 12,326 cars passed through, or 139 cars more than last week and a decrease of 686 cars compared with last year. Louisville & Nashville loadings decreased 1,032 cars and since the report was issued the Chesapeake & Ohio reports show dozens of mines down in the Big Sandy, Elkhorn and on the main line. So, it would appear that it is the coal above ground rather than the coal freshly mined that figures most in tipping the market.

In the low-volatile section screenings have dropped to $1.25@$1.50, mine-run is weak at $2.25; but Eastern demand has pushed egg, stove and nut to $5.50, as compared with Western contract deliveries at $4.25 and spot around $4.75 @$5. Lump for Western shipment is $4@$4.25; east 25 to 50c. higher. Nearly all of the producers say that with the exception of screenings they have orders and contracts booked now to carry them over into February.

High-volatile slack and mine-run suffered most in the recent slump. Some distress screenings went down to 50c. Mine-run was freely offered at $1.25 for steam and $1.40 for byproduct and gas. Egg went as low as $1.75, but block and large lump held fairly firm, West Virginia selling on a range of $2.50@$2.75 and Kentucky $2.75@$3.25.



There have been no retail changes in price here. River business again is halted by weather conditions.

The mercury again controlled the destinies of the domestic market in southern Ohio last week and the predicted cold wave came too late to help either prices or demand. The retailers are buying only when absolutely necessary and they find that the stocks they are now carrying are ample to meet the householders' orders.

The retailers are keeping a close watch upon credits, which in some cases have been overtextended. Most of the consumer buying now is held down to one- and two-ton lots. Retail prices, however, have not declined. Smokeless lump is selling for $9.50@$10; splint, $7@$7.50; Hocking and Pomeroy Bend, $6@$6.50; Kentucky block, $7.25@$7.50. Demand farther east is limiting the tonnage of smokeless egg running to Columbus retail dealers.

Industrial demand for southern Ohio coal continues lethargic. Prices are irregular. Some distress coal finds its way to market, but the quantity is much smaller than usual under like conditions. Mine-run was shaded 10c. during the week. West Virginia screenings were easy at about 75c. Public utility and steel plant buying are the backbone of the existing steam market, but the purchasing agents for these institutions are not spendthrift buyers. There is little talk of new contracts.

Southern Ohio production last week was approximately 22½ to 25 per cent of capacity. Pomeroy Bend mines working on the 1917 wage scale captured a large share of this tonnage.

Despite cold weather in eastern Ohio a softening tendency has prevailed in f.o.b. prices on Ohio coal. Cleveland retailers, however, have been rather busy filling orders from householders, but the major portion of this is West Virginia and Kentucky coal.

The feature of the week has been the weakness in spot prices on slack and nut-and-slack. Nevertheless, steam inquiries are stronger because of low stocks and indications that business conditions with industry are beginning to show some improvement. Railroad purchasing is held to contract commitments. There is little distress coal.

Eastern Ohio production for the week ended Jan. 16 aggregated 286,000 tons or about 41 per cent of potential capacity. This was 9,000 under the output of the preceding week but is 9,000 tons over output of the corresponding week a year ago.

Gloom Still Heavy in Pittsburgh

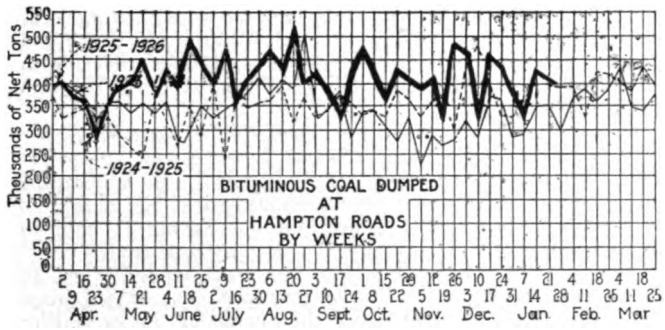
The Pittsburgh district coal market continues in decidedly poor shape. There has been no improvement in the past week, when in some quarters there was expectation of improvement, based in part on the fact that the call for Connellsville coke brought about such high prices that the demand might overflow into bituminous, as it did on the last coke bulge, late in October. What little demand comes from the East is for egg, which brings about $2.50.

Demand for domestic coal is good in a sense, but the area of distribution is so limited that the total tonnage is small relative to the capacity of the region. Industrial consumption is heavy. The steel industry ran at a very high rate in November and December and is doing as well this month.

Coal prices are not quotably changed, except that slack has sagged off a trifle farther.

Failure to end the anthracite strike has materially increased production in the central Pennsylvania bituminous field and prices have stiffened quite materially. The additional demand, however, is far from taxing the capacity to furnish fuel. All grades of coal are affected by the rise in prices, the latest quotations at the mines running as follows: Pool 18, $1.80@$1.90; pool 11, $2@$2.20; pool 10, $2.35@$2.50; pool 9, $2.55@$2.80; pool 71, $2.80@$2.90; pool 1, $2.95@$3.10. Lump is $4.75; egg, $5@$5.50; nut, $5@ $5.25; slack, $2.

Deadly indifference characterizes the attitude of the industrial coal consumer toward sellers in the Buffalo market. In many cases, it is claimed, steam plants are making no pretense of carrying proper storage reserves against winter interruptions to transportation. Prices show a monotonous regularity. Fairmont lump is quoted at $1.60@$1.75; mine-run, $1.40@$1.50; slack, $1.25@$1.40; Youghiogheny gas and No. 8 steam lump, $2@$2.25; slack, $1.30@$1.60; short-rate Allegheny Valley mine-run, $1.75@$2.



Anthracite Rumors Govern New England

The immediate reaction from the anthracite settlement rumor on Friday was enough to show how dependent the New England market is on day-to-day conditions. Prices of screened bituminous dropped 50c.@$1 within an hour or two, not to speak of cancellations that poured in, and it will take another ten days to recover. The absence of severely cold weather has already influenced retail dealers to discount local demand during February. Operators who refrained from commitments beyond January are again scurrying about to place tonnage.

Were the anthracite controversy settled the market for substitutes would flatten out over night. Deliveries have slowed up materially, especially from the smokeless districts all-rail, and buyers generally are cautious in arranging for their probable needs. Splints and other hard-textured high volatiles are less in demand than was the case a fortnight ago. Prepared low volatile enjoyed a buoyancy that had not been seen since November, as high as $7 per net ton being paid at the mine for No. 1 egg, but now the range is $5@$5.50, keeping pace with high grade low volatiles in Pennsylvania that are to be had at from $5.50 up, although on the minimum Clearfield rate.

F.o.b. vessel at Hampton Roads there has been no corresponding fluctuation in price. Coastwise movement is fair, owing to current demand from retailers inland from Boston, Providence and other rehandling ports, but it can hardly be said there is any improvement among the industries. Neither all-rail nor by water is there any noticeable call for Pennsylvania coals.

Bituminous More Active at New York

Activity ruled the bituminous coal market at New York last week. Prices were firm and buying of all grades increased. Industrial consumers kept mine-run moving while householders who formerly used anthracite took a fair amount of sized coal and some mine-run. The cream of the domestic trade and the volume too, however, went to coke.

Prices on high-volatile run of mine fluctuated within a narrow range, leaving practically no net change. Quotations on low-volatile were stronger. This was true also of the prepared sizes of high-volatile coal moving into this territory on the Pittsburgh rate. These commanded about $3.25—an advance of $1 within a few weeks. Low-volatile nut was quoted at $5.50@$6; Broad Top mine-run up to $3 and screened coals from this Pennsylvania district at approximately $7 on the average, with a few shippers asking as high as $8. B. R. & P. and Shawmut offerings were on a mine-run basis of $1.85@$2.25.

The New York market is taking more prepared New River and Pocahontas coals for domestic purposes and paying up to $6.50.

Arrivals at the local piers have not been heavy during recent weeks. Some complaint was heard of close deliveries, but no hardship has been experienced.

Greater activity also was the rule in Philadelphia. With the collapse of the anthracite negotiations on Jan. 12 and the approach of the time when consumers would be calling for fresh supplies to tide them over for the rest of the winter, retailers began to cash in on their missionary efforts to sell mine-run. On top of this came a growing demand from industries which normally depend upon anthracite steam sizes. Further tenseness was added to the situation by the suggestion of congestion in transportation service.

Each week sees more call for prepared sizes of Pocahontas and New River coals in the Philadelphia market. There is little surplus available and quotations have jumped from $4.50 to $6 and $7 within a fortnight. Central Pennsylvania low-volatiles have benefited from this advance as dealers who have been unable to buy all the West Virginia coal they desired have turned to the Pennsylvania product with satisfactory results.

Screened gas coal also has moved up several notches in price. Coal selling ten days ago at $2.50 was quoted at $4 last week.

The effect of the anthracite strike on bituminous in the Baltimore market is more noticeable in tonnage than in price. Both the Western Maryland and the Baltimore & Ohio are showing marked increases in coal revenues. Aside from prepared sizes, however, there has been no material change in quotations and high-grade coals can be had at low prices.

Good Coals in Demand at Birmingham

The Birmingham steam market for medium and lower grade coal is easy. High quality fuels are in more active demand. The large stocks accumulated during the first three weeks of December are still being drawn upon and this is having some effect on the spot market. The railroads are taking good tonnages.

The domestic market is in very good shape. Demand is good for all the better grade coals and fair for the medium and poorer qualities, sufficient business being booked or taken on from day to day to clear the output with little or no delay.

While the bulk of the sales are made on basis of quotations which have been in effect for several weeks, some little tonnage has been reported as moving from Walker County at slight reductions. Domestic quotations are stable and without change.

A strong coke market is reported with foundry grades $6.50@$7 per ton for spot business. Egg and nut are in good demand at $5.50@$6. Gas coke, with fair inquiry, is $6.50@$7 ovens.

Peace Rumors Stir Anthracite Market

Rumors of a resumption of anthracite wage negotiations stirred the anthracite trade at New York last week. Both dealers and consumers would welcome a return to peace as the existing situation is to the liking of neither group. The only anthracite still available is a small quantity of No. 1 buckwheat. A few cargoes of this size were quoted at $16 alongside last week. Washery chestnut was offered at $15, f.o.b. washery; No. 1 buckwheat, $8; rice, $6 and barley, $3.

Coke has the edge on competing fuels in the race for the consumer's favor. Mine-run low volatile coal is a close second. The position of the latter is being improved steadily by the sky-rocketing prices asked by the coke ovens. Sized coke is held as high as $12 and $13 at the ovens, and even those quotations hold no definite promise of prompt delivery. In some cases retailers in Greater New York are asking $22 from the consumer.

The Philadelphia trade in the past fortnight settled down to the belief that there would be no early resumption of anthracite mining. Many consumers, watching diminishing cellar stocks, have come to the same view and have rushed to their retail dealers for substitute fuels.

Coke bore the brunt of the charge and ovens asked up to $12 and $13 for their product—to the disgust of the retailers. Many of the latter declared that they would place no orders until prices declined. Turning to bituminous mine-run, the retail men have also been met with rising prices. Necessity, however, has compelled them to order freely.

At Baltimore the retail coal merchant continues to plug away on sales of soft coal and other substitute fuels. The householder is becoming more discriminating in his buying and the less desirable grades of bituminous are becoming a drug on the retail market. Briquets and coke are making new friends. Oil-heating systems, too, are finding a wider market. Fire and building department regulations, however, keep down the number because many of the cheaper burners cannot meet the requirements laid down by the municipal authorities.

Buffalo accepts the anthracite shortage as inevitable, but is bitter in its complaint against what it considers the avarice of the coke producers. Recent oven quotations have mounted as high as $14 although coke may still be bought for curb delivery by the householder for $9.50 from one company.

Sky-Rocketing Coke Prices Continue

Connellsville coke prices are still rising. The advance since last week is fully $1 a ton, perhaps nearer $2. The spot market has been entirely under control of the Eastern demand.

There has been practically no blast-furnace inquiry. The furnaces are, in general, covered by contracts for the quarter, made at what seem now to be very low prices. Since the first of the month two furnaces affiliated with coke ovens have banked to release the coke for the very profitable sale now possible, there being several times as much profit in coke as could be hoped for out of pig iron. Another has been considered likely to do the same at the end of this month.

Run of oven furnace coke is about $8.50@$9.50, with yard crushed at $11@$13 and broken coke, $9@$11.

The *Courier* reports coke production in the Connellsville and Lower Connellsville region in the week ended Jan. 16 at 112,100 tons by the furnace ovens—an increase of 1,300 tons—and 121,100 tons by the merchant ovens, an increase of 2,120 tons.

Foreign Market And Export News

British Coal Market Outlook Brightening; Foreign Inquiries Up

The British coal market started the new year under the handicap of a tonnage shortage. Recent gales seriously delayed shipping, and collieries experienced difficulty in clearing supplies. With concessions for immediate shipping obtainable in almost all districts, buyers are covering only urgent requirements. A fairly good business, however, is in hand. There is a strong inland demand for both coal and coke, and further improvement is expected.

Late January inquiry from France is encouraging, but South American demand has moderated after the recent spurt. Shipments are fair to Italy, but new demand is slow to develop. There is good business offering for late January on the part of the coaling depots, particularly the Near East. Three cargoes are loading for the United States. A quieter tone pervades the Newcastle-on-Tyne market and little attempt is made to interfere with the prices which prevailed over December. The decision of the Durham miners' union to allow local settlements had a good effect on the outlook, for it paves the way to the adjustment of many disputes in the country, and the trade should benefit thereby. The steam coal section, while fairly active, was not as steady as the gas and coking coals, the latter having improved in demand since the iron and steel trade picked up. For the same reason coke of all grades showed a better tone when the year opened.

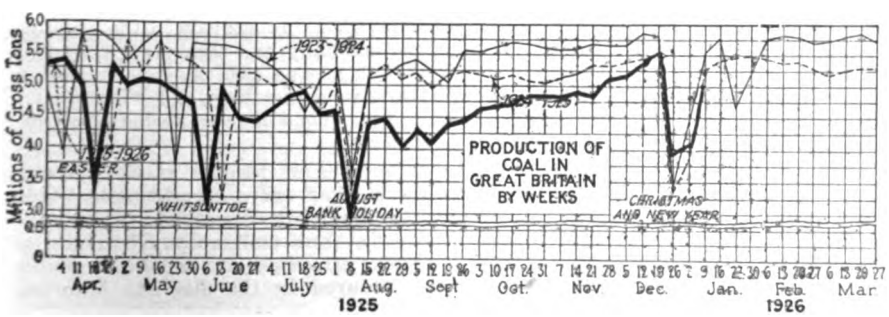
Production by British mines during the week ended Jan. 9, according to a special cable to *Coal Age*, totaled 5,060,000 gross tons, compared with a total output of 4,050,000 tons in the preceding week.

Belgian Steam Coals Still Dull

Many Belgian collieries, particularly those producing industrial coal, have recorded a loss over the year, or such a trifling profit that it is not worth while to mention it. This probably will lead to some concentration schemes among collieries in the Hainaut.

The domestic market is still very lively, with dealers complaining of insufficient tonnages. As the weather is much milder, however, no doubt demand will soon moderate.

The prospects of a general strike of the men are definitely set aside. The general feeling is that the men will accept a curtailment in their wages of 3 fr. per day, and the continuation of the pourparlers engaged with a view to conclude a new wage convention.



Strong Demand for Domestic Taxes French Market

The French coal market begins the new year auspiciously. Demand for industrial coal is strong enough to take care of output. Domestic coal factors are complaining that French and Belgian shippers are behind on deliveries and that the retail trade has been compelled to turn to higher-priced British coals. Welsh anthracite nuts were quoted at 410@450 fr. at Rouen last week. Transportation difficulties—both rail and water—have held back the French and Belgian collieries. The floods have almost shut off internal water movement.

The new prices on Nord and Pas de Calais coals had not been published when this report was written (Jan. 7), but it was rumored that there would be an increase of 4 to 5 fr. on industrial and domestic coals and possibly 15 fr. on patent fuel. Sharp increases in the price of binder material are held responsible for the greater advance in patent fuel prices. Flaming coals from Marles and Bruay are up 5 fr. The increase in French prices is due to the fresh taxes imposed upon collieries. If the miners' request for higher wages be granted, another boost will follow.

Belgian coals for French delivery show an increase of 3 to 5 fr. because of the difference in the rates of exchange. A comparison of base prices last October with quotations effective Jan. 1, 1926, show advances of 8.75@47.35 fr. due to changes in exchange rates.

In addition to adverse exchange rates, French buyers also are hit by increases in rail transport rates which went into effect the first of the year. Rates from the Pas de Calais field to Paris are up 4 fr., and from Jeumont, on the Belgian frontier, 4.35 fr. Rates for the Belgian haul have increased about 2 fr. Belgian, boosting the cost in French francs from 5 to 7 fr.

It is reported that an agreement on free German coals will be negotiated this month. The first of the year prices on domestic coal were advanced as follows: Sized anthracite, 40 fr.; lean, 5 fr.; semi-bituminous, 5 fr.; lignite briquets, 5 fr.

During December, 1925, the O. R. C. A. received 258,358 tons of coke from the Ruhr.

France produced 4,078,710 metric tons of coal and lignite, 270,342 metric tons of coke and 321,958 metric tons of patent fuel in November, 1925.

U. S. Fuel Exports in December

	1924	1925

News Items From Field and Trade

ALABAMA

At a recent meeting of the Birmingham chapter of the Joseph A. Holmes Safety Association, at Powhatan Mine, of the Franklin Coal Co., officials of the company stated that since the operation was started in 1919 1,250,000 tons of coal had been mined without a fatal accident in the ranks of the 250 to 300 men in the service. J. Frank Rushton is president of the company; T. R. Jordan, vice-president and general manager; L. T. Daniel, secretary-treasurer and sales manager, and J. H. Tidmore, local superintendent. The general offices of the company are in Birmingham.

ARKANSAS

Mine employees of the Clark-McWilliams coal mine in the Spadra field who had been on a strike since early in December, have returned to work, according to word received from mine authorities there. The controversy was brought about when the workmen demanded a change in working hours. The miners returned to work on their own accord it was said, no agreement having been reached previously by the men and the operators.

COLORADO

The state coal mine inspector's report for Colorado for December shows an increase of 39,000 tons in output over the same month a year ago. Total production in 1925 was approximately 9,402,000 tons, a decrease of 110,000 tons compared with 1924.

ILLINOIS

James F. McDonnell, of Bloomington, has been named receiver for the St. Louis Coke & Iron Co. to succeed the late James Duncan, of Alton. The appointment was made by Federal Judge Louis Fitzhenry. Under Mr. Duncan's administration the properties of the company were sold to the Midland Coke & Iron Co., which was organized by financial groups interested in the affairs of the St. Louis Coke & Iron Co. The new company has made extensive improvements at the plant.

INDIANA

The engine room of the Bruceville coal mine, near Bicknell, a unit of the Knox Consolidated Coal Co., which operates five mines in that vicinity, was damaged by fire to the extent of $20,000 the night of Jan. 13. Officials of the company believe the fire was of incendiary origin. The mine has been idle for several years, since it was consolidated with the Knox company, with headquarters at Indianapolis.

Somerville Mine No. 1, near Princeton, resumed work Jan. 18 following completion of construction work on a new tipple. The old structure was destroyed by fire several weeks ago. With the reopening of the Somerville mine all pits in Gibson county with the exception of the Bosse Coal Co. mine near Buckskin are at work. Labor trouble is keeping that pit closed.

Fire of unknown origin on Jan. 11 destroyed the surface buildings of American Mine No. 1, near Bicknell. More than 1,000 men were thrown out of work. This blaze, discovered as the day shift reported for work, comes on the heels of two others. The operators see an effort of the union men to intimidate mine owners, while the union believes the property was burned to reflect upon the union. Investigation by the State Fire Marshal's office is to be asked by District 11, United Mine Workers.

KANSAS

Thirty-three applicants for certificates of efficiency took examinations in Pittsburg, Jan. 16. This was the largest class to seek such certificates in mining since the passage in 1917 of the law requiring them for certain positions. Of the thirty-three, six took the examination for gas men, eight for mine foremen, three for electrical engineers, twelve for shotfirers and four for hoisting engineers.

KENTUCKY

G. W. Hay, of McRoberts, general manager of the Elkhorn Division of the Consolidation Coal Co., has been named general manager of operations of the concern, acording to an announcement made by Frank R. Lyon, vice-president. At the same time, H. S. Carpenter, general superintendent of the Elkhorn Division, was named general manager of that division. The changes will be effective Feb. 1. Mr. Hay formerly was a mining engineer in the anthracite field but has been employed by the Consolidation Coal Co. since June, 1917. At different times Mr. Hay was superintendent of the Consolidation mines at Dunham and McRoberts.

MARYLAND

C. W. Van Horn has been promoted from general superintendent of the Maryland division of the Baltimore & Ohio R.R. to general superintendent of transportation, with offices in Baltimore. Mr. Van Horn, who has been connected with the company 24 years, formerly was located in Fairmont, Grafton and Cumberland, Md., and is known to hundreds of coal operators.

MASSACHUSETTS

Massachusetts retail coal dealers reported stocks of 118,000 net tons of anthracite in their yards Jan. 1, compared with 178,000 tons on Dec. 1. Cumulative deliveries of hard coal by dealers since April 1, last, total 3,672,558 tons, which compares with deliveries during the entire preceding coal year of 5,115,717 tons. Eugene C. Hultman, Massachusetts Fuel Administrator, reports that during December the coal dealers of Massachusetts delivered to householders 309,434 tons of soft coal, an increase of 90,000 tons over the amount delivered in November. On Jan. 1 the dealers had a total of 326,433 tons of bituminous coal in their yards.

NEW YORK

James P. Geagen, William J. Dalton and Benjamin Wertheim have been elected additional vice-presidents of Burns Brothers, New York City. Mr. Geagen has been assistant general manager for fourteen years. Mr. Dalton formerly was vice-president of the Wyoming Valley Coal Co. and Mr. Wertheim is a brother of the president.

OHIO

The Webb mine of the Cambria Collieries Co., south of Bellaire, where on Dec. 22 nine lives were snuffed out by fumes and smoke from a fire starting in a section off the main entry, resumed operations in full Jan. 11 with practically the entire force of 600 men at work. The mine had been idle since the accident but a force of men had been at work cleaning up the débris left by the fire and getting the workings in shape. The mine has been carefully inspected by state mine officials since the fire as well as by experts in the employ of the company and they state that the workings are as safe as it is humanly possible to make them and with plenty of orders ahead a long period of work is expected.

A number of leaders of the United Mine Workers were arrested last week in the Pomeroy Bend field and it is hoped in that manner to clear up a number of cases of sabotage which have occured in the district. Maurice

Digitized by Google

Thornton, a union leader and head of the miner's relief organization, was arrested charged with being implicated in the burning of the tipple of the Blackstone Mine at Rutland, Aug. 8. David Fowler, another union miner, was arrested in connection with the burning of the same tipple. Osby Martin was charged with driving an automobile in a raid on a powder house at the Simpson Coal Co. The arrests followed confessions of Warren Falia and Clyde Tyree, mine workers, made in connection with the powder raid.

Mine No. 1 of the Short Creek Coal Co., Duncanwood, has resumed operations after suspension since last April.

A gas explosion, followed by a fire, last week, caused a loss of about $12,000 in the mine equipment of the Green & Schultz Coal Co., at Sand Run, near Logan. Repairs will be made at once.

PENNSYLVANIA

The Engineers' Society of Northeastern Pennsylvania held its annual meeting at Wilkes-Barre Jan. 21, when officers were elected for the ensuing year. The new men, who were installed at the banquet at the close of the meeting, are as follows: President, C. R. Seem, electrical engineer, Glen Alden Coal Co.; First Vice-President, R. H. Buchanan, president, South Penn Collieries Co.; Second Vice-President, L. H. Vail, assistant electrical engineer, D. L. & W. R.R.; Secretary, B. E. Shaffer, electrical engineering department, Hudson Coal Co.; Treasurer, W. G. Metzgar, manager safety division, Hudson Coal Co.; Directors, E. A. Lewis, general superintendent, Scranton Electric Co.; Myron S. Knight, mining engineer; P. J. Murphy, vice-president and general manager, Laurel Line.

The Pittsburgh Coal Co. in the week ended Jan. 16 produced a new record weekly tonnage in the Western Pennsylvania mines since it started operating on the 1917 scale, when 28,907 tons were turned out. On Jan. 21 the company announced that it had 1,522 men at work. On the same day a new maximum daily production of 5,809 tons from the seven mines was reported..

The Standard mine of the H. C. Frick Coke Co., at Mt. Pleasant, had an unusual record in December. With more than 700 men at work on 25 days in the month, there was not an accident. In December, 1924, there were 10 accidents in which time was lost.

UTAH

Application of the Utah Railway Co. to purchase the 8.9 miles of railroad built into Gorley and Gordon Creek canyons by the National Railway Co. has been approved by the Utah Public Utilities Commission. A request for permission to take over the line also has been filed with the Interstate Commerce Commission. The Utah company proposes to acquire the line as a branch to the 25.78 miles of railroad now operated and owned by it between Mohrland and the Utah Railway Junction connecting with the D. & R. G. W. The consideration involved is approximately $550,000. The branch line of track was built into the Gordon Creek district to open up some new coal fields owned in that region by the Great Western Coal Mines Co., the Sweet Coal Co. and the Union Coal Co.

VIRGINIA

The Virginia Iron, Coal & Coke Co. reports gross earnings of $1,009,713 for the quarter ended Dec. 31, and net income of $9,752 after all charges. In the September quarter the gross was $865,709 and the net $61,997. Based upon the quarterly statements, gross earnings for 1925 aggregated $3,386,308 aganist $3,602,442 in 1924. Net profit, subject to inventory adjustment, amounted to $218,791 last year, against a loss of $53,503 in 1924. The net profit for 1925, after allowing for preferred dividend requirements equaled 93c. a common share.

The Clinchfield Coal Corp. for the quarter ended Dec. 31, 1925, reports net income of $147,698 after all expenses and charges. After allowing for preferred dividends this was equal to 77c. a share on the 145,476 shares of common stock. After payment of both common and preferred dividends the company reported a surplus of $40,591 for the quarter.

WEST VIRGINIA

Robert Lilly, district mine inspector, was unanimously re-elected president of the Fayette County Mining Institute at a meeting held at Mt. Hope, W. Va., Jan. 9. Also re-elected were William Ward, first vice-president; John Whitehead, second vice-president; Hobart E. Gillespie, third vice-president. E. S. Criwell was elected secretary-treasurer to succeed Mose McSpadden. Thomas Allen, a mining engineer from Colorado, delivered a most interesting address on how extreme weather conditions affect mining in Colorado. A feature of the meeting was the exhibition of two interesting moving pictures, entitled "Dynamite at Work" and "Let Dynamite Do It," which disclosed the difficult tasks which could be performed by the proper use of explosives.

The Fairmont coal sales office of the Consolidation Coai Co. opened Jan. 16 in the Watson Building.

A mine fire occurred in the mine of the Buffalo Creek Coal Co. at Accoville, in the Logan field, last week, according to Robert N. Lambie, of Charleston, chief of the West Virginia Department of Mines. From last reports the fire was under control.

New Coal companies organized in West Virginia during December had an aggregate capital stock of $770,000, although two of the seven companies organized have stock of no par value. The new organizations include the Copen Creek Coal Mines, Inc., of Gassaway, with a capital stock of $10,000; Clarksburg Coal Co., of Clarksburg, $50,000; Henry Coal Co., of Nolan, $10,000; Bur-Mar Collieries Co., of Huntington, with chief plants in Kentucky, $200,000; Sturgeon Creek Coal Co., of Charleston, with chief plants in Kentucky, 1,000 shares of no par value; Crown Coal Co., of Johnstown, Pa., $500,000; Octavia J. Coal Mining Co., of Cincinnati, Ohio, 3,000 shares of no par value.

The offices of the Richland Coal Co. near the Richland mine, at Warwood, were completely destroyed recently by a fire of unknown origin. Loss in office equipment was estimated at about $5,000, but valuable records of the company also were destroyed.

The West Virginia State Department of Mines has inaugurated a safety program which was started Jan. 15, according to Robert M. Lambie, of Charleston, chief of the department. It is planned to hold meetings at different mines in the Fairmont region every Wednesday. State mining inspectors and men in charge of rescue stations met in Charleston on Jan. 1 and 2 to discuss routine matters, chiefly the subject of safety, and plan for the safety drive.

O. J. Keys, superintendent of the Pittsburgh-West Virginia Coal Co., announces that a mine tipple, at Cross Creek, Brooke County, replacing the one recently destroyed by fire was placed in operation Jan. 5. A warehouse of the company was destroyed Jan. 4 by an explosion.

The Yukon Coal Co. has ceased to exist as a corporation, having surrendered its charter to the state, and the George Whyel Coal Co. has surrendered its charter.

Abner Lunsford, in charge of the coal mines of the Ford interests, stated in Huntington last week that his company has no further purchases of coal property in mind, as present production just about sufficed to meet the requirements of the Ford factories. He stated that it required the use of between 1,500,000 and 2,000,000 tons of coal annually to operate the Ford plants.

According to reports, the work of rock-dusting Federal mine No. 1 of the New England Fuel & Transportation Co., at Grant Town, has been completed and work will be started soon on Federal mine No. 3, at Everettsville, Monongalia County.

The Brady-Warner Coal Corporation is installing screens at the Osage mine, in Scott's Run, in order to prepare 3- and 4-in. lump.

WYOMING

The Union Pacific Coal Co., the largest mine operator in Wyoming, has bulletined notice that any employee hereafter detected carrying matches into its mines will be summarily discharged, and a charge against him will be lodged with the chief state mine inspector. The mines of the company in Wyoming now are being operated on a 100 per cent safety-lamp basis. Since the passage of the new mine safety code last Feb-

Digitized by Google

ruary, the corporation has been conducting an educational compaign among its employees.

CANADA

Unemployment has reached an acute stage at Sydney, N. S., where the Princess Colliery was closed down indefinitely on Jan. 11 and the working time of the Florence Colliery was reduced to six days per month. About 2,000 men are employed in the two mines. J. E. McLurg, vice-president of the British Empire Steel Corp., states that this is due to lack of demand for coal and that the situation is beyond the company's power to help or hinder. The Board of Trade and the Town Council have appealed to the Provincial government for assistance.

A serious situation prevails in the Alberta coal industry, seventeen mines in the Wayne and Drumheller fields alone having been practically closed owing to the mild winter in the West and consequent scarcity of orders.

Traffic

I. C. C. Examiner Advises on Southeastern Rates

Examiner William B. Hunter, of the Interstate Commerce Commission, has made a proposed report in Docket 13823, Virginia Coal Operators Association vs. Aberdeen & Rockfish Railroad Co., et al., in which he recommends that the Commission should find that rates on coal from the Appalachia and Dante districts in Virginia to points in North Carolina, South Carolina and Georgia, and rates from the Harlan County district in Kentucky to the same destinations are not unduly prejudicial.

The examiner further recommends that the Commission should find that the rates to Jacksonville, Fla., and points in Florida basing on Jacksonville are, and for the future will be unduly prejudicial to the complainants to the extent that the rate from Appalachia and Dante districts to Jacksonville exceeds the rate from the Harlan County District Group 4 to Jacksonville. The proceedings in this case were reopened for further hearing for the purpose of developing the facts with respect to the lease of the Carolina, Clinchfield & Ohio R.R. by the Louisville & Nashville and the Atlantic Coast Line and the effect thereof upon the rate situation complained of. It is the examiner's opinion that in light of the changed conditions the Commission should adopt the recommendations made above.

Would Unify Coke Rates to Ohio

The Coal, Coke & Iron Ore Committee, Central Freight Association Territory, announces a hearing at Room 606 Chamber of Commerce Building, Pittsburgh, Pa., Feb. 4, at 10 a.m., on a proposed advance to $3.40 per ton in the rate on coke, coke breeze, coke dust and coke screenings from Boomer, Cannelton, Carbondale, Dickenson, Gauley Bridge, Harewood, Longacre and Marting, W. Va., to stations on the Toledo & Ohio Central R. R., between Toledo and Renner, Ohio, inclusive, and Moline and Granville, Ohio, inclusive. The proposed increase is intended to place the rates on a parity with those carried from the same district by competing lines.

Dismisses Complaint on Rates To Indiana-Michigan Points

The Interstate Commerce Commission has dismissed complaint in Docket 15698, Kalamazoo Chamber of Commerce et al. vs. Chesapeake & Ohio Ry. et al. This complaint also included sub No. 1, Grand Rapids Association of Commerce vs. C. & O. The complaint challenged the lawfulness under Sec. 1 and 3 of the Act, of the rates on bituminous coal from mining districts in Ohio and from the Inner and Outer Crescent regions to Elkhart, Ind.; Grand Rapids and Kalamazoo, Mich., and several other Michigan points in the same general vicinity. The Commission finds that the rates assailed are not shown to be unreasonable and further states that it is not convinced that the spreads between the various assailed and compared rates heretofore fixed by the Commission in the light of all the surrounding circumstances, and which are still maintained, are sufficiently out of line to warrant a finding of undue prejudice, and, therefore, the complaint is dismissed.

Central Cuts N. Y. Coke Rates

The New York Public Service Commission has approved reduced rates of the New York Central (East) on coke, coke breeze and coke dust, from Buffalo, East Buffalo and Harriet to the following West Shore stations: Syracuse, Amhoy, Warners, North Memphis, Jordan, Weedsport, Port Byron and Montezuma, $2.02; Savannah, South Clyde, Lyons and Newark, $1.76; Port Gibson, South Palmyra, Macedon, Wayneport, Fairport and Ridgeland, $1.51; Mortimer, $1.39; effective Feb. 21, 1926.—Supplement No. 4 to P. S. C. N. Y. C. No. C-154.

Rate Cut on Wabash to Hannibal

The Wabash R.R. has cut the freight rate from the Springfield district to Hannibal, Mo., 10c. per ton on steam coal, effective Feb. 11. About 50 per cent of the coal used in Hannibal and vicinity comes from the Springfield district. The reduction is the result of a complaint filed some time ago by the Hannibal Shippers' Association.

The Wabash also has been instrumental in effecting a reduction of 45c. per ton in the rate on coal from eastern Kentucky to Hannibal.

Association Activities

The West Kentucky Coal Bureau, traffic organization of the western Kentucky operators, held its annual meeting in Louisville Jan. 19, after a postponement of a week on account of the death of Fred P. Wright, Crescent Coal Co., of Bevier, vice-president of the organization. Resolutions were adopted by the association in connection with Mr. Wright's death. James D. Overall, of the Reinecke Coal Mining Co., Madisonville, was elected president; A. W. Duncan, of W. G. Duncan Coal Co., Greenville, vice-president, and C. E. Reed was re-elected secretary-treasurer and manager. Percy D. Berry, Providence Coal Mining Co., Providence, retiring president, was elected chairman of the Executive Committee, and W. A. Wickliffe, of the Wickliffe Coal Mining Co. and Greenville Coal Co., Greenville, along with K. U. Meguire, of the Dawson Daylight Mining Co., Dawson Springs, were named to fill vacancies on the committee. C. R. Hawley, of the Hawley-McIsaac Co., Madisonville; G. S. Miles, of the Gibraltar Coal Mining Co., Memphis; M. B. Lanier, of the Norton Coal Mining Co., Birmingham, and C. R. Richardson, of the West Kentucky Coal Co., Sturgis, were re-elected to the committee.

The Hazard Coal Operators' Exchange met at Lexington, Ky., Jan. 22, when the following directors were elected: James Bonnyman, S. R. Jennings, George P. Fitz, Hugh Buford, Dan Pritchard, C. Reginald Riley, W. M. Miller, Calvin Holmes, W. S. Dudley, A. L. Allais, Prentis H. Burlingham, T. J. Cassidy, John P. Gorman, T. Ward Havely, John H. Jones, J. H. Bowling, Carl Robinson and Henry Pfening. These officers were elected: W. J. Brown, Jr., president; Henry Pfening, vice-president; James Bonnyman, chairman executive committee; Irvin Davis, secretary executive committee; J. E. Johnson, secretary, and H. E. Bullock, treasurer.

Better selling methods to popularize high-volatile coal in New England and elsewhere were discussed at the quarterly meeting of the **Kanawha Coal Operators' Association**, in Charleston, W. Va., last week. Despite propaganda against the use of high volatile, reports from many sections of New England indicated that it was being favorably received and that there was strong probability of its being able to retain its markets after the anthracite strike was settled. While no definite action was taken on shipping on consignment, many operators stated that the practice had done much to unsettle market conditions and was not fair to regular buyers of coal.

Obituary

S. Thurston Ballard, 71, president of the Liberty Coal & Coke Co., Louisville, with mines in the Pineville (Ky.) district; also president of the Ballard & Ballard Co., largest winter wheat millers in the South; vice-president of the Louisville National Bank, U. S. Trust Co., and other concerns, died Jan. 19 at his home in Louisville, following a year's illness. Mr. Ballard was one of Louisville's leading business men. Years ago he adopted a profit-sharing policy with all his mill workers, the plan being so successful that he was called on and worked with the government for some years in the Industrial Relations division. From 1920 to 1924 he was Lieutenant-Governor of Kentucky. The Kentucky Legislature, in session at the time of his death, adjourned after adopting resolutions mourning his passing.

Samuel O'Neil, aged 83, pioneer coal operator in the Monongahela Valley, and organizer of the O'Neil Coal & Coke Co., of Clarksburg, W. Va., died Jan. 18 at Pittsburgh, Pa. He had retired from active business several years ago. For many years he was connected with the Fayette City Coal Co., which in 1898 was merged with a number of smaller companies into the Consolidated Coal & Coke Co. The same year he went to Clarksburg and organized the O'Neil Coal & Coke Co., which in 1903 was sold to a larger concern. After the sale of his West Virginia company he went to Pittsburgh and had resided there since.

Philip S. Emmons, 60 years old, wealthy coal operator, of Scottdale, Pa., was crushed to death Jan. 13 beneath his automobile, which skidded and overturned in the Connellsville-Scottdale highway, at Pennsville, near Connellsville.

Joseph Byron Echard, 66, widely known throughout the Western Pennsylvania coal and coke region, died at Connellsville, Pa., January 14. Pneumonia was the cause. Born at Pennsville, he spent his boyhood days on a farm there and attended school in that district. When a young man he went to Connellsville and for a time was employed as a fireman on the Baltimore & Ohio R.R. Later he engaged in the coal business, purchasing that beneath the Murphy and Stickel farms at Star Junction. He built 60 ovens at what is still known as Echard, near Star Junction, and formed the Echard Coal & Coke Co. When that coal was worked out he became identified with the Etna-Connellsville Coal & Coke Co. He was president and manager of that company for a time and at the time of his death was manager and vice-president.

Coming Meetings

American Institute of Electrical Engineers. Annual convention, Feb. 8-12, 1926, at Engineering Societies Bldg., New York City. Secretary, F. L. Hutchinson, 29 West 39th St., New York City.

Pittsburgh Vein Operators' Association. Annual meeting, Feb. 15, Cleveland, Ohio. Secretary, D. F. Hurd, Marion Bldg., Cleveland, Ohio.

American Institute of Mining and Metallurgical Engineers. Annual meeting, Feb. 15-17, 1926, at Engineering Societies' Building, New York City. Secretary, Dr. H. Foster Bain, 29 West 39th St., New York.

The Rocky Mountain Mining Institute. Winter meeting, Feb. 23-25, 1926, at Albany Hotel, Denver, Colo. Secretary, Benedict Shubart, Boston Building, Denver, Colo.

Canadian Institute of Mining and Metallurgy. Twenty-eighth annual and general meeting, March 3-5, at the Windsor Hotel, Montreal, Quebec, Canada. Secretary, G. C. Mackenzie, 603 Drummond Bldg., Montreal, Que., Canada.

New England Coal Dealers' Association. Annual meeting at the State Armory, Worcester, Mass, April 7 and 8. Secretary, E. I. Clark, 141 Milk St., Boston, Mass.

Industrial Notes

Clarence R. Claghorn, credited with having originated the idea of using conveyors in coal mines, has been appointed sales representative of the **Conveyor Sales Corp.,** of New York, to handle the Eickhoff conveyor in the states of West Virginia, Virginia and Maryland. Mr. Claghorn has an office at 715 Continental Building, Baltimore, Md. The Vulcan Iron Works of Denver, Colo., has the Rocky Mountain district sales rights on the Eickhoff.

The Okonite Co. and the **Okonite Callender Cable Co., Inc.,** have opened an office in the Hoge Building, Second Avenue and Cherry Street, Seattle, Wash. This new office, in connection with the branches already established at San Francisco and Los Angeles, places Okonite products and service within the immediate reach of buyers all along the Pacific Coast.

A. S. Urquhart, representative of **Madeira, Hill & Co.,** in eastern New England, with headquarters at Boston, having resigned, the following changes will be made in the company's district representatives: **E. C. Hitchcock,** from New Haven to Boston; **G. M. Stauffer,** from Elizabeth to New Haven; **John Jacobson,** from New York to Elizabeth, N. J.

The Timken Roller Bearing Co., Canton, Ohio, announces the appointment of Ernest Wooler as chief engineer, in full charge of all automotive, industrial, experimental and service engineering.

The Penn Electric Co., of Scranton, agent jobbers for the Westinghouse Electric & Mfg. Co., has been awarded a contract for electrification of the Buck Mountain Coal Mining Co.'s new operation at Gowen, near Hazleton. The contract covers substation, compressor and locomotive haulage.

The Terry Steam Turbine Co., Hartford, Conn., has appointed **John M. Rittelmeyer,** 332 Healey Building, Atlanta, Ga., as sales representative in the territory in the vicinity of Atlanta.

Publications Received

Annual Report of the Department of Mines of West Virginia for the Fiscal Year Ending June 30, 1924. Sections I and II. Pp. 392; 6 x 9 in.; tables.

Practical Coal Production, by Frank H. Kneeland. McGraw-Hill Book Co., Inc., 370 Seventh Ave., New York City. Price, $3. Pp. 419; 5½ x 8 in.; illustrated. Describes the preliminaries of coal mining, including prospecting, explosives, development, drainage and ventilation.

Fuels and Their Combustion, by Robert T. Haslam and Robert P. Russell. McGraw-Hill Book Co., Inc., 370 Seventh Ave., New York City. Price, $7.50. Pp. 809; 6 x 9 in.; illustrated. This book is a comprehensive treatise on the economic utilization of fuels.

New Equipment

Pneumatic Gun Projects Refractory Cement

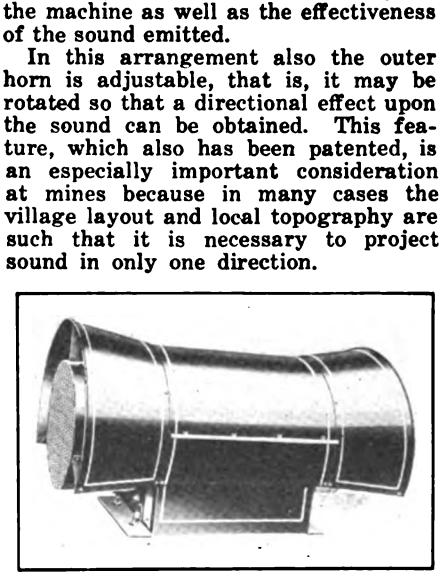
In the field of refractories two new products have recently been placed on the market by the Carborundum Co., of Niagara Falls, N. Y. One of these is a cement for lining or repairing furnace walls, and the other a gun for its application. Carborundum, one of the most highly refractory substances known, forms the chief ingredient of the new cement which is known as "Carbolastic." Through the proper selection of bonding material this cement is made to inherit the heat-resisting properties of carborundum. At the same time it lends itself readily to application by means of the gun which is shown in the accompanying illustration. Preparation of the cement consists of merely adding water until the material attains the proper consistency. Upon application it soon sets in the air with a strong bond and is highly resistant to even intense heat.

Air Gun Shoots Cement

This little instrument, which weighs only 12 lb. and operates on either steam or air, can project cement onto a furnace wall at the rate of 100 lb. per minute. It is readily portable and can be used on short notice for either lining or patching furnaces. Its manipulation is extremely simple and it can be operated by any ordinary laborer.

Minimizing the effects of flame impingement on brickwork, filling up cavities that are the result of spalling or of the destructive barring off of clinker formations or which arise from other destructive agencies employed in furnace operation, maintenance or repair, are the chief uses of this new cement. Its application as a coating over a firebrick furnace wall or its use as a plastic refractory in patching, the makers claim, will prolong the life of firebrick settings while at the same time the necessity for frequent shutdowns for repairs is eliminated. It can be applied to either hot or cold settings.

The gun is an extremely handy little device for applying this cement. It weighs only 12 lb. and has no moving parts to get out of order. It is controlled by a single valve placed near the handle. It may be operated on either steam or air at 100-lb. pressure and will shoot the cement at the rate of over 100 lb. per minute. The principle of the ordinary injector is utilized in its construction and it sucks the cement from a pail or bucket, no auxiliary hopper being necessary.



Adjustable Horn Siren Is an Efficient Noise Maker

Sirens have been used as a substitute for bells or steam whistles at electrically operated mines for many years. By and large, these machines have given excellent satisfaction. In several respects, however, they have been much improved in detail. Thus the double-head type B siren as now built by the Federal Electric Co., 8700 S. State St., Chicago, Ill., has several new features.

In the latest model a 5-hp. motor operating at 3,000 to 3,500 r.p.m. is used. The fans or rotors that generate the sound are of 15-in. diameter. A bent steel plate is used as a motor footing or base which lightens the machine and makes it easier to erect than the older machine with its cast-iron base. The hood also has been improved until it now resembles that of an automobile, being hinged at the back and provided with wing nuts in front so that when it is raised the motor is entirely accessible and open to view.

Probably the greatest improvement in this device, however, and one that has been patented is the double horn effect over the slot openings. By means of this double horn the incoming stream of air is separated from the outgoing stream, the friction of the two currents being thus reduced to a minimum. This materially increases the efficiency of the machine as well as the effectiveness of the sound emitted.

In this arrangement also the outer horn is adjustable, that is, it may be rotated so that a directional effect upon the sound can be obtained. This feature, which also has been patented, is an especially important consideration at mines because in many cases the village layout and local topography are such that it is necessary to project sound in only one direction.

Improved Adjustable Siren

This compact unit is lighter than its predecessors. It is fully housed yet the housings may be readily lifted, giving access to the motor. The double horns may be adjusted so as to project the sound in the direction desired.

New Scale Weighs Big Trucks Used for Local Track

At many coal operations local trade absorbs a large part of the mine output. In these days of good roads and motor haulage much of this local fuel is delivered by motor truck. It therefore becomes necessary for the mine to provide a scale of sufficient size to accommodate and weigh these machines.

To meet this need the Fairbanks-Morse Co. has produced the scale shown in the accompanying illustration,

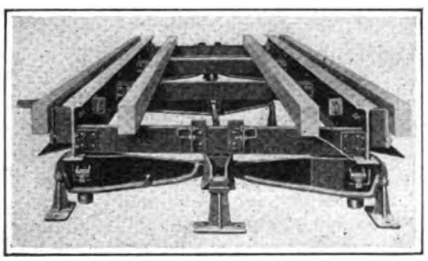

Fig. 1—Platform Foundation and Balance Beams

This scale is designed for quick, accurate work. The platform is 10 ft. wide and 28 ft. long or big enough to accommodate even the largest of motor trucks. The scale beam proper may assume any one of several shapes to suit the needs of the user.

several of which have been placed in operation during the past year or so. This is a scale of 30 tons capacity having a platform 10 ft. wide and 28 ft. long. It may be furnished with a variety of beams. Thus it may be equipped with a plain full-capacity beam with a tare bar of sufficient size to accommodate the largest of trucks, or it may be furnished with a full-capacity type registering beam. This latter type of beam records the weight in type on a ticket. If business is "rushing" or where trucks follow each other in quick succession the scale may be fitted with a full-capacity direct-reading dial that will indicate the weight up to the limits for which the scale is built. Such a dial is shown in Fig. 2.

Fig. 2—Indicating Dial for Quick Weighing

This scale may be fitted with a variety of beams. The one here shown, consisting of an indicating dial, is particularly useful if rapid weighing must be done. All of the ordinary types of weighing beams may also be had to suit the customers' needs.

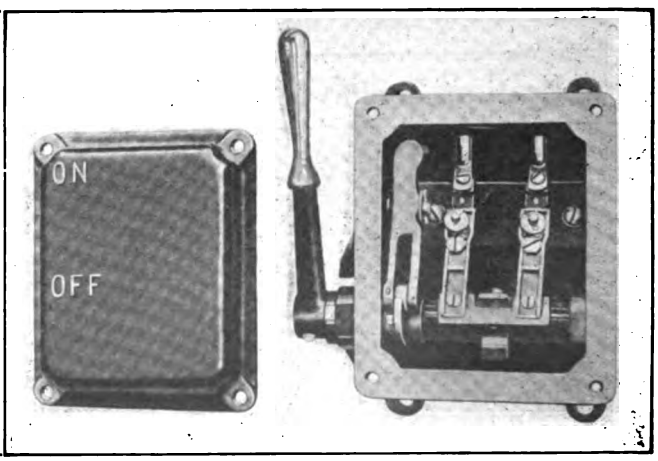
New Valve Built to Withstand High Pressures and Heats

After much experimentation the Hydraulic Press Mfg. Co. has evolved a new forged steel valve intended for high pressures and superheats. This is known as the Forgsteel valve and is of straight-way or gate type. The metal body is of uniform thickness throughout, thus equalizing expansional and contractional stresses, as well as providing a full opening for the steam flow, which reduces friction to a minimum.

In this valve the seat, disk and stem are all of non-corroding, acid-resisting metal, either steel or monel. Because of the construction, wire drawing is eliminated and the valve remains tight when cold even though it was closed while hot. Ample packing space is provided and the valve may be repacked in five minutes without in anywise interfering with operating conditions. The packing nut is made of monel metal, the yoke of steel and the stem is extra large.

This valve, which was designed especially for high temperature and high pressure work, is built to withstand extremely severe operating conditions. It is the product of over fifty years of experience in this kind of work.

Master Switch Is Protected Against Moisture and Fumes



For those places where it is desirable to protect electrical apparatus against moisture and acid fumes, the Cutler-Hammer Mfg. Co., Milwaukee, Wis., has introduced the control station shown in the accompanying illustration. The mechanism is inclosed in a cast-iron case, and has a cover fitted with a gasket, which excludes all moisture and fumes. A stuffing gland fitted to the shaft provides a tight fit, and the thick wall of the cast-iron body allows enough threads for a tight conduit or pipe connection.

Contact is made on the brass cylinder by two heavy fingers of standard non-stubbing design. These fingers are mounted on asbestos lumber and are zinc-plated as are all other small parts. The contact tips are of heavy rolled copper. The fingers are of sufficient capacity to permit the use of this master control station on any pilot circuit at all commercial voltages.

The large polished brass handle gives a convenient grip to the average operator. It extends far enough from the case to indicate whether the station is open or closed. All parts are generously proportioned to reduce chances of breakage in rough or careless handling. The case is sprayed with a protecting paint to withstand submersion in water or the effect of acid fumes.

Tight Case

This cast-iron box incloses the master switch mechanism so snugly that it seals out moisture and acid fumes. The switch is ruggedly constructed and generously proportioned to withstand rough treatment.

An Exide-Ironclad-equipped motor hauling a heavy trip up a steep grade at W. R. Gallagher & Bros. Coal Company, Houtzdale, Pa. An Exide-Ironclad Battery always has plenty of power in reserve for grades or extra heavy loads.

How many cars did you load and ship today? Many mines that have tried Exide-Ironclad Batteries have found the smoothness and efficiency of their haulage service so increased that more tons go over the tipple.

The empties are ready, but where is the motor? When an Exide-Ironclad is on the job empties are hustled in and the loads brought right out—without delay.

* * *

The motor is ready to take the empties in and the motorman is giving the Exide-Ironclad a "boost" while he eats his lunch. The battery takes its charge quickly, easily, and with little waste of current.

The miner and his helper rarely have to quit work for lack of cars, when the gathering motors are equipped with Exide-Ironclad Batteries.

Hauling more coal for less money

MORE and more are the important coal mines of this country standardizing on Exide-Ironclad Batteries for haulage service. They are doing so because they have found this battery handles the most coal, in the quickest time, at the lowest cost.

It does this because its first cost is reasonable, its life long, its power and speed great, its charging efficiency high, and its repair and maintenance cost negligible.

It will pay you to know more about Exide-Ironclad Batteries. A representative from our nearest branch will gladly call, or you can write for free booklet No. 1791, "Facts for Consideration in *Selecting a Battery* for Locomotive Service."

"Making Weather" With Coal

"COOLING WITH COAL" is no idle dream. Next summer a good many more owners of hotels, restaurants, offices, factories and homes are going to be thinking about it—and perhaps *doing* something about it, with the encouragement of power companies that see increasing business for themselves. This means an increasing summer consumption of coal, as R. Dawson Hall will point out in next week's *Coal Age*. It is the second of his articles on this subject.

* * *

CONVEYORS IN THIN COAL are doing good jobs in various parts of the country. Dr. J. J. Rutledge, chief mine engineer of the Maryland Bureau of Mines, made a survey of them with a number of other well known mining engineers and coal company officials and has some encouraging things to say in next week's *Coal Age* concerning what he saw.

The "hutch conveyor" in the longwall region of Illinois, at Spring Valley, reminiscent of a skid conveyor used in British Columbia years ago, was one of the striking installations. It is a trip of steel sheets on wheels, shuttling back and forth along a 400-ft. face, unloading at midpoint by scraper into cars on a depressed track. He describes some other thin-seam conveying schemes in Oklahoma and Alabama, concluding that some substantial progress has been made.

* * *

A NEAT BOOKKEEPING PLAN which can be used by a company operating several mines will be described by John C. McNeil, a certified public accountant with a good deal of coal mine accounting experience. It provides a simple and efficient way of controlling the accounts of the group of mines by office machine methods.

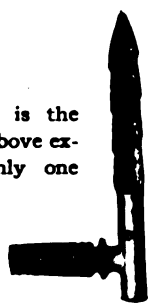
This is a modification of the single spool Type C Insulator long used in mines. This assembly, suspended from the roof will carry the wires along the side wall out of the way.



Similar to the fitting shown above except the spools are supported side by side. It will carry the three wires along close to the roof and out of the way.

A barbed pin supports the three insulator pins. If supported in the roof the insulators are carried one above the other. If supported in wall the insulators are side by side.

This fitting is the same as the above except it has only one insulator pin.

A pipe suspension for use with O-B Security Feeder Insulators.

New —and only One Hole to Drill

Have you the problem of stringing a 3-phase feeder circuit in your mine?

Do you want to run a signal or telephone wire along on the same bracket with the two wires of your D.C. feeder?

These new O-B fittings will make the job speedy and easy for you. They only require one hole in the roof or wall— for the expansion bolt or barbed pin.

In fact, there are dozens of combinations of distribution wires that are taken care of. And — only one hole to drill.

Here are combinations that have been developed from an understanding of the practical needs of the man trying to make a real job on his feeder lines. They cut down on time in installation and that means dollars and cents saved.

You can be proud of your distribution wires strung up out of the way in this neat fashion.

Longwall and Explosions

PERHAPS no publication on coal-dust explosions has appeared in many years having greater significance than that which the British Safety in Mines Research Board has just issued through His Majesty's Stationery Office. It has long been known that openings and enlargements in cross-section have a marked effect on the violence of explosions of dust, but it remained for H. P. Greenwald and R. V. Wheeler to give quantitive figures on the effect of the former. There will no doubt be an immediate desire on the part of the public to obtain this brief report, which explains in large part the restriction of mine explosions in British mines before the rock-dusting era. So much of the British mining consists of longwall workings that such explosions as occurred in mines even when not naturally rock-dusted were placed in a position peculiarly favorable for their extinction. That method of operation gave opportunity for the air to expand beside and in front of the point of ignition.

In these experiments the passage or passages by which the air entered, though choked down, were extremely short. Who can say definitely if mine passages of area equal to that of the main gallery would give equal expansive opportunity with that of a free entry of air arriving through an opening one-eighth, one-quarter or 64 per cent of the full entry as in the experiments? It is to be hoped that U. S. Experimental Mine at Bruceton will solve that problem by experiments with blown-out shots with openings in front and behind the point of ignition. In the British experiments no coal dust was placed behind the ignition point, whereas in actual practice not only the area in the rear but the intersecting passages have coal dust spread over their roof, ribs and floor.

But enough is unveiled in this report to show to the public, as the experimenters declare, that openings whether in front or behind, and especially behind, the ignition point are effective in reducing the ultimate violence of explosions. Is it to be assumed that an opening covered by a temporary stopping which an explosion will blow out readily is almost as great a deterrent to violence as if the stopping did not exist at all? It seems almost as if it would be found that this is true. If it is by all means let there be temporary stoppings near the advance workings, even at the risk of a little leakage. Perhaps also it will be well in advancing longwall to have an entry driven through the coal to some other roadway in advance of the longwall face as has been done at Sublet, Wyo., for other reasons.

One explosion initiated immediately behind an opening 64 per cent as large as the gallery in which the explosion occurred developed a negligible pressure and actually died out after a travel of 70 ft. with plenty of dust on the floor in front of it. On the other hand with the same initiating conditions and the same rock-dusting the explosion traveled to the end of the gallery 500 ft. and developed a pressure of 73 lb. per square inch and a mean speed of 2,600 ft. per second, tearing the steel gallery apart.

A sad reflection is that the need to quench explosions is greatest near the face; and less in the main haulageways where a network of crossing roadways helps to extinguish the explosion; yet at the face where the coal is obtained is just where it is difficult to rock-dust without covering the coal with a deposit that will make it unmarketable. This again is an argument for longwall, that gives a less dangerous condition than room-and-pillar workings. However, longwall gives concentrated mining and a general dustiness that may give an explosive content as great per cubic foot as in a narrow place with equal or more distressing consequences. A test made by the British with both of the ends of the tube wide open might have thrown some light on this if the dust had been strewn in equal measure at both ends of the gallery.

Coal Laws of Pennsylvania

TWO ECONOMIC factors in the coal situation, which are not being commonly discussed these days, recently were referred to in Congress by Representative Treadway, a Republican. He said that Pennsylvania should repeal its export tax on anthracite, which cost the users $7,000,000 to $9,000,000 every year. He observed that "every ton of coal going into interstate commerce is paying a direct subsidy into the treasury of Pennsylvania and therefore adding to the cost of fuel to the consumer. If that is not profiteering at the expense of other citizens of the Commonwealth of Pennsylvania, then I do not know what is."

He added that there is another law in Pennsylvania which is important to the coal consumer. "I refer to the miners' license law. That law provides that nine men who are themselves members of the union must pass on the qualifications of every man going to be a licensed miner. Can you think of anything more ridiculous than a law that places in the hands of nine men that power? In other words, this board composed of the union says to every miner that wants to do anything in the mines of Pennsylvania: 'You must belong to our union or you cannot mine coal.'"

The miners' license law was enacted before the organization of the mine workers' union and in the interests of safety, a cause which demands the maximum support. Still, it is true that the union has captured the operation of the law, and thereby made it impossible for anyone who is not a member of the union to obtain a miner's license, thereby diverting the effect of the law from enforcing safety to enforcing unionism. The enforcing of an individual to ally himself with any one group, or to take a certain political or public course, regardless of his views and inclinations, is un-American and should not be tolerated. Should the

Digitized by Google

union obtain that other much-desired whip over the individual miner—the check-off—his pocketbook would no longer be his own any more than his views, and the infringement of his rights and options as a citizen would be complete.

The Value of Technical Staffs

THE METAL mining industry has learned to value highly the abilities of its managerial and technical staffs; it is disposed to claim a real financial value for an assemblage of engineering and directing talent, and to believe that the men it has discovered and developed are as much a part of its real assets as the ore which it has uncovered after years of effort and expense.

Instances are not lacking of coal properties which failed to produce a profit because of a low order of the skill in their operation; such properties, put in skilled hands, have proved that all they needed was the application of proper methods of mining and marketing, to make them profitable. Readiness to pay sufficient salaries to procure the best men, and recognition of the importance of a high-grade mine staff will produce in the coal industry the same rapid advances that the metal-mining industry has experienced through the same means.

One of the economies that shows least imagination and foresight is the buying of technical talent in the lowest market with an eye solely to price. The talent that makes for success is not secured by such injudicious shopping.

The mining industry of the United States in general is conducted with great ability. Not only has it recently been discovered that we have an exportable surplus of managerial and technical talent at our metal mines, but also that we have engineers in the coal industry capable of increasing the output and decreasing the operating cost of the mines of Germany and Russia; and recent visitors from Great Britain have found that we have some practices and equipment that are needed for economic operation in the mines of that country.

The Danger Hour

AN OLD PLAINSMAN and Indian fighter once remarked, "Injuns is most dangerous between the fust o' May an' the fust o' December. That's when they're on the move. But when a feller is in the Injun's country, if 'e values 'is hair he'll keep 'is eyes peeled *all the time!*"

He who works underground in a coal mine—or above, for that matter—is figuratively speaking, just as truly in the Indian's country as he who in former days pioneered beyond the Western frontier of civilization. Accidents are liable to occur at any time and he who would avoid them must keep constantly on the alert. But strange as it may seem, they are most liable to occur at certain well-defined hours of the day, when everything else is moving most rapidly.

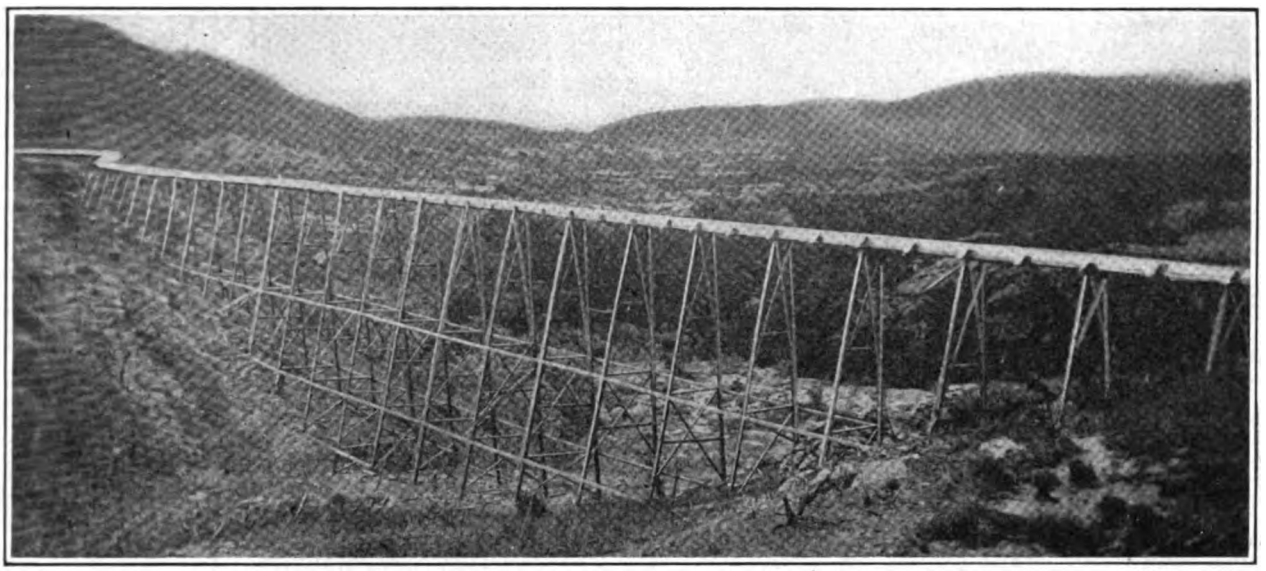
The exact hour of maximum danger changes from mine to mine. A period of the day that may be extremely dangerous at one operation may be comparatively safe at another. Not infrequently, two distinct danger peaks during a shift may be encountered. These may be either close together or widely separated. Records kept at one large group of sizable mines in West Virginia year after year have shown that the hour of greatest danger is at 9 a.m. with a secondary danger peak between 4 and 5 p.m. Similar records kept at another group of mines in Kentucky show that the time of greatest peril is not attained until between 2 and 3 o'clock in the afternoon. Here also a secondary danger peak is reached between the hours of 4 and 5 p.m.

A variety of theories have been advanced to account for these periods of greatest danger. In general they appear to coincide with the hours of greatest hurry—the times when the coal is moving the fastest. Thus the major peaks occur at the hours when those at the face are working the hardest to load out their coal. The minor peaks in both instances coincide with the time when all hands are finishing up the day's work—hustling to get places cleaned up, to get the last trip out, or what not.

Regardless of what may be the actual cause of these periods of maximum danger, they unquestionably exist, and the lesson to be drawn from them is that at these times not only should the foremen and assistant foremen, but all mine workers as well, observe if possible extra precautions and practice if possible extra vigilance. In doing so, however, the mine worker should bear in mind that these are hours of extra hazard only—that real danger exists at all times.

And so, while extra care to avoid accident may logically be taken during certain definite periods of the day, the exact time of which can be determined only from careful records, the miner who would preserve his skin whole may well follow the advice of the old plainsman and "keep his eyes peeled all the time."

Let There Be More Light



ONE ADVANTAGE of concentrated mining is that it makes better illumination possible, yet the opportunity is being neglected in many instances. Electrically-operated loading machines are, as a rule, equipped with headlights which provide a fair degree of illumination at the face. But much of the concentrated mining is being done with scrapers or by hand loading into face conveyors; and headlights are not logical equipment items of the machinery designed for these systems.

Adequate illumination is perhaps more important with scrapers and face conveyors than with true loading machines, because the coal at the face usually can be cleaned when the former methods are used but must be abandoned when loading by a machine. It is often the necessity of cleaning the coal at the face that decides which method should be adopted.

That better light results in increased production, decreased accidents, and a higher quality of product was proved, long ago, to industry in general. Coal mines have been backward in the "better light" movement because of the scattered nature of the work. Now with the advent of more concentrated mining better illumination has become practicable.

With portable flood lights a face that is being worked rapidly can be illuminated at a reasonable expense for the power cost will be less than half a cent per lineal foot of face in an 8-hr. shift. The floodlights should be of the type having an extra large reflector and a diffusing lens. This will reduce the intrinsic brilliancy and so prevent unnecessary glare. Units of from 300- to 500-watt capacity lend themselves well to face illumination. However, no doubt conditions exist where 1,000-watt units would be desirable and within reason.

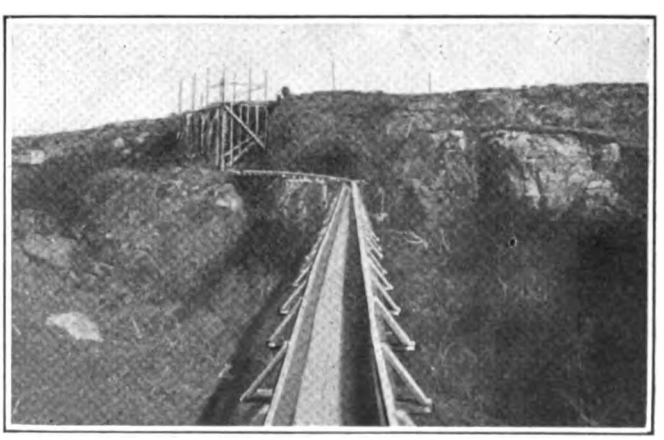
Long Flume Transports Coal in Hilly Region

New Zealand Company Flows About 150 Tons per Hour by Trough 5¾ Miles to Screening and Loading Plant with Water Impounded in Conservation Scheme

By G. Townsend*
Westport, New Zealand

A SYSTEM of transporting the output of a New Zealand coal mine more than five miles by flume to a screening plant and railroad loading point has been installed by the Westport Stockton Coal Co., Ltd., at Ngakawau near Westport, N. Z. The system was built to reduce the cost of bringing this coal in fine sizes down from the mine in the hills. It is the largest coal flume in the world.



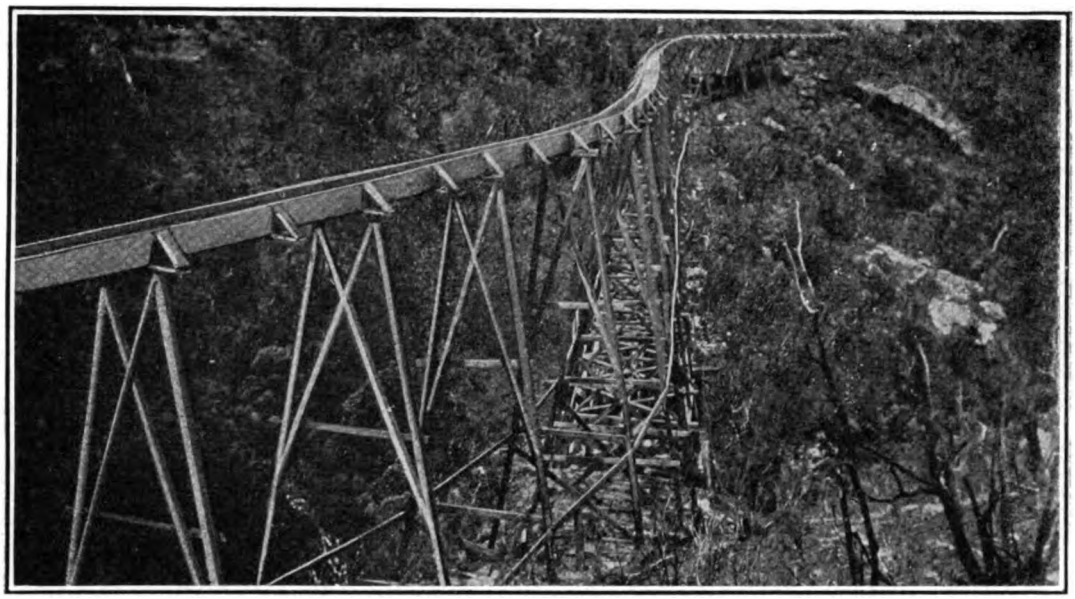
The water is obtained from natural sources, a dam having been built for conservation purposes. The installation is new and no accurate measurements of the quantity of water used have yet been taken but probably about 1,000 gal. per minute is required to move the approximate 150 tons of coal per hour that can move in the flume. The speed is between 8 and 10 m.p.h. This speed, of course, varies slightly with the volume of water and coal in the trough at any given time. It has also been found that heavy rain has an appreciable effect upon the flow of the water as the flume presents a large catchment area.

FLUME SUPPLANTS TRACK HAULAGE

Within the coal industry of New Zealand the principal method of transport from mines to railway is one of rope haulage of gravitation, although in some instances other methods are adopted such as aërials, electric trains, and winding appliances. At Ngakawau, the Westport Stockton company has been using both rope and haulage and electric locomotive. At this mine the coal had been conveyed some five miles from the mine to the head of the inclines by electric trains thence to the storage bins situated alongside the railways by rope haulage down steep inclines.

After many years of indifferent results from this system, a new scheme of operations was adopted. This fluming method of transport is not altogether new in New Zealand, as small flumes have been operated successfully in the Reefton district and at Seddonville, the seat of co-operative mining. But a flume of such length never before has been operated in the Dominion.

The coal won by the miner at the face is conveyed by electric haulage to new storage bins situated outside the mine. These bins have an approximate capacity of 600 tons and are built of the best of New Zealand timbers, procured from the sawmillers of the district. Here the coal is weighed, classified, and then stored within the bins. After dumping their loads the cars



Where the Coal Starts Its Ride

This picture, taken during the construction of the flume, shows the 600-ton storage and loading bin in the background where the coal is dumped near the mine and fed into the flume. When the photograph was made the flume box had been constructed but the iron lining had not been installed.

In the headpiece is shown a length of the Westport-Stockton Coal Co.'s flume running across ravines and curling its way through the hilly country bearing coal in a swiftly flowing current of water from the mine to Ngakawau, near the town of Westport, N. Z.

*General manager of the Westport Stockton Coal Co., Ltd., Westport, N. Z.

Digitized by Google

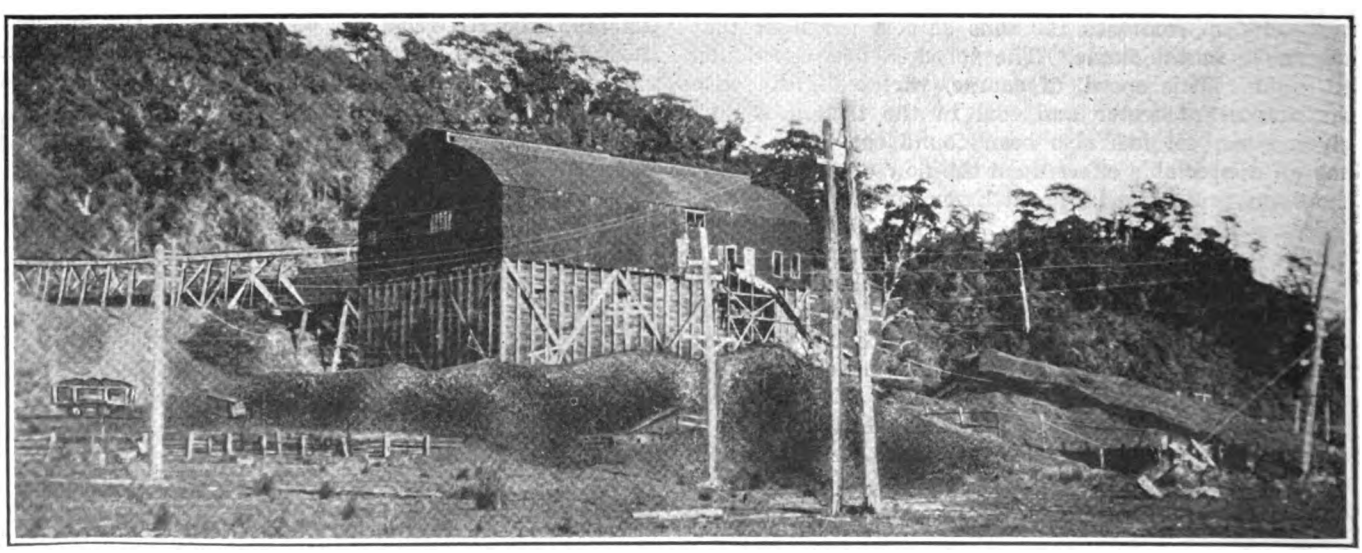
High Trestle

The country through which the Westport - Stockton Coal Co.'s flume runs is far from level. It is so hilly that the flume itself is 5¾ mi. long though the airline distance from mine to discharge point is but 3½ mi. At some places it crosses gullies on trestlework as high as 90 ft. There are a few hairpin turns and three tunnels in the course, but the coal negotiates the route successfully at a rate varying from 8 to 10 m.p.h.

continue their journey and by a circuitous route return to storage sidings and thence to the mine again. Thus on each journey from the mine and back the cars are not reversed.

The coal gravitates into the flume by means of doors, the size is regulated by several grids through which it passes.

The flume proper is 5¾ mi. long from the new bins to Ngakawau though the distance between these two points is only 3½ miles in a direct line. Many difficulties were experienced by the survey to find a suitable gradient.



After leaving the storage bins the flume passes over Mangatina Creek at a height of 90 ft. and continuing from there enters a tunnel about 275 ft. long. Emerging from there it negotiates several high places and sharp bends, passing through the mining township of Stockton, thence to Mine Creek, over which it passes and enters the virgin bush, and wends its way round the natural line of the hill, passing through two more tunnels and finally approaching Ngakawau from a northeasterly direction.

The dimensions of the flume are 17 in. across the bottom and 12 in. high. This box is placed on trestle legs. The inside is sheathed with special high grade, galvanized iron ⅛ in. thick. This iron was imported from England in flat sheets and in order to conform to the shape of the flume it was necessary to have the sheets bent.

For this purpose a special machine was designed and constructed by the company's staff and two men with the aid of this machine completed about 200 sheets per shift.

These plates are joined together with galvanized bolts and the plates at the joints are separated by felt lining. In difficult traverses the flume is protected by works to guard against possible land slips which are prevalent in some parts.

A screening and loading plant is installed at the mouth of the flume for the handling of the coal on its arrival. Passing from the flume the coal and water traverse a two-level screen. The top plates have ¾-in. perforations to screen out the household coal for which Stockton is famed. This coal will pass immediately to

This Is the End of the Line Where the Flume Discharges Its Coal and Water

The water, drawn from a reservoir high in the hills near the mine, bears its load of about 150 tons of small coal per hour to this preparation plant at Ngakawau, near Westport, N. Z., where, having been separated from the coal by several sets of screens, it flows into the Ngakawau River, its natural destination. Four or five sizes of coal ranging downward from "household" size, which is caught on ¾-in. grids, are screened out and loaded into railroad cars. The yard is used for storage.

Digitized by Google

the railway cars by a retarding belt, the water and the balance of coal meanwhile passing to the second screen of a ⅜-in. mesh to catch the Stockton nuts, which in turn are conveyed to the storage spaces by a scraper conveyor.

The water and coal of under ⅜-in. measurement then enters a gigantic revolving screen which rotates at 120 r.p.m. It is 27 ft. long composed of two sleeves, the first having a diameter of 4 ft. 6 in. and the second 5 ft. This machine separates the peas from the water and slack.

Two identical sets of this machinery will deal with different classes of coal which will be run in the flume by arrangement. In addition to this, auxiliary machinery has been provided in case of breakdowns, for once the coal is placed in the flume at the top it must come right to the bottom and cannot be sidetracked halfway.

The water subsequently passes through a minute mesh to separate the dust and finally reaches the Ngakawau River where, if it had been untramelled by man it would naturally have gone, finally being lost in the Pacific Ocean.

The whole scheme from start to finish has received minute attention and scrutiny and nothing of an emergency nature has been left unprovided for. When the topography of the country is known, one can easily realize the colossal undertaking, and the almost insurmountable difficulties experienced by the builders.

At a trial run of the flume 65 tons of coal were conveyed the 5¾ miles from the head receiving bins to the bins at Ngakawau in 36 min. without any appreciable damage to the product. Some specimens were rounded by the wash of the water, but when the flow increased in volume, the coal slid along easily and freely and arrived at its destination at the seaboard without breakage. The flume system is regarded by many as the best future method of transport of coal from the high country to sea level.

How Long Will Anthracite Region Produce Coal?

Pennsylvania Survey Gives Eastern Middle Field 35 Years and Southern District 110 Years of Active Life—Extraction Improves

THERE IS anthracite coal still in the ground that will last for thirty-five years, in the Eastern Middle district of Pennsylvania, while the life of the reclaimable coal in the Southern field of the state is estimated at 110 years according to the Pennsylvania Geological Survey. A recent bulletin, prepared by Dr. George H. Ashley, state geologist, shows that there is 16,354,676,000 tons of anthracite in the ground, of which 8,979,474,000 tons are recoverable. It further points out that the anthracite industry has increased its percentage of recovery of coal in the ground about 16 per cent since the middle nineties.

About 30 yr. ago a state commission studied the mining of anthracite with reference to its recovery and the waste of coal. The report showed that recovery then averaged 41.5 per cent of the coal in the ground; or, omitting certain collieries in the Southern field one of which reached a recovery of 51.5 per cent, the average of the rest was only 38.5 per cent of the coal originally below the surface.

This new publication of the Geological Survey indicates that the recovery in the anthracite fields in 1921 averaged 61.1 per cent with a total loss of 38.9 per cent, of which 4.3 per cent was in preparation. This indicates clearly that mining and preparation methods in the anthracite regions are improving rapidly.

In the olden days, particularly in the early years of the anthracite industry, only lump coal was shipped. All the smaller sizes were either left in the mine or carted to dump piles, which are now known as culm. The coal was separated inside by means of a long-toothed hand rake. After more efficient means of burning the anthracite was invented, sizes down to pea coal were used, and only the smaller sizes, such as buckwheat, rice, and barley, were discarded.

In the last few years by means of patent grates and forced draft the various industries have been using these finer sizes with much success. In the last five years efficiency has gone even further, and the fine silt, most of which will pass through a ⅛-in. round screen, is being reclaimed and burned under boilers by forced draft. The anthracite operators and consumers are utilizing practically all of the coal mined.

Some coal losses are unavoidable, says the Survey report. The anthracite regions are thickly populated and mining is carried on beneath cities. Large quantities of coal must be left to support the surface. In the anthracite fields there are from 12 to 26 coal beds one above another, many of them lying close together. In order to mine all of these beds it is necessary to leave large pillars for supporting the coals above. Some of the coal in these pillars eventually can be removed but much of it inevitably is lost. Bad roof and floor mean the loss of valuable coal which must be left in these positions. Areas of thin coal, which can not be mined profitably, must be left behind and, in most mines, is lost forever. Coal under streams and rivers must be left in place to prevent the seepage of water into the mines and eventual flooding.

In the Northern anthracite field the mines have drifted into an old buried stream channel of glacial origin. The gravels in this channel are water-bearing and large barriers of coal must be left around these gravels in order to prevent the flooding of the mines and the loss of life. Other forms of pillars which are necessary to mining cannot be wholly recovered.

Big Loss Caused by Fires

Disastrous mine fires have also resulted in the loss of large areas of coal. These fires in most instances have been entirely extinguished and the coal in their immediate vicinity may be loaded out eventually; in fact, some coal companies are reburning coal which has been burned underground. Mining hazards, such as squeezes, flooding, and creeping, also cause temporary loss.

The entire anthracite field raises an average of 10.9 tons of water per ton of coal mined. In areas where the water is in too great a volume to permit mining the coal at a profit, this coal must be left behind as lost. There are many other causes of loss in mining anthracite, such as reservations under railroads, water lines, and other public utilities.

In the production of coal there is always a loss in preparation and transportation. In the bituminous fields of Pennsylvania this loss is not large because 90 per cent of the coal is shipped as it comes from the mine. Anthracite is prepared in elaborate breakers,

Digitized by Google

some of which cost as much as $2,000,000. Public demand for sized coal means that there is a loss in breaking the coal. Coal is lost off of cars in transportation. These losses are unavoidable.

In answer to a question often asked in these days, this bulletin states that there are 16,354,676,000 tons of anthracite remaining in the ground. Of this quantity 8,979,474,000 tons are recoverable. The accompanying table gives the distribution of these tonnages.

Field	Total Remaining (in Billions)	Per Cent Recoverable	Recoverable Tonnage (in Billions)
Northern	3,276,763	67	2,195,431
Eastern Middle	248,628	69.4	172,548
Western Middle	3,573,025	58.1	2,075,928
Southern	9,256,260	49	4,535,567
Total	16,354,676		8,979,474

This report estimates the original content of the fields to have been more than 20 billion long tons, which is a somewhat larger estimate than that of the Pennsylvania Second Geological Survey. Of the total 9 billion odd tons less than 4 billion tons are thought to be recoverable within the next 40 years, leaving more than 5 billion tons to be recovered after that period. The Northern field is estimated to have a life of 50 years, the Eastern Middle 35 years, the Western Middle field 100 years, and the Southern field 110 years.

Bureau Tells How to Build Life-Saving Barricades

"The fortunate rescue of 21 coal miners from No. 8 mine of the Jamison Coal & Coke Co. at Farmington, W. Va., after their having been entombed Jan. 15 for a period of 18 hr., affords a striking example of the great possibilities of underground barricades as a means of saving human life following mine fires and explosions" said Scott Turner, director of the Bureau of Mines, when he heard the news of the disaster. "Press dispatches report that these 21 survivors of a disaster that snuffed out 19 lives preserved their lives by bratticing themselves in a room, thereby protecting themselves from the deadly fumes and gases that permeated the wrecked mine.

"The Bureau of Mines has records of the saving of approximately 300 lives in coal mines through the erection of barricades of cloth, board, coal or rock following explosions. The Bureau believes that many lives may be saved in the future by disseminating among the miners the knowledge of how to erect such barricades."

The following practical recommendations for the guidance of miners entrapped at mine disasters are made by the Bureau in Miners Circular No. 25:

When entrapped by gases from fires or explosions, and forced back into workings in which there is comparatively good air, men should keep uppermost the thought of building a bulkhead or stopping, and collect on the way tools, timber, canvas, water, dinner buckets, and anything else that might be useful.

If there is no compressed air, the best thing for miners behind a barricade to do is either to lie down or sit on the floor in the hope that the rescue-crew will find them before they are overcome. In this relaxed position they will breathe much less air than if they exert themselves.

As soon as a place is chosen for a barricade, its erection should begin, for the gases often travel quickly. The movement of gases by air currents should be checked as soon as possible by the opening of doors outside the barricade and the hanging of brattice cloth or by the moving of a door to a new place across an entry. The permanent barricade should be started 50 to 75 ft. from the outer barricade. As much of an entry, room, or drift, as possible should be barricaded off so as to provide a maximum quantity of air. Before constructing a bulkhead men should make sure than there is no connection with other workings through which gases could come. At some place outside of the first stopping, if more than one stopping is built, a sign should be placed to show that men are behind it.

If a barricade be made of lumps of coal, slate, or other debris, two walls 2 to 3 ft. apart ought to be built and the space between filled with fine material or mud. The stopping must be air-tight. Board stoppings are not as easily made gas-tight as those built of dirt or rock and dirt. All chinks and holes in the barricade should be stopped with clay, rags, clothes, and similar material.

If a piece of pipe is available, it should be placed through the stopping and plugged at the inner end, in order that tests of the air outside the barricade can be made by removing the plug.

After the barricade has been built, in order to conserve the oxygen of the air, the men should keep as quiet as possible. However, occasionally somebody should walk around so as to mix the air. All the men should not congregate in one place.

The first barricade recorded in the reports of the Bureau of Mines was built by entombed miners during the fire at the Cherry mine in Illinois, in 1909. Six days after the outbreak of fire in this mine a rescue crew met a party of eight men who had barricaded themselves with twelve others, saved later, but had come out when the air improved and were making toward the shaft. They had walked over half a mile, past cars and dead mules, in the dark, and in an atmosphere (afterdamp) that would not support a flame light. These men were in comparatively good condition when found.

Barricades Save Many Lives

By bratticing themselves in an emergency shelter, by closing the "creep-hole," a sliding door in a stopping above a compressed-air pump, and then breathing the exhaust from the pump, thirteen men saved their lives in the No. 2 mine of the San Bois Coal Co., at McCurtain, Okla., in March, 1912.

At the time of the explosion in No. 5 mine of the New River Collieries Co., at Eccles, W. Va., seventy-four men were in No. 6 mine above it; of these eight were overcome at afterdamp, thirty-one were rescued, and thirty-five saved themselves by retreating from the hot afterdamp to a sump room, where they bratticed themselves off by means of canvas. Here they remained for four hours, until rescued.

There were 153 men in No. 7 mine of the West Kentuck Coal Co., at Clay, Ky., when an explosion on Aug. 4, 1917, killed sixty-two miners; forty-three of the others saved their lives by bratticing off an area not affected by the explosion where they were rescued three and a half hours later.

On March 2, 1915, an explosion at No. 3 mine of the New River and Pocahontas Consolidated Coal Corp., at Layland, W. Va., killed 115 of the 169 men in the mine. Of the fifty-four that escaped, forty-seven saved their lives by erecting bulkheads at two different points.

Ingenuity and $125,000 Rejuvenate Old Mine

By J. H. Edwards
Associate Editor, *Coal Age*,
Huntington, W. Va.

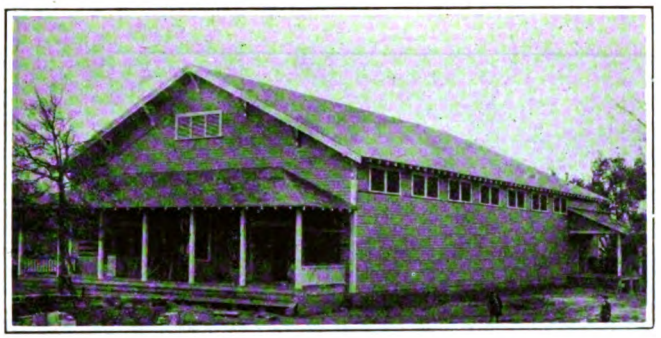
A NUMBER of unusual features were introduced in the rehabilitation program carried out since 1924 at the Empire mine of the DeBardeleben Coal Corp. in Alabama. With an eye for the future the company spent more than $125,000 equipping the property to better prepare its 1,000-ton daily output and effecting changes underground to make operations in the 28-in. coal continue profitable in spite of growing competition. The old mine has been rejuvenated by improvements to the tipple, a complete new washery, the construction of a new mine yard, the addition of more haulage locomotives and the installation of a slate disposal larry. The chief interest, however, centers in the alterations to the top works where novel devices were required because of the wide variety of cars used.

In order to speed up the handling of cars at the tipple the use of a modified rotary dump located on the mine track level was decided upon. This necessitated the installation of a 42-in. belt conveyor, 238 ft. long, to handle the coal from the dump house to the shaker screens of the old tipple.

In the construction of the rotary dump and the car feeder special features of design were incorporated. Variations in width, height, shape, size of wheels and other details of the cars precluded the use of a standard dump. A two-car equipment was designed and built especially for the case by the Charles T. Steward Machine Co., of Birmingham.

When the dump is upright, two sets of arms actuated through a cam on the driving mechanism are forced to a position releasing the sides of the cars. There then is no possible interference with the free movement of the cars. But when the dump starts to revolve the cam causes the arms to close in over the top edges of the car bodies. Heavy springs interposed between the actuating arms and the holding tips provide the flexibility made necessary by the varying shapes of cars and by large lumps of coal that may be in the path of the arms.

The dump is turned by a 5-hp. squirrel-cage motor. Control and reversal of the motor are by means of an inclosed double-throw line switch. A spring-set brake, which is released automatically by the switch lever, holds the dump in any position, when the power is cut off. The dump has handled 225 cars in one hour.



The installation of a trip feeder, also was complicated by the dissimilarity of mine cars. However a design was worked out which required no changes or additions to the cars. The channel which forms the runway or guide of the upper strand of the feeder chain, is built in 4-ft. hinged sections and held up above the track by coil springs. This brings the chain high enough so that the dogs will catch the car bumpers if no engagement with any lower part is made, yet allows the chain to be depressed by the axle or any low projection on the cars.

The speed of the car feeder is timed so that a trip cannot be moved forward faster than the cars can be handled through the dump. This speed is always within the limit of the tipple capacity.

Preparation at the tipple consists of separating the coal into three sizes and picking the lump and egg sizes. A horizontal reciprocating screen is used. First the coal passes over a plate having 1½-in. round holes. Everything going through is conveyed to the washery. Next the coal goes over a plate having 2½-in. holes, separating the egg and lump. The lump is picked as

A general view of the Empire tipple and washery is shown in the headpiece. The conveyor in the foreground is that from the dump house up to the shaker screens in the old tipple. All of the equipment seen in the picture is new except a part of the old tipple, which is still in use. The small building at the extreme right houses the drive of a bucket conveyor which deposits slate and rock from the dump house into a bin, for disposal with a motor-driven larry. Back on top of the hill is the discharge end of the washery refuse conveyor.

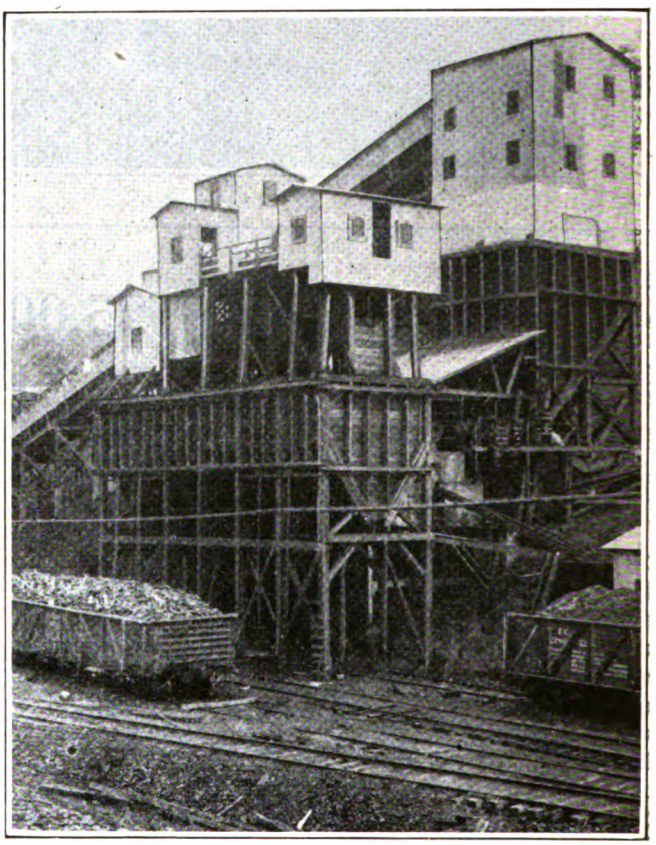
The New Commissary Nearing Completion

A portion of the ruins of the old two-story building which formerly housed the commissary and office can be seen in the foreground. It burned last summer.

it passes over a blank plate of the screen, and the egg picked on the loading boom.

In the new washery a 50-ton-per-hour jig, and four 7½-ton-per-hour tables make up the principal equipment. A 30-in. belt conveyor 209 ft. long brings the 1½-in. screenings from the tipple to the headhouse of the washery.

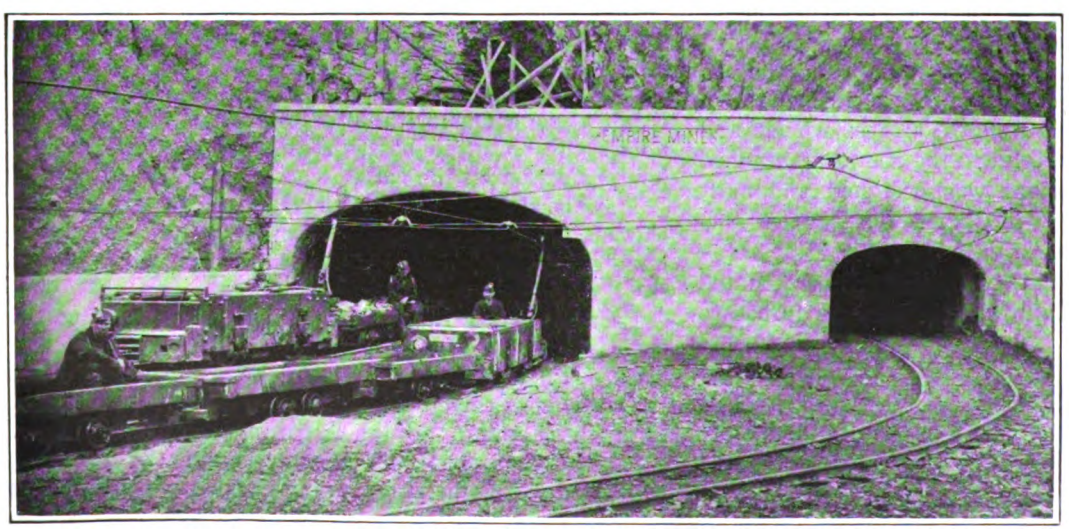
The order of preparation in the washery is as follows: First the coal is fed to a rotary screen having 1-in. holes. All of that which goes over passes directly to the jig while that which goes through is next screened on a vibrating equipment of ⅜-in. mesh. Everything through the latter screen passes directly to the tables and that which goes over is mixed with the large size from the rotary on its way to the jig.



Washed coal from the jig and from the tables passes into separate settling tanks. That from the jig is then elevated in perforated dewatering buckets to a rotary screen of 1-in. mesh located above the loading track bin. Here it is separated into nut which goes over and chestnut which passes through the screen. The fine coal from the settling tank of the tables is dewatered in the same way and is either shipped as ¼-in. smithing or mixed with the nut or chestnut to make steam coal.

An analysis selected at random from a number of the regular runs, showed ash contents of the washed coal as follows: nut 2.05 per cent, pea and slack 4.10 per cent, blacksmith 2.16 per cent. The superintendent explained to a visitor that this report happened to be somewhat better than the average, and stated that percentages of 2.25, 4.5 and 2.75, respectively, came nearer being representative.

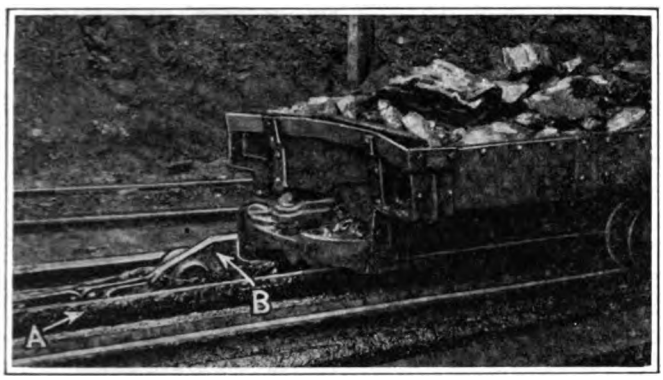
When the new washery was put into use it was found that considerable breakage resulted from the dropping of the washed nut from the rotary screen into the loading bin below. After considerable planning and experimenting a spiral chute was installed which has proved entirely satisfactory in lowering the coal without breakage.



This chute has a vertical height of 18 ft., and extends down into the bin about 10 ft. It is composed of 10-in. sections of ⅛-in. curved steel plates electrically welded and supported by ⅝-in. rods on a center column of 3-in. pipe.

Refuse from the washery is carried on an 18-in. belt conveyor, about 200 ft. long, to the top of a low hill

The New Washery at Empire



This was put into use early in 1925, and represents part of the $125,000 recently spent at the mine for improvements. A plunger type jig and four tables make up the washing equipment. Two primary sizes are turned out by the washery, however, by later separation and combination, five sizes are made available for shipment.

New Portal

This concrete entrance was finished last October. The locomotive bringing out a trip of loads, is a new 10-tonner. Most of the mine cars are rather old and are not of uniform design, but all are necessarily of a very low type. The coal per car averages about 1,500 lb.

Digitized by Google

Car Haul

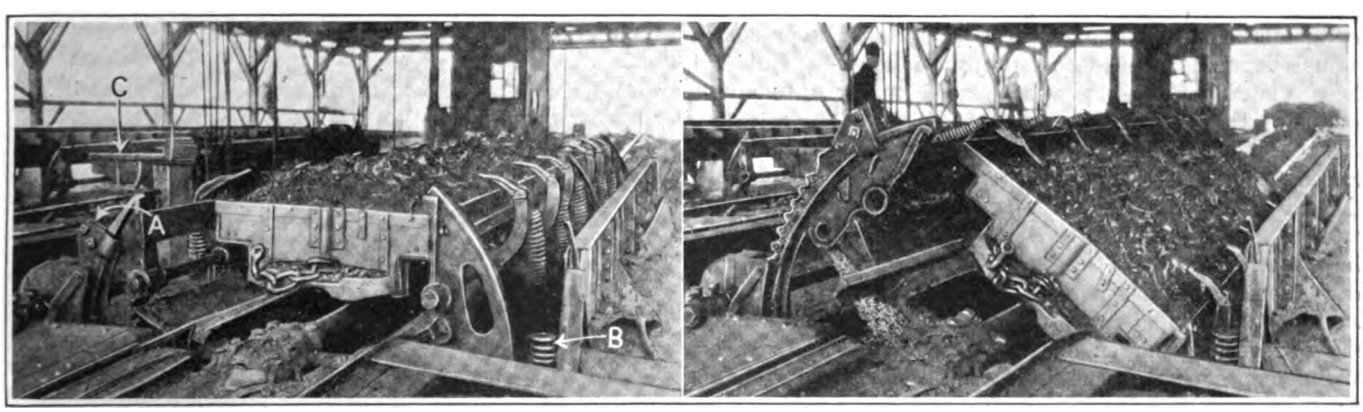
The channel which acts as a runway for the upper strand of the chain is made up of hinged sections supported by coil springs. This provides flexibility and brings the dogs high enough to catch some part of the car, regardless of its design. No special angles were added to the car bottoms. "A" is the runway and "B" the dog.

nearby. To the same point the used water from jig and tables is pumped. This water discharges on the refuse falling from the conveyor flushes it away thus eliminating the necessity of frequent extensions to the conveyor. The water, freed of solids by filtering through the refuse pile is reclaimed at a pumping station located beside a dam which has been constructed at a point several hundred yards down the hollow.

The Empire mine is in the Black Creek seam of the Warrior basin. The coal lies practically level, contains no parting, and is of a grade which finds a ready market for domestic and steam purposes. Generally speaking, the mine top, a hard sandy shale, is fairly good.

THIRTEEN MACHINES CUT COAL

Room-and-pillar methods are followed, the rooms being driven 25 ft. wide on 45-ft. centers. The coal is undercut with electric machines having 7½-ft. cutterbars. About 12 in. of top is brushed from above the track in the center of the rooms mainly to give sufficient height for unloading the mining machines. The added clearance also has the advantage of making it possible to load larger lumps over the sides of the cars. The cutting equipment is made up of thirteen machines.



Practically all of the coal is loaded by contract at approximately 65c. per ton, this including, drilling by hand and shooting, pushing cars to and from the entry, laying track in rooms, and timbering where necessary, setting the posts on 4-ft. centers. Yardage is paid for separately at varying rates on butt and face headings and for brushing in rooms.

Haulage is one of the big problems at Empire. The coal per car averages only 1,500 lb., the mean length of haul is 2½ miles, the longest haul 3½ miles, and there are 23 miles of main haulway in use, some of it running through hills and across hollows, winding about like a scenic railway. Locomotives of the storage battery, combination, and trolley types gather the loads from the entries or room necks and assemble them for main haulage by 10-ton trolley locomotives. The company uses a haulage boss whose rank corresponds to that of assistant superintendent.

Spiral Chute

Before this chute was installed to lower nut into the loading bin the coal had to be dropped about 20 ft. when the bin was empty and about 9 ft. when the bin was full. When the photograph was made the bin was nearly full, thus backing coal up in the lower end of the chute. The pitch of the chute is such that it unloads itself as fast as the level in the bin lowers.

Empire's Rotary Dump Had to Be Built to Handle Various Shapes and Sizes of Cars

The cars not being of uniform design, it was difficult to find a dump suitable to the condition. With this special arrangement designed for the purpose, there can be no binding or sticking of the cars. In the level position, shown in one photograph, the holding arms of the dump are forced back from the top edges of the car by a cam-operated mechanism. "A" is the bumper, "B" a bumper spring, "C" is a car in the rock dump nearby.

In the picture showing the dump in action the holding arms have closed in, over the tops of the cars. The dump makes about one-half a revolution and returns. It is driven by a 5-hp. squirrel-cage motor, controlled by an inclosed double-throw line switch. A brake, released from the controller handle and set by springs, holds the dump in a fixed position, wherever it may be stopped.

Coal Industry Can Raise Its Own Timber And Cut Big Cost Item

Idle Forest Lands Near Mines Can Yield More Than 2½ Million Cords Used Annually—Preservation Pays

By H. S. Newins*
State College, Pa.

Photos Courtesy of U. S. Forest Service

WOOD is required in enormous quantities to maintain the coal industry. Uses are so numerous and so large in the aggregate as to total 0.7 cu.ft. for each ton of anthracite produced from the mines and 0.33 cu.ft. for each ton of bituminous coal. No complicated calculation is required to reveal the tremendous drain necessitated by this industry upon our forests. Forest resources have been lavishly wasted but the cut-over and idle forest lands in the vicinity of all our coal-producing mines are more than capable, when placed under management, of supplying the industry's requirements indefinitely.

Statistics compiled by the United States Forest Service, Department of Agriculture show that for the year 1905 the coal industry absorbed for underground use 134,985,700 cu.ft. of round timber and 242,000,000 board feet of sawed timber. (Table I.) These exactions have continued and today the Department of Commerce announces that according to data collected in co-operation with the Departments of Agriculture and Interior 152,342,217 cu.ft. of round timber and 296,641,000 board feet of sawed timber were used underground in 1923 by 5,205 coal mining establishments. This amount when converted by the factor of six board feet per cubic foot constitutes a grand total of 201,702,383 cu.ft. or reduced to cords by the equivalent of 80 cu.ft. per cord (solid wood), a total of 2,522,279 cords.

Based upon conservative figures of growth our unmanaged forests in the vicinity of coal mines should be capable of producing an average yearly growth of one half a cord of wood per acre. At this rate 5,044,558 acres of forest land, provided they were protected from fire, could be employed indefinitely to satisfy the present annual demands of the coal mining industry. But if these visionary forests were placed under intensive forest management it is not too much to expect an average production in growth of one cord per acre, thereby reducing the area by one-half.

Each of our large mining regions has ample forest land within the immediate vicinity to more than supply the requirements of the industry. The 156 mining establishments reporting from the anthracite region actually own 500,000 acres of land and this alone placed under forest management would almost fulfill their requirements permanently. Yet this region is forced by the lack of sufficient local timber to import the bulk of the required stock, drawing these supplies chiefly from the loblolly pine districts of Virginia and Maryland, and even from Oregon via the Panama Canal and the Port of Philadelphia, and paying a price more than four times as great as that paid when the mine timbers were available locally. The average cost of mine timbers in 1905 was 6.6 per cubic foot. Today the average cost is 27.5c. per cubic foot of round timber delivered, of which amount more than 57 per cent is for freight alone.

In the bituminous regions of central and western Pennsylvania the supply of sawed timber is almost exhausted and the mines are now importing from the South. In fact, the Pittsburgh district uses alone more lumber annually than is produced each year in the entire state of Pennsylvania. Round timbers chiefly for props are available in sufficient quantities within the state but in many cases must be hauled 200 or 800 mi. and this material is fast disappearing. In the earlier days of coal mining this region was so well furnished with available timber that the valuable white pine was used. After the supply of this species was exhausted white oak, hemlock and chestnut were taken each in turn until today the industry must depend upon the second growth hardwoods for all temporary uses.

Table I—Quantity of Mine Timber Used Underground, by Classes of Mines: 1923 and 1905[1]

	Number of Establishments[2]		Round Timber (Cubic Feet)		Sawed Timber (Board Feet)	
	1923	1905	1923	1905	1923	1905
Total	6,384	5,163	174,389,004	165,535,900	507,359,000	435,944,000
Bituminous	5,149	2,940	110,983,610	91,309,700	227,340,000	140,790,000

Pine and hardwoods from the South are used for the more permanent type of construction as in entries, haulage ways, and main openings. However, 75 per cent of all the wood products used in these mines is of round timber rather than sawed timber. Since these timbers are employed in the smaller dimensions as well as in the larger sizes it is possible to utilize a great quantity of products from local forests for which there is no competition except in some cases where there may be a demand for post material. This region has sufficient forest land within its boundaries to supply easily the requirements of the mining industry. If these forest lands were placed under management a longer rotation would be necessary for sawed timber but the round timber of much smaller size could be produced meanwhile in abundance and the cutting of the round timber largely as thinnings would benefit the forest.

West Virginia uses approximately 25,000,000 cu.ft. of timber per year in the coal mines of the state. Until recently West Virginia ranked first in the total production of hardwoods in the United States, but now these valuable stands of hardwoods as well as those of pine and spruce are being rapidly exhausted by commercial exploitations, and already the mines of this woodland state are required to use an inferior grade of second growth timber.

Illinois, according to the Second Report on a Forest Survey of Illinois by Herbert H. Chapman and Robert B. Miller, ranks third in the consumption of wood for coal mining and used during 1921 an estimated total of 21,552,260 cu.ft. as follows:

Props, 13,375,989 cu.ft.
Mine ties, 2,691,399 cu.ft.
Caps, 1,902,220 cu.ft.
Legs and bars, 2,537,970 cu.ft.
Riprap, or lagging, 202,422 cu.ft.
Mine cars, 1,329 800 cu.ft.
Construction, 512,460 cu.ft.

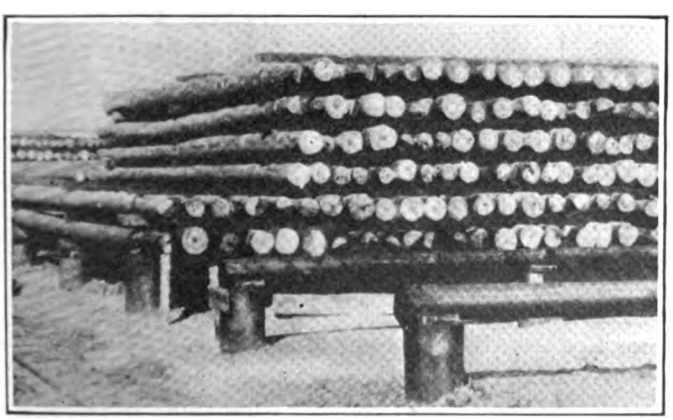
The more recent estimate for 1923 by the United States Department of Commerce shows a consumption of 17,471,530 cu.ft. for underground use instead of 19,710,000 cu.ft. as in 1921. On the basis of the year 1921 a total of 246,375 cords of wood is required to mine all the coal produced in Illinois.

Exactly 91.24 per cent of all this wood is in the form of round or hewn products of which but 7.12 per cent are legs and bars of sizes large enough to yield lumber. Thus 84.12 per cent of all the wood used in these coal mines consists of relatively small props, mine ties, and lagging which utilize trees down to 3 to 4 in. in diameter breast high.

The average price paid at the mines for all classes of timber reduced to cubic feet was in 1921, 18.3c. per cubic foot. The larger sizes such as for legs and bars cost 26.7c. or an amount 46 per cent greater than the average, while mine props cost 16.2c. per cubic foot or 11.5 per cent lower. Therefore the larger sizes command a price per cubic foot 64.3 per cent greater than the smaller. It has been computed that an area of less than 500,000 acres of forest land will furnish a perpetual supply of mining timbers for Illinois. The mining companies own 799,000 acres, or 60 per cent more than they require to produce their own needs.

Although known as the prairie state, Illinois continues to draw more than 60 per cent of the mine timber used from within its own boundaries. Most of the introduced woods come from the Ozark region of Missouri and are chiefly white and post oaks of small dimensions.

The Clinton district of Indiana uses mostly local timber of small sizes and these are of second growth and of inferior quality.



KENTUCKY AND TENNESSEE WELL SUPPLIED

Kentucky produced in 1924 about 45,000,000 tons and Tennessee about 5,000,000 tons of coal. On the estimated basis of 0.33 cu.ft. per ton these states must consume jointly a total of nearly 17,000,000 cu.ft. of timber. These states, like West Virginia and Virginia, are well supplied with valuable forest land and have already been large factors in supplying timbers to the coal mines of Pennsylvania. Hardwoods, chiefly oak and chestnut, constitute the principal species, although spruce and pine were at one time abundant.

Virginia produces about 9,500,000 tons of coal annually and probably uses more than 3,000,000 cu.ft. of timber.

Alabama now produces about 20,000,000 tons of coal per year, and it is safe to assume that the annual requirement for timbers is almost 7,000,000 cu.ft. for these coal mines alone. The Alabama forests have been cut over pretty generally but continue to yield longleaf, shortleaf, and loblolly pines, white oak, red oak, cypress, and red cedar among numerous other species not used in the mines.

The problem of timber shortage which confronts the

Proper Handling of Timber in a Mine Yard Saves Money

At the left is shown a stock of peeled timber properly piled. When handled this way, the wood is little subject to decay and will season quickly. The other picture illustrates an excellent way to pile untreated ties and other short, sawed timber for seasoning or storage. In this arrangement a minimum area of wood surface is touching.

Digitized by Google

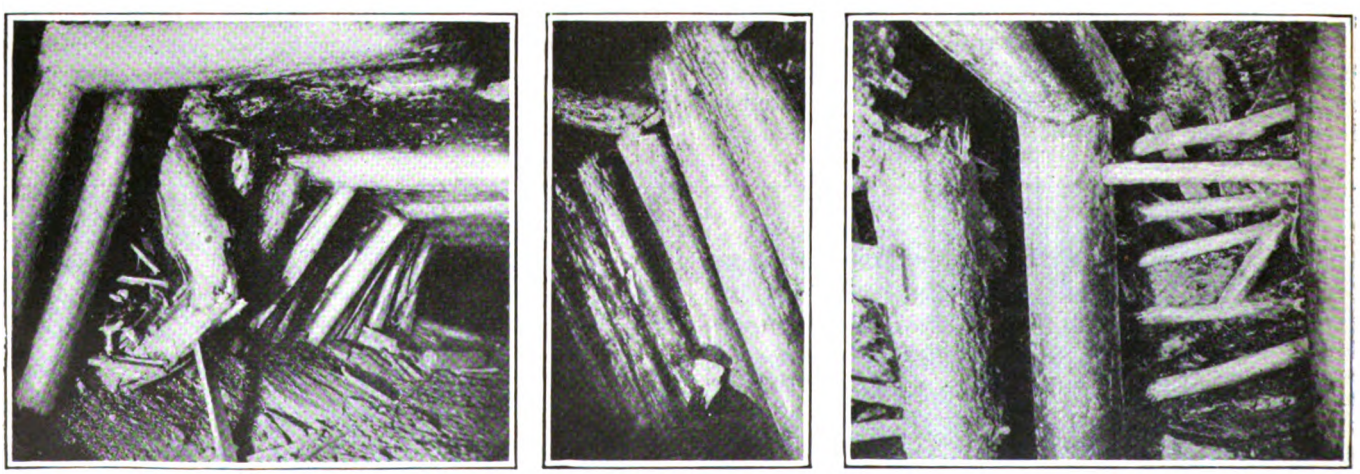
coal mining industry may be solved in just two ways: Greater production of timber and more careful use and preservation of wood in mines. In scientific timber production, on cut-over and idle lands within the commercial vicinity of the mines, federal and state aid can well be expected, but, as a matter of sound economy, the coal operators themselves should note the handwriting on the wall and take heed by focusing their foresight some thirty years in advance and organizing now their forestry departments and employing forest experts to supervise, manage, and properly protect from fire the large holdings of timber land which they control.

Encouraging progress along this line has been made in some sections. The Pennsylvania coal companies which have taken the initiative in practising forestry upon their holdings include at least the following:

Clearfield Bituminous Coal Corp., Lehigh Coal and Navigation Co., Berwind-White Coal Mining Co., Philadelphia & Reading Coal & Iron Co., Bethlehem Mines Corp., Rock Hill Coal & Coking Co., Rochester & Pittsburgh Coal & Iron Co., Cambria Mining & Manufacturing Co., Eastern Bituminous Coal Mining Co., Homer City Coal Co., Vinton Colliery Co., Arrow Coal Mining Co., Pittsburgh Coal Co., and Graceton Coal Co.

Other companies are practising forestry in a small way and it is hoped their influence may spread to the larger number of operators who have taken no action in this regard.

WHAT 40c. PER ACRE WOULD DO



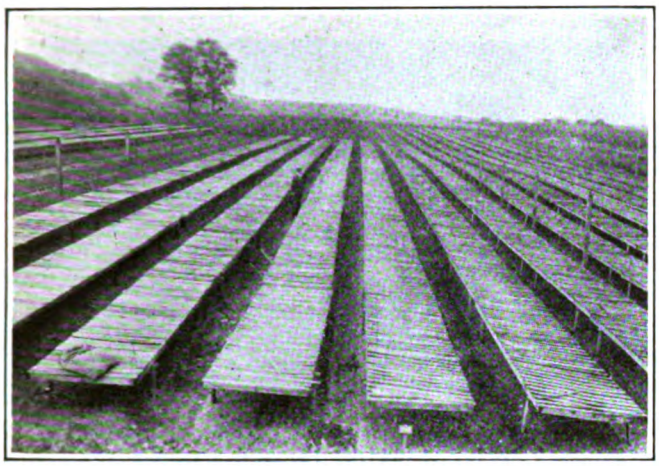
The Philadelphia & Reading Coal & Iron Co. of the anthracite region is now spending 30c. per acre annually for the protection and development of the forest land which it controls. It has been estimated by A. C. Silvius, the forester of this company, that if 40c. per acre were expended each year by each of the anthracite establishments it would take 33 years to expend for this purpose the equivalent of the present annual freight bill on wood timbers imported to this region. Mr. Silvius suggests that if the 500,000 acres of land controlled by these operators were divided into units of 5,000 acres or more, the expenditure of 40c. per acre might well be made as follows:

For roads, trails and fire lanes	15c.
For surveys and maps	2c.
For forest planting	4c.
For fire prevention	4c.
For fire extinction	2c.
For tools and supplies	1c.
For supervision	5c.
For miscellaneous expenses	2c.
For slash disposal	5c.
Total	40c.

The Clearfield Bituminous Coal Corp. offers an excellent illustration of what may be achieved in the bituminous regions when the responsible parties are thoroughly aroused to the forestry situation. The forestry branch of this company was first organized in the spring of 1920. The company's holdings comprise 150,000 acres, of which 24,000 acres are owned in fee and are available for reforestation. A survey of this land indicates that 2,000 acres are covered with a good stand of timber, 16,000 acres contain natural reproduction, 4,000 acres are barren, 1,000 acres are semi-barren near the mines and 1,000 acres are of farm land.

Since 1920 rapid strides have been made in the proper care of this forest land. The natural reproduction has been encouraged in its growth, fire lanes have been cut, roads opened, and a fire tower connecting by telephone with the state system has been erected. But the biggest development has been this company's forest tree nursery. The nursery site was established in September, 1923, near the town of Clymer, Indiana County, Pa., and the first seed sown in March, 1924.

An inventory taken in August, 1925, showed for this nursery about 2,215,000 two-year-old coniferous seedlings and 2,140,000 one-year-old coniferous seedlings. In addition the nursery contains about 16,000 hardwood seedlings and 170,000 transplants. This nursery is the largest and most successfully operated of any forest tree nursery controlled privately in Pennsylvania. This company is contemplating the planting of 1,000,000 trees each year.



This Is Why It Pays to Practice Timber Preservation in Coal Mines

In the picture at the left the broken part above was weakened by decay to the point of failure after one year's service in the mine. It was sound when installed but was not treated with a preservative. The post next to it which was treated with a preservative and placed at the same time remains sound and uninfected by decay. Two other untreated timbers in the foreground show fungus attack.

In the center picture, the timber at the left of the man—being the second upright shown in the foreground of this haulageway illustration—was set after treatment with lime chloride in 1908 and is still sound after 17 years' of service. The untreated timber immediately at his right is decayed and due for early replacement. The timber was installed only four years ago to replace a treated timber which had been in service for 14 years. The original treated cap of this set seen supported by the decayed timber is sound in its 18th year of service.

The other photograph shows—left to right—an untreated timber, a zinc chloride treated timber, and one treated with creosote after all three had been in service in a coal mine for 18 months. The two treated timbers are still free from decay.

Some Coal Companies Have Nurseries Like This

Seedlings are under the protection shown here during a part of the year before they are ready for transplantation to the open acreage the company maintains.

Seedlings with Protective Covers Removed

At the end of each season these tiny trees in a coal company's nursery are "given the air." Usually in the third season the trees are ready to be set out for their larger growth.

The planting of forest trees upon idle land not only increases the value of the property but also reduces the tax bill of the property owner appreciably. The state of Pennsylvania provides for placing such improved forest lands in a class called the auxiliary forest reserve and assesses each acre at a sum not to exceed one dollar until the time when the protected timber is ready to cut and then the state claims one-tenth of the stumpage value of the products. This affords one of the best arguments in favor of forestry on coal lands and is really too good a business proposition to pass unaccepted.

Utilize Every Timber in Mine

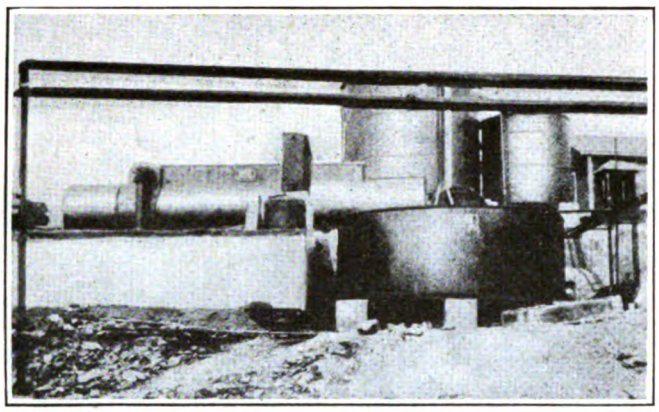
Besides increasing timber production, the other solution of the mine timber problem is that of the closest utilization of every piece which enters the mine. Wood is essential because it is cheaper than substitutes, such as masonry and steel; it is easily worked and fitted to place and involves no great difficulty in handling.

To insure the greatest strength values in mine timbers the strongest pieces should be selected for the most important places, and especially is this true today when there is but little choice between good and bad local timber. Density is an important factor in this regard and is an indication of the quantity of wood substance present, and considering two pieces of wood of equal moisture content the denser piece will have the greater strength.

Defects such as decay, knots, shakes, splits, checks, and cross grain seriously depreciate the strength values in wood, and where possible woods containing these defects should be avoided. Wherever possible timbers should be carefully seasoned before use. Timbers free from bark and properly air seasoned have greater strength and durability than those which are green and may harbor disease, insects and moisture beneath the bark.

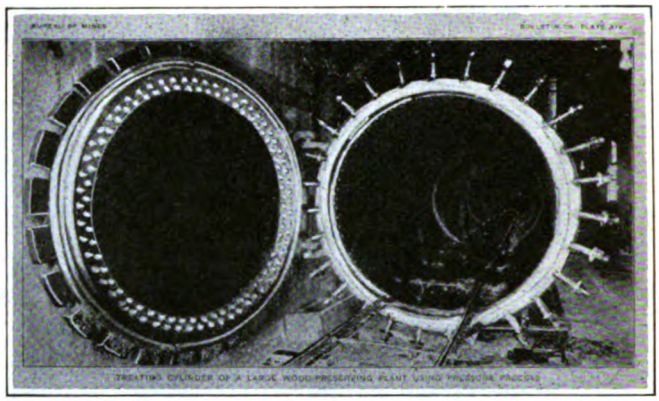
Decay in wood is caused by a disease we term "fungus." The fungus feeds upon food substances stored within the sap-wood cells. It obtains this food by the penetration of small threads called mycelium. Wood which is apparently sound may contain these tiny threads and will eventually succumb to decay. This fungus will thrive in the presence of air, moisture, and warmth, all of which are required. Since light is no factor it may readily be understood why this disease develops to such an extent underground where it often presents itself to the miner in many grotesque forms adhering as fruiting bodies to the decaying wood.

If the moisture content of wood can be reduced to a point lower than 20 per cent (based on dry weight) these fungi cannot endure—hence the value of seasoning wood products to remove the fungus and thereby increase the durability of the wood. But, of course, seasoned wood placed in most mines will absorb moisture. Therefore, in these cases and where durability is required it is necessary to impregnate the wood with preservatives which are toxic against decay. The creosotes are more generally used for this purpose than the zinc chloride because the latter, being soluble in water, is subject to leaching.



Mine timbers are destroyed by decay, insects, fire, and mechanical abrasion and of these, decay is by far the most destructive. Where the natural durability of the wood extends beyond the period of temporary use it is not necessary to use preservative treatments. However, it is safe to presume that of all the timbers used underground for coal mining fully 15 per cent or 30,267,357 cu.ft. are employed for the more permanent uses, such as in main entries, shafts, and haulage ways.

Timber Preservation Essential



These timbers if untreated will, in some cases, barely endure one year of service, but assuming three years to be the average life there will then be required in the average mine shaft, drift, and gangway three renewals during a twelve-year operating period and, perhaps, as many as five to ten. On the basis of the minimum number of renewals, there is used in our coal mines during a twelve-year period for these more permanent purposes a total of 121,069,428 cu.ft. of timber, of which 90,802,071 cu.ft. could have been saved by preservative treatment. At the average cost of 25c. per cubic foot this amounts in value to $22,700,516.

Wood preservation has passed far beyond the experimental stage and is now a recognized necessity in the nation's scheme of closer utilization of wood products. Fortunately, some of our large mine operators have taken the initiative and are already setting the pace for others to follow. There is really nothing objectionable in the use of creosoted products in coal mines. Some miners have complained that the odor is objectionable, and they have expressed a fear of so-called

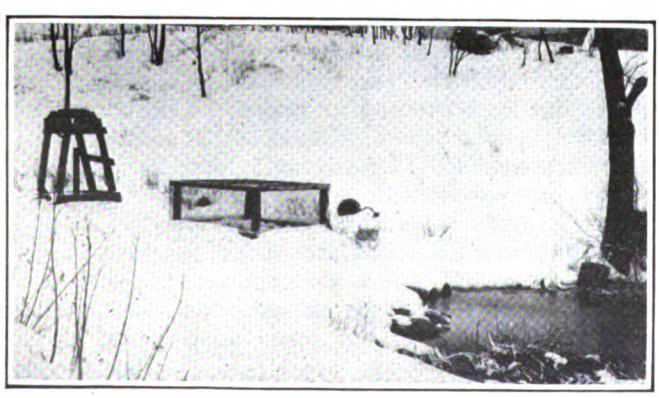
A Non-Pressure Plant in Pennsylvania for Treating Mine Timbers

The Treating Cylinder of a Large Wood Preserving Plant Using the Pressure Process

explosive gases coming from the timber preservatives. This objection has no foundation of fact.

Proper ventilation of mines is an important factor in the life of timber as well as it is a factor in the more important consideration of the life of the operating miner. A perfectly dry, well ventilated mine gives the longest life to timber, while a poorly ventilated mine which is alternately wet and dry gives the shortest life and a mine which is wet all the time but well ventilated rates between the two. Ample ventilation in essential to the prolonged life of mine timbers whether they be treated or untreated.

We hear much of the fire hazard. Under any circumstances where the fire hazard is great, as in timbered downcast shafts and shaft stations, the timbers, whether treated or untreated, should be protected by a fireproof coating preferably of gunite, plaster, cement, concrete slabs, or other non-inflammable substances.



The reclaiming of mine timbers or their salvage after temporary use would be an important utilization factor were it not for the hazard and cost involved in drawing the mine timbers from these working places. A post puller is on the market which partially eliminates this danger to the operator but on account of the cost the practice is not general.

The present indications are such that in all probability steel and concrete will substitute wood in the more permanent locations in additional quantities as time goes on. In coal mines where the waters are strongly acid, corrosive action tends to destroy these steel supports, but otherwise the conditions in these mines favor the use of substitutes as the cost of the large wood timbers advances. Brick and stone are sometimes used in constructing bulkheads or stoppings, but no satisfactory substitute for the wooden temporary roof support has as yet been found and since the aggregate of these temporary uses totals 85 per cent of the wood consumed underground it is important that conservation measures be undertaken to provide indefinitely these necessary timbers.

Borehole Enables Mine to Drain Itself Without Pumps

Approximately 1,600 gal. per minute is the natural flow into the stream at the right from the 176-ft. borehole, the top of which is protected by the fence in the center of the accompanying illustration. This 12-in. borehole into the abandoned mine No. 39 of the Pennsylvania Coal & Coke Corp., at Patton, Pa., drains the No. 28 mine without the aid of pumps. The two mines are in a bed which in this locality has a general pitch of 6 to 7 per cent. Mine No. 39 was abandoned in 1924 but pumping was continued in order to get rid of the water from mine No. 28.

A careful check of the levels indicated the top of the borehole to be 3 ft. above the lowest point in No. 28 mine. On the strength of these measurements the pump in No. 39 was removed and the abandoned mine allowed to fill. In order to increase the differential head, the top of the borehole casing was cut off about 14 in. below the surface and two large pipes run from here to a discharge point about 15 ft. away.

Gallons per Minute Cut No Ice Here

The borehole in the center of the picture once served a mine long ago abandoned. Now it is merely an outlet through the abandoned operation for water flowing down from a higher-level mine.

Light Needed, Not Glare

Bare lamps in mines are all too prevalent, and are an especial hazard because such brilliant light sources directly in the field of vision will cause pupilary contraction and partial blindness, with the result of risk of injury. Glare under mine conditions, where surroundings are black is more detrimental to the eyesight; it is almost a criminal negligence. Light that does not fall directly upon surfaces to be illuminated is absorbed by the black surfaces, as there is no diffusion of light in a coal mine, and hence light is wasted if not directed exactly to the proper place. For this purpose porcelain-enameled steel reflectors should be used which not only direct the stray light to the proper area, but shield the light source from the eyes of the miners.

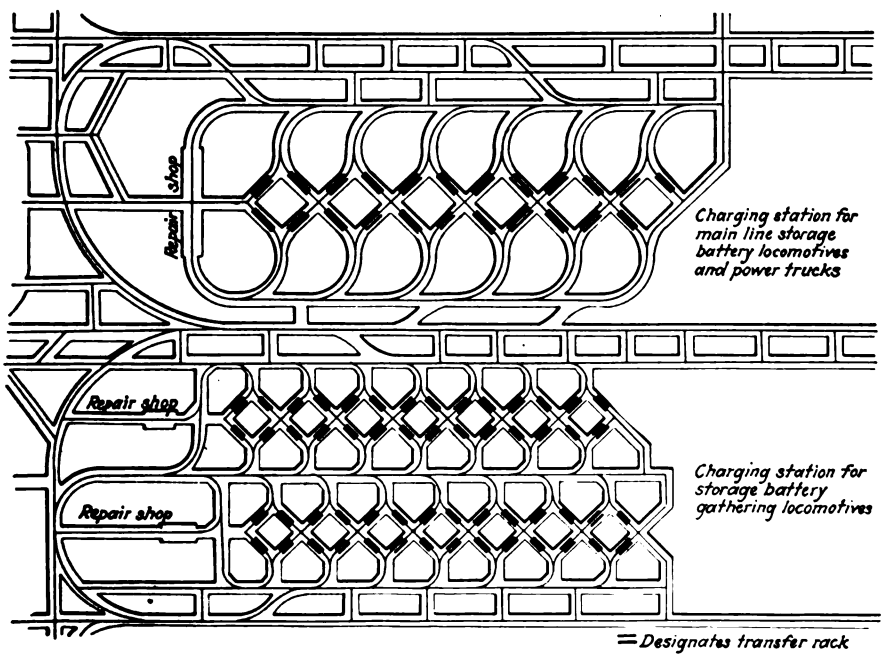
Problems In Underground Management

Bottom Layout Increases Efficiency Of "Wireless" Mine



The Consolidation Coal Co.'s new mine at Caretta, W. Va., has a bottom unique in several respects but interest centers for the moment in the charging station for locomotives and portable power units. Inasmuch as this is a "wireless" mine, all gathering, haulage and cutting being done by means of storage batteries, the charging facilities must be ample or operation is liable to be seriously hampered.

In the accompanying illustration, as may be seen, each charging stall is double, that is, it contains two charging racks. One of these will always carry a battery either in the process of charging or fully charged.

Suppose that a locomotive or portable power unit, the battery of which has been discharged in operation, comes to the station. The battery compartment of these machines is a separate component part readily attached to or detached from the chassis. The exhausted locomotive accordingly enters a stall where one charging rack is empty depositing its battery. Then the chassis, running on power from a cable, backs out and runs under a rack on which is a charged battery. Drawing this down from the rack in the customary way the locomotive returns to service.

Facilities are provided on this bottom for 28 gathering and 12 haulage locomotives or power trucks. Either charging station may be readily extended whenever necessity may require.

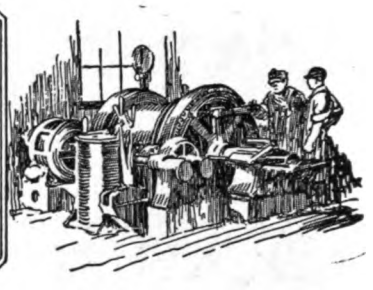
In gaseous regions the "wireless" mine possesses many advantages over the trolley-equipped operation. Heretofore one of the chief objections to haulage and other equipment operated on storage batteries has been the time required to charge the accumulators or the difficulty involved in changing battery boxes. Such bottoms as the one at Caretta, and locomotives and power units from which the batteries can be removed and replaced as easily as those there employed, will doubtless do much to overcome this difficulty and permit the wireless mine to operate on far more nearly equal terms with its trolley-equipped competitor.

Caretta Bottom Has Large Carrying Capacity

The charging station for locomotives and power units is practically double, one-half being for the accommodation of main line or haulage locomotives and the other half for gathering locomotives. By providing each machine with two batteries one can be kept on charge while the other is furnishing current for mining operations. It requires only about 5 min. to change batteries.

Blowing Out Old Grease Saves Bearings

Many automobile owners nowadays prefer renewal of their crankcase oil at definite intervals or after a certain mileage has been covered to periodic replenishment of this lubricant. The idea back of this practice is that oil deteriorates with use, losing a certain amount of its lubricating quality. It is therefore believed to be cheaper and more satisfactory in the long run to throw the old oil away and substitute new than to replenish the supply already in the crankcase.



A somewhat similar idea is followed by certain coal companies who make it a practice to blow the grease out of their roller-bearing car wheels at definite intervals and then to repack the bearings. Compressed air at 100 lb. pressure is used to blow out the old grease and the new lubricant may be shot in by the same means. Much of the old grease may be melted, strained, filtered or otherwise purified and reused if desired.

At first glance this might appear to be an expensive practice as it would seem to entail the consumption of an excessive quantity of grease. What is lost in lubricant, however, seems to be saved in bearings. Last year one large company following this practice and using 1,840 mine cars or 7,360 bearings consumed about 20 tons of grease. It makes a practice of packing its car bearings four times per year. But in the past five years this operator has been compelled to purchase only 125 cages of rollers for renewal purposes, making a renewal rate of approximately 0.34 per cent annually —a cost so small as to be negligible.

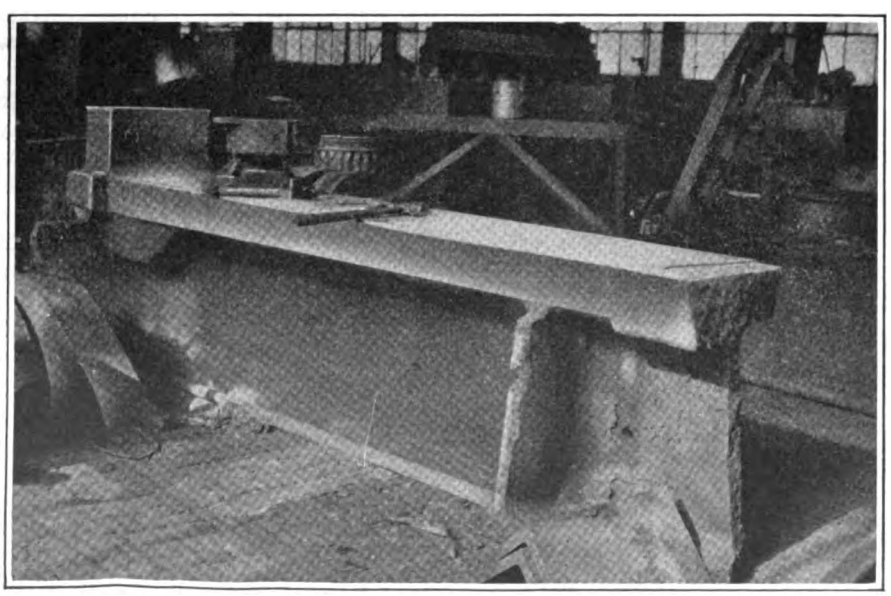
Practical Pointers For Electrical And Mechanical Men



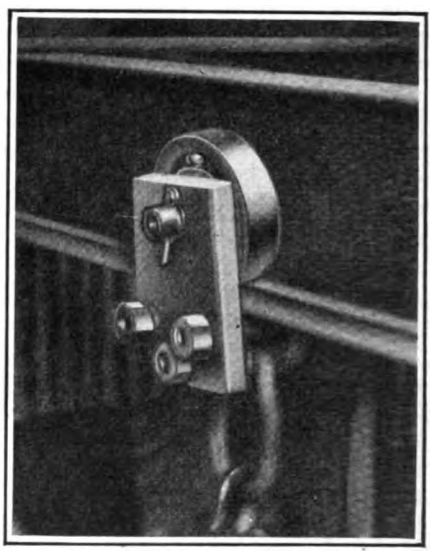
Improvised Plane Table Facilitates Work In Mine Shop

In the performance of many shop operations the work is greatly facilitated by the use of a true and even surface. This is especially the case in certain layout and assembly jobs where a solid, even foundation for the work in hand is essential. The supporting surface may then be taken as a sort of "origin of coordinates" and measurements and heights taken from it.

Unfortunately what is known in the shop as a machinist's plane table, (and this must not be confounded with the surveyor's instrument of the same name) is quite an expensive piece of equipment; so expensive, in fact, that few mine shops are provided with them. Sometimes it is possible to salvage some part of an old or broken machine and make it perform the function of a regular plane table.

Such an instance of salvage and application to a useful purpose is shown in the accompanying illustration. The shop where this photograph was taken once employed a bulldozer, but this machine was too small for the work in hand, gave trouble and finally broke down completely. A new and larger machine of the same kind accordingly was ordered. The guides of the broken machine were 10 in. or more in width on top and, of course, were planed to an even finished surface. The possibility of using one of them as a plane table was at once recognized by the management and in the accompanying photograph it is being employed in this capacity.

Although the height of this old guide is perhaps a little less than that of an ordinary plane table it is not particularly inconvenient on this account. If this were the case it would be an easy matter to raise the guide to the desired height upon either a temporary or a permanent foundation. Upon the other hand, this guide is amply big and heavy and has a surface sufficiently accurate to satisfy most requirements.



Bulldozer Guide Used as a Plane Table

When the bulldozer after giving much trouble finally broke down completely the shop management was quick to recognize that one of the old guides possessed more than its mere scrap value. By means of the acetylene torch it was cut to proper length and is now used in the shop as a small plane table upon which fine work can be done with satisfactory accuracy.

Old Ball Bearings Make Good I-Beam Trolleys

High-grade I-beam trolleys of commercial types usually are equipped with anti-friction bearings. Because of the wheel and bearing difficulties, not many home-made trolleys are in use. One of this type and of unique construction forms part of the repair-shop equipment of the Fordson Coal Co., at Nuttallburg, W. Va.

A Sturdy, Easy-Running Trolley

The wheels are "all bearings." They consist of worn ball bearings removed from the motors of 10-ton mine locomotives. The outer race of the bearing rides directly on the beam.

The wheels and bearings of this trolley, which is shown in the accompanying photograph, are one. They are nothing more than worn ball bearings removed from the motors of 10-ton locomotives. The outer race of the bearing rides directly on the I-beam. Because the balls are exposed to dust and the service is comparatively light no grease is used on the balls.

The I-beam on which the trolley is mounted is a short one extending from the main I-beam serving the track and motor pit, to a point above the shop lathe. Even with a load the trolley operates so easily that with but a slight start it will coast the length of the beam.

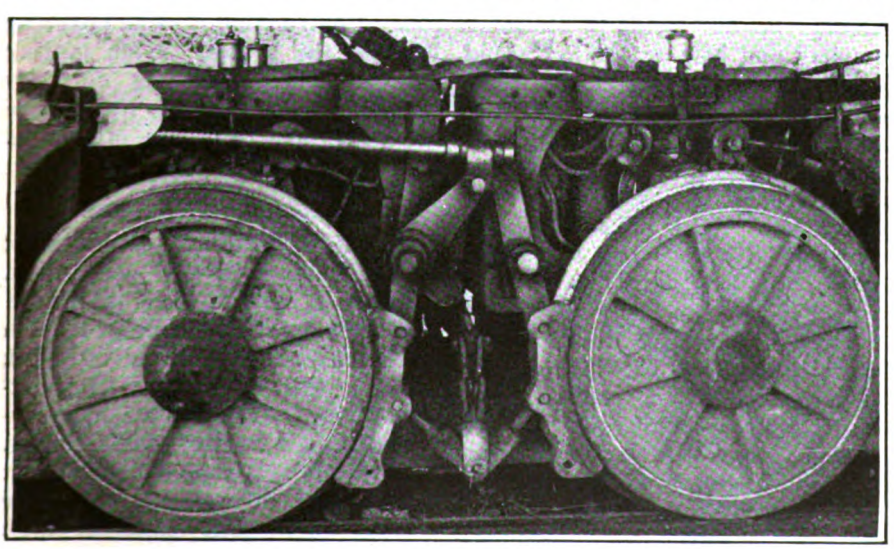
Small Grinder Reclaims Old Switch Covers

When G. L. Birch went to Balkan, Ky., as chief electrician of that operation of the Southern Mining Co., he found in the scrap many reverse-switch covers of CE-6 mining machines. In practically every case the covers had been thrown away because of a small burr or roughness on the inside, caused by an arc. This roughness prevented removal of the insulator for repair or renewal.

Arc deposits on cast iron are, as a rule, too hard to file or machine. Grinding is then the only method which can be used for smoothing a surface thus affected. But to grind the inside of a reverse cover requires a special wheel of small diameter. For this purpose Mr. Birch purchased a 3-in. cup-shaped wheel and attached it to a ½-hp., single-phase 110-volt, 3,400-r.p.m. motor. This grinder removes the burrs and smooths the surface in a few seconds. The insulator can then be taken out and the cover is again ready for use.

For several years it has not been necessary to buy new reverse covers at Balkan. Those damaged by arcs are repaired, and the ones lost or broken are replaced by covers reclaimed from the scrap and made servicable with the grinder.

Arc-Damaged Cover, and the Grinder



The arrow indicates the arc burrs or blisters which were the reason for junking many mining-machine reverse-switch covers. The grinder was made by attaching a 3-in. diameter, cup-shaped wheel to a ½-hp. alternating-current motor. This grinder in a few seconds removes the burrs which could not be "touched" with a file.

Discarded Tires Put to A Second Use

In the motor barn of the New Caryville Coal Co., Caryville, Tenn., is an 8-ton veteran locomotive which after many years of active service has been retired to the reserve. It is still maintaind in good condition ready for use when a breakdown of the regular equipment occurs. One reason why it was taken out of service was because of the small track clearance. In all the years of its service, the worn tires were never turned and used again, but instead new ones were put on in order to maintain proper height.

In 1917 when J. E. Gider came to the mine as chief electrician he wondered what use could be made of the large pile of slightly worn tires which had been removed from the "veteran."

Measurements showed the inside diameter of these tires to be 1 in. greater than that of those used on a 5-ton locomotive of more recent design. The next time that this locomotive needed new tires, the worn ones were left on, and were turned flat to a ½-in. thickness. Over these were applied turned tires from the old locomotive. Since that date in 1917, no new tires have been purchased for the 5-tonners. Eight sets (32 tires) from the old locomotive have been used on the newer machine.

Locomotive from Which the Tires Were Removed

During the many years that this locomotive operated at the New Caryville mine, tires of but one wearing were removed and piled in the scrap. Since 1917 this pile of tires has been the base of supply for all renewals on another type of locomotive. The old tires are turned and then applied over a ½-in. remnant of the original tires.

"Lamp Pick" Has New Uses

Now-a-days a lamp pick for pulling up a wick is a curiosity, and more so when carried by a man wearing a carbide lamp. This snap shot of C. C. McGraw, mine foreman of the Roden Coal Co., Marvel, Ala., shows him carrying a lamp pick, in the regular place on his cap, to use as a "signal rapper." The principal use of this tool is to signal the hoist operator by making a connection between the bare signal wires which parallel the tracks where rope haulage is used. The "boys" in the blacksmith shop state jokingly that Mr. McGraw wears out one of these rappers every week, and he admits that he uses it "for almost everything"—testing timbers, ties, brattices, and so on.

Did Mr. Reynders Prove Coal Mines Reasonably Safe?

On page 818 of the issue of Dec. 10, J. V. W. Reynders, president, American Institute of Mining & Metallurgical Engineers is quoted as saying that the dangers of coal mining had been greatly overestimated by the public, adding that out of 86,000 fatalities in the United States less than 2,400 occur at coal mines.

This may appear a small proportion but I view it otherwise. There are over a hundred million people in the United States, and less than a million are mine workers, or under 1 per cent of the whole. These work less than 200 days a year for eight hours only, yet with 2,381 fatalities in 1914 the proportion of fatalities in the mines to all those incurred is 2.77 per cent, so the mine workers' death rate is 2.77 and more times the average.

FIGURES SHOW UNDUE PROPORTION

Using S. D. Keller's statement that 25 per cent of all accidents occurred in industry, the total number must have been 21,500 and those that occurred at the mines must have been 11.07 per cent of these, certainly an undue proportion.

Again, I cannot accept the conclusions which Mr. Reynders derives from a study of automobile accidents, for if 70 per cent of the American people are exposed to the automobile hazard, that is 70 times as many persons as are exposed to the mine hazard, and the number of fatalities would be 166,670 instead of 18,000 if the hazards in each case were of the same severity.

GREAT BRITAIN CORRECTING ERRORS

Writers are always comparing the United States accident rate with that of Great Britain. I believe Great Britain is learning her mistakes and correcting them, but I fail to note that the United States is doing so. From 1887 until 1891 inclusive 13 per cent of all fatal accidents in Great Britain were caused by explosions. In 1924 only 35 men died from this cause in Great Britain. In the United States in 1923 the fatalities from explosions were 15 per cent of all fatalities and in 1924 there were 536 lives lost from this cause in the United States or 22.5 per cent of all the fatal accidents, 75 per cent of these being caused by gas explosions and 60 per cent of these fatalities occurring in mines where open or mixed lights were used. ROBERT EMERY.

Neffs, Ohio.

Break the Roof on the Bias And Avoid Trouble

I conclude from your recent articles in *Coal Age* on the use of face conveyors that such aids to coal loading are yet in the experimental stage in the coal fields of this country. The different methods of working that appear, from your articles, to be the most successful happen to be identical with those I have seen used in the British coal fields—namely, modifications of the straight longwall face. The only difference noticeable is the shortness of the wall. I believe better results will be obtained by lengthening these faces, especially under roofs that will bend. This will enable the roof to settle down in the waste.

DISAGREES ON METHOD

There is one point Mr. Hall mentioned in the Oct. 8 issue which does not fit in with my experience in the working of conveyors with longwall mining. In the article he said, "another helpful factor in attaining complete and safe extraction would be afforded if the face of the working was arranged to parallel the natural break lines or steps of the roof." That is a state of affairs which should be avoided and not encouraged. When it has developed it has many a time had to be corrected by cutting lightly on one end of the wall so as to bring the face at an angle of about 45 deg. to these natural break lines or slips.

By the method of working advocated by Mr. Hall the slips will be exposed from end to end of the wall thereby deliberately inviting trouble and giving the coal a good opportunity to sit down on the machine when cutting, provided one of these breaks should be coincident with the back of the cut. Also, should the face start working and one of these slips be in line with the last cut then the wall will close from end to end. This unhappy result will be avoided if the face is so aligned with the slips that the latter run into the coal instead of parallel with the face.

With this method systematic timbering of the face is needed in order to aid in the control of the roof.

West Virginia.

Grate Scheme Saves This Coal Consumer's Money

When the coal strike was announced I had no coal to speak of in the cellar and to tell the truth I was a bit worried. However, I have fared pretty well, in fact, much better than if there had been no strike. The city eased up on the ruling in regard to the use of soft coal and I bought a few tons of pea coal and soft coal mixed. The first week I tried to burn it I built a fire every morning and then came home at night and rebuilt it. The fire simply would not maintain itself in the firepot but persistently went out on me no matter how carefully I prepared it before leaving the house.

WIRED GRATES TOGETHER

I knew there must be some way of burning it as others were using it with satisfactory results. I finally hit on a scheme to keep the fire in the proper place. I wired the grates together on the outside of the furnace making them absolutely stationary so that they could not be moved. I started the fire and it has not been out since.

It is not necessary to shake the grates as the fire can easily be cleaned by running a small poker up between the grates. I am getting just as much heat as formerly though perhaps with a little more attention than with the other coal which I had been using.

ATTRACTIVE SAVING MADE

The thing that strikes me most is the saving to my pocketbook. Hard coal even if bought in the summer time costs about $14 a ton in the city and now I understand it is better than $25 a ton. The mixture cost me about $10 a ton, a saving of $4 at a conservative estimate. On the winter's supply it means at least $20 saved, which is not to be sneezed at in these times of high prices. Consequently you can easily see why I, as an individual am not worrying about the strike.

Brooklyn, N. Y. KEN BLAINE.

Book Reviews

How to Start a Coal Mine From the Grass Roots

All coal publications receive frequent inquiries as to the procedure that should be adopted in opening a coal mine, frequently from those who have little knowledge of the art of coal mining. To such the answer has had to be that no American book was available. Many British books have been written on the practices of the mining fraternity in starting a mine and operating it, but there was an entire dearth of books giving the practices which American conditions make necessary.

A book of 419 pages, measuring 5½x8½ in., has been prepared by Frank H. Kneeland, one of the editors of *Coal Age*, for the Mc-Graw-Hill Book Co., 370 Seventh Ave., New York City. Its major title "Practical Coal Production" is evidently one that two or more books will bear in turn. The subtitle is more explanatory, "Preliminaries of Coal Mining: Prospecting, Explosives, Development, Drainage, Ventilation." Modestly it is said by the author to be merely a compilation but in truth is no mere collection of other men's writings but a well-balanced study of the whole subject in which due use has been made of the best practice of the mining profession with much material derived from the author's own experience.

Mr. Kneeland has a mechanical bent which shows itself in a careful study of details such as only a man who likes to spend his time in actual manual construction work would develop, a man who enjoys the mechanical work of prospecting and who is never so happy as when in a workshop. The best feature of the book is its eminent practicability. It is not a collection of generalizations but a careful study of each operation from the point of view of one who has to perform the work. Those details which some engineers would leave entirely with a false confidence to their subordinate mechanics are carefully treated so that the reader knows exactly how the various tasks should be performed.

Mr. Kneeland has not the flair for geology so common among engineers. The geological phases of prospecting on which some would spend page after page he dismisses briefly. After all, each section has its own problems, its peculiar geological conditions and if any should attempt to give the geologist all he wants he would easily fill a book like this and never succeed in satisfying each and every engineer in some one or other of the regions into which the country is divided geologically.

Prospector's Equipment and Methods

There is enough, however, in the book to lay the basis for such studies, and the reports of the U. S. Geological Survey for any particular area will provide in detail all that is known if not all that is desired. Here are described, however, in detail the equipment of the prospector, the methods of prospecting by inspection, by earth augers, by churn and diamond drills and test pits with something on determining the thickness and quantity of coal in the area prospected with information as to faults, wants, rolls and folding.

Explosives are also treated exhaustively and with due attention to the needs of the man who must make them do their work economically and effectively. Here also will be found a chapter on drifting, tunneling and shaft sinking and one on planning, projection and development. Mine layout is left presumably for later treatment. Drainage is given careful consideration and ventilation also, not, however, to such a degree as to enter into the vexed question of fan design.

Electrical Measurements

When mines everywhere are either equipping themselves for complete electric operation throughout or are modernizing their equipment in order to secure greater efficiency, thus reducing unit costs, the little volume just issued by the Weston Electrical Instrument Corporation, Newark, N. J., is of particular interest. Although this book is dedicated to the advancement of the electrical laboratory of the public utility it, nevertheless, contains much that is of interest to the coal mine manager and electrical engineer. Time was when a mine official was a coal producer exclusively; today in order to be successful he must understand at least the principles governing the control of the form of energy upon which the operation of his plant depends.

Electrical engineers as well as mine executives will find this book useful because of its descriptions of many electrical instruments and instructions for their proper use. Some of the chapter headings are as follows:—Designing and equipping a laboratory; high voltage laboratory; accessory fittings; facilities for field work; portable electric measuring instruments; proper selection of portable measuring instruments; instrument connections; electrical measurements; instrument standardization; explanation of a few electrical terms; conducting tests in the field; number system for instruments, meters and transformers; systematizing, testing and standardizing work; inspection of meter equipment; inspection of power plant equipment; testing of electrical appliances; the testing of industrial plant equipment; a few suggestions on the case of measuring instruments; protection against personal injury; appendix and tabulation sheets.

Illustrations Are Helpful

Illustrations, both halftones and line drawings, have been profusely employed throughout this volume. The latter comprise both working drawings and diagrams. Many of them are particularly useful to the man who is not an electrical engineer because they show the proper arrangement of instruments and connections for making tests.

Many explanations and definitions of electrical terms, the meanings of which are usually more or less nebulous and hazy in the mind of the ordinary coal mine official, are also included. Thus the meaning and significance of "power factor," with which every electrified mine must reckon whether current is purchased or not, is explained at some length. Load factor, maximum demand and regulation are similarly treated.

The book contains 155 pages 6x9 in., 113 figures together with several tables and form sheets. It is available to all responsible interested parties. And, although as has been stated it is intended primarily for the use of those interested in central stations and public utilities, it doubtless will become a valued reference in many coal-mine offices.

News Of the Industry

Hard-Coal Peace Conference Breaks Up Again; Negotiations Split on Arbitration

Anthracite wage negotiations again have been broken off.

The third wage conference, meeting at the Bellevue-Stratford, Philadelphia, Pa., adjourned *sine die* on Tuesday night in another hopeless split over the question of arbitration. Arbitration was also the rock upon which the two preceding conferences were wrecked.

Neither side would yield the slightest on this main question. When the conference broke up, the president of the union characterized the position of the operators as a lockout of the workers for the purpose of starving the latter into submission. The operators retorted that the break was attributable to the blind determination of the union chief to impose his will upon the industry and upon the country regardless of cost. The producers further announced that they would carry the fight to the region and seek the approval of the idle workers for the proposals rejected by the union scale committee.

The break had been clearly foreshadowed by the developments of the meetings last week. From Jan. 26 to Jan. 30 plan after plan had been discussed only to be cast aside. Proposals embodying arbitration were rejected by the miners. Counter-proposals making no provision for avoiding deadlocks were turned down by the operator members of the conference.

Lynett Plan Scrapped

The Lynett plan fell by the wayside the first day the conference was reconvened (Jan. 26). A proposal for a flat two-year contract at the old rates put forward by the United Mine Workers as a modification of the Lynett plan was voted down by the operators after a bitter debate with Mr. Lewis. In presenting that modified plan, the president of the union argued that the first Inglis letter to Mr. Lynett had raised no objection to the provisions of the plan for the continuance of the old rates until 1928. Therefore, declared Mr. Lewis, the operators anticipated no crisis in the industry within that period and they might well let the future take care of itself.

To this Major Ing'is replied that "the fundamentals of any workable contract were a long period of duration and a means of adjusting wages, if necessary, without strikes and suspensions." A five-year contract was the minimum to be considered. On no other basis could the industry function in competition with other fuels.

"Substitute fuels," continued the spokesman for the operators, "encroach on markets where anthracite is the natural market for two reasons—high prices and frequent interruption of supply. Many former customers have changed to other fuels. To maintain anthracite sales, assure work for the men and prosperity for the region, these customers must be regained, further defections prevented, or new customers secured by the natural growth of population in the anthracite-consuming territory.

"When a new house or building is erected, consideration must be given to the type of heating apparatus to be installed. Once installed, changes are infrequent. If we should sign a two-year agreement only, we venture to assert that few buildings erected during that period would be equipped with apparatus designed to burn anthracite, owing to the uncertainty of supply.

"In making our proposal, which included agreement to pay the old wage scale until Aug. 31, 1926, the industry felt that it would further reduce the margin of profit, which during the operations of 1924-25 was below a fair return. The operators believe that this condition can be mitigated by closer co-operation from our employees. They further believe that this co-operation could be made so effective—assuming that the market will absorb full production—that there would be no necessity for a wage reduction."

Lewis and Inglis Debate

Mr. Lewis retorted by inquiring why the operators had refused an extension of the old contract when that offer was made in March, 1924. Major Inglis replied that the anthracite producers were too fearful of the effects of the Jacksonville agreement upon the bituminous operators signing that pact to obligate the anthracite industry in the same manner.

Mr. Lewis charged the anthracite operators with keeping the miners in idleness because the hard-coal producers were concerned with the problems of the bituminous industry. Major Inglis answered that had the union accepted the suggestion made at Atlantic City last summer there would have been no suspension.

Later in the same session, Mr. Lewis offered a resolution that the negotiating committee be increased by the addition of S. D. Warriner, chairman of the Anthracite Operators' Conference; W. J. Richards, president of the Philadelphia & Reading Coal & Iron Corporation, and two representatives of the mine workers "acceptable to the operators." George B. Hadesty, general manager of the Reading company, assured the conference that the present committee of operators had full power to act and that an increase in its membership would not increase the possibility of making an agreement. The motion was lost.

The Anthracite Operators' Conference, at a meeting held at the Ritz-Carlton Hotel, Philadelphia, on Jan. 29, took cognizance of Mr. Lewis' demand by unanimously adopting the following resolution:

WHEREAS, The negotiating committee, duly authorized by the operators with full power to negotiate a working agreement, has reported to the conference the action and policy it has pursued,

Resolved, That the committee's action and policy is unanimously approved and has the support of the entire industry. The vote of confidence in previous meetings is hereby reaffirmed.

Discuss "Final" Plans

For the next three days the principal topic of debate was the two "final" plans of miners and operators. The operators' plan read as follows:

(1) A five-year contract ending Aug. 31, 1930.

(2) The wages in effect under the last contract to be paid until Aug. 31, 1926, as a consideration for an immediate resumption of work, and to continue thereafter, subject to revision when and as economic conditions may require, in the manner outlined herein.

(3) Either party may on June 1, in any year, make request of the Board of Conciliation for a reconsideration of the wages paid.

(4) The board shall meet forthwith, consider the facts presented and render a decision within thirty days.

(5) If the board deadlocks, the questions at issue shall be referred to three persons to be appointed by the Hon. Charles Evans Hughes or, in the event of his inability to act, by some person of similar standing to be mutually agreed upon.

(6) The personnel of the appointees to consist of one man representative of labor, but not affiliated with the United Mine Workers, one man representative of industry, but not affiliated with the anthracite industry, and one man of eminent reputation and attainments.

(7) The three men thus appointed shall sit with the Board of Conciliation, hear the arguments, ask for and obtain any additional data they may consider essential and render a decision on the points in dispute before Sept. 1.

(8) The decision thus rendered shall be final and binding on both parties for the remaining term of the contract unless reopened as provided in paragraph 3.

(9) No change in the wage rates paid shall be made except in case of economic necessity.

The miners' plan read as follows:

(1) The agreement to continue for five

Digitized by Google

years, except as it may be changed as hereinafter provided.

(2) The wages and conditions in effect under the last contract to be continued until Aug. 31, 1928, subject to the revisions as may be later determined by the agencies hereinafter provided.

(3) Either party may on June 1, 1928, make request of the Board of Conciliation for revision of the agreement. If this request is made, a fact-finding commission shall be appointed, consisting of the Hon. Charles Evans Hughes, the Hon. James J. Davis and the Hon. Gifford Pinchot, or, in the event of their inability to act, some persons of similar standing to be mutually agreed upon.

This commission thus constituted shall exercise the authority to make complete investigation of all the facts relating to the operation of the anthracite industry and shall make recommendation to the Board of Conciliation, exclusive of the umpire, affecting wages and profits.

(4) In furtherance of this constructive work three reputable and expert public accountants shall be employed, one representative of the public, one the operators and one the mine workers, the expenses to be borne as the expenses of the Board of Conciliation are now fixed.

The Board of Conciliation, exclusive of the umpire, upon receipt of the report of the fact-finding commission, shall proceed to dispose of the matter as promptly as possible.

(5) The Board of Conciliation, exclusive of the umpire, shall also investigate and recommend practical methods for increasing efficiency and reducing the operating costs of mines and recommend the most practical manner for avoiding suspension of mining, and for assuring the public of an uninterrupted supply of coal.

(6) It is further agreed that in each district there shall be established a joint commission of one miner and one operator working with the conciliators from each district, the latter who shall also be members of such commission in each district. This commission shall endeavor in every practical way to strive for greater co-operation, harmony and efficiency in the industry, and in this work it shall have the support and co-operation of the operators, the district organizations and the international union of the mine workers.

(7) In consideration of this co-operation it is agreed that the operators shall also co-operate in a business way by recognising voluntary, individual, written requests of any mine worker to assign a portion of his wages or earnings for the purpose of conducting the administrative affairs of the mine workers' organization and paying the pro-rata share of the mine workers to the commission set up in this agreement, and for the further purpose of carrying out the provisions of this agreement in general, said amount to be assigned and deducted not to exceed the sum of $14 per annum.

(8) The Board of Conciliation shall proceed to equalize wages as per the agreement of 1923 and they are also empowered to handle matters with relation to conditions, etc.

Collapse of Parley Foreseen

These two propositions came to a vote on Jan. 30. Many impartial observers predicted that a speedy collapse of the conference was imminent. Nevertheless the negotiators hung on. With every plan out of the way, it was suggested that a recess be taken until Tuesday of this week in order to give the conferees a chance to juggle the many planks which had been discussed into a platform upon which both sides could stand.

"I move," said E. H. Suender, manager of anthracite operations for the Madeira-Hill interests, "that we adjourn until next Tuesday [Feb. 2] in order that at least one more sincere and conscientious effort may be made to bring about a settlement of this controversy."

"In rising to second Mr. Suender's motion," declared Major Inglis, address the miners, "I would like to suggest to you before we adjourn this afternoon that you, as well as ourselves, consider a plan or plans that would embody the workable provisions contained in the various plans we have considered and received and see if a plan cannot be framed that would, on due consideration, be acceptable to both parties."

Fiction Mocks Stern Fact

Over 500 plans for ending the anthracite strike have been submitted to the joint wage conference — and new proposals still flow in. The newspaper men covering the parleys, banded together as the Union League Club Anthracite Conference Correspondents' Association, set up an unofficial oubliette in the Bellevue-Stratford last week for the reception of hare-brained schemes to end the strike.

Operators Submit Revised Plan

When the conference reconvened this week, the operators submitted a revision of their proposals which provided:

(1) A five-year agreement.

(2) Wages and working conditions of the last agreement to continue to a date to be mutually agreed upon.

(3) Either party to have the right to request once each year a wage revision by the anthracite board of conciliation. If such request was made, the board should ask Charles Evans Hughes to appoint a commission of three to investigate the facts and make recommendations to the board affecting the matters in controversy.

(4) Said commission would be empowered to employ certified public accountants to aid in the assembling of the facts.

(5) Upon receipt of commission's report, the board would write a contract incorporating the findings of the commission with such modifications as might be mutually agreed to.

(6) In case of disagreement as to any of the commission's recommendations, either party could appeal to Mr. Hughes, who thereupon would make a finding which would be binding upon both parties.

(7) The board to investigate and recommend practical means for increasing efficiency and avoiding suspensions.

(8) The board to equalize wages in accordance with the agreement of 1923.

This proposal was rejected by a tie vote.

The operators then proposed an immediate resumption of work at the old rates until March 31, 1927, subject to the further agreement that the Anthracite Board of Conciliation, functioning as it normally does (that is, including the umpire to break deadlocks when the board members are unable to agree), shall take under consideration and decide the terms of a contract extending until Aug. 31, 1930. Under the terms of the proposal the board's contract would cover wages and methods of wage revision, if revision were necessary from time to time.

The miners moved to amend this by continuing the initial wage term until March 31, 1928, by eliminating the umpire and by granting the check-off. This amendment the operators declined to accept because it made no provisions against suspensions, would bind the industry to the old rates for another year and included the check-off, still anathema to the operators.

The miners then asked that the full joint scale committee be called. This the operators rejected as unnecessary.

Andrew M. Fine, vice-president, Hudson Coal Co., then moved the adjournment, "in view of the conditions as they now are and the apparent impossibility of coming to an agreement," he said, "I move we adjourn *sine die* to meet at the call of the chair on his own initiative or at the request of either side."

Major Inglis seconded the motion, the question was put and the conference was at an end.

Future Clouded in Doubt

What the next move will be and when it will be made nobody knows. Last week, belated knowledge of the presence of Secretary of Labor Davis in Philadelphia gave rise to rumors that Federal pressure was being exerted to end the tie-up. Spokesmen for the operators denied that the Secretary had conferred with them; Mr. Lewis declined to make any comment. The next day the admission came from Washington that Mr. Davis had conferred with his conciliators while in Philadelphia and, following the Cabinet meeting that day, it was stated that the national administration was hopeful that an agreement would come out of the present conference. On Feb. 1 objection by Senator Reed of Pennsylvania blocked consideration of the Copeland resolutions for mine seizure.

The death of State Senator Harris at Harrisburg led to a postponement of the scheduled consideration of the Pinchot coal bills until this week. In the meantime, Representative B. F. Evans introduced a resolution naming Senators Pepper and Reed and ex-Governor Stuart as a conciliation commission to represent the public in attempting to effect a settlement of the strike. This resolution is not considered seriously by those in touch with state politics.

The House Committee on Mines and Mining, after a lengthy hearing, in which the Senate committee participated, voted on Feb. 2 to report negatively the bill to declare anthracite a public utility and the proposal to authorize the Governor to enter into an interstate compact with other states to control prices and distribution. The Senate also held a public hearing on the Woodward bill amending the state mine certificate law.

Operators' Association Of Northeast Kentucky Holds Annual "Powwow"

Coal-tax legislation, past-sales reports, freight rates and publicity were the chief subjects of discussion at the eighth annual meeting of the Northeast Kentucky Coal Association, held at Ashland, Ky., Jan. 29. Production records compiled by F. E. Durham, statistician of the association, showed that the Big Sandy field mined 10,822,260 tons during the past year, a gain of 27 per cent over 1924 and 90 per cent over 1920.

Among the coal bills reported as having been introduced in the Kentucky Legislature that providing for a state tax of 2 per cent on the sale value of all mineral as extracted, with provision for an additional 1 per cent at the option of the county for school and road purposes, attracted the most attention. The legislative committee of the association reported, however, that the open-faced publicity campaign which is being carried on has caused many former proponents of the bill to see and acknowledge the unfairness of the proposed tax.

Geo. Bauswine, Jr., secretary of the Williamson (W. Va.) Operators' Association, and T. H. Huddy, manager of the Bailey Fuel Co., of the same locality, explained to the Kentucky operators the working of the past-sales reporting system which was inaugurated last May by the Williamson association.

Mr. Bauswine announced that the Kanawha (W. Va.) operators have voted to start a statistical program in conjunction with that of the Williamson association. An office is being established in Huntington, W. Va., to serve both fields. The northeast Kentucky operators were invited to join the other two associations in the use of the Huntington office. A committee was instructed to investigate the proposition.

Harry Gandy, executive secretary of the National Coal Association, urged the reporting of past sales. He stated that at present 20 per cent of the whole tonnage of the country, or 33 per cent of the commercial tonnage, is being reported to the various bureaus.

At the close of the meeting, and before the banquet of the evening, the following new officers were elected: President, Henry Laviers, manager North East Coal Co., Paintsville, Ky.; first vice-president, Lew Roach, manager Elkhorn Piney Coal Mining Co., Powellton, W. Va.; second vice-president, T. T. Rogers, manager Rogers Elkhorn Coal Co., Virgie, Ky.; treasurer, N. M. White, manager Colonial Coal & Coke Co., Prestonsburg, Ky. C. J. Neekamp continues as secretary.

27 Saved as Coal Ship Sinks

Captain Carl Graalfs of the Hamburg-American Liner Westphalia rescued the captain and crew of the freighter Alkaid on Feb. 1 about 1,800 miles from New York, when the Dutch freighter caught fire in a heavy storm. The Alkaid, which weighed 3,028 tons net, was on her way to New York with a cargo of briquets consigned to the Shipping & Coal Co., 17 Battery Place.

Suggests Polar Bear as Emblem of G. O. P.

Commenting on the administration's policy of non-interference in the hard-coal strike, Senator Copeland, Democrat, of New York, told the Senate on Jan. 30 that the Republican Party should change its emblem. Expressing the hope that something could be done to bring the suspension to an end, he said:

"During the campaign there was one promise which the Republicans made which they have kept. They are keeping cool with Coolidge. That is all very well in August, but in January, with present prices of coal, that slogan is not so popular, and I am wondering why the Republican Party does not give up its emblem of the elephant and take the polar bear instead."

Senator Copeland said that if the President would invite the operators and miners to the White House and point out to them the necessity of ending this situation, the strike "would be settled in two hours."

Senators Approve Proposal To Enlarge I. C. C.

The bill of Senator Smith, Democrat, South Carolina, providing for regional appointment of members of the Interstate Commerce Commission and for increasing the membership of the commission to twelve was unanimously approved Jan. 27 by a Senate Interstate Commerce sub-committee.

The sub-committee amended the bill to increase the number of regions to six instead of four and to change the representation of each region from three to two.

Bell Jailed and Fined

John A. Bell, of Pittsburgh, Pa., formerly head of the defunct Carnegie Trust Co., the Carnegie Coal Co. and other enterprises, was sentenced on Feb. 1 to six and one-half years in the Allegheny County Jail and fined $19,000. Bell was convicted of misappropriating $643,743 of the funds of the trust company when the coal companies which he controlled got into difficulties.

Open-Shop Miners Keep Wolf from Door

Government income tax returns by the Bethlehem Mines Corporation, which operates the Barrackville and Dakota mines, near Fairmont, W. Va., on the 1917 scale, strikingly refute the oft-repeated charge that open-shop miners labor for starvation wages. Tables compiled by the company reveal that in 1925 one loader earned over $5,400, 8 over $4,200, 26 over $3,000, and 74 over $2,400. One day man earned more than $5,000, 10 over $3,000, and 52 over $2,000.

Eastern Roads Move Ample Anthracite Substitutes

Forty industries of the Eastern Atlantic States expect an average increase of 10 per cent in business for the first quarter this year over the corresponding period last year, according to the trade survey submitted at the second annual conference of the Atlantic States Shippers Advisory Board, held in New York City, Jan. 14. Approximately 400 shippers and railroad representatives—the buyers and sellers of transportation in the Eastern territory—were in attendance.

Coal dealers in the territory of the Atlantic States Shippers Advisory Board—which includes New York, eastern Pennsylvania, New Jersey, Delaware, Maryland and the Virginia peninsula — reported through the coal committee that their trade was being handled successfully by the use of substitutes; that they had no difficulty in getting all the substitutes necessary for the comfort of their trade and that they proposed to keep on hand during the balance of the anthracite strike a sufficient supply of substitutes to take care of all customers' requirements.

The coal committee stated that normally the Eastern territory would use in the first quarter this year 7,469,800 tons of prepared-size anthracite and 2,935,900 tons of steam-size anthracite. Dealers will take care of the bulk of this tonnage through the use of substitutes. At the present time half of the dealers are carrying less than 50 per cent of their usual stocks. The other half of the dealers are carrying the same amount of substitutes as when they were handling anthracite. Practically all dealers reported that they were getting unusually prompt delivery of coal and coal substitutes by the carriers.

Wakenva Coal Co. Issues Bonds to Finance Merger

An issue of $1,000,000 Wakenva Coal Co., Inc., 7 per cent first mortgage (closed) sinking fund bonds is being offered by a syndicate composed of Robert Garrett & Sons, Baltimore; Spencer Trask & Co., New York City; Caldwell & Co., Nashville, and the Geo. C. Riley Co., Cincinnati. This is part of the plan to finance the consolidation of fourteen coal properties located in southwestern Virginia, eastern Kentucky and adjacent fields in West Virginia (see Dec. 24 issue of *Coal Age*, page 897), with C. Bascom Slemp as chairman of the board of directors.

Jamison Inquest Deferred

The inquest into the cause of the explosion at mine No. 8 of the Jamison Coal & Coke Co., Farmington, W. Va., has been postponed from Jan. 29 to Feb. 5 in Fairmont. The safety conference that was to have been held in Fairmont last week between Safety Service Director Read of the U. S. Bureau of Mines, and Robert M. Lambie, chief of the West Virginia Department of Mines, also was postponed. Mr. Lambie was unable to go to Fairmont last week, because of a mine fire in the southern part of the state.

Washington Dealers Fail to Put Blame For High Prices on Operators

By Paul Wooton
Washington Correspondent of *Coal Age*

The investigation of coal prices before the District of Columbia Committee of the Senate impresses some members of Congress as being an interesting controversy between the pot and the kettle as to their respective colors. Out of the jumble of figures which have been presented as to costs and margins the average legislator seems to have reached the conclusion that the anthracite strike has given a scarcity value to prepare sizes of soft coal which has made for price increases in which both producer and middleman have shared. The usual assumption is that the extra profit is more or less equally divided.

Members such as Senator Copeland, of New York, and Representative Treadway, of Massachusetts, are trying to establish that the acceptance of this unusual profit constitutes some sort of crime. Other members see in this action only the natural course followed by the producers of other commodities, who sell at the highest available price regardless of the circumstances responsible for having run up the price.

The retailers have not been entirely successful in the effort to lay at the door of the operators the major responsibility for a $14 price for prepared sizes of smokeless coal. There were general statements as to high prices paid at the mines but when actual invoices and receipted bills were requested by way of substantiation they were refused on the ground that legitimate business secrets would be revealed. This led Senator Neely, of West Virginia, to remark that only the operators would be hurt were invoices presented showing high mine prices. A few invoices were presented, but they covered isolated shipments. What the committee wants to know is the price paid by the dealers to the operators with whom they have their principal relationships.

Enough was brought out at the hearing, however, to indicate that any established dealer who paid more than $5 at the mine had demonstrated his inefficiency as a trader.

Say $12 Price Is Justified

The testimony on behalf of the retailers, however, made it quite apparent that a $12 price, at least, could be justified. The additional $2 apparently was not explained to the committee's satisfaction, but the Senators were impressed with the extra risk which the retailer is running when there can be no certainty as to the duration of the strike.

The favorable impression made on the committee by E. J. McVann, counsel for the Smokeless Coal Operators' Association of West Virginia, gave the operators' side of the question an advantage at the beginning of the hearings. Mr. McVann had precise information on many of the points in which the committee was particularly interested. His figures covering New England, north Atlantic and District of Columbia sales for the week ended Jan. 16 showed prices ranging from $3.50 to $5 for lump; $3.75 to $6 for egg and $2.75 to $5 for nut.

George S. Pope, in charge of the Government Fuel Yard, showed delivered costs at government departments which tended to weaken some of the claims made by the retailers.

Representative Treadway urged the committee to recommend the setting up of a fuel administration for the District of Columbia as an example to the states. This, or a fuel administrator for the whole country, was opposed by Edgar Wallace, representing the American Federation of Labor, on the ground that government control means that high-cost mines fix the prices.

One of the very significant results of these hearings is the effect they are having on producers generally. They already have revived talk of co-operative selling by the operators. The success which has attended the retail operations of the Consolidation Coal Co., the Peabody interests and others has led other large companies to consider opening their own retail yards.

Talk of Co-operative Selling

It is recognized that only the very large operators can afford to break into the retail business. The small producer of coal, it has been proven repeatedly, cannot afford to undertake his own wholesaling. The bituminous operators seem to feel, however, that the retailer cannot be relied upon to follow up the advantage gained in increased use of soft coal by the domestic consumer. This has led to serious discussion of co-operation looking to the opening of retail yards in the North Atlantic region. The suggestion is made that a distributing corporation be formed to handle prepared sizes only which would buy at the mine and sell at wholesale and retail in the anthracite-using states. There would be no interference with the established procedure in the handling of industrial, railroad and public-utility business.

Senator Howell, of Nebraska, one of the public ownership group in the upper house of Congress, on Monday introduced a resolution authorizing the Government Fuel Yard to sell coal to householders at cost. At the request of members of the committee conducting the informal hearing into district coal prices, Senator Howell withdrew temporarily his request for immediate consideration.

The District of Columbia committee authorized its chairman, Senator Capper, to take such steps as may be necessary to obtain an audit of the books of Washington retailers. The audit is not intended to be a thorough one. The idea simply is, it is explained, to ascertain what coal is costing the retailers and to establish an approximate idea of the cost of handling the business.

Industry Has Coal Stocks For 54 Days

Stocks of anthracite and bituminous coal in the hands of industrial consumers on Jan. 1, according to the National Association of Purchasing Agents, totaled 68,399,000 tons, or sufficient to last 54 days at the December rate of consumption. This compares with 50,458,000 tons on hand at the corresponding date a year ago.

In December, last, industries consumed about 36,925,000 tons of anthracite and bituminous coal, compared with 37,464,000 tons in the preceding month and 41,900,000 tons in the corresponding month of 1924. Thus, while consumption fell off about 1,461,000 tons in December production increased to 55,049,000 tons of soft coal and 232,000 tons of anthracite, against 50,780,000 and 152,000 tons, respectively, in November.

British Coal Industry Awaits Commission Findings

The report of the findings of the commission which has been inquiring into the future of the British coal industry, expected about the end of February, is awaited with deep interest since the operators and miners submitted their proposals, three weeks ago. The operators urged a return to the eight-hour day, district instead of national wage agreements, freedom from political interference and removal of the subsidy at the earliest opportunity. The miners strongly opposed this plan, offering instead an elaborate scheme of nationalization not only of the coal industry but of power production.

According to a forecast by the *Westminster Gazette* of the Coal Commission's report, which the Associated Press released this week, the recommendations will include the grouping of mines somewhat after the manner already done with the railways, and the closing down of unprofitable pits. Such grouping is said to be essential for the satisfactory reorganization of the industry.

Another recommendation, it is believed, will relate to internal migration —the moving of unemployed miners to other districts where they could be employed in more active mines. It is further advised that wages and conditions shall be the immediate concern of the local organizations and that district wage boards shall be retained.

While longer hours and lower wages are not advocated, the commission considers that lower wages may be possible, which in the long run would give the men equal pay with their present earnings.

The commission, it is predicted, will recommend that the Mining Association, representing the owners, and the Miners' Federation should concentrate on national matters such as safety of the mines, Parliamentary business and for liaison between the Mines Department and these two organizations.

Rock Dust Prevents Heavy Loss of Life In Orient Mine Blast

Five men were instantly killed in an explosion in the New Orient No. 2 mine, owned by the Chicago, Wilmington & Franklin Coal Co., at Orient, near West Frankfort, Ill., at 7:40 a.m. Jan. 29. Officials of the company, investigating the cause of the blast, believe it may have been started by a cigarette found in the hand of one of the dead miners. This mine is on a closed-light basis.

That there were only five fatalities with 1,235 men at work is attributed to the use of rock dust, which limited the effects of the blast to a small area.

The mine, which is the greatest in the world, having hung up a record output of 12,823 tons in one day a few weeks ago, was carefully planned throughout—workings, shafts and surface structures—before the first breaking of ground. Into the plans went the newest safety measures.

At strategic points throughout the workings, rock dust is stored in platforms easily tilted by the slightest rush of air from an explosion. It was that which filled the air with stone particles and confined the effects to the immediate vicinity of the explosion. Rock dust also is scattered on the floors of the entries, keeping coal dust from getting into the air.

The panel system is used in the mine, dimensions permitting rooms to be worked out in the coal with one set of workers protected from the others or accidents by barrier pillars with comparatively small openings.

The workings are all on one level, 500 ft. underground, and the coal averages 9½ ft. in thickness.

Wilburton Blast Blamed On Disobedience to Law

No exact cause of the ignition of gas that started the explosion Jan. 13 killing 95 men in the Wilburton (Okla.) mine of the Eastern Coal & Mining Co. was assigned in the official report filed Jan. 26 by Ed Boyle, state chief mine inspector, and Robert H. Brown, district inspector. The report, however, points out that the explosion could not have occurred had the state mining law governing crosscuts been obeyed. Mr. Boyle, at the time of the blast, condemned the company. In reply it was pointed out that he had refused to permit the use of closed electric cap lamps in Oklahoma.

The official investigation indicated that gas was ignited in the 16th west entry between rooms 9 and 17 and that it had moved from rooms 17 or 18 or the adjoining heading. The report says: "As the fireboss was one of the victims . . . we will never be able to determine the reason this gas was not moved before the men were permitted to go down into the mine."

The report reads: "This investigation further shows that the mining laws were not being complied with in regard to crosscuts which carry the ventilating current through the working places, as the law provides that they shall be made not to exceed 30 ft. apart in each pillar of coal on each side of the working place, which ventilating current should be conducted around the working places 200 cu.ft. per minute. If this law had been complied with the disaster would not have occurred. The law further provides that all dust must be sprinkled or sprayed or removed from the mine. This investigation shows that this was not being complied with."

Frank H. Hemelright

3 Dead in Colorado Blast

An explosion in Mine No. 3 of the Bear Canon Coal Co., at Vallorso, 25 miles northwest of Trinidad, Cal., on Jan. 29, caused the death of three men, but thirty-three miners escaped. All of the survivors, however, were burned and seared, five seriously. A gas pocket is believed to have caused the explosion.

Panic in Gassy Mine When Worker Puffs Cigar

Sixty-five employees of the Yukon mine of the Imperial Coal Co., at Lowesville, near Morgantown, W. Va., fled in a panic from the mine Jan. 28, when George Orovitz, a coal loader, appeared in the working place smoking a cigar. One man was knocked down and trampled in the mad dash of the men for the outside. The mine contains a large amount of gas, officials of the company said.

State police officers placed the man under arrest before any violence occurred. He was fined $50 and costs by a magistrate after he had entered a plea of guilty to smoking in a gaseous mine.

Officials of coal companies in the Lowesville district whose plants contain gas asked Magistrate Moore to apply the maximum penalty upon persons convicted of smoking in gaseous mines in the future. The maximum penalty is 90 days in jail and $500 fine. The magistrate told officials he would carry out their request in future cases.

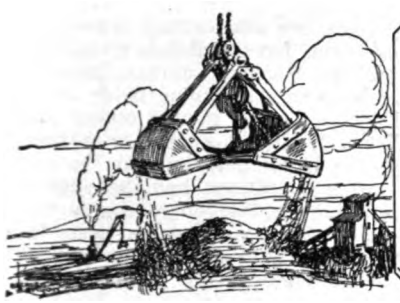
Hemelright Quits Presidency Of Temple Company

Frank H. Hemelright, for the past nine years president and for forty years an employee of the (now) Temple Anthracite Coal Mining Co., of Scranton, Pa., has resigned his executive position. Upon his return from a three months' vacation in the South Seas he probably will engage in marketing mining securities, stocks and bonds.

Forty-five years ago, as a door tender in the Haddock Coal Co. operation at Luzerne he received 40c. a day. He advanced himself through practically every branch of mining, laborer, miner, mine foreman, outside foreman, superintendent, district superintendent, general manager, vice-president and president.

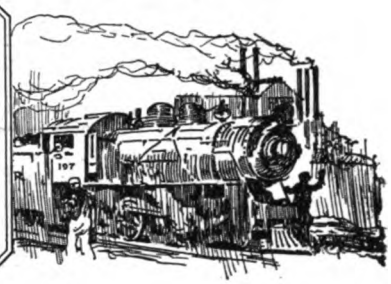
Mr. Hemelright will continue as a director of the Temple company and as a director of the Glen Alden Coal Co., a post he has held for several years. He is president of the Peckville National bank and is interested in other businesses, enterprises and industries.

Explosion in Alabama Mine Takes 27 Lives



An explosion in the Mossboro Mine of the Premier Coal Co., near Helena, Shelby County, Ala., at about 4 p.m. (shooting time), Jan. 29, entombed about forty-six miners and company employees, twenty-seven of whom were killed by the force of the explosion itself and the afterdamp which followed in its wake. Eleven of the dead were white men and sixteen negroes. Nineteen of the men in the mine at the time of the accident made their way to safety uninjured.

Unofficial reports state that the catastrophe was caused by a "windy shot" which ignited gas and dust in the sixth entry of the mine, where ten of the workers met instant death. The force of the explosion is said to have damaged the inside workings and equipment heavily. The mine is a slope opening on the Black Shale seam. The coal is pick-mined and delivered to the main slope, where it is brought to the surface by an electric hoist.



The property is leased from the Tennessee Coal, Iron & Railroad Co., and has been operated by the Premier Coal Co. for several years. G. W. Postell, well known in industrial circles and a mining man of long experience and recognized ability, is president of the company. Rescue teams from neighboring operations and from mines of the Woodward Iron Co., Alabama By-Products Corp. and from the Bureau of Mines rescue station at Birmingham were rushed to the scene by special train, and under the direction of Charles H. Nesbitt, chief mine inspector, and Bureau of Mines officials were promptly organized and went into the mine and by the early morning of the 30th all of the dead had been removed from the workings.

An official investigation will be instituted to determine the exact cause of the blast.

Production And the Market

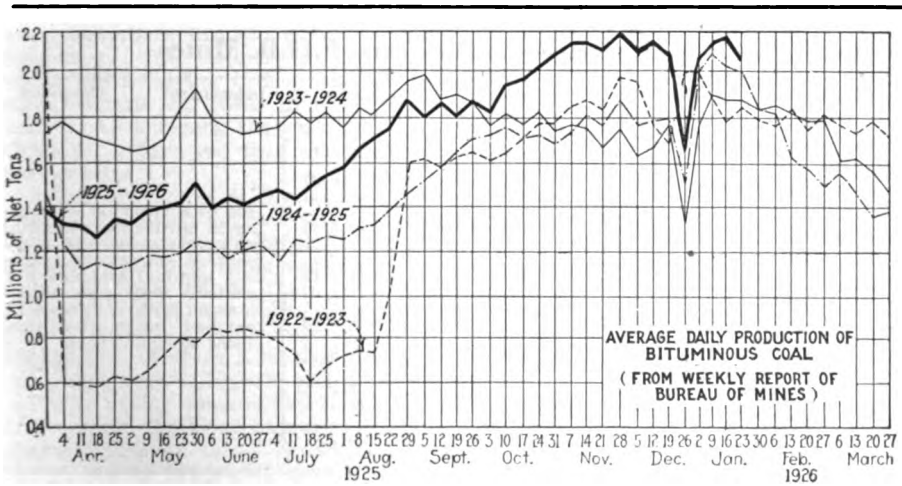
Coal Market Develops Unusual Features Due to Anthracite Strike; Screenings Sag

The upsets created by the anthracite strike alone differentiate the bituminous coal market at the present time from the usual run of season-end trading. Dutch boulets in Philadelphia, German coal in Brooklyn and Alabama coke in Chicago give some indications of the way in which coal consumers and distributors have accommodated themselves to the situation arising from the prolonged suspension of hard-coal production. Aside from these changes, the domestic market is a weather proposition pure and simple and no different in its reactions to the mercury than in years gone by.

The effect of the anthracite strike, now in its sixth month, is not, however, limited to the extraordinary movements mentioned above. Its impress is to be found as well in the clamor for certain sizes of West Virginia low-volatile and, to a lesser degree, in the good market now enjoyed by some of the high-volatiles prepared for domestic consumption. And these developments have been reflected, in turn, in the movement of mine-run and slack from the same mines and in the expansion of tonnage from operations in the Middle Western fields.

Production Geared Up Too High?

Cautious trade observers are beginning to fear that the producers have overshot the mark in their recent tonnage records. The figures for the week ended Jan. 23, as reported by the Bureau of Mines, show a sharp drop in the rate of output and no pronounced recovery was promised for last week or for early February. The weather demands and the calls for coal to make up the anthracite deficit intensify the situation as they threaten to force the production of the smaller sizes of coal at a faster rate than the industrial consumer can or will absorb. Many steam buyers are now playing a waiting game, ready to pick up distress tonnage if the price is low enough.



In most sections of the country screenings have given way to the pressure of an increasing accumulation of unsold coal. Gas slack at Pittsburgh is noticeably weaker, high-volatile fine coal prices have declined in the Columbus and Cincinnati markets, some coal selling down to 50c.; Hocking screenings have wobbled; Indiana screenings are off 10 to 25c. and some southern Illinois coal is offered under circular. Quotations on low-volatile, on the other hand, have been somewhat steadier, but not because of increased demand. Mine-run prices, too, show a tendency toward greater firmness and lump was up in some markets, counterbalancing the loss in screenings.

Index Figure Unchanged

Coal Age Index of spot prices of bituminous coal on Feb. 1 stood at 178, the corresponding price being $2.16, the same as on Jan. 25. As previously stated, advances offset price declines in other directions.

Dumpings at Hampton Roads shot up to 440,522 net tons the week ended Jan. 28. The total the preceding week was 407,625 tons. The month-end clean-up to avoid demurrage, more than increased demand, explains the heavier movement over the piers.

For the time being, at least, the high-dollar coke shippers seem impervious to criticism. The tonnage moving at top quotations, however, probably represents only a small percentage of the total coke now going into the domestic trade. Nevertheless, it is enough to give an unfavorable tinge to the whole business.

Estimates of Production

Cold Snap Cleans Up "No-Bills"

When a sudden severe cold snap descended on the Middle West last week, operators who had coal on track or in transit were able to sell it readily at full circular prices. Franklin County (Ill.) operators disposed of all their "no-bill" lump and 6x3-in. egg and accumulated a good volume of orders for later shipment.

The base price of $3.50 on lump for Franklin County coal will continue throughout the month, according to the present set-up of the trade, and may hold until well into March. At that time it is planned to announce spring reductions, which will be subject to gradual advances throughout the new coal year.

Anthracite substitutes are still very scarce in the Chicago market. Coke and smokeless egg and nut are particularly tight. Even when an order is accepted, there is no guaranty of early shipment and car numbers are at a premium. Eastern Kentucky and West Virginia high-volatile coals also are enjoying a strong demand, with transit tonnage sought after keenly. When the cold wave was at its crest distributors were besieged with emergency calls from retailers all over the territory begging for immediate shipment.

The steam coal market is still sluggish. Indiana screenings dropped 10 to 25c. last week and some of the Illinois coals weakened. Franklin County held out against lower prices and some of the big Saline County shippers supported the neighboring district. Belleville and central Illinois, on the other hand, let the industrial buyers dictate quotations.

The domestic activity in the Chicago market, however, was only slightly reflected back in the mining fields and in the St. Louis market. Carterville egg moved under pressure and nut coal was distinctly slow. Shaft mines found the struggle to sell steam sizes in competition with the strip pits a hard battle. The latter operations had the edge on spot railroad orders where price was the controlling factor.

Mines in the Duquoin field were on a five-day basis last week, but that rate of operation was maintained only under high sales pressure as neither domestic nor industrial consumers displayed any overwhelming anxiety to flood the district with orders. Railroad demand was light. Broken running time was the rule in the Mt. Olive district. "No bills" discouraged heavier production and there was little buying for locomotive fuel to cheer ambitious salesmen. Conditions in the Standard district were unchanged. The general price range is without profit to the producer; "no bills" plague; industrial and railroad demand drags; 6-in. lump alone moves with signs of life.

The St. Louis local domestic market reacted favorably to the falling mercury. Demand favors the higher grade coals, but the scant supplies available and the prices quoted hold down the movement. There is no Pennsylvania anthracite to be had and little of the Arkansas product. West Virginia

Coal Age Index of Spot Prices of Bituminous Coal F.O.B. Mines

	1926			1925
	Feb. 1	Jan. 25	Jan. 18	Feb. 2
Index	178	178	181	169
Weighted average price...	$2.16	$2.16	$2.19	$2.05

This diagram shows the relative, not the actual, prices on fourteen coals, representative of nearly 90 per cent of the bituminous output of the United States, weighted first with respect to the proportions each of slack, prepared and run-of-mine normally shipped, and second, with respect to the tonnage of each normally produced. The average thus obtained was compared with the average for the twelve months ended June, 1914, as 100, after the manner adopted in the report on "Prices of Coal and Coke: 1913-1918," published by the Geological Survey and the War Industries Board.

smokeless, too, is scarce. Standard district coal benefits only in a small way. Wagon steam trade has been active and carload business just enough under offerings to keep prices unchanged.

The country demand is fair for the medium grades of coal. Western Kentucky coals are gaining ground west of the Mississippi River and shipments from eastern Kentucky east of that stream. There also has been a fairly active country demand for chestnut-sized coke. Steam trade is quiet.

Buyers Wait for Breaks in Kentucky Prices

Purchasers in the Louisville market have been holding back on orders in anticipation of breaks in prices during February. The majority of the industrial consumers and retail yards buying in that market are said to be carrying stocks which will cover their requirements for a month or more. As a result, they wait for the sellers to appeal to them for orders and then take full advantage of the situation created.

A low thermometer brought a stronger demand for fuel from the householder over the week-end, but retailers bought very sparingly for replenishment of slowing depleting yard stocks. Although some eastern Kentucky block was held above $3 f.o.b. mines, there was little sold for Louisville delivery over $3 and more at quotations ranging down to $2.50. Two-inch lump was offered at $2.25@$2.50; egg, $2@$2.25. Western Kentucky block was held at $1.85@$2; lump and egg, $1.75@$2; nut, $1.35@$1.50.

Public utility demand has been backward since the middle of January. Railroad buying, all things considered, may be characterized as fair. Notwithstanding the absence of a heavy run of industrial orders, the volume is seasonable. Only operations very fortunately situated from a sales standpoint are doing better than three or four days a week; many are working less. Transportation conditions are excellent. Eastern Kentucky mine-run is quoted at $1.40@$1.75; screenings, 90c.@$1.10. Mine-run from the western part of the state is held at $1.25@$1.50; screenings bring 65c.@$1.

Dock Trade Takes on New Life

Movement of coal from the Duluth-Superior docks to points in Minnesota, northern Wisconsin and North Dakota has been on a larger scale the past ten days because of colder weather. Hand-to-mouth buying by retailers and large industrial consumers left them with such small reserve stocks that the drop in temperatures forced them into the market with a rush and docks have been working close to capacity since Jan. 25.

January car loadings probably will exceed the December total of 25,735 cars. The outlook for the rest of the winter is regarded as satisfactory. Because railroad service continues unimpaired, the late January rush was handled without putting improvident buyers to inconvenience or distress.

Steady improvement marks the industrial situation in the Northwest. Coal consumption is mounting, but the shipments, with few exceptions, are upon contracts entered into last fall. Local demand also has been good. Steel Corporation operations on the Minnesota ranges are using more coal; independent shippers, however, show an inclination to go slow until the future of iron prices has been determined, but considerable stripping and development work is being carried on.

Only two docks at the Head of the Lakes have any anthracite left and the supply is limited to small quantities of egg, nut and buckwheat. If these docks would accept orders offered, it is said that they would be cleaned up in two or three days. The disappearance of anthracite reserves has increased the movement of West Virginia low-volatile coal and briquets. Notwithstanding that fact, there is so much Pocahontas held in storage that prices on lump, egg and nut have been cut 50c. Mine-run, on the other hand, is up a quarter. Screenings are quoted at $4.25.

It is estimated that the stocks of all bituminous coals on the docks Feb. 1 approximated 4,550,000 tons.

The fuel situation in Milwaukee and communities drawing their supplies from local docks is becoming more tense with the advent of real winter weather. There is some all-rail movement of Pocahontas, but shipments are held down. Demand for coke is strong and prices are firm. Range size was advanced $1 the past week. Retail prices are $16 on range, $15 on nut and $13 on pea coke.

Little Change in Southwest

Conditions in the Southwest show no material change. The market has settled down to a weather proposition, fluctuating with the rise and fall of the thermometer. Fill-in orders from the householder are reflected in an improved buying of Arkansas semi-anthracite.

The past week saw a slight improvement in demand for domestic coal from Colorado mines, which are operating on an 85 per cent basis. The weather was responsible for the improvement. There is still a surplus of "no bills" on track, however, which demand has not been able to absorb. Transportation and labor conditions are satisfactory. No changes in prices are in contemplation at the present time.

The domestic coal trade in Utah continues to improve, thanks to the prevalence of wintry weather, but as dealers are depending largely on yard stocks, not much of the increase has been passed on to the operators. Dealers expect to have their stocks cleaned up about March 1. Demand from the Pacific Coast, which had been rather good, is slowing up, due to milder temperature. Some mines are working full time, others four days a week, but a number are producing only two, and a few even one day a week. The average for the state as a whole, however, exceeds half time. The slack situation is a little better and the shortage is light. Prices continue steady, car supply is ample and the labor situation is good.

Cincinnati Fears Overproduction

That overproduction may swamp the market is the fear which besets the Cincinnati trade. In spite of the cold wave which swept the country last week, prices still sag. Mine-run and slack are the weakest members of the price list.

Digitized by Google

One large southeastern Kentucky operator has openly quoted 50c. on screenings and buyers had no difficulty in filling their wants at 60@70c. Extra choice grades moved slowly at prices up to $1.10.

There was plenty of West Virginia mine-run seeking a market last week at $1.25. The same figure ruled on some of the Kentucky coals. From that figure quotations ranged up to $1.40@$1.50 for choice steam and $1.75 for special gas and byproduct coals. High-volatile egg for western delivery also suffered; some quotations dipped to $1.75.

February circular prices on low-volatile coal are: Lump, $4.25; egg, stove and nut, $5 for westbound movement and $5.50@$6 for eastern deliveries; mine-run, $2.50. Spot prices late last week were on a level with circular quotations, although some New River coal and some Pocahontas from smaller operators could be had at a 25-cent reduction.

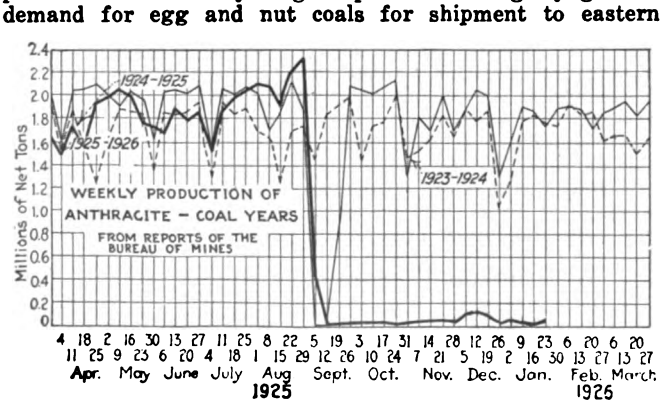
The situation on smokeless slack is the fly in an otherwise delightful ointment. Sales at $1.25 are common and orders at $1.50 cause rejoicing. The byproduct ovens are bearing the market, and retaliation is threatened by some coal operators who say they will fire their own coke ovens if prices work lower.

Retail prices are unchanged.

Railroad movement through the Cincinnati gateway last week showed an interchange of 12,702 cars of coal—52.1 per cent of the total interchange. This was an increase of 376 cars over the preceding week but 217 cars less than for the corresponding week last year. Compared with the preceding week, L. & N. interchange increased 496 cars and Norfolk & Western, 18 cars. Chesapeake & Ohio coal interchange dropped 119 cars and the Southern Ry., 19 cars.

Ohio Responds Feebly to Weather Stimulus

Aside from a slight gain in domestic movement, central Ohio did not respond to the weather stimulus of the past week. Retail buying was light because the average dealer is still comfortably supplied with coal and the householder has purchased only when necessity impelled. Most of the latter buying in the Columbus market has been in small lots so that retail facilities have been kept busy. Retail prices are firm at levels maintained for some time past.



Steam business continues dull and irregular, and little hope is held out of any substantial betterment in the near future. Public utilities, the railroads and the steel plants take the greater part of the steam tonnage moving. Many of the general industrial establishments are working on part time or with reduced forces. Prices are weak. Screenings are a drug on the market and some sales have been made as low as 50c. Attempts to make up the losses on fine coal by boosting prices on prepared sizes have met with scant success.

Southern Ohio production hangs around 25 per cent of capacity. Railroad buying saves the Hocking district. Most of the commercial business gravitates to the Pomeroy Bend field.

Retail demand has picked up in Cleveland territory with the advent of colder weather. Operators, too, are more optimistic despite a decline in the price of No. 8 screenings. Eastern Ohio mines produced approximately 276,000 tons during the week ended Jan. 23, or about 40 per cent of capacity. Compared with the corresponding week a year ago, production was off about 11,000 tons.

Pittsburgh Market Loses Ground

The spot market on Pittsburgh coals suffered badly the past week. The only bright spot was a slightly greater demand for egg and nut coals for shipment to eastern anthracite-consuming states. This demand forced quotations up to $2.75@$3.25 for the better coals, as against $2.50 the preceding week. Production of those sizes, however, is limited. Some small operators have endeavored to grab a share of this business by breaking down lump into egg by hand.

Slack prices have tumbled again. Steam slack is in plentiful supply at $1 and there is no scarcity of gas slack at $1.25. The usual explanation that the decline was caused by increased shipments of lump does not hold good this time. Rather does it seem to be a case where slack consumers are so well stocked up that they can afford to stay out of the market.

Improvement both in production and prices continues in the central Pennsylvania field and few "no bills" are in evidence. In the week ended Jan. 23 loadings totaled 21,103 cars and in January to the 23d 65,570 cars were loaded as compared with 66,103 to the same date in December. All grades of coal are affected by the upward tendency in prices. Run of mine quotations are as follows: Pool 18, $1.85@$1.90; pool 11, $2@$2.10; pool 10, $2.25@$2.35; pool 9, $2.40@$2.55; pool 71, $2.60@$2.75; pool 1, $2.80@$3. Lump is $4.75@$5; egg, $5.25@$5.50; nut, $5@$5.25; slack, $2.10.

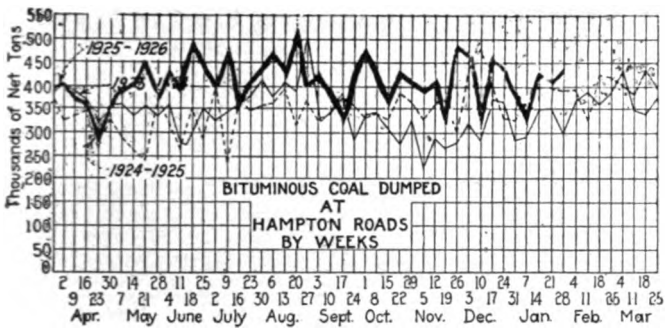
Practically no change from the recent attitude of indifference of industrial consumers in the Buffalo market is observable except, perhaps in degree, slack showing increasing dullness—and that in spite of extra efforts to move it. More contracts are said to have been closed than at this time last year. Fairmont lump is quoted at $1.60@$1.75; mine-run, $1.40@$1.50; slack, $1.25@$1.40; Youghiogheny gas lump, $2.25@$2.50; Pittsburgh No. 8 steam lump, $2@$2.25; slack, $1.25@$1.40; short-rate Allegheny Valley mine-run, $1.75@$2.

New England Turns to Substitute Fuels

New England retail coal merchants have about decided that they will be compelled to finish out the season with substitute fuels— but the preference is not for bituminous coal. Welsh anthracite, ovoids, dry steam and coke have the call over the product of West Virginia and Pennsylvania. In spite of the unfavorable experiences with foreign fuels at the beginning of the anthracite strike, a strong spot demand has since developed and there is now renewed inquiry for late February shipment.

The only indication of strength in the smokeless market is a reasonably steady request for screened sizes. Yet even here operators are obliged, in many cases, to use egg, stove and nut to move the lump. Prices on prepared coal range $5.50@$6.50. Unless the demand stiffens, however, it is expected that these levels will be reduced as desirable central Pennsylvania coal can be laid down in New England at a lower price.

Hampton Roads conditions are unchanged. There is still coal at the piers far in excess of current demand. Spot prices wobble between $4.70 and $5 per gross ton, f.o.b. vessel. Pool 1 coal on cars at Boston and Providence is offered at $6.50 for inland delivery.



Bituminous Active in New York Market

The New York bituminous market continues fairly active. Mine-run is moving readily. Demand for prepared sizes has broadened, and prices have been marked up. Bar-screened egg and nut were quoted at $2.50@$2.75 late last week; shaker-screened egg commanded $2.75@$3 and nut and stove $3.25@$3.75. High-volatile West Virginia and Pennsylvania coals were quoted at about $3.50. Prepared sizes of Pocahontas and New River were held at $7@$7.50. There was an active demand for those coals on Long Island.

Mine-run from the Broad Top field was held at $3@$3.75; screened coals, $6.50@$7.50. Other low-volatile Pennsylvania coals were 75c. less, with occasional offerings under $5.75. High-volatile slack was weak at $1.25. The scarcity of free coke redounded to the benefit of the shippers of prepared coals.

Philadelphia was another market at which the demand for prepared sizes of bituminous was strong. Calls from former users of anthracite steam sizes strengthened the price list on mine-run and slack. There is little free tonnage of low-volatile Pennsylvania coal available and West Virginia smokeless shipments are increasing in volume. Kentucky also is making a bid for a share of the business normally held by anthracite.

Digitized by Google

The only weakness is in high-volatile slack, which is suffering from the swing to screening to take care of the attractive market for prepared sizes. To make this situation worse, the cement mills have reduced consumption while the seasonal overhauling of plants is going on.

An additional fillip has been given to the market by consumer interest in contracts for the new coal year. For the most part, larger producers are convinced that the present boom in the spot market will be short-lived. Therefore, they are not overlooking any opportunities to close worthwhile contracts.

Developments in the Baltimore bituminous trade the last week in January were devoid of novelty. The tonnage running has been ample to meet all demands. There has been some increase in the number of short-term contracts placed, but little interest shown in signing up for 1926-27.

Slight Improvement at Birmingham

There has been a slight change for the better in inquiries and in the buying of medium and lower grades of steam coal in the Birmingham market the past week. Mines have added enough spot business to contract commitments to take up current output without material delay. The better grades of washed coal are eagerly sought after for industrial consumption and coking. There also has been some increase in the calls for bunker fuel.

The domestic market is well sold up on the higher grade offerings and there will be little spot tonnage available for several weeks. Some of this demand has spread over into the medium grades, but mines producing those coals must still push for orders. Cahaba lump is quoted at $4.25@$5.50; Black Creek, $5@$5.50; Montevallo, $5.75@$6.25.

Coke is moving over a wide area. Michigan and Chicago territory have been drawing upon the Alabama ovens and some shipments have been made as far north as Canada. Egg and nut are held at $6@$6.50. Foundry grades are active at $6.50@$7 and demand absorbs all the gas-house tonnage offered at $7.

Coke also is the first choice of domestic consumers in the New York market, but, as related in a preceding paragraph, the scarcity of spot lots has been throwing more orders to sized bituminuous coal. Run of oven output was quoted at $9.50@$10, f.o.b. ovens, last week; egg, $11.75@$12.25; stove $12.50@$13. Toward the end of the week there were a few boats offered at $18@$20 alongside.

Several vessels carrying foreign coal were expected late in the week, but the heavy storms at sea delayed their arrival. One cargo of 7,000 tons was reported lost.

Washery anthracite nut was quoted at $14@$15, f.o.b. washery.

A cold wave seriously taxed the ability of Philadelphia retailers to take care of the domestic trade, but no suffering ensued. The high prices asked for coke is militating against the popularity of that fuel as a substitute for anthracite and has helped the sale of low-volatile bituminous. The price differential in favor of mine-run is persuading many consumers to try that size, with satisfactory results. There also is a growing consumption of boulets, which are retailing at $15@$18. The supply of domestic fuel has been augmented by shipments of Holland boulets.

Prepared sizes of bituminous coal have the call in the Baltimore domestic market despite the fact that they retail at $2.50@$3.50 more than mine-run. A movement is under way to start the delivery of soft coal in ton-lots in paper bags.

Though Buffalo consumers accept the dearth of anthracite with a reasonable degree of resignation, the actions of the coke producers are not doing much to promote good humor. Coke sells all the way from $9.50 to $18 at the curb, and higher prices are not unlikely, as some dealers are unable to obtain supplies for a week at a time.

Rise in Connellsville Prices Unchecked

The unchecked advance in spot prices on Connellsville coke gives the market an appearance of strength which underlying factors do not warrant. Run of oven coke last week was sold at $9@$10; yard-crushed coke at $12@$13, with occasional sales higher. Demand itself is more insistent than heavy. Spot or prompt shipment coke alone will be considered by the eastern buyers who have created the present market.

The blast furnaces are out of the picture. Contracts for the quarter average about $4 and there is no shortage of pig iron production to induce the furnaces to bid up the market.

The Connellsville *Courier* reports coke output in the Connellsville and Lower Connellsville regions for the week ended Jan. 23 at 110,600 tons from the furnace ovens and 124,270 tons from the merchant ovens. Furnace oven production declined 1,500 tons; merchant output increased 3,170 tons.

Foreign Market And Export News

Steady Improvement Brightens Outlook in British Coal Market

In the British coal market a steady improvement in business is noted. Stability has been re-established on a freer arrival of shipping, and with few exceptions collieries are well placed for prompt orders. Export inquiries are encouraging, and though big business is lacking, there is quiet confidence in the immediate outlook. Steady revival continues in inland demand, particularly on the part of the metal trades. Excepting dry-coal collieries, which are experiencing a slack time, the pits are working better, and there has been a steady reduction in unemployment.

A strong tone now dominates the coal market in Newcastle. Inquiry for all classes of fuel is good, not only for this month but for delivery throughout the year, and prospects would be quite good were it not for the uncertainty of the outlook when the government subvention ends and a new agreement comes to be made with the miners. For this reason there is still difficulty in negotiating contracts for delivery after the end of March. Meantime current trade is brisk and most classes of coal are so heavily booked as to be scarce for immediate shipment, with the result that prices are firm and on the upgrade.

Output by British collieries during the week ended Jan. 16, according to a special cable to *Coal Age*, totaled 5,460,000 gross tons, compared with 5,060,000 tons in the preceding week.

Steady Demand for All Grades In French Market

French collieries report a generally steady demand for both industrial and domestic coals. Transportation difficulties continue, empty cars being in insufficient supply at times and movement by water being seriously impeded by floods. Freight rates are firm at 30 fr., Bethune-Paris.

The new prices for Nord and Pas de Calais coals, issued on Jan. 12, show an increase of 5 to 6 fr. on industrial and domestic grades, except in the case of a few specialties, which are raised 10 fr. Coke also has been advanced 5 fr. Patent fuel has been increased 14 to 15 fr., the greater advance being due to the continued upward tendency in the price of binder material. The additions are quite moderate considering supplemental fiscal charges and the rising course of general expenses.

Further advances are certain if the miners are successful in their quest for higher wages. Quotations on Belgian coals sold in France also are expected to be increased as a result of the raises in the Nord and Pas de Calais. Three to 6 fr. has been tacked on the charge for coal imported from the Sarre, a result of higher wages and heavier fiscal charges.

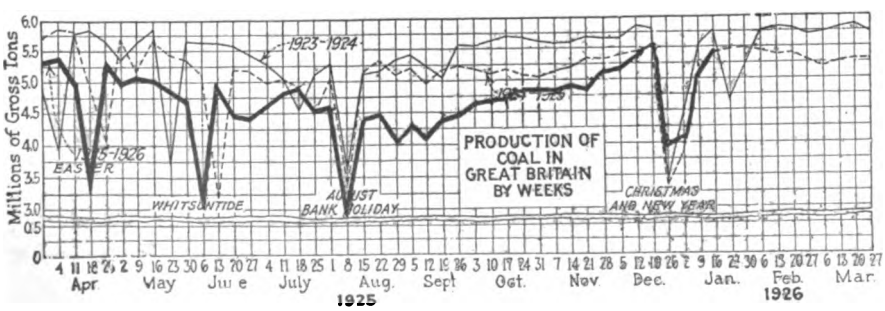
The O. R. C. A. received from the Ruhr 100,189 tons of coke from Jan. 1 to 11. The price of indemnity coke has not been changed, but an advance of 7 to 8 fr. per ton is expected.

Belgian Market at Standstill As Strike Threat Fades

Since the passing of the strike threat the Belgian market has been at a standstill. Consumption of industrial coal is moderate, but an improvement in demand is expected, due to the resumption of work in the Charleroi metallurgical district. The domestic coal situation is still satisfactory in spite of milder weather.

Imports of British, Dutch and French coals show an appreciable falling off and increased prices in the Nord and Pas de Calais will tend to moderate French competition.

Shipments have been impeded or completely stopped by floods, some collieries in the Charleroi district having been obliged to cease production.



Mine prices for January are practically unchanged from the December circular and the same is true of indemnity coal prices.

Ruhr indemnity fuel deliveries to Belgium in 1925 totaled 2,902,908 tons, as against 4,381,786 tons in 1924.

News Items From Field and Trade

ALABAMA

At the annual meeting of the Birmingham Coal & Iron Co., of which I. E. Boyette is president, announcement was made of plans for extensive developments during the year. Coal production is to be increased so that the output of mines in the Oneonta section, Blout County, on the Louisville & Nashville R.R., will be around 1,000 tons daily. Additions to the board of directors include Joseph A. Disso, New Orleans; George E. Elrich, Baton Rouge; Christian Captiville and E. A. Martines, New Orleans; Judge John R. Kelly, Hattiesburg, Miss., and A. A. Fendley of Oneonta. The company owns considerable lands and development will be started at once.

J. E. Ross, Jasper coal operator, is opening a new coal mine on lands which he owns near Jasper, Ala.

The Pratt Fuel Corp., controlled by the Walter Moore interests, of Birmingham, has purchased from the Alabama By-Products Corporation, of which Morris Bush, of Birmingham, is president, 13,000 acres of coal lands near Dora, in Walker County, for $1,500,000. The property contains six coal-mining operations, besides 300 houses for employees, equipment for mining and livestock. Acquisition of this property gives the Pratt corporation approximately 40,000 acres of land underlaid with Big Seam and Black Creek coal, and nineteen miles of frontage on the Black Warrior River. Annual output of the Pratt corporation is 1,500,000 tons, which can be increased if necessary from 500,000 to 750,000 annually, according to Walter Moore.

ARKANSAS

A hospital association for coal miners was the object of a conference of 80 miners who met in Fort Smith recently. The association is intended to succeed the Union Hospital Association, formed by miners of District No. 21, but which went into the hands of a receiver several weeks ago. Miners from McAlester, Henryetta and other Oklahoma and Arkansas fields attended the meeting.

CALIFORNIA

With the installation of a 600-hp. substation, development work at the Siskiyou Coal Mines Co., near Ager, has been speeded up. R. D. Clark, president, said that within 90 days he had hopes of a large proven tonnage, drilling in the last four months having been very satisfactory. "The power will be used," said he, "in unwatering the old tunnel and clearing the débris from the old works. It is possible that new work also will be undertaken."

COLORADO

A man and a boy were killed, another miner seriously injured and a fourth trapped in the shaft as the result of an explosion of undetermined origin which wrecked the Harvey Gap coal mine, sixteen miles north of Rifle, on Jan. 23. Investigation has been started into the explosion in the mine, which is operated by the Colorado Fuel & Iron Co.

An unusual record for the shipment of coal by the Colorado Fuel & Iron Co. was made in 1925, when 40,416 cars of coal were shipped through Pueblo. The coal was mined at the company's mines in southern Colorado. It was practically all handled by the Denver & Rio Grande Western R.R. and established a new record for coal shipment over that road from any part of the state. The year's record was boosted in the last four months of the year, when there was an unusual demand for coal from points east of Colorado, affected to some extent by the anthracite strike.

ILLINOIS

The Illinois Miners' Examining Board has scheduled examinations this month as follows: Belleville, Feb. 8; Harrisburg, 9th; Herrin, 10th; West Frankfort, 11th; Duquoin, 12th; Centralia, 13th; Staunton, 15th; Springfield, 16th; Taylorville, 17th; Danville, 18th; LaSalle, 19th and Peoria, 20th.

The Nason mine of the Illinois Coal Corporation, at Nason, Jefferson County, is reported to have failed to meet its semi-monthly payrolls on Jan. 28. This is the second occurrence of this kind in recent months and the company is supposed to have gone into the hands of a receiver soon after its first failure to pay off. The mine is classed as one of the largest and best equipped in the southern Illinois field. The company also controls the Jefferson & Southwestern R.R., running from Mt. Vernon to Nason.

The Chicago & Eastern Illinois R.R. has taken over the switching operations of the two Orient mines of the Chicago, Wilmington & Franklin Coal Co. at Orient, near West Frankfort. The work has been handled in the past by the Chicago, Burlington & Quincy lines. The C. & E. I. added five additional train crews to handle the work, which was considered sufficient. The new Orient mine, which recently again exceeded its own world's record, is served by four roads: the Illinois Central; Chicago, Burlington & Quincy; Chicago & Eastern Illinois and the Missouri Pacific line.

Indications are that the prospective merger of practically all mines in the Fifth and Ninth districts with the exception of one company is likely to be put over. A number of prominent financial houses are back of the present move and auditors are working on the statement to be furnished them.

INDIANA

The Indiana Coke & Gas Co., Terre Haute, plans the addition of a new battery of coke ovens and auxiliary equipment to cost about $400,000. A byproduct plant also will be erected for the production of sulphate of ammonia, estimated to cost about $100,000 with machinery.

John Bull mine, between Chandler and Boonville, has reopened following the signing of a contract between union officials and Lon Shaw, lessee of the mine. T. D. Scales, of Boonville, owns the pit, which employs about 100 men. Various local unions of District 11 voted an assessment of $1 per month per member at a meeting at Princeton on Jan. 13. This money will be used for emergency relief for men out on strike in the southern Indiana field.

Fires which destroyed the home of a mine foreman of the Bosse Coal Co. mine near Boonville and damaged a washhouse at Yankeetown mine were declared of accidental origin following an investigation conducted by the Indiana state fire marshal's office. Investigation of the cause of the fires, which occurred while an organizing movement was being conducted in the southern Indiana field by the United Mine Workers, was asked by the mine union officials. Operators of the mines co-operated in the investigation.

KANSAS

Neil A. Phillips, trustee, paid $5,000 late in January for coal deposits under the 160-acre farm of E. H. David, one mile west of Valeda, in the Coffeyville field. Mr. Phillips, who is said to be acting for the Missouri-Kansas-Texas R.R., now controls more than 3,000 acres of coal rights lying to the east of Coffeyville, extending over the Labette County line into Montgomery County. Core drillers have been at work for

Digitized by Google

several months and are reported to have found a 9-ft. bed of coal at a depth of 800 ft. The coal is said to be covered with thick rock that provides a strong roof. It is predicted that the "Katy" will be ready before long to take over the acreage and begin sinking mines.

A strike was called during the week ending Jan. 23 at the Domestic Fuel Co. mine No. 3, near Croweburg. The mine is being operated by the McGrath Coal Co. William Brady, district board member of District 14, stated that the strike was the result of a dispute over wages. He said the operators had signified their intention to operate open-shop, and declared several non-union men had been employed in pursuance of this decision.

Two miners were killed and another was seriously injured, Jan. 26, by a rock fall in Cockerill mine No. 9, near Franklin, operated by the Ryan-Ready Coal Co., of Franklin. The accident occurred in a parting entry in a new section of the mine that was being opened up. The men were digging out a skip for a double track when the fall occurred. Robert Bertino and Pete Medos were killed and Amel Prommier was injured.

An engine has been received by the Lighting Creek Coal Co. at its mine near Cherokee. The company was organized recently in Cherokee and is opening a shaft on land leased a year ago by the company. The shaft is expected to be in operation before next fall.

Application for a charter to operate in Kansas has been made by the Brown Coal Co., of Pittsburg. The application was signed by Louis M. Brown, Homer Brown, I. N. Brown, Miss Mabel Brown and Mrs. L. A. Kooney. The Browns propose to continue operation as a corporation of a mine they have been operating near Pittsburg under a partnership agreement.

———.

KENTUCKY

In 1925 the Elkhorn Piney Coal Mining Co. established a new record in producing 1,119,331 tons of coal at the Weeksbury, Powellton and Stanaford properties. According to Lew Roach, manager, the company hopes to produce 2,000,000 tons this year. A new steel tipple having a capacity of 2,000 tons daily is being erected at Stanaford to handle the output of the No. 3 mine which is now being rapidly developed. The company also contemplates the expenditure of $100,000 for miners' houses at the new development.

The residence of James Rogers, of the Rogers Coal Co., Bevier, was destroyed by fire about the middle of January, with a loss of about $20,000.

The Detroit Coal Co., of Columbus, Ohio, a subsidiary of the Essex Coal Co., has started loading at its new operation on the Little Coal River branch of the Chesapeake & Ohio Ry. in Boone County. The company has 3,200 acres of coal land in the Dorothy seam and modern equipment has been installed. The equipment consists of cutting machines and conveyors, shaker screens, loading booms and picking tables. The initial output is 150 tons daily which will be increased rapidly as only two main entries and two butt entries have been started. The product is sold through the Essex Coal Co., of Columbus.

C. J. Neekamp, secretary of the Northeast Kentucky Coal Association, is urging the construction of railroad terminals on the Ohio River at Ashland, where coal might be transhipped by barge on an all-water route to ports on the Great Lakes or the Atlantic seaboard. He proposes that the old Ohio canal, which starts at Portsmouth, be reopened and improved so as to make Port Clinton, on Lake Erie, its northern terminus.

From Pikeville it is reported that the Chesapeake & Ohio R.R. is building 28 miles of road up Levisa Fork and that the Norfolk & Western is coming in by another route, both lines working toward the coal properties of the Kentland Coal Co., and going through much fine coal acreage with the extensions.

A new $43,000 school has been erected at Elkhorn City, on an eight-acre site donated by the Consolidation Coal Co., of Jenkins. The Pike County Board of Education accepted the building recently.

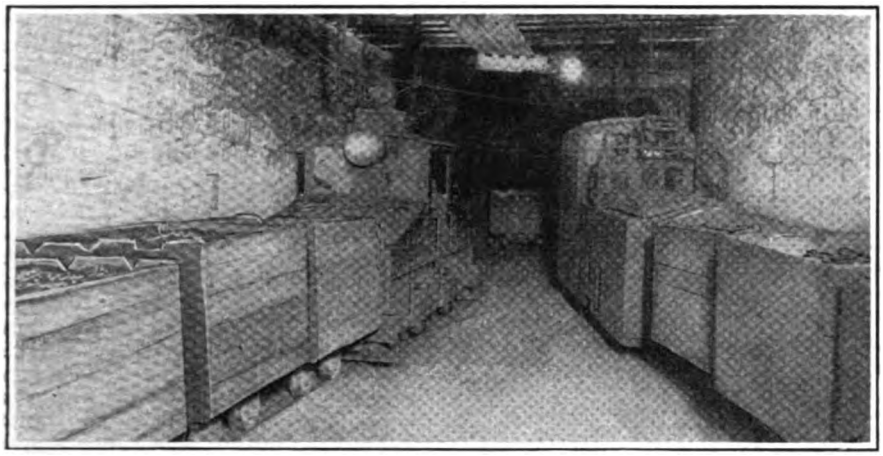
The Kentucky River Mining Institute recently was organized at Hazard by over 100 mining men from all parts of Perry and Letcher counties. The announced objects of the new organization are the more efficient production of coal and the promotion of safety in the mines. Meetings are to be held monthly at Hazard for the discussion of such mine problems as haulage, drainage, upkeep of mines and machinery. The following officers were elected: George Fitz, of Hazard, president; D. T. Mitchell, vice-president for Perry County; Henry Pfening, Jr., Seco, vice-president for Letcher County, and Mr. Samuels, of Sergent, secretary.

MINNESOTA

The Zenith Furnace Co., at Duluth, sustained a fire loss on Jan. 17 estimated at $75,000 through the destruction of its coal-crushing plant and a section of its coke ovens. The fire was attributed to spontaneous combustion originating in a pile of screenings. The company's trade in domestic coke has been dislocated for the time being. Contracts for rebuilding of the damaged section of the plant were let on the day following the fire, and it is hoped that it will be operating at full capacity again within a short time.

Coal dock operators at Duluth-Superior were interested in a recent statement by an official of the Minnesota Power & Light Co. to the effect that with the completion of the program now under way the limit has been practically reached in water-power developments over northern Minnesota. The presence of extensive peat deposits over the territory he regards as a deterrent factor in economically operating additional power dams. The power company is known to have in contemplation the building of a large auxiliary steam power plant at Duluth to take care of any contingency that may arise through insufficient water to fill its dams. A plant of the nature contemplated would entail the consumption of a substantial tonnage of coal.

The Ford Motor Co. advertised in the Twin Cities last week that consumers could obtain surplus coal in all desired sizes from the Ford mines in eastern Kentucky in a continuous supply at a fair price. The explanation is made that the coal is shipped to Duluth as a return cargo for the Ford boats which are used to transport lumber and ore from northern Minnesota and Michigan to the Ford factories at Detroit.



MISSOURI

James T. O'Hara, of Bowie County, Texas, is leasing land north of Kirksville with the purpose of developing a coal field. He already has obtained 1,000 acres on option and will acquire more before starting operations. Tests have revealed a 4-ft. seam of coal at a depth of 150 ft. with a sound roof over it. The plans include a start on the shaft on March 15 and the operation of the mine by Aug. 1. The mine will have ample railroad facilities for shipping coal to the market. O'Hara is reported to have all the necessary financial backing to put the deal through.

NEW MEXICO

Warren Bracewell, state inspector of coal mines, in his annual report to the Governor, suggests appointment of a commission of mining men from various sections of the state who shall act with the Bureau of Mines to draft a new mining code that will insure greater safety to the workers. The death toll from mining operations in New Mexico the past year was one man for every 124,412 tons of coal mined, says the report. A total of 2,616,855 tons of coal was mined during the year ended Oct. 31 in the eight coal counties of the state. This is a decrease of 160,800 tons from 1924. Of the total tonnage, 1,714,059 were pick mined and the balance, 902,796 tons were cut by machine. The Phelps Dodge Corporation at Dawson during the past year produced 77,842 tons of coke, valued at $622,736. The daily average employment of men in New Mexico mines during the year was 3,115 in the mines and 718 outside the mines, says the report. New Mexico mines, according to the report, have generally adopted provisions for safety of workers, as follows: use of permissible explosives, rock dusting and dust barriers, sprinkling, elimination of coal dust and use of closed lights.

Digitized by Google

Underground Haulage Equipment at Lota, Chile

Long haulages make electric traction necessary at this mine. M. R. Michado declared in 1913 that the mine had four square miles of available sea-covered territory and that the works extended 2½ miles beneath the water.

NEW YORK

The Agnew-Smith Fuel Co., special distributor of Maryland anthracite at Buffalo, has given up turning it over to retailers throughout the city and opened an office in its own name on William Street near the live-stock yards, with R. H. Allen in charge.

NORTH DAKOTA

Production of lignite by North Dakota mines exceeded 1,000,000 tons for the second consecutive year in 1925. Records compiled by the state Railroad Board show that the total shipped in 1925 was 1,028,218 tons as compared with 1,001,691 tons in 1924. Intrastate shipments totaled 915,718 tons and interstate shipments were 112,500 tons.

OHIO

Bids opened Jan. 27 by H. C. Cain, secretary of the Columbus Board of Purchase, for coal were as follows: 12,500 tons of Ohio nut, pea and slack for the municipal light plant, W. S. Harman Coal Co., Columbus, Ohio, $1.24; Jay Miller Coal Co., Columbus, $1.25. The same companies submitted the same bids on 7,000 tons for the Scioto River water works pumping station and 2,500 tons for the garbage disposal plant. For 500 tons of West Virginia nut, pea and slack for the coal pulverizer at the garbage disposal plant the Jay Miller Coal Co. bid $1.05 and the W. S. Harman Coal Co., $1.10.

Guy R. French, vice-president, and for the past sixteen years connected with the Producers Coal Co., of Cincinnati, miners and shippers in Logan County and southern West Virginia, has disposed of his interest in the organization and resigned as of Feb. 1.

The taking over of five mining properties by the Kentucky Fuel Co. of Cincinnati has caused a change in the ownership of this selling company. John Hoffman and Louis H. Koring have split. Hoffman taking over the business with new partners, Major E. S. Helburn, identified with the Log Mountain Coal Co. and road commissioner for Kentucky; J. D. Evans, operator, of Middlesboro, Ky., and W. C. Welborn, mine owner, of Evansville, Ind. Koring is organizing a new selling corporation to be called the East Kentucky Coal Co. and operated under an Ohio charter. The mining companies to be taken in will be Clay County Coal Co.'s No. 1 and No. 2, the Willis Harlan Coal Co., the Turner Jellico Coal Co., all in working condition in Clay County, Kentucky, and the Coaldale Products Co. of Ohio.

Business of the Man o' War Fuels Co., located in the Dixie Terminal Bldg., Cincinnati, will be conducted through the branch office of the Indian Run Coal Co., Charleston, W. Va., recently opened in Cincinnati in the First National Bank Bldg., James C. Layne has been appointed its manager; Ed. Holyoke, formerly of the Wyoming Coal Sales Co. and the Cory-Mann-George Co. is office man, and Joseph L. Rebert goes on the road.

PENNSYLVANIA

Representative Philip Sterling, Philadelphia, introduced in the House at Harrisburg on Jan. 26 the state administration bill embodying the Delaware River compact. This has been accepted by the Legislature of New York and is before the New Jersey Legislature. The Pennsylvania Legislature rejected it in 1925. The compact provides for the regularization of the flow of the Delaware and the conservation of the water. Mining companies and representatives of various industries from the eastern part of Pennsylvania opposed the compact at a recent hearing at Harrisburg. The compact was introduced after Mayor J. Freeland Kendrick of Philadelphia had written to Governor Pinchot favoring a compact that would assure Pennsylvania the absolute right to develop a considerable part of the watershed of the Delaware River drainage basin without any interference from the neighboring states.

Frank S. Knox, Jr., of Columbus, Ohio, who has been connected with the Pittsburgh Coal Co. for a score of years, has been promoted to the position of assistant general manager of mines with headquarters in Pittsburgh. He will be directly under Arthur Neale, general manager of mines and head of the operating department. Mr. Knox has been manager in charge of the company's mines in Ohio and has been instrumental in operating a number of mines in the Pomeroy Bend field under the 1917 wage scale.

The Coleraine Colliery Co. has awarded a contract to the Penn Electrical Engineering Co. for the electrification of its new breaker and mines at Coleraine, near Hazleton. The equipment will consist of breaker motors, substation apparatus, compressors and mine pumps. The mine pumps will be equipped with automatic control to eliminate pump runners.

W. M. Wilshire and C. C. McGregor, receivers of the Carnegie Coal Co., asked the U. S. court at Pittsburgh that the properties and assets of the company be appraised. The court appointed John M. Rayburn and James Donaldson to appraise the assets.

W. J. Rainey Co., Inc., has ordered the Paul plant in the Connellsville district to ship only furnace coke for an indefinite period. No foundry coke will be produced. The mine ships five cars of coke and two cars of coal daily.

Equity proceedings instituted by the Maryland Coal Co. against the Stineman Coal & Coke Co. to force the latter company to maintain a barrier pillar of at least 200 ft. between the two contiguous operations of the companies in the South Fork region were indefinitely continued on Jan. 25 by agreement of both parties. The action had been on in the Cambria County Court before Judge John H. McCann for a week. A vast amount of evidence is being taken and the hearings are not likely to be resumed before April 1.

Output of the Pittsburgh Coal Co. in the 1917 wage scale mines in western Pennsylvania reached a new high record in the week ended Jan. 23, when a total of 29,463 tons was loaded at seven mines. This brought the total for the first three weeks of January to 83,190 tons. On Saturday, Jan. 23, the company distributed a two-weeks' pay amounting to $91,178.85, also a new record. This was distributed among 244 men at Library, who received $16,-864.93; 158 men at Warden mine, $10,-461.53; 310 men at Midland, $20,690.94; 47 men at Mansfield, $3,545.87; 74 men at Dickson, $4,082.42; 257 men at Banning No. 2, $19,026.71, and 240 men at Banning No. 1, $16,506.45.

Strong opposition to the seven giant power bills sponsored by Governor Pinchot in the special legislative session was raised at a public hearing held in the Senate chamber at Harrisburg Jan. 26. These measures replace the twenty-two defeated during the regular 1925 session. Advocates of the bills said the pooling of electric energy, regulation of its distribution and prices, the submission of securities of companies for examination and other features would stabilize the electric in-

Digitized by Google

dustry. Opponents characterized the bills as impracticable and said they would do nothing that is not already being done by the electrical industry in Pennsylvania.

TENNESSEE

The Marion Coal Mining Co., Tennesee Power Bldg., Chattanooga, has leased 3,000 acres of coal land between Whiteside and Shellmound, and will develop it. H. L. Cory is president of the company.

UTAH

G. Vern Sears, well known Salt Lake City coal salesman and connected with the Western Fuel Co. for the past four years, has gone to the Chesterfield Coal Co., a mining company with headquarters in Salt Lake City and a mine at Sego, in Grand County.

Coke made by the Columbia Steel Co. is being distributed in Salt Lake City by the Wasatch Coal Co., retail agency of the Carbon Fuel Co., and it is stated that 50,000 tons or more will be available annually. Agencies are being opened up also in other parts of the state.

John H. Wootton, prominent in mutual coal company circles and a former member of the Utah State Senate, is lying seriously ill at Salt Lake City Hospital, following an automobile accident. Mr. Wootton is 60 years of age. He is an attorney by profession.

A prominent Salt Lake City oil refiner is quoted as saying that the local coal industry will lose out to oil, now that oil has been struck in Utah, unless the coal men get busy and produce a smokeless coal in commercial quantities.

WASHINGTON

The Bellingham Coal Mines output in 1925 was 297,000 tons, valued at more than $1,000,000. The company employs more than 200 men.

WEST VIRGINIA

Mine No. 1 of the Gilbert-Davis Coal Co., in Scott's Run, operating under union conditions, recently loaded what is believed to be the largest tonnage ever dumped over one tipple in West Virginia in a single day of eight hours. This record was made Jan. 23, when 5,250 tons of coal was loaded. The Gilbert-Davis mine is the largest union operated mine in West Virginia, and it is working every day.

A short-circuit in the air course in Chesapeake mine of the Fairmont-Chicago Coal Co. on Jan. 27 caused a pocket of gas to be ignited from the flame of an open lamp. Two miners were slightly burned. The local gas explosion was light and little damage was done to the interior of the mine.

The Clarksburg District Mining Institute elected the following officers at the annual meeting held Jan. 23 in the Traction Building, in Clarksburg: President, Charles F. Bashore; Vice-President, Harry W. Brown; Secretary and Treasurer, R. P. McOlvin. Mr. Bashore, who was a member of the first-aid team that penetrated Jamison No. 8 mine after the explosion, spoke on lessons that may be drawn from the explosion.

The Bear Pen Coal Co. was sold at trustee's sale at Summersville, in Nicholas County, on Jan. 18 and was bid in by one of the creditors of the company. Several hundred acres of coal land were involved in the sale.

The third Young Men's Christian Association to be established by the Island Creek Coal Co. will be ready for use in March, at Mud Fork. The others conducted by the company are at Monaville and at Whitman. General Manager A. R. Beisel is much interested in the Y. M. C. A. work.

Mr. and Mrs. Harry E. Sands, of Pittsburgh recently transferred to Fred O. Blue, of Charleston, five-thirty-firsts of an undivided interest in 1,797.93 acres of coal and mining rights in the Elk district of Harrison County and the same fractional interest in 826.88 acres on Elk Creek, in Barbour County. Mr. and Mrs. Sands also have conveyed to Arthur S. Dayton, of Charleston, a similar interest in these lands.

Thirty 1,000-ton steel barges recently have been put into service by the West Virginia Coal & Coke Co., according to an announcement made by Brooks S. Hutchinson of Fairmont, vice-president of the company. The barges will ply on the Ohio River chiefly between Huntington and Cincinnati and also on the Kanawha River. The company has ordered a steamboat which will be delivered in either March or April.

From the Oakwood mine of the New River Co. prepared coal has been put up in 25-lb. paper bags and two carloads were shipped to Boston during the first week of the month. There is said to be a good demand for the small bags of coal in the cities where it is retailed for cooking stoves. Other shipments of coal by the same method are soon to be made. Ordinarily the company ships its prepared coal in bulk.

The Mill Creek Coal & Coke Co. has acquired the property of the Mill Creek & Elkhorn Coal & Coke Co. and will operate. A new tipple will be rebuilt to accommodate the entire output of the mines.

WISCONSIN

A. P. King, of Cleveland, vice-president of the United Coal & Dock Co., was elected president of the organization to succeed Adam Gross, retired, at the annual meeting at Milwaukee, Jan. 20. Alex Uhrig, former president of the Milwaukee Western Fuel Co., was chosen chairman of the board of directors; John I. Mayer was re-elected vice-president and J. W. Gross, secretary was chosen secretary-treasurer. The United company is affiliated with the North American Coal Corp., Cleveland, successor to the Cleveland & Western Coal Co. It handles about 500,000 tons of coal annually and its docks have a storage capacity of 200,000 tons.

CANADA

The Canadian National Rys. have arranged to ship 25,000 additional tons of Alberta coal to Ontario at the special freight rate of $7 a ton, Charles McCrea, Minister of Mines for Ontario, was informed Jan. 25 by a representative of Sir Henry Thornton, president of the National lines. It is expected that some of the 25,000 tons will be moving to Ontario within a week. If the hard-coal strike is not settled soon and the 25,000 tons proves insufficient, it is understood that consideration will be given by the C.N.R. to additional shipments.

Mining in the Minto Coal Co.'s mines in New Brunswick was resumed on Jan. 18, when the 325 miners who had been on strike returned to work under an agreement, pending an investigation of working conditions by a government commission. The miners return under the same conditions as obtained before the strike.

Output of coke in Canada during December totaled 152,173 tons, being slightly below the November output of 156,182 tons. The total production for the year 1925 was 1,471,116 tons as compared with 1,370,599 tons in 1924. Imports of coke in December were 131,276 tons and exports of Canadian coke 4,401 tons. During December 91,863 tons of Canadian coal and 139,496 tons of imported coal were used in coke making.

It is officially stated that the Canadian National Rys. has given a contract to the British Empire Steel Corp. for 600,000 tons of coal for use this year, including 120,000 tons of banked coal.

Traffic

Complains of Tennessee Rates

The Roach Creek Coal Co., of Roach Creek, Tenn., complains of unjust and unreasonable rates on coal between Roach Creek and points in the Glen Mary and Coal Creek groups by reason of the failure and refusal of carriers to perform or to pay for the cost of performing that part of the service between Roach Creek and Roach Creek Junction. The coal company asks for the establishment of just and reasonable rates and the performance of the service or the making of an allowance for it. Reparation to the extent of $4.05 per car shipped since June 12, 1925, also is demanded.

Obituary

Silas Reece, aged 76 years, a pioneer in the Clearfield bituminous coal region and well known as a coal prospector, was burned to death when his home in Decatur Township, Pa., caught fire on Jan. 23. He knew all about the coal for many miles around and his knowledge and advice were much in demand among coal operators. He was a teacher in his early life, later following the coal business as member of an operating firm.

Coming Meetings

American Institute of Electrical Engineers. Annual convention, Feb. 8-12, 1926, at Engineering Societies Bldg., New York City. Secretary, F. L. Hutchinson, 29 West 39th St., New York City.

Pittsburgh Vein Operators' Association. Annual meeting, Feb. 15, Cleveland, Ohio. Secretary, D. F. Hurd, Marion Bldg., Cleveland, Ohio.

American Institute of Mining and Metallurgical Engineers. Annual meeting, Feb. 15-17, 1926, at Engineering Societies' Building, New York City. Secretary, Dr. H. Foster Bain, 29 West 39th St., New York.

The Rocky Mountain Mining Institute. Winter meeting, Feb. 23-25, 1926, at Albany Hotel, Denver, Colo. Secretary, Benedict Shubart, Boston Building, Denver, Colo.

Canadian Institute of Mining and Metallurgy. Twenty-eighth annual and general meeting, March 3-5, at the Windsor Hotel, Montreal, Quebec, Canada. Secretary, G. C. Mackenzie, 603 Drummond Bldg., Montreal, Que., Canada.

New England Coal Dealers' Association. Annual meeting at the State Armory, Worcester, Mass, April 7 and 8. Secretary, E. I. Clark, 141 Milk St., Boston, Mass.

The American Mining Congress. Annual Exposition of Coal Mining Equipment, May 24-28, at Cincinnati, Ohio, in conjunction with the annual meeting of practical operating officials. Assistant secretary, E. R. Coombes, Washington, D. C.

International Geological Congress. The fourteenth congress will be held in Madrid, Spain, commencing May 24, 1926. From May 5 to 22 excursions of interest to the visiting delegates will be arranged. Information concerning the congress can be obtained from the secretary of the organizing committee, Enrique Dupuy de Lome, Plaza de los Mostenses, 2, Madrid, Spain.

New Companies

The Wilson Nolan Coal Co., with a capital of $15,000, has been incorporated at Russellville, Ark. The incorporators are Albert L. Wilson and J. L. Nolan.

The Superfuel Coal Co. was incorporated in Paris, Ark., the first week of January, with a capital of $15,000, by F. J. Mashaw, W. W. Bailey and others.

The Barbour Coal Co. was incorpoated in Denver, Colo., with a capital stock of $1,300,000, the first part of January, by Harry Carlson, Clarence B. Frink and others.

The High Grade Coal Co., Shawnee, Ohio, has been incorporated with a capital of $10,000 to mine and sell coal. Incorporators are Richard Phillips, Sheldon Kinsel, Fred J. Phillips, G. C. Davis and W. P. Nutter.

The Niagara Coke Co. has been incorporated at Niagara Falls, N. Y., with Paul Schoellkopf, leading capitalist, in the list of incorporators. A site has been selected for a plant and work will begin in the near future.

New Equipment

Heavy Duty Truck Facilitates Rapid Delivery

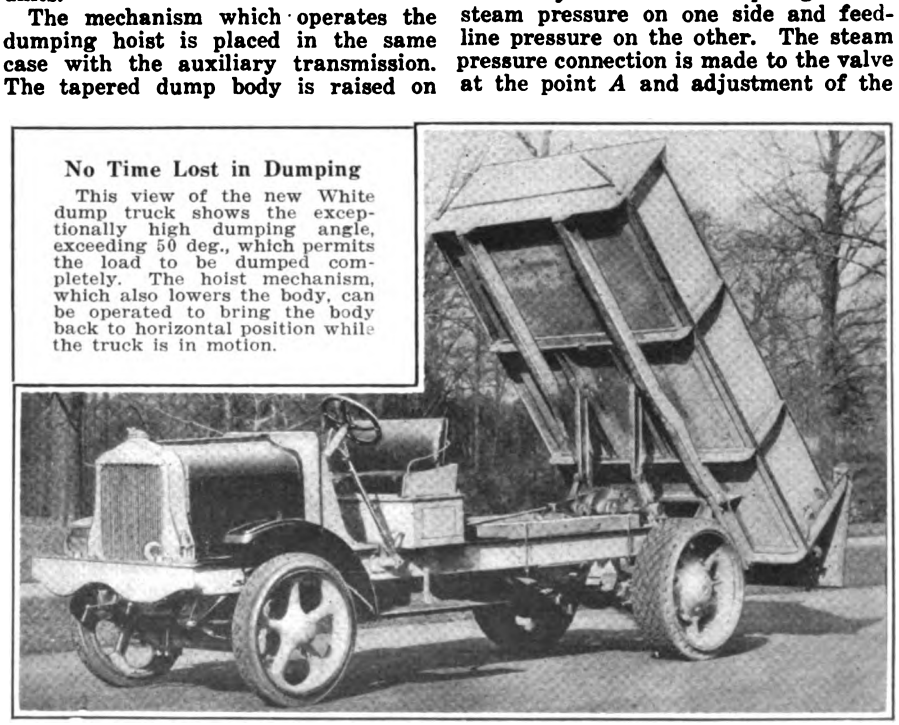
Good roads are so common about the mines today that much of the material formerly handled by means of teams and wagons is now shipped by truck. In order to meet changing conditions in this respect the White Co., of Cleveland, Ohio, recently has brought out the heavy duty dump truck shown in the accompanying illustration and known as its Model 52-D.

This new model has an auxiliary transmission affording the equivalent of five separate speeds giving extra low gear pulling power for hill climbing or for getting out of holes or mire; a new dumping mechanism and dump; tapered body; also an improved patented oil system, and a double reduction gear drive. Other improvements embodied in this new model include a large tubular type radiator, spring-cradles on the frame, a wide, heavy, pressed steel bumper, heavier steering gear, an air temperature rgulator that saves fuel and adds to engine efficiency in all seasons, heavy springs, reinforced frame of alloy steel and brakes with drums of a special metal that insures quick, certain stopping and long brake life.

The auxiliary transmission gives great flexibility of power. It enables the driver to gear down to the hardest pull when this is needed and allows the main transmission of work at a higher top speed on the level road. Power is transmitted in a straigh line from starting crank to the rear axle when operating under load. This assures maximum life for all drive units.

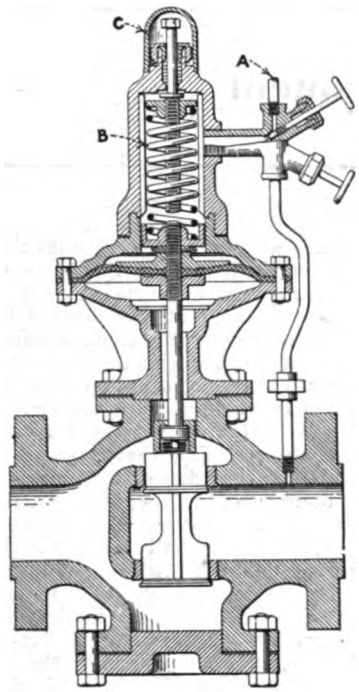
The mechanism which operates the dumping hoist is placed in the same case with the auxiliary transmission. The tapered dump body is raised on sturdy arms and links by means of a positive gear drive to an angle exceeding 50 deg. This is sufficient to dump any load completely, yet the body is under positive control at all times and may be held at any desired angle. It is lowered by the same mechanism that raises it, but can be brought back to horizontal position on the truck while this machine is in motion.

The actual dumping point is so far behind the rear axle that the load slides neatly over the edge of a soft fill without danger of miring the truck, or piles up in the clear on flat ground. A double-acting tail gate facilitates dumping and the low body sides make loading from the ground unusually easy. The dumping mechanism is set down within the frame in a dirt-proof and weather-proof housing, the gears being operated in oil. The wheel base on the new model is 156 in. Solid tires are used, the forward tires being 36 x 6 in., and the rear ones 40 x 12 in.



Regulator Valve Eliminates Pressure Variations

In order to eliminate the variations in the pressure on the feed line encountered where several boilers are supplied with feed-water from one pump, the excess pressure tending to vary with the rate of feeding, the S. C. Regulator Co., of Fostoria, Ohio, has perfected a new valve. This control valve is designed especially for installation in the line just ahead of each feed-water regulating valve. Its general construction is explained by the accompanying illustration.



The opening through the valve is controlled by means of a diaphragm with steam pressure on one side and feed-line pressure on the other. The steam pressure connection is made to the valve at the point *A* and adjustment of the

No Time Lost in Dumping

This view of the new White dump truck shows the exceptionally high dumping angle, exceeding 50 deg., which permits the load to be dumped completely. The hoist mechanism, which also lowers the body, can be operated to bring the body back to horizontal position while the truck is in motion.

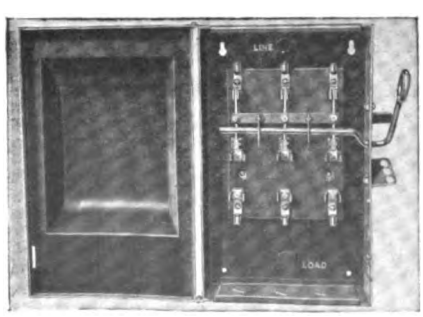
This Valve Controls Pressure On Boiler Feed Lines



excess pressure desired is obtained by varying the tension on the spring *B*.

In addition to being used to control the excess pressure ahead of the individual feed-water regulating valve, this new device can be employed in the discharge of electrically driven boiler-feed pumps to maintain a constant excess pressure on the feed line.

Industrial Safety Switch Has Quick-Break Mechanism

A new quick-break safety inclosed switch recently has been brought out by the Westinghouse Electric & Manufacturing Co. This switch, known as the Type WK-62, is externally operated, totally inclosed, and has a simply constructed, quick-break mechanism. It is for industrial and other applications where a disconnect switch is desired.

The stops that limit the travel of the switch arm and the blades are placed on the outside of the box. This simplifies the construction and affords ample room for wiring. Clean-cut and easily removed knockouts are provided in the back, sides and the top and bottom ends for any desired arrangement of the conduit. A diamond-point jaw and an extended type blade are used in the switch so that any burning occurring when the switch is opened does not foul the current carrying area of the blades. This new switch is supplied in capacities from 30 to 200 amp. and is rated at 250 volts d.c. and 250-500 volts a.c. in both the fusible and non-fusible types.

New Quick-Break Switch

Construction of this switch is simplified by placing the stops limiting the travel of the arm and blades outside the switch box. This also affords ample room within the case for the wiring.

Simple Chemical Extinguisher Quickly Kills Fire

In order to quickly cope with fires of any origin, but which are normally difficult to suppress, the Bastian-Blessing Co., 240 E. Ontario St., Chicago, Ill., recently has placed upon the market the fire extinguisher shown in the accompanying illustration. This machine is extremely simple both in construction and operation. It consists of two elements, a cone, filled with chemical salts which, upon heating, evolve carbon dioxide and water, and a cylinder of liquified carbon dioxide gas. The cone and cylinder are connected by means of a suitable valve so arranged that when the valve is opened a stream of the powder is blown onto the fire.

Extinguisher in Operation

To use this devise it is merely necessary to turn it to the position here shown and open the valve. A stream of powder is thus projected onto the fire that quickly quenches it.

To operate this extinguisher it is merely necessary to turn it upside down and release or open the valve. By this means a stream of the powder and carbonic acid gas may be projected 20 ft. or more from the nozzle. Inasmuch as fire depends upon oxygen, and since the carbon dioxide evolved from this powder will blanket any fire, it will extinguish it almost immediately. The powder is not injurious to the most delicate machinery or fabric, with the result that it may be used successfully for extinguishing electrical fires as well as others. After the fire is out the powder may be brushed off and the machine restarted. The extinguisher may be used repeatedly or until either the powder or the carbon dioxide are entirely exhausted when either container may be refilled. The device is claimed to be extremely rapid and effective in action.

Industrial Notes

A. H. Tischer recently joined the engineering force of the **Foote Bros. Gear & Machine Co.**, of Chicago, as designing engineer. He has been engaged in the design of a new line of herringbone speed reducers.

The Griscom-Russell Co. announces the removal of its general offices to the new Murray Hill Building, 285 Madison Avenue, New York City.

The Power Equipment Co., 315 Third Ave. North, Minneapolis, is now representing Foote Bros. Gear & Machine Co., of Chicago, on industrial gears, spur, worm and herringbone speed reducers.

The A. M. Byers Co. has brought out a new four-reel film entitled "The Little Red Ball." It embodies a diagrammatic and scenic presentation of the manufacture of wrought iron pipe from ore to finished product. Hand puddling of wrought iron, including diagrammatic views of the interior of a puddling furnace, the drawing of the "little red ball," squeezing, rolling of muck bar, cutting, piling, reheating and rolling are shown. The methods of forming and welding flat strips of "skelp" into pipe are especially well explained by animated drawings. Engineering, trade and business clubs and organizations generally may secure free showings of this film by communicating with the A. M. Byers Co., Pittsburgh, Pa.

The Kuhlman Electric Co., of Bay City, Mich., has awarded a contract to the Henry G. Webber Construction Co. for an addition to the Kuhlman factory. This addition will measure approximately 75 x 250 ft. In this new building the Kuhlman company is preparing to build the larger sizes of transformers.

Dr. R. B. Moore, formerly chief chemist of the U. S. Bureau of Mines and now general manager of the Dorr Co., who was largely responsible for the development of helium production during the war, received the Perkin Medal for 1925 at the Chemists' Club, New York City, on Jan. 15. The medal is given by the American Society for Chemical Industry, and the selection is made by a committee from that organization, the American Chemical Society, the American Institute of Chemical Engineers and the American section of the Société de Chimie Industrielle.

The Foxboro Co., Inc., of Foxboro, Mass., makers of indicating, recording and controlling instruments, has moved its Pittsburgh office from the Park Bldg. to what will now be known as the Foxboro Bldg., at the corner of Sixth Avenue and Grant Street. H. S. Gray continues in charge of the company's Pittsburgh branch.

Trade Literature

Electric Heat in Industry. General Electric Co., Schenectady, N. Y. GEA-261. Pp. 32; 8 x 10½ in.; illustrated. Deals with the advantages of electric heat for various industrial applications.

The C. F. Pease Co., Chicago, Ill., has issued Catalog G containing **Everything for Blue Printing and Everything for the Drafting Room.** The book is indexed for handy reference, contains 362 pp. and is well illustrated.

The General Electric Co., Schenectady, N. Y., has issued Catalog 6001B covering its entire line of manufactures. Reference to the different subjects is easily found as the book is thumb-indexed for ready reference. It contains 1104 pp., measures 8 x 10½ in. and is well illustrated.

Curtis Steam Turbine Generators. General Electric Co., Schenectady, N. Y. GEA-54. Supersedes Bulletin 42,206. Pp. 44; 8 x 10½ in.; illustrated. A collection of photos showing these generators installed in different plants throughout the country.

The World's Accepted Authority on Coal Mining

McGraw-Hill Publishing Co., Inc. **February 11, 1926** 20 Cents per Copy

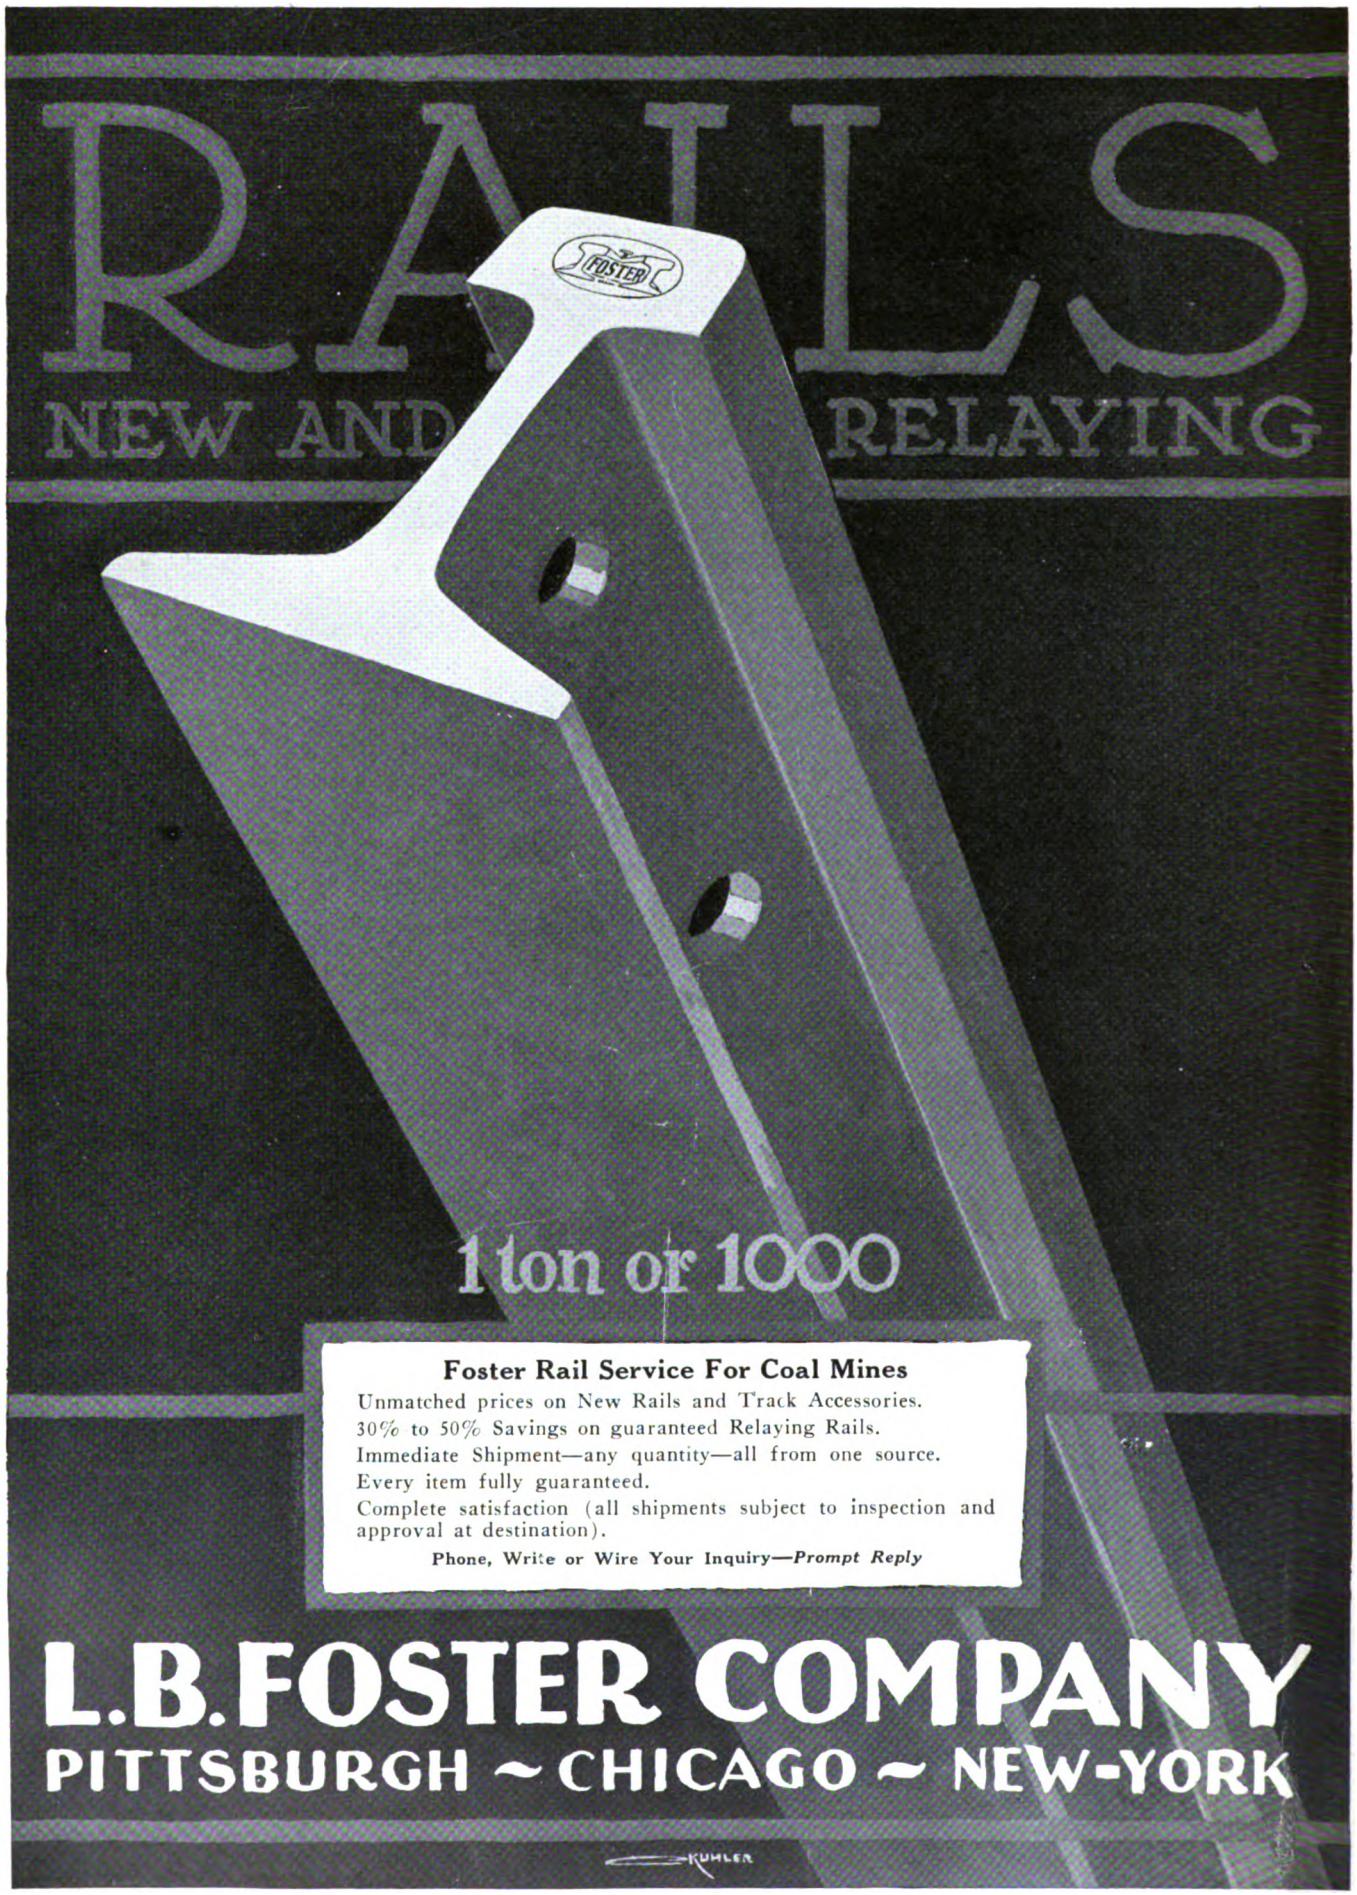
"Fair Weather" Mines

YOU can put almost any kind of equipment in "easy service" mines and get results—

But where production is pushed to the utmost—where the cars turn several times each day—that is where it pays to pin faith in Hyatt equipped mine cars.

On tangent and curved track—in the world's largest coal fields—thousands upon thousands of Hyatt equipped cars, whose capacities range from one half ton to twelve tons—are justifying the faith of countless operating men.

Cars equipped with Hyatt Roller Bearings can be secured from about thirty manufacturers—all of whom can point to many successes and very little grief—even after eight to fifteen years of exacting use.



Guarantee your production as others have done—insure your haulage against failure by specifying Hyatt equipped wheels or journals. Hyatt Roller Bearing Company, Newark, Huntington, Chicago.

Belts Rush Room Coal To the Entry

BELT CONVEYORS in rooms, operated as independent systems from face to car loading point at room neck, are winning their way in comparatively thin coal. The Pennsylvania Coal & Coke Corp. operating 35 mines has worked out a plan for their use, perfected two types of conveyors to make the plan workable and is now producing coal from three belt-equipped mines. The scheme has been in operation for a year and a half. The story of this newest cost-cutting, labor-saving idea appears in next week's issue of *Coal Age*.

The ingenious engineers of the company are proving that it is possible to apply "new fangled notions" in underground loading to old-fashioned mining layouts. It wasn't necessary to scrap the established room-and-pillar system with the inevitable travail and disorganization that usually follow an attempt to change a mining plan. Instead, 30-ft. rooms 275 ft. deep were continued. A 20-ft. self-contained belt conveyor unit was developed to be laid parallel to the face —it is a marvel of lightness—discharging into the main belt running along the rib to the entry.

The detail of how these belts are constructed and how the main one operates over wooden idlers suspended between posts along its course will interest every wide-awake coal mining man next week. This may be the scheme that answers the demand of a good many hard-headed engineers for a swift loading method that can be applied to room-and-pillar mining.

A Quicker and Better Way to Install Guard Board

You have a quick and inexpensive guard board installation with this new support. It slips into place without disturbing the trolley hanger or clamp. It is a simple design and assembly—two identical castings and bolts. It is built for insulated hangers, $3\frac{1}{4}$ to $3\frac{3}{4}$-inch diameter over the skirt of the shell.

Install this support on new trolley lines.

Put it up on existing trolley lines.

It is an equally simple job in both cases.

Once in place, the guard board stays in alignment—you always have a neat job.

Gunning for Golden Geese

IN THE NEXT FEW WEEKS the situation created by the prolonged anthracite strike probably will enter its most critical phase. Then, if ever, the chances that the coal-consuming public may feel a real pinch of fuel shortage will be greatest. For the most part, the fortunate householders who laid in liberal stocks of hard coal last spring will be coming into the market for a few tons of fuel to carry them through the closing weeks of the coal-burning season. Their demands will be added to the requirements of the less provident who have been struggling since last September or October to learn a new fuel technique. Should there be a breakdown of transportation service on top of this, we would have all the elements at hand for a dangerous coal panic.

What is needed above all else is the exercise of a spirit of self-restraint—individually and as an industry. There is too much at stake to risk losing all for the sake of an immediate extra profit. Coal producers and distributors who have a sense of public obligation will forego capitalizing upon public necessity. Those in the industry who feel that the treatment which they have received at the hands of the coal buyer has not been such that they should show the consumer any special consideration, nevertheless, if they are well advised, will move cautiously in the matter of increasing prices under the shelter of the inexorable law of supply and demand. They will surrender the chance to pile up extra earnings where in many cases extra earnings are sorely needed.

Such a policy, it is recognized, is contrary to the general rule of business. It means placing a bridle upon human nature. It means asking the coal industry to act in a manner which many of its severest critics would not follow had they a like opportunity to tap a golden stream of profits. Indeed, much of the criticism against high prices is the wail of frustrated desires. But much of the complaint, on the other hand, comes from people who can ill afford to pay exorbitant prices for the comfort of warmth in their homes. These latter are the innocent victims of an industrial struggle which was not of their making—but they are not inarticulate.

Enlightened selfishness, if nothing higher, therefore, should act as a brake on greed. The bituminous producer who doubles his price, the coke oven that asks $12 to $15 for fuel it willingly sold at $4 a few months ago, the retail merchant who tries to make the consumers take all the risk of his investment in substitute fuels may not kill the golden goose, but the bird will surely fly to more inviting nests. No coal man who is politically minded should undermine a national policy of non-interference by creating a widespread public demand for government intervention and regulation. No coal man who wants to guide the industry into sound merchandising channels should be a party to wrecking the business on the uncharted reefs of profiteering. If not for the public, then for the good of the industry, the coal trade must demonstrate anew its ability to meet a crisis with fairness, with skill, with adequate management and with moderation.

Keeping Down Coal Dust

MOST DANGEROUS of all explosive dusts are those that are fine. They are, too, the source of such diseases as are due to the breathing of dust. Any method, however thorough and energetic, that merely wets down the coarse dust, which promptly falls to the floor of the room, does not give the assurance of safety that conditions demand. If fusain and rosin dusts are peculiar hazards because of their fineness, we do ill to combat them by waiting till they have fallen because before they fall they may explode or when they fall may settle in some completed room or return airway beyond the reach of sprays.

Dr. R. R. Sayer's monograph on "Silicosis Among Miners," Technical Paper 372, of the U. S. Bureau of Mines, refers to the use of a spray when a shot is actually being fired. The dust is thus caught in the air and brought down to the ground. Some of the nitrous fumes are probably similarly eliminated. This practice seems well worth consideration by the coal industry. In many cases the metal-mining industry is using compressed air with water in its sprays. Unfortunately, compressed air is rarely available at the coal mine face. However, between the cloud-like discharge from an atomizer and the drenching stream from a nozzle, there is a middle course which might do much to lower the dust count in the mine air. But unless the water is clean and under a good pressure the delivery of a fine spray is out of the question. Of course, even though the room is sprayed, the coal itself should be drenched with a hose.

The Battery Locomotive

IT IS NO SECRET that many battery-equipped gathering locomotives are being converted to the cable-reel type, as the batteries wear to the point of renewal. Indications are that this move is taking place principally at the smaller mines.

Several reasons for the trend have been advanced. One, that regardless of the question of ultimate economy, battery renewals are being side-stepped because of the lump-sum nature of the upkeep cost. Another, that the advent of rubber-sheathed cable has decreased the delays and repair cost of reel locomotives, taking away any advantage in lower operating cost that the battery locomotive may have had.

Other reasons are that there were undoubtedly many misapplications of battery locomotives during the flush years in the coal industry, and that, with the stringent

Digitized by Google

economies of the last few years, many batteries have suffered for want of care.

Probably no other equipment is so adversely affected by the lack of a "stitch in time" as is a battery. It does not require an electrical engineer or a skilled electrician to keep a battery in condition, but it does require that there be someone of authority in the mine organization who fully realizes that the secret of low-cost battery maintenance lies in cleanliness and in immediate attention to the little defects as they may arise.

Batteries have proved to be reliable in mine-locomotive service. But few things can happen to a battery which will cause long delay during a shift. A broken jar cover, a broken connector, or a bad cell are minor difficulties. It requires but a few minutes to repair temporarily a connector or to "short out" a bad cell.

Perhaps the very features of reliability and the possibility of quick, temporary repairing have reacted to the disadvantage of batteries. If in practice the temporary repair is recognized as being only a means of finishing the shift, and not a way of finishing the week or month, there can be an assurance that one of the most important things in battery maintenance is being accomplished.

Schools, Past and Present

IT IS BOARDED UP now—the danger of a piece of the roof falling was too great and the safety engineer deemed it wise to shut off the entrance with a strong, business-like barricade. But only a few years ago that natural cave or opening in the side of the mountain served as a schoolhouse. It was cool and comfortable in there even on the hottest days, and here the children —and some of them could hardly be classed as infants either—gathered to learn the three R's.

They were a hardy lot, those children of the mountains. Like the regions they inhabited they were rough and rugged and the cave school was in entire keeping with the character of the young folks who attended it and with that of the master who presided. The community was poor and this little school room under the rock was the best that the "hollow" could afford. And so the cave school represented the only institution of learning available to the boys and girls of that rugged country.

But a change came. A big Northern company bought the coal rights for miles around, built a railroad up the hollow and opened some magnificent mines. The little valley became a beehive of industry. Where had been what was once termed a "farm," the thriving community of Lynch, containing several thousand people sprang up almost over night. And true to the traditional traits of the American pioneer a school house was one of the first buildings to be erected.

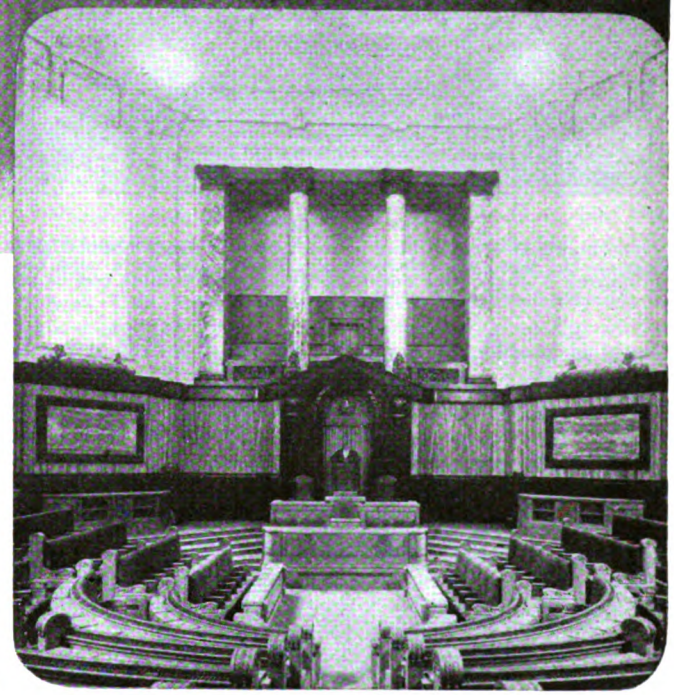
Those who planned this modern mining town among the Kentucky mountains possessed admirable foresight. Time, however—and only a short time at that, a span of years that can be more than counted on the fingers—has proved that they were not foresighted enough. Within two years the beautiful stone school building that was first erected proved inadequate to the demands made upon it and a larger, thoroughly modern high school was built beside it to relieve the pressure. This too has proved inadequate and already additional accommodations are needed. They will soon be provided.

Today, instead of the three R's as taught in the cave school less than a dozen years ago, the children of the mountains and the children of the hollow, the offspring of the miner and the offspring of the "sager" alike can obtain the advantages of a fair education by merely putting forth a reasonable effort. The curriculum of the high school now embraces all branches usually taught in such schools including higher mathematics and the classics.

Nor is instruction confined to such subjects or to strict "book learning." The school has its band of about 20 pieces, an orchestra of approximately 30 instruments and a good-sized glee club. It also has its gymnasium and its athletic contests. Both the girls' and boys' basketball teams are second to none within the state. Once a week as a rule during the winter, usually on Wednesday evenings, these teams meet rival organizations from other communities or visit other schools for a like purpose. On such occasions the teamwork exhibited is frequently excellent and—what is vastly more important—the sportsmanship displayed is clean, fair and admirable.

In its way also, the high school serves to educate the entire community. It is its civic center and the hub of its civic pride. It is the place where everyone in the hollow meets on a common footing, and where genuine democracy is inculcated. Thus during the course of, say, a hotly contested basketball game, when the teams are evenly matched and the tide of advantage ebbs and flows from side to side with dizzying and bewildering rapidity, when disaster is skillfully averted or a particularly difficult goal is "shot," it is not uncommon to see the wife of a miner and the wife of a high company official occupying adjacent seats in the "bleachers" spring to their feet simultaneously, and wave their fur coats frantically as they shriek encouragement or commendation to son or daughter of the home team on the floor below. Nor to the inexperienced eye is there any marked difference in the quality or intrinsic value of the garments waved or in the size or luster of the jewels adorning the hands that wave them.

There are those in our complex present-day civilization who habitually prate about the heartless avarice of soulless corporations and bemoan the practical servitude and dependence of the industrial worker. To such calamity howlers a contrast between the present high school in this obscure hollow and its cave school of a decade ago might prove enlightening. Certain it is that the coming of the railroad and the opening of the mines, in short the dawn of industrial development, marked the beginning of real prosperity and progress to all those who dwelt within its mountain confines.



The Need for Research in Coal Uses

DEFINITE STUDIES are being, and have been for years, undertaken to promote the conservation of coal by economies in combustion. As O. P. Hood, of the fuels division of the American Society of Mechanical Engineers, says: "The boiler room has become a laboratory for steam generation." With all the study to make boiler practice economical of coal, with the American Railway Fuel Association extending the work to locomotive boilers, what studies are the coal industry making to find new uses and opportunities for its product?

The manufacturers of any product who take it for granted that business will grow like a snowball with a definite increment for every unit of travel are liable to be sorely disenchanted. Coal is learning that an unstimulated business is prone to be a declining one.

Refrigerated Air Is Cooling Buildings And Increasing Use Of Coal

By R. Dawson Hall
Engineering Editor

REFRIGERATED AIR is used not only in motion-picture theaters, as recorded in the article on "Cooling with Coal" in the issue of Jan. 14, but in many other places, cafés, restaurants, dance halls, amusement "palaces" and even in a hospital, all contributing their bit toward wider consumption of coal and a levelling upward of the summer sag in coal business. There are other places where it is used, but that I leave to a later issue.

It is quite likely that museums and picture galleries will adopt it. Museums are said to be proving the tombs for a number of world-famous pictures. In the *New York Evening Post* a correspondent from Paris writes: "Canvases by Raphael, da Vinci, Carolus Duran, Henner, Renoir, Monet, Degas, Sargent, Boldini and others, but ten years ago commending the admiration of every connoisseur, are almost unrecognizable. The reason is afforded by Albert Flament who says that 'in winter most Paris state art galleries register a temperature of 24 deg. F. and in summer the same state art galleries register 104 deg.'" Differences such as these are unknown in American art galleries because they are steam heated, nevertheless the range of temperature is doubtless larger than it should be between summer days and winter nights.

The headpiece shows the London County Council Hall and the main chamber which is cooled in summer by conditioned air from a plant in the basement.

American refrigerating and air-cleaning methods have already been applied to the atmosphere of London, England. A plant has been installed by the Carrier Engineering Corporation, of Newark, N. J., in a magnificent building known as the new London County Council Hall. The legislative and municipal bodies of England, as is well-known sit in long benches, not in separate seats and with desks. Such carven seats, or should we say "pews," are provided in the building mentioned. In front of the occupants of the pew is a ledge projecting from the stall in front. It is termed a desk—apparently by courtesy. Under the ledge is a box with a control lever which if thrown one way throws conditioned air toward the occupant and thrown the other way directs the air upward through the grille above the desk. At the end of the seat is a grille by which air is removed from the room and there are others beneath the seat. Each seat is independently controlled so that the occupant can have air to his liking.

Here, perhaps, something should be said as to the system of refrigeration at this plant which also is used in many buildings in this country, notably Madison Square Garden, reference to which will be made later.

This system uses the liquid refrigerant dichloro-ethylene, known commercially as dieline (di-e-line). The

How It Operates

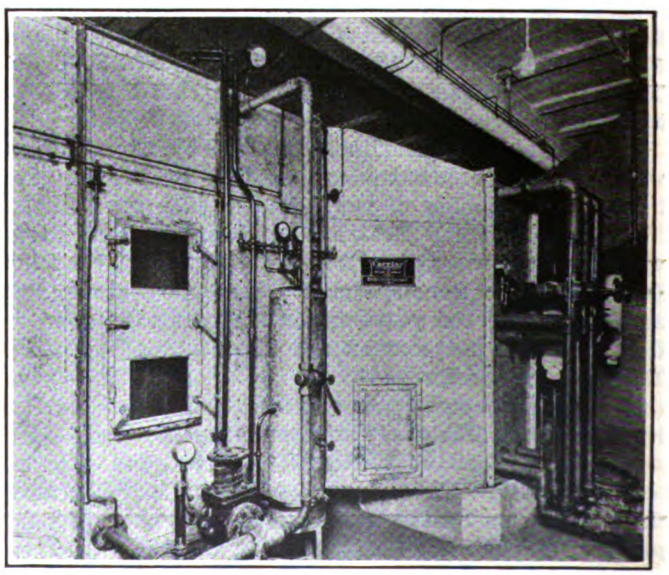
The occupant of each seat in the London County Council Hall controls the flow of conditioned air through the ducts near him by moving a small lever under the desk. Thermostats can be set to maintain continued control.

liquid is heavier than water and has a boiling point at atmospheric pressure of about 120 deg. F. It is thus a stable liquid at all normal air temperatures and pressures. Its vapor has approximately three times the weight of air and though it is flammable it burns only with relative difficulty. When spread it will burn forming a heavy vapor which blankets the surface of the liquid, thus shutting out air and extinguishing the flame.

This vapor, like carbon tetrachloride, extinguishes fire not by any active property of its own except by being non-flammable and shutting out air. There is, therefore, said to be no gas hazard, particularly as the vapor instead of being under pressure within the system is under vacuum. There is practically no loss of the liquid refrigerant. It passes through a continuous cycle of evaporation and condensation within vacuum-tight walls. Small quantities of the refrigerant may be drawn from the machine during the purging process preparatory to starting but this mainly is recovered in passing through rectifiers.

The water or brine in the refrigeration system is produced by the evaporation of the dieline under a vacuum, produced by a centrifugal compressor which is a simple multi-stage fan similar in construction to the usual type of rotary compressor or steam turbine. This compressor produces the vacuum necessary for the evaporative cooling that takes place in the evaporator.

The third part of the equipment is a simple condenser with which the vapor is discharged from the compressor at a pressure considerably below that of the atmosphere, but sufficiently high to be condensed by a counterflow of cooling water taken either from the city mains or recirculated through a cooling tower. The condensed refrigerant is then, of course, returned to the evaporator to begin the cycle anew.

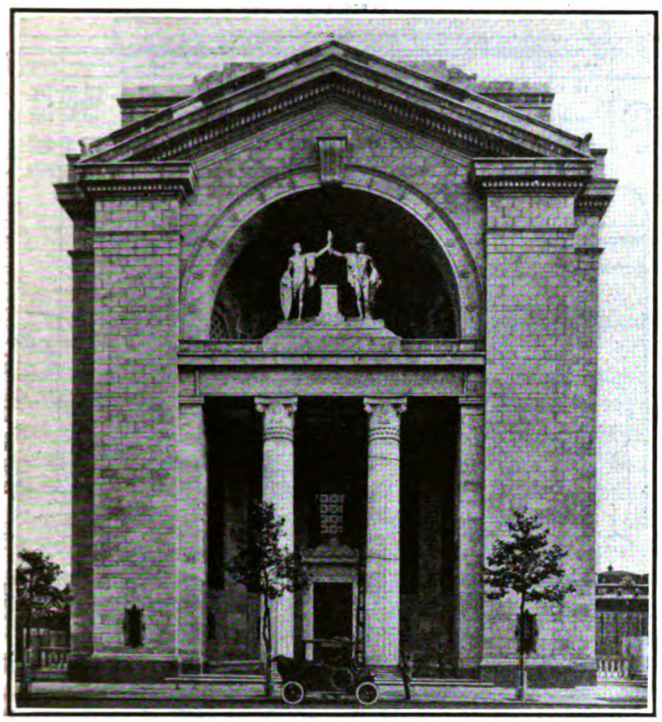


The innovations in the system are: That the entire cycle of evaporation, compression and condensation takes place at pressures considerably below those of the atmosphere, thus eliminating any possibility of outward leaks under operating conditions; that there are no valves or cylinders and the only contact parts are the main shaft bearings, and that the compressor has a direct motor or turbine drive operating under constant speed under all load conditions except such as constitute so extreme a range as to make this impracticable. It is claimed that this machine occupies about 25 per cent of the space required by other systems of the same capacity.

A growing use of refrigeration is found in the grills, dining rooms, cafes and like rooms of hotels. Mention was made in the article of Jan. 14, "Cooling with Coal," to the refrigeration cooling of the Pompeian, Gold and French Rooms in the Congress Hotel, Chicago, and to similar cooling at the Ritz-Carlton Hotel in New York. These are historic installations. Chicago has not been slow to develop such cooling, and already the Sherman, Windermere, Sovereign, Wellington Arms, Southmoor, Belmont, New Bismark, New Palmer (225 tons of refrigeration), Blackstone (100 tons) and Morrison all have cooled rooms.

CHICAGO IS MOST ACTIVE

Chicago leads in this activity as in theater, restaurant and dance-hall refrigeration. In fact that city is the leader in the "keep-cool-with-refrigeration" idea. Two of the most active companies for the installation of such equipment are there and three leading engineers for comfort refrigeration are there also, Dr. E. Leonard Hill and C. W. and George L. Rapp, the two last being architects. The following restaurants in Chicago have refrigeration-cooled air: North American, Twentieth Century, Alamo, Winter Garden and Planters. The Astor Hotel Grill in New York has cooling by refrigeration as also, as stated, the Ritz-Carlton. So also has the Italian Tea Garden at the Ambassador Hotel, but so far New York has been apparently unawake to what can be done to relieve the sweltering discomfort of the summer.



Ohio has no less than three hotels cooled by refrigeration machinery: the Miami, at Dayton; the Winton, in Cleveland, and the Deschler (75 tons) in Columbus. The Book-Cadillac at Detroit, Mich., also is thus cooled. The South also is moving along. A pioneer was the

Summer Heat Cannot Enter Here

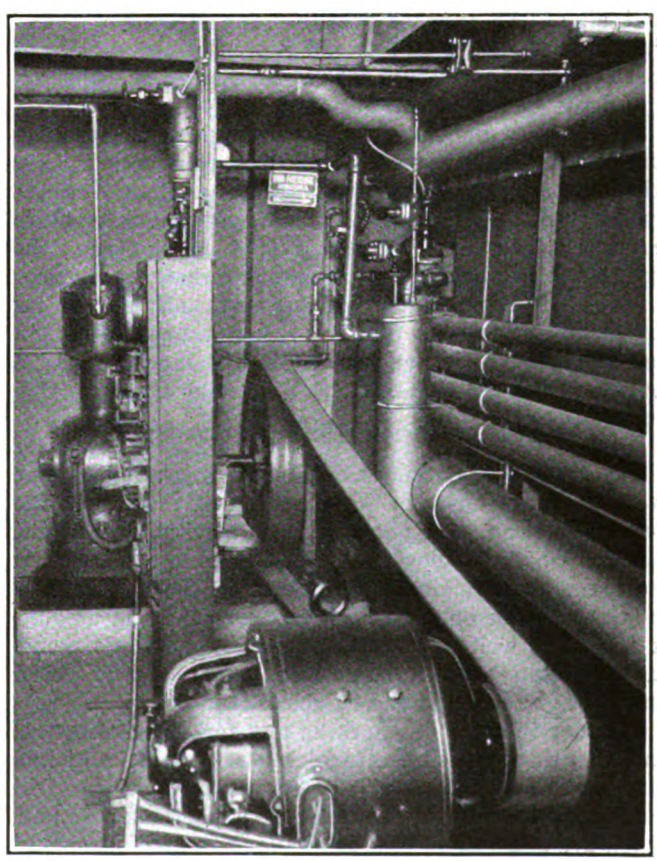
Bush House, London, whose noble facade is illustrated, is cooled in the hot months by iced water pumped through the heating pipe system. During a test in the offices, the room temperature was brought down from 84 to 72 deg.

Rice Hotel in Houston, Tex., and now the Muehlebach in Kansas City and the Mayflower in Washington, D. C., have joined the list.

Other places of public entertainment are being or have been equipped. At Madison Square Garden in New York City where at times when a prize fight is being staged, 23,000 persons can be seated, the hall is cooled with dichloro-ethylene refrigeration. Here are 3 units each of 267 hp. capacity or a total of 801 hp. Each unit has a 280-hp. turbine running condensing. The recirculating pump for each unit is of 40 hp. In addition to the big hall a skating rink is kept at 67 to 70 deg. with ice on the floor.

Cool Air for Dance Halls

Two dance halls have been built and provided with refrigerated air, one for Andrew Karzas in Chicago and one at Hammond, Ind. In the latter not only the dance hall but a billiard room and bowling alley are or will be cooled. The Karzas ball room has 225 tons of refrigeration, the horsepower of the two compressor motors installed is 300 and that of the recirculating pumps, 20.



An interesting innovation is the refrigeration of the air supplied to J. L. Hudson's department store in Detroit. The store has three units of 200 tons each or 600 tons of refrigeration. The well-known pipe store of Alfred Dunhill of London, Inc., on Fifth Ave., New York City, keeps the temperature of the air in its cigar storeroom, which is ventilated separate from the store, at 66 to 70 deg. F. the year round, achieving this by a 2-ton installation of ammonia-refrigerating machines having thermostatic control. The air is cleaned and humidified and delivered to the storeroom at a humidity of 60 per cent. At temperatures around 68 deg. the larvae which assail fine tobaccos do not develop and air-conditioning consequently pays big dividends.

The following note from *The Engineer*, of London, England, issue of June 19, 1925, shows what is being attempted at Bush House, an American activity in London. This has not yet had a try out through a long hot summer to determine the comfort it affords:

"A novel form of reducing the high indoor temperatures, to which we have been subjected for the past fortnight, has just been tried in London, and has, we understand, proved very satisfactory. In the structure of Bush House, Aldwych, an elaborate system of piping was incorporated for heating purposes in cold weather, and it is now doing duty for cooling the rooms by the simple expedient of pumping cold water through the pipes.

"The success of the idea is however, due to the peculiar arrangement of the piping. Instead of using ordinary radiators, for heating the building, grids of ½-in. pipes are arranged in the walls just beneath the surface. Experiments were first made by circulating water from the city mains through the pipe grids, but it was not sufficiently cold to have any appreciable result. When, however, water from the artesian well belonging to the house was used, a considerable reduction in the temperature of the rooms was produced, as the well water is naturally cool.

"Finally some ice was put in the water tank, and the room temperature was brought down from 84 deg. to 72 deg. It would, of course, have been impracticable to seek this result with ordinary radiators, as their limited surface area would have necessitated the water being very cold to get the required transfer of heat, and freezing of moisture on the outside of the system would have caused inconvenience."

This Plant Cools Cigars

Two tons of refrigerating capacity is devoted here in the basement of the Alfred Dunhill store in New York, to maintenance of a stock room in which high-grade tobacco must not deteriorate during storage.

This Bookkeeping Method Simplifies Accounts

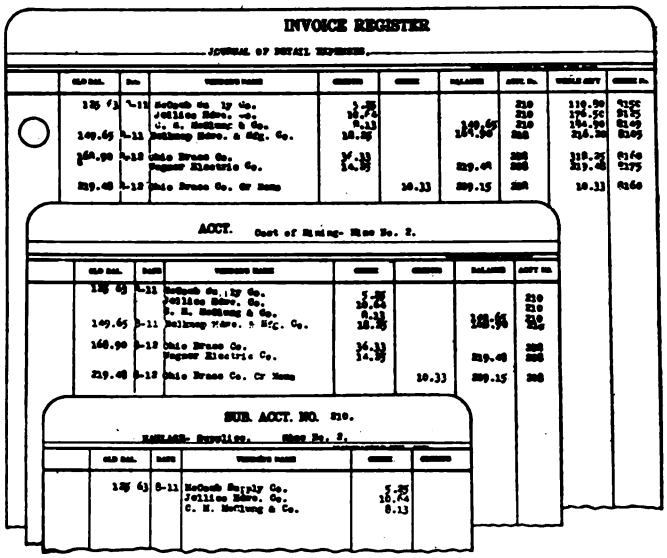
By John C. McNeil, C. P. A.
Louisville, Ky.

THERE IS at least one good method by which coal companies operating several mines can detail the operating expenses at each mine, obtain the total of all expenses at each mine and a daily proof of all expenses charged to all mines in one operation, and control the expenses at all mines through one general ledger account.

This is accomplished through the use of bookkeeping machines. All invoices when received for entry in the accounts payable should be charged through the accounts payable accounting system to the general ledger account, cost of mining. After all invoices have been posted in the general accounts, those affecting the cost of mining are removed from the other invoices for posting to the cost accounts.

Three forms illustrate this system. They are: (1) the Sub Account, (2) the General Account and (3) the Invoice Register covering all invoices posted.

The invoice register is placed in the machine and through an arrangement, a permanently attached sheet of carbon passes over this sheet to and including the balance account and all entries made on the other two sheets are made on this automatically.



The expense classifications should divide the detail expenses—both labor and materials—into 100 accounts for each mine (although it is not necessary to use all of the numbers) and number the mine general accounts in even hundreds. Thus, Account No. 100 would represent all of the expense accounts for Mine No. 1 and the accounts 101 to 199 would represent the details of these expenses. Account 200 would represent Mine No. 2 and the details for this account.

As invoices go through the various mine superintendents, it is, of course, understood that each invoice will be chargeable to one mine only and that a single invoice will not, except upon rare occasions, contain charges against two mines. This being true, the invoices should be assorted as among mines, the invoices for No. 1 being put in one arrangement and the invoices for No. 2 in another. The Mine Account, which is the general account, is next placed in the machine and a carbon runs over this form to the credit account.

Preparing the Detail Account

The particular detail account that is covered by one or more items shown in the expense distribution on the invoice is taken and placed in the machine. The old balance, which is shown in the Old Balance column on the main account sheet, is written in the similar Old Balance column on the detail account, and the amount of the debit written, together with the vendor's name, on the detail account, and the number of the detail account is written on the ledger account.

In order to assist in checking and for other reference purposes the total of the invoice is also written on the Invoice Register in the whole amount column. All charges from invoices in favor of a particular vendor which are chargeable to a particular sub-account should be written on the Sub Account and after these are entered, the balance shown in the cross computing mechanism of the machine is written in the Balance column on the ledger.

These Forms Simplify the Job

They are the principal ones used in the method explained in this article by which easy control can be kept at one office over the accounts of a group of mines.

This procedure is run through the entire posting of the accounts and when all the invoices have been posted, the vertical totalizers of the machine will show a total of all old balances picked up, a total of debits posted, and a total of credits posted, as well as a total of the new balances. As a proof of accuracy of the posting it is understood, of course, that the total of old balances picked up plus the total of debits posted less the total of credits posted will be in agreement with the total of new balances. Credit postings in these accounts will represent credit memoranda and other deductions from expenses previously posted.

After the day's work has been posted, the total debits shown on the Invoice Register will be in exact agreement with the total charges to Costs of Mining obtained from the accounts payable distribution.

No Month-End Jam

By handling the distribution of detail expenses in this manner it is not necessary to carry an account with each mine in the general ledger, it also does away with pen-kept cost ledgers for each mine and facilitates the preparation of the various analytical statements which help the management in controlling expenses. As the three records are made in one operation and are proven daily with liabilities put on the books, there is no peak load at the end of the month.

By this system one operator in a day can handle an average of over a thousand postings including proving and balancing the accounts. Few coal companies exist that have 25,000 entries to their cost accounts each month and those that do have this volume of work are not detailing with a single operator their cost accounts and proving them with their actual payments or accounts payable credits. For the average coal company with two or three mines, about an hour per day would be required by an operator using this system.

IN CO-OPERATION with the Public Health Service, the U. S. Bureau of Mines is conducting a health survey at coal mines in different states, with the view of determining possible ill effects of breathing air carrying fine particles of coal dust, and the healthfulness of the conditions to which the miner in the average coal mine is exposed.

Conveyors Work Well in Thin-Seam Mines

Survey in Many Mining Fields Reveals Some Progress at Spring Valley, Ill., Henryetta, Okla., and Straven, Ala.—Lump Proportion Raised

By J. J. Rutledge
Chief Engineer, Maryland Bureau of Mines, Baltimore, Md.

SOME DISTINCT advances in methods of mining thin seam coal in various parts of the country have been achieved, especially by the use of conveyors underground. This fact was apparent after a study had been made, in company with a number of prominent coal mine officials, during a recent tour of operations in Illinois, Oklahoma, Arkansas and Alabama. The outstanding conveyor installations observed were those at the Spring Valley Coal Co. in the northern Illinois longwall field; the Crowe Coal Co., at Henryetta, Okla.; the Peerless Cahaba Coal Co. and the Montevallo-Straven Coal Co. at Straven, Ala; the Paris Purity Coal Co. at Paris, Ark., and the Montevallo Mining Co. at Aldrich, Ala. Developments at the first three will be covered in this article. The others have been described previously.

Several of the experiments involve the use of radically new methods of working and equipment, and reflect credit on the mine management and the engineering force. It is believed that this paper records a distinct advance in the methods of mining thin coal seams efficiently and economically. The methods described are being carried out in strongly organized coal fields as well as in fields where there is no organization; in thin seams lying horizontal and in steeply pitching seams; in mines where no inflammable gas is found and in closed-light mines.

Mine No. 1 of the Spring Valley Coal Co. at Spring Valley, Ill., in which the "I. G. P." hutch conveyor was used for a period is a longwall operation and is characteristic of the northern Illinois longwall coal field. L. H. Smith is general manager of the company and I. G. Pospyhala the engineer.

The seam averages 3½ ft. in thickness and lies practically horizontal under about 400 ft. of cover which is composed of shales and thin sandstones. No strong heavy strata are in the cover. The coal has no persistent bands of parting. The immediate roof is of soft, gray shale. These mines have been worked longwall advancing, Scotch system, for many years. Where the new method of mining was tried the cover is 450 ft. thick. Formerly all mining in this field was by hand, but during recent years machine mining has been introduced. The "back-breaks" in machine mining seem to be nearly vertical while in hand mining the line of break leans back on the gob. The greatest trouble with the new system seemed to be that the breaks were vertical rather than inclined backward on the gob, probably due to more rapid advance and uneven distribution of roof pressure. This results in premature breaks which close the face at times.

The method of working was panel longwall advancing with faces of a total length of 400 ft., 200 ft. on each side of the roadway. The cutting was done in the lowest portion of the coal seam by a longwall mining machine. Pack walls, 20 ft. wide, were built on each side of the haulageway. The panel longwall faces produced 240 net tons of coal daily with the following labor: 12 loaders, 3 machine men and 4 men shooting the coal, building cogs and timbering, 1 man operating hoist, and 1 man switching mine cars.

Two rows of cogs or cribs were used along the face. A room hoist moved the conveyor. This hoist was placed over the roadway, the bottom of the roadway being cut to a depth of 4 ft. to permit loading from conveyor into the mine cars. The conveyor ran on a face track of 19-in. gage. Props were placed on both sides of the face track. A "strap," or split-bar, was set over the conveyor, the outer end of which is supported by a prop and the other end hitched into the coal face. Four men did the timbering and built the cogs. It required 14 hr. for 3 men to cut 400 ft. of panel longwall face, or 42 man-hours.

The conveyor is made in 6-ft. sections. The track is in 8-ft. sections and is of 16-lb. steel though 12-lb. can be used. The gage of the track is 19 in. The splice bars are bolted to one end of each rail by a single bolt. The other rail, on the adjoining section,

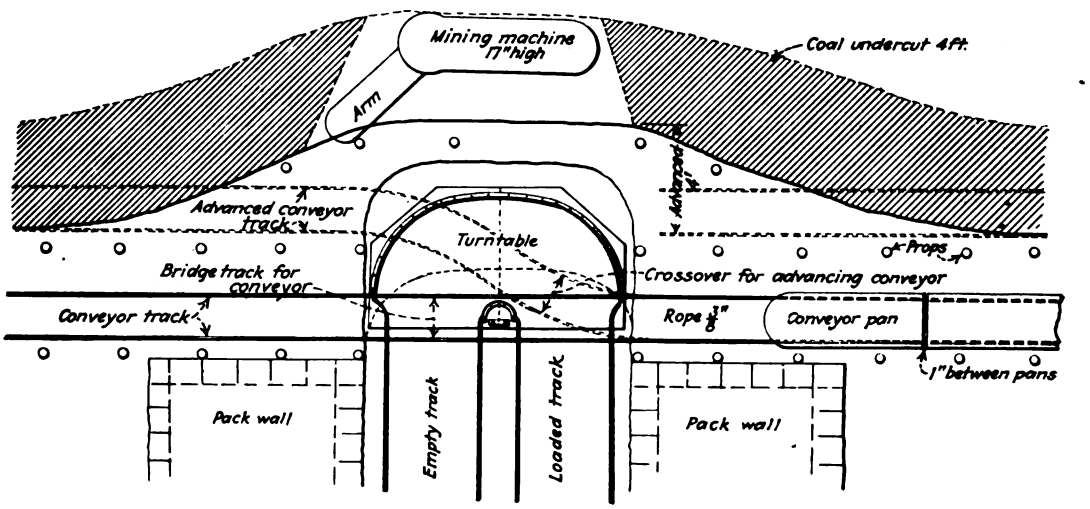

FIG. 1

How Hutches Operate

Digitized by Google

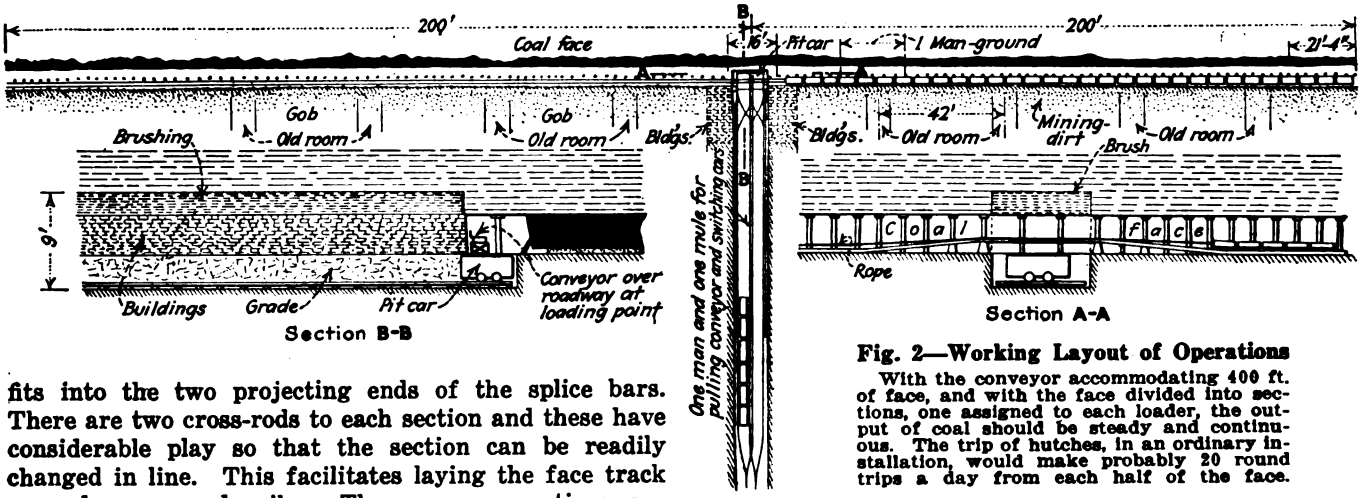

Fig. 2—Working Layout of Operations

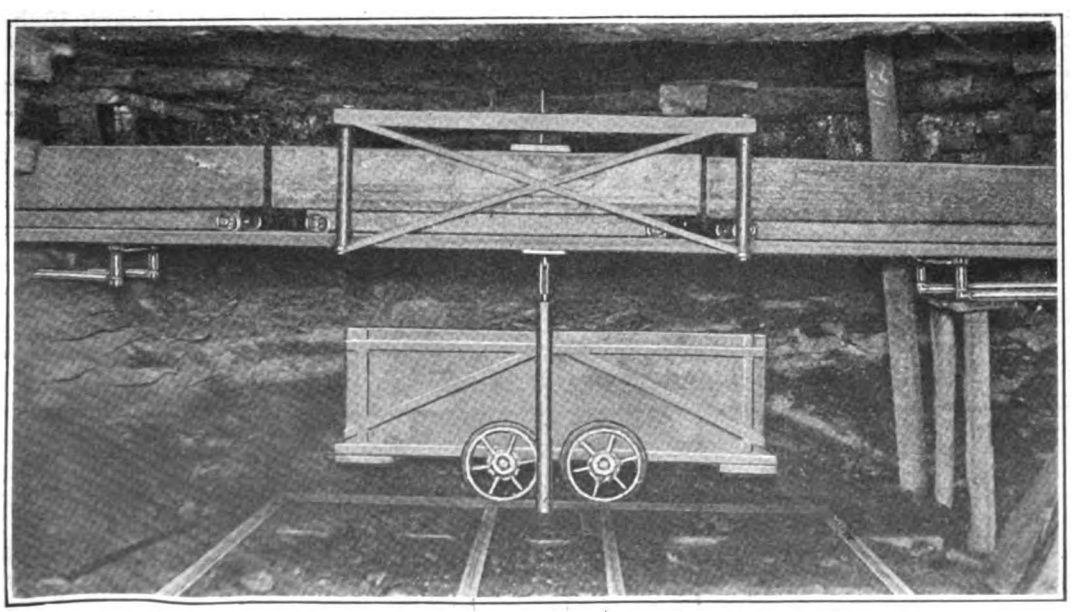
With the conveyor accommodating 400 ft. of face, and with the face divided into sections, one assigned to each loader, the output of coal should be steady and continuous. The trip of hutches, in an ordinary installation, would make probably 20 round trips a day from each half of the face.

fits into the two projecting ends of the splice bars. There are two cross-rods to each section and these have considerable play so that the section can be readily changed in line. This facilitates laying the face track around props and cribs. The conveyor sections are supported on roller-bearing wheels, 3 in. in diameter. A washer is between the wheel and the angle-iron. The conveyor section is 6¾ in. above the floor of the mine.

It is the practice to drill holes into the coal face, after it has been undercut, at distances of from 10 to 12 ft. and to explode small charges of permissible explosives in these holes. These small charges do not shatter the coal, which is of extremely hard character, but merely afford points of attack for the miner, who makes a shearing to a depth of 1½ ft. at the points where the shots are fired and then loads out the coal thus loosened. This shearing requires considerable time and delays the work of loading out the face.



The panel longwall face had been practically closed by a premature break several days previous to the visit of the party to the mine, and, therefore, only a portion of the conveyor was in operation at the time of the visit. The lost portion of the face, which included the mining machine, was being recovered and apparently the damage to the machinery was not great. Several days work should have reopened the face.

The practice followed at the mine in loading out the coal face after it had been undercut and blasted could be greatly improved by so arranging drill holes that the entire coal face would be broken up, though the coal would not be shattered. By choosing a proper permissible explosive and judiciously alternating the drill holes in the face, the coal could be so loosened as to be easily loaded. As it is the loader must shear into the face for a distance of several feet, at the places where the coal face has been blasted, so as to give a loose end from which the coal can be readily loaded. This shearing requires several hours and while the miner is doing the shearing he is loading no coal and, therefore, his portion of the conveyor is empty and idle.

The face should be so broken up by blasting that it can be readily loaded into the conveyor without the necessity of the shearing. There is a decided prejudice against blasting coal in this longwall region, where such practice has never been customary, the weight bringing down the coal with little or no use of explosive, after the face had been undercut. Since the method is radically different from the old practice, it will necessitate material changes in methods of working.

By means of the room hoist located above the road-head, the pans or hutches which are attached to ⅝-in. wire ropes passing over the drum on the hoist are alternately drawn along the face track, first along the panel longwall face on one side of the road head, and then along the other. After the loaders have filled the pans, they are drawn in a trip to the road head, where the plow scrapes the coal from the hutches and causes it to drop into the mine cars below.

The empty trip of hutches is useful in transporting timber, rock, supplies, etc. along the working face.

Heart of the System

Here the hutch conveyor delivers its coal into a car waiting on a turntable below a plow which scrapes the load from the trip of hutches or flat sheets on wheels. The conveyor parallels the face and advances with it. The depressed double track is extended correspondingly so that the turntable is always kept under the plow. The mine cars approach on one track, reaching the turntable where they are loaded, and revolved so as to be hauled away on the other track.

Digitized by Google

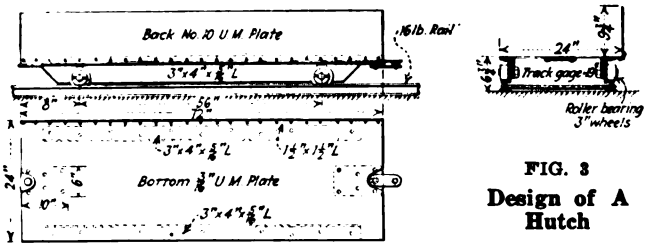


FIG. 3
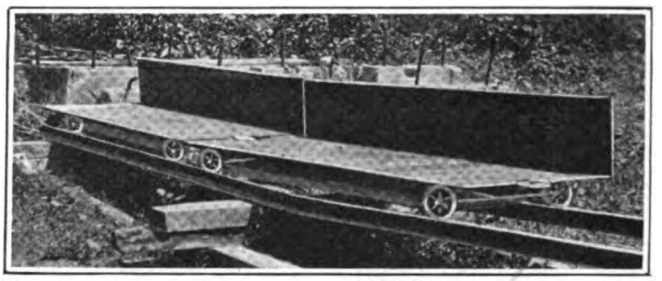
Design of A Hutch

It can be passed from one side of the road head to the other by a movable elevated track, passing in front of the hoist. The track is flexible and can be bent around props or cribs which cannot be moved on account of the roof weight.

In the event of one face being troubled by the roof working the hutches can be pulled to the other side, out of danger.

An interesting conveyor for thin coal has been developed by the Crowe Coal Co. at one of its Henryetta (Okla.) mines. The mine officials are E. F. Woodson, general superintendent; J. S. Cameron, mining engineer, and Justus Croyles, mine foreman. They have perfected a type of machine similar to that used in Arkansas by the Paris Purity Coal Co. and which was described in the March 5, 1925, issue of *Coal Age*.

The coal mined is the Henryetta seam, averaging 3-ft. thick with several small binders. The usual method of working has been pillar-and-room, entry and air course. Rooms are turned at 60-ft. centers and are driven at a width of 42 ft. with a room roadway on each side of the room. Room pillars are from 15 to 18 ft. thick. Few pillars have been pulled and the recovery is estimated to be 60 per cent under ordinary room-and-pillar method of mining, using machines, without extraction of pillars.



A panel longwall system has been adopted for the use of the conveyor so that recovery could be increased. The conveyor, using two parallel chains with angle scrapers between, was manufactured by the United Iron Works, Kansas City, Mo. The cost together with an extra tail piece and a 15-hp. a.c. motor and drum control, was $3,800.

One man can move the conveyor in 4 hr. It is built in 10-ft. sections weighing 354 lb. per section without chain. It has a total length of 300 ft. including the tail and motor sections. An "oil field jack" is used for moving it and has proved fairly efficient in this work.

Previous to beginning the longwall experiment, four rooms were driven up to the usual limit and the room pillars pulled. Then taking the inby rib of the last room as the face, the experiment of panel longwall mining advancing was begun. When visited the mine was working a face 225 ft. long. The coal was undercut by a short-wall mining machine, having a 6-ft. cutter-bar.

Cover is 275 ft. thick and is composed of sandy shales and thin beds of sandstones with no thick or strong strata. The present work has advanced the new face 100 ft. or a total of 225 ft. counting the four 45-ft. rooms on 60-ft. centers. Mr. Woodson said he estimated that he had recovered a total of 6,000 net tons of coal from the area 225x225 ft.

Props are 8x8-in. oak and set in rows of four about 4 in. apart and in a line at right angles to the face. There is a row of such props every 4 ft. It is the practice to draw the fourth prop, or the one nearest the gob first, using an 8-lb. hammer.

Two of the Hutches Outdoors

This pair of 6-ft. steel sheets with their 9½-in. back plates illustrate the type of units which, coupled into 16- or 32-hutch trips, comprise a continuous, flexible conveyor to shuttle back and forth along a coal face, serving hand loaders.

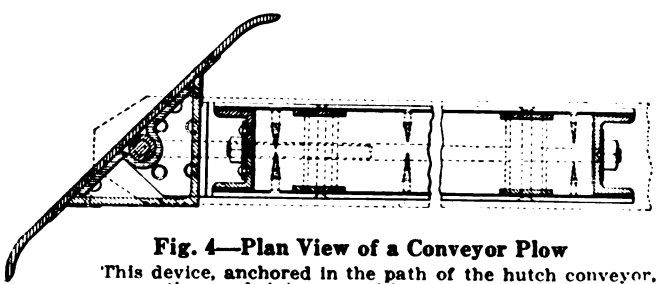
In previous pillar-and-room mining, using machines for undercutting the coal, the yield was of the following proportions: Lump, 40 per cent; nut, 20 per cent; slack, 40 per cent. It is expected that the yield under the panel long-wall method will be: Lump, 80 per cent; nut, 12 per cent; slack, 8 per cent.

The coal that we saw loaded by the conveyor was in exceedingly large lumps. The roof weight had been well controlled and only a few lines of fracture in the roof slate were noted crossing the face. Only one crib was observed which had been built recently to maintain the morale of the working force. Props had been used almost exclusively. A narrow place had been driven in the solid coal in advance of the panel longwall face, to afford a way of escape for the men in the event of the face suddenly closing.

A roof break observed was leaning back on the gob at about 60 per cent with the horizontal. The nearest row of props to the face was 12 ft. away and no props were between the conveyor and the face, which was being loaded out at the time of the visit to the mine. A second excellent break had been realized and the angle of break leaned back on the gob at about an angle of 45 per cent with the horizontal. There was a break in the roof, or what seemed to be an impending roof fracture running over the roadway and parallel thereto, where it had been brushed to permit the loading of coal into the mine cars from the conveyor, but this looked more like a weathering of the roof than a crack or line of fracture due to roof pressure.

The Peerless Cahaba Coal Co. in its Peerless mine at Straven, Ala., presented probably the best example of roof control over a conveyor that we saw. A. Sicard is president of the company and F. E. Dunlap general superintendent.

This mine is located on the Southern Ry., in the lower portion of the Cahaba coal field, at a point where the seams pitch heavily. The method of mining previously followed was pillar-and-room, with the rooms driven directly up the pitch. The coal is in the Helena seam, the output of which usually is of excellent quality



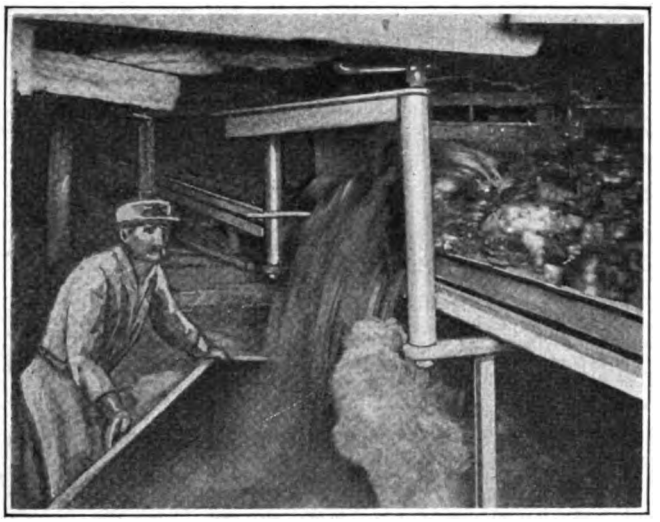


Fig. 4—Plan View of a Conveyor Plow

This device, anchored in the path of the hutch conveyor, scrapes the coal into a waiting car on the turntable directly below.

Unloading a Hutch Conveyor

The plow is held rigidly in position over the depressed mine track. The load of coal from each trip is scraped into the mine car. The conveyor is drawn by a car hoist in the haulageway.

and is sold for domestic use. At this point it is about 5 ft. thick of the following section:

Hard shale, dark colored	
Draw rock	3 in.
Clean coal	2 ft. 2 in.
Middle man	3 in.
Clean coal	1 ft. 8 in.
Middle man	5 in.
Hard bottom coal, clean	10 in.
Bottom, hard shale	

At the outcrop the dip begins at about 35 deg. but down in the present workings—over 1,800 ft.—it pitches about 15 deg. The coal is hard in character and is difficult to mine but when undercut makes excellent lump.

The problem confronting the company was to perfect a safe method of working which would yield the tonnage desired at the minimum cost of production, with the maximum proportion of domestic lump. The usual plan in this field, where the overburden is from 500 to 700-ft. thick, is to leave about 50 per cent of the coal in pillars. Therefore, it was decided to mine out the first 50 per cent in solid blocks, such blocks constituting working faces, with one face on each entry. The remaining 50 per cent would be left as solid blocks which could be mined on the retreat, all the other work being done on the advance. Solid coal is between the second and third entries as well as the fourth and fifth entries. The "walls" or "panels" are thus bounded by the sixth and fifth headings, fourth and third headings, and second and first headings, giving six walls or panels which are referred to as "sixths," "fourths," and "seconds" because the coal passes down hill from the walls to these headings. The solid pillars of coal are left between the "seconds" and the "thirds" and "fourths" and "fifths" headings. The coal in these pillars will be brought back retreating through the "thirds" and "fifths" haulageways.

The main top overburden in this mine is massive sandstone with interstratified shale and sand, varying from nothing to 6 ft. between this sandstone and the coal seam.

In all of the walls the top stands perfectly for longwall work. The practice of shooting out the props has been discontinued but three rows of extra heavy breaker props are still set at 60-ft. intervals to break the roof and to permit the roof pressure to cushion down behind the row of breaker props and to break at will. This practice, it has been found, keeps the breaking of the roof farther back from the working face and this results in less delay in the work at the coal face. The breaks in the roof are made on an average of every 60 ft.

The present method of working is true panel longwall. A 200-ft. face is driven away from the slope on the strike line of the seam. The active area may be likened to a room 200 ft. wide, driven directly away from and at right angles to the slope and in the line of strike toward the boundary of the lease which is a mile on either side of the slope. Below this panel longwall face, or room as it may be called, is the haulage entry, separated from the wall by a chain pillar. Below this haulageway is an unbroken pillar of coal 200 ft. thick, which it is planned to pierce at intervals of from 1,500 to 2,000 ft. with a passageway, 10 ft. wide, to shorten the travel of the air currents. This passageway will also shorten power transmission lines and afford escapeways.

Above each panel face is yet another entry, separated from the first face by a chain pillar which provides a direct return for the air current and also is useful in lowering timbers and supplies along the longwall face. This entry will be used to retreat with the 200-ft. solid block of coal left above it.

This company has developed and is advancing six of these faces. The two top faces are the steepest and

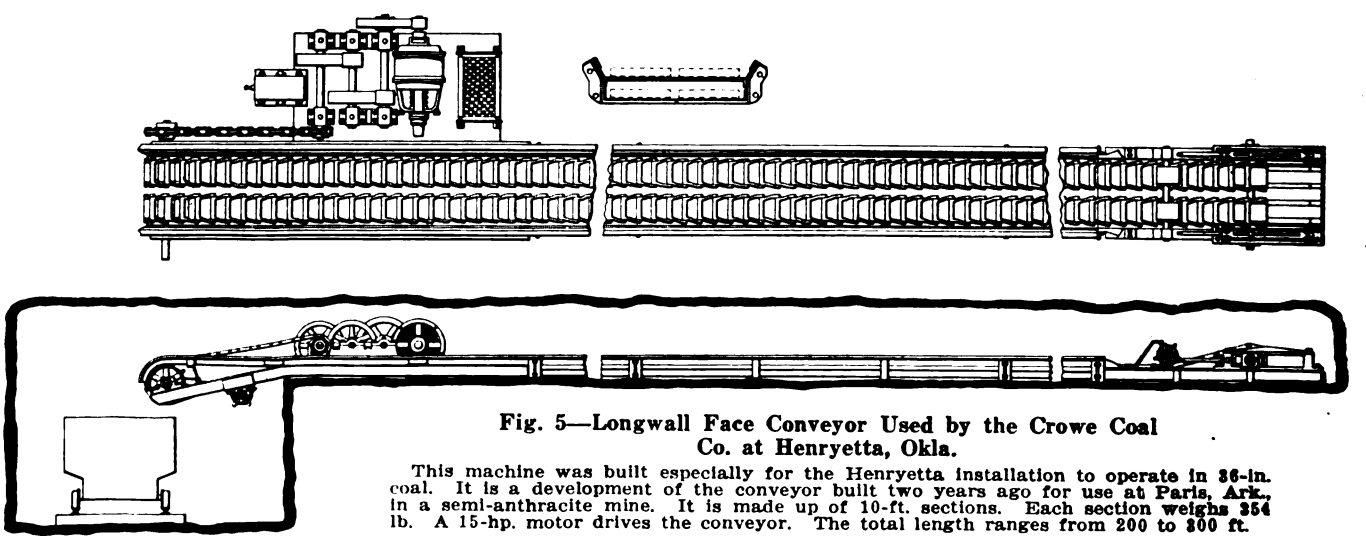

Fig. 5—Longwall Face Conveyor Used by the Crowe Coal Co. at Henryetta, Okla.

This machine was built especially for the Henryetta installation to operate in 36-in. coal. It is a development of the conveyor built two years ago for use at Paris, Ark., in a semi-anthracite mine. It is made up of 10-ft. sections. Each section weighs 354 lb. A 15-hp. motor drives the conveyor. The total length ranges from 200 to 300 ft.

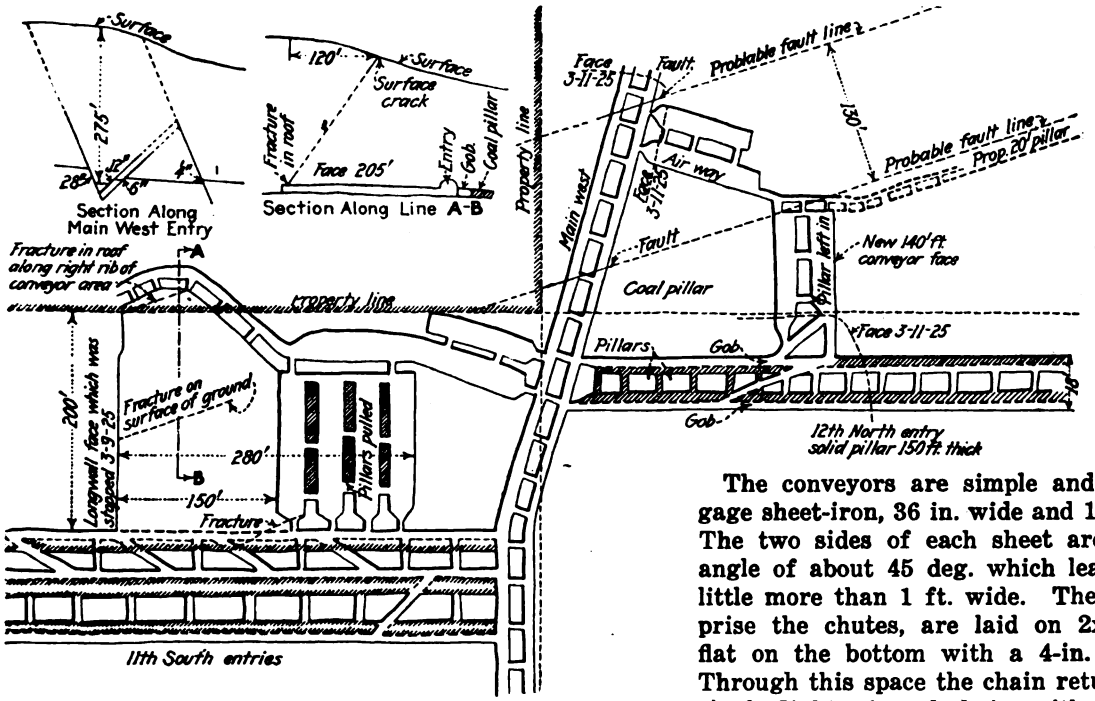

FIG. 6

Conveyor Did Well Here

This layout in one of the Henryetta mines of the Crowe Coal Co. shows how the conveyor enabled the company to shift over from room-and-pillar to longwall mining. In consequence, the proportion of lump rose from 40 to 80 per cent. Recovery in the district averages 60 per cent. This mine will far exceed that average.

have been advanced 1,200 or 1,300 ft. without trouble. The other panel longwall faces have been driven about 800, 700, 500 and 400 ft., respectively. The work is progressing steadily.

In order to protect the entries and make ventilation positive, three of the steepest faces, which pitch 25, 30 and 40 deg., are driven with the chain pillar above and below the panel faces. As these three faces are so steep no conveyors are needed and the coal slides by gravity down the sheet iron chutes which are kept full of coal to prevent breakage. When the pitch becomes as great as 40 deg. the coal slides freely on the hard, smooth bottom. At the bottom of each face the chute is deflected as the face advances to permit the coal to pass through the last open upset to the haulageway below.

On the other three walls where the pitch is only 15 to 20 deg., the bottom chain pillars are taken out to permit the operation of longwall conveyors along the panel faces directly down the pitch of the coal seam to the mine cars. In all entries, 2 to 3 ft. of bottom is taken up in the haulageways in order to bring the tops of the mine cars down to about the level of the bottom of the seam. This allows an easy discharge of the coal from the conveyor to the cars. One hundred 3-ton automatic drop-bottom mine cars are used.

MACHINES CUT UP THE PITCH

In the three lowest faces the cutting machines, which work in the lowest portion of the seam, make an arc cut starting at the bottom on the entry, and in all cases, cut directly up the pitch. By making these rounded cuts, the entry is kept ahead of the panel faces a sufficient distance to maintain space for an empty mine car supply for the conveyor. All the coal is cut without moving the machines in the haulageways from one entry to another—a process which is always hazardous on steep pitching seams. The company has had no difficulty in cutting up the steepest face where the dip was about 40 deg. In one place the machine was observed to be successfully cutting up a pitch of 55 deg. Usually the 200-ft. faces can be cut in from 3 to 6 hr.

The conveyors are simple and home-made. No. 11 gage sheet-iron, 36 in. wide and 10 ft. long is employed. The two sides of each sheet are bent upward on an angle of about 45 deg. which leaves the flat bottom a little more than 1 ft. wide. These sheets, which comprise the chutes, are laid on 2x4-in. timbers, placed flat on the bottom with a 4-in. space between them. Through this space the chain returns. No. 78 Reliance single-flight, riveted chain, without any special flights, is used. As the pitch is almost great enough for the coal to slide by gravity, only a small motor is necessary to supply power to move the chain. A 5-hp. motor, connected to a 5-hp. speed reducer, with a reduction of 28 to 1 for a 1,200-r.p.m. motor and 50 to 1 reduction with an 1,800-r.p.m. motor serves the purpose.

This provides a light, flexible drive which does not require any more attention than the motor proper. The conveyor drive sprocket is on the speed reducer shaft; the bottom conveyor pan fits down tightly over the top of the frame of the speed reducer. It has not been found necessary to anchor this conveyor at any point except at the bottom.

It was some time after the first break in the roof was made before the company learned how frequently the breaks should be made. After trying light and heavy swings of the roof, it has been found advisable to make the roof breaks every 60 to 75 ft. In general, the roof condition is good if advancement is rapid and uniform. A few rooms were driven upward from the two first entries, under the belief that they were too steep for panel longwall work. But in these few rooms, which were 30 ft. wide, it was difficult to hold the roof up until the rooms were driven their full distance.

Notwithstanding this experience, it was found possible to advance a panel longwall face until a 200-ft. square area was mined out with about the same relative quantity of timber. As a consequence these rise rooms have been discontinued and are now included within the two top longwall panels. It is planned to advance the combined area of the 350-ft. panel longwall face to the boundary of the lease, leaving a 400-ft. solid pillar between the top of the body of coal and the outcrop of the seam. The advantages of this method over the old rise room and pillar method are: First, there is a concentration of working places; second, the haulage is simplified; third, the cutting is continuous; fourth, the ventilation is positive and travels the minimum distance.

The Peerless Cahaba Co. reports that the greatest advantage of the present method is the larger size and better quality of coal produced.

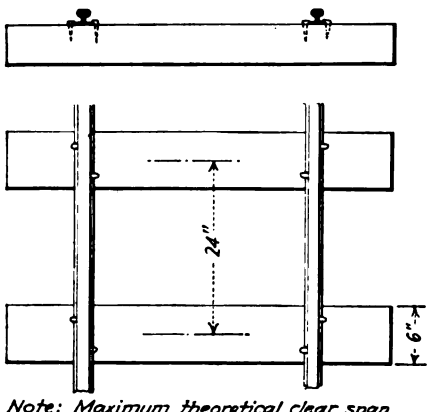
Union Pacific Coal Co.'s Code of Standards—VII*

Track Standards, Ties (Continued)

8. In no case shall ties extend less than 8 in. beyond the outside flange of rail.

Note—The ideal mine tie length is 1.8 times the distance between rail centers.

9. All ties should have two parallel faces, the minimum width of which should be not less than 4 in. and in no case should slope and main haulage-road ties be less than 6 in. thick. Room ties should be not less than 5 in. thick.



Rails and Spikes

1. All tracks must be laid with broken joints; that is, the joints in one line of rails should be as nearly opposite the centers of the rails in the opposite line as practicable.

2. No rail less than 10 ft. in length will be permitted on any main haulage road.

3. The practice of placing spikes where miners can help themselves must be discontinued. Spikes should be issued by the foreman and assistants as needed.

4. Spikes should be staggered; that is, those on the outside of the rail should be to one side of the tie and

Note: Maximum theoretical clear span allowable with 40-lb. steel and a 10-ton locomotive is 42"

Fig. 31—Haulageway Construction Cuts Costs

Spikes are staggered so as to obviate the possibility of splitting the ties and causing the rails to become loose.

those on the inside of the rail to the opposite side of the tie. (See Fig. 31.)

5. Each foreman and assistant foreman is to provide himself with and carry a clinometer rule.

6. On straight runs of track the gage shall be held at right angles to the track and the rail held tight against the gage and spiked. Any allowance given for clearance shall be made on the gage length.

7. Superelevation of rails on curves will be given by the engineer at the property, as the gage of track, velocity of trip, and radius of curvature are determining factors entering into the calculation of each individual case.

8. For increase of track gage on curves allow not more than ½ in., which is about the maximum for various wheel bases, wheel treads, curve radii, etc.

9. Each trackman's gage for each property shall be of a standard length, viz., even gage, leaving nothing to the guess or allowance of the workman.

10. Spikes in abandoned, worthless ties must be reclaimed by burning.

11. A record of all derailments shall be kept by the mine foreman giving date, cause and location. Drivers and motormen must give their reports of such happenings to the mine foreman daily.

12. Rails shall be of three weights only, viz., 20-, 40- and 60-lb., of A. S. C. E. section.

Sixty-pound rails will be used on main slopes, 40-lb. on panel slopes and motor haulageways, and 20-lb. rails in rooms.

13. The size of spikes for the various weights of rail shall be as follows:

20-lb. rail, 4 x ⅝ in. (1,000 per 200-lb. keg). (These only should be given to miners.) 40-lb. rail, 5 x ¾ in. (450 per 200-lb. keg). 60-lb. rail, 5½ x ⅞ in. (375 per 200-lb. keg).

Curves and Turnouts

1. Lines for all turnouts off main slopes and partings, together with frog and switch locations, will be given by the chief engineer or his assistants, and no such turnout shall be placed without his preliminary layout.

2. All curves on rope haulageways shall be placed in accordance with Figs. 32, 33 and 34, and the engineer must give the lines and plans for this work.

3. The mine foreman must see that all work conforms to plans and lines as given.

4. All curves and turnouts are to be laid with proper reference to clearance at points where switching is done.

Note—Do not spoil a good track layout by making the track conform to the rib. Make the rib conform to the track.

Fishplates, Angle Bars and Rail Braces

1. All rails of any weight shall be laid with joint fastenings.

2. Twenty- and 40-lb. steel shall be fishplated; 60-lb. steel shall be joined by splice (angle) bars.

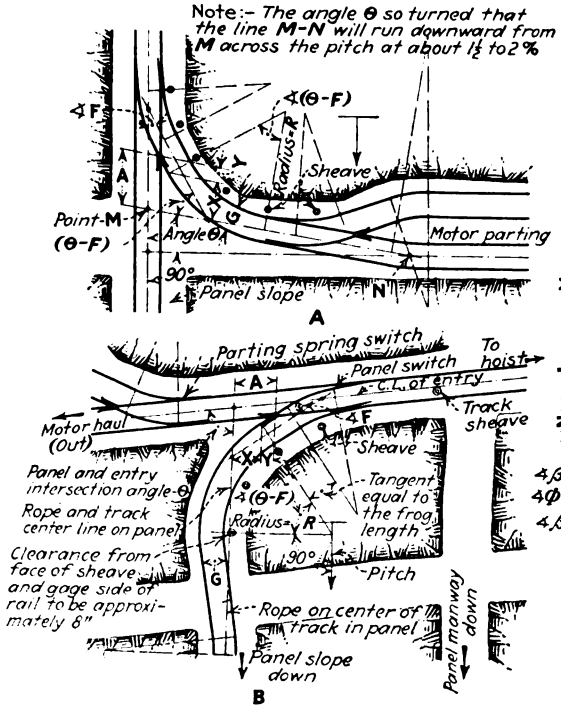
3. All joint fastenings must be applied with their full complement of bolts, nuts and cut washers screwed up and kept tight.

4. Rail braces should be applied to all curves where the gage is maintained with difficulty.

5. Where rail braces are used they should be applied to both rails.

Frogs and Switches

1. A No. 2 cast frog conforming to Fig. 35 shall be used on all new room switches of 20-lb. rail.



2. Frogs Nos. 3, 4 and 6 are to be built up and must conform to Figs. 36-40.

3. No. 6 frogs will be of 60-lb. steel only and will be used only in turnouts off the main slope.

4. Turnouts of standard material shall conform to the standard turnout drawings.

5. Turnouts within the mine must be placed to conform to the ribs of the curve and not to the nearest rail joint.

6. In the future, when the laying of a turnout with material that is not standard is contemplated, the engineer of the property will take the frog and switch dimensions from the material on the ground and compute the turnout data.

Figs. 32, 33 and 34 Curves and Turnouts

Lines for turnouts and partings are given by the chief engineer before construction work is started. Curves on rope haulageways are laid in accordance with the accompanying illustrations. Proper dimensions are to be substituted for letters here shown.

*This is the concluding article of a series giving the Code of Standards put into effect by the Union Pacific Coal Co., at its operations in Wyoming. The preceding articles appeared in the issues of Dec. 17, 24, 31, Jan. 7, 14 and 28.

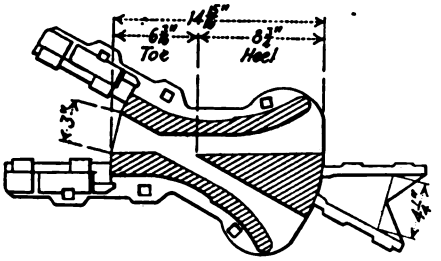

Fig. 35—Standardizing Frogs

This is a sketch of the type of cast-iron frog to be used on all new room switches using 20-lb. rails.

7. Do not fail to provide the proper clearance around switch throws.

Mine Rescue Apparatus and Training

1. The mine rescue apparatus for the Rock Springs field will be concentrated at Rock Springs.

2. No crew will be allowed to enter the rescue building and take, use or handle any apparatus unless the person having charge of this apparatus is at hand.

3. No rescue crew will be allowed to enter any mine to do actual rescue work unless a reserve crew is on hand with machines and equipment to lend assistance if necessary.

4. All apparatus is to be thoroughly inspected not less than twice each month, and each machine or piece of apparatus is to be tested, examined and a tag attached thereto giving date of examination and stating the condition of that particular machine or piece of equipment.

Note—Any recent repairs made, such as new breathing bag, tubes, etc., must be noted on the attached tag in order that the person wearing the apparatus may be on the alert for loose gaskets or connections in the new parts when the machines are first worn.

5. There shall be kept on hand at all times not less than 800 cu.ft. of reserve oxygen (7 containers).

6. A monthly report of apparatus will be made by the person caring for this equipment: one copy to be sent to the general superintendent and one to the safety engineer.

Note—This report must cover recent repairs, supplies on hand, condition of machines (each machine to be designated by a number) and the like.

7. The safety engineer must keep a file of all men employed by the company, that have received first aid or mine rescue training.

8. A record of the men and the training they have received at the local mine rescue station is to be kept by the person in charge thereof.

9. A record of all new men to receive training, or those entering the employ of the company that have had previous training, must be filed with the safety engineer.

10. No man shall be trained in mine rescue work without a physician's certificate showing that he has a sound heart and normal blood pressure.

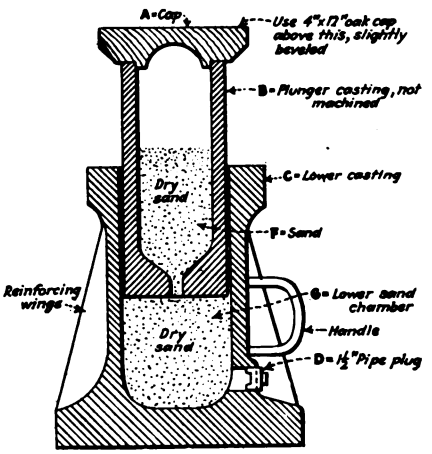
Underground Operation

Sand Jacks in Arkansas Support Roof in Low Coal



Sand jacks are being used extensively in Europe for the support of the mine roof. They are, however, probably new in this country and the following facts on the sand jacks used at the Paris mine of the Paris Purity Coal Co., in Logan County, Ark., are taken from a paper delivered by J. J. Rutledge, chief engineer, Maryland Bureau of Mines, Baltimore, Md., before the West Virginia Coal Mining Institute.

The draw slate at the Paris Mine is held by round pine props of about 12 in. diameter. Concrete blocks were used for a while as an experiment, and they seemed to give good service, but they were heavy for use in such a thin seam, the coal thickness averaging 25 in. to which must be added the size of the kerf cut by the mining machine into the bottom clay making the total depth from roof to room floor 30 in. Cribs made of pine wood were used and appeared to have given good service but were placed only for the protection of roadways and not at the face; at this latter place props and sand jacks are the only roof supports used. The jacks were designed by the owners of the mine and manufactured by an ironworks in the neighborhood. They weigh about 300 lb. and cost $12 each.

ONLY TWO PARTS TO JACK

They are composed of two pieces, the diameter of the foot being 15 in. and of the top 10 in. The interior diameter of the jack is 8 in., and a 1½ in. plug in the base of the jack permits of the withdrawal of the sand. The upper part of the jack has a cross-like section with four ribs, but it is purposed to make this portion of the jack round, as it has been found that the ribs are readily broken by roof pressure when the jack is slightly out of plumb.

It has been suggested that bird shot be used instead of sand as it is said to be more compressible. Already about one hundred of these jacks are in use at the Paris mine alone. The jacks can be moved ahead at any time by removing the plug and allowing the sand to escape. Each jack will hold up a pressure of 300 tons. Should the lower casting careen, however, the pressure will be thrown on one side and the jack may be broken. New designs will remedy this. Patents for the sand jack have been sought. The roof cover that the jacks support is probably 165 ft. thick, and the load about 14 tons per square foot of roof to be supported.

Strong Yet Easy to Draw

By tapping the sand, the resistance to pressure on the head of the jack can be removed, leaving it loose for transference to any point desired. The jack will stand pressures up to 300 tons if placed on a true footing.

Track Gages and Curve Radii Should Be Carefully Chosen

American coal mines employ many different track gages. Some of these have been chosen wisely; others have been selected merely to follow precedent without any particular regard to the needs or local conditions of the mine or mines served. Many mines also are equipped with track curves of altogether too short radius for the rolling stock used. This causes much haulage delay if not actual danger to life and damage to both cars and locomotives. In the *Employees' Magazine* of the Union Pacific Coal Co., James L. Libby treats of this phase of mining as follows:

The gage of the track is the distance between the inner sides of the balls of the rails. Any number of gages are in use in different mines, but three of the most common are 30, 36 and 42 inches.

The matter of gage should be given careful study in opening up a mine and the proper gage selected to fit existing conditions, as this dimension will be almost impossible to change after the mine attains any depth from the mouth or shaft bottom.

CONDITIONS DICTATE CAR SIZE

Local conditions govern the size and design of cars used, which in turn regulates the gage. The thickness of the seam limits the height of the entry, and the roof and floor conditions limit its width. These two factors govern the width and height of the car, hence its capacity. If both are restrictive the length may be slightly increased, but here we are confronted with the fixed axles combined with a short wheel base in use in coal mines. Cars are, therefore, seldom over 10 ft. long inside. Modern methods and machine mining tend to increase the capacities handled necessitating a wider gage. A broad gage gives greater stability to the cars, promotes a smoother action with less wear and tear on both equipment and tracks.

There is a more or less erroneous idea concerning the advantage of narrow-gage track on curves, but to all intents and purposes the minimum allowable radius of curvature is dependent on the wheel base, size of wheels and flange depth. The track gage has little to do with it, as will be more fully discussed under the subject of curves.

The main advantage of a narrow-gage track is the cost; due to the use of shorter ties, less ballast, and,

Digitized by Google

where grading must be done, the width is less. With cars of wood construction, without brakes, the overhang on the sides is limited on account of strength, also wheels must be accessible for spragging. With cars having brakes and constructed with a wood bottom and steel sides, the flare and overhang can be increased and as wide a car built for a 36-in. gage as is now commonly constructed for 42-in. gage.

ADVANTAGE OF BIG CARS

The ratio of weight of coal to weight of car is about the same for both large and small cars. The larger cars do not show any increase in per cent of coal handled as the different parts have to be made heavier, which offsets the increased capacity. The main advantage gained by use of a larger car comes from the less number of cars that must be handled to produce the required tonnage. The system of mining, method of loading and handling the cars, also limit the size of car which can be used economically. A 36-in. gage is large enough for cars that must be man handled and hand loaded, but a 42-in. gage is preferable where cars are handled mechanically and the coal is loaded by machinery.

Track should be well maintained, kept in good alignment, and to grade. Slight reverse curves, swags and bumps, swing and roll the cars, causing unnecessary jars and damage to equipment, with loss of coal. Spillage causes dirty tracks, interferes with haulage and constitutes a serious menace to safety.

CURVES OF LARGE RADIUS REQUIRED

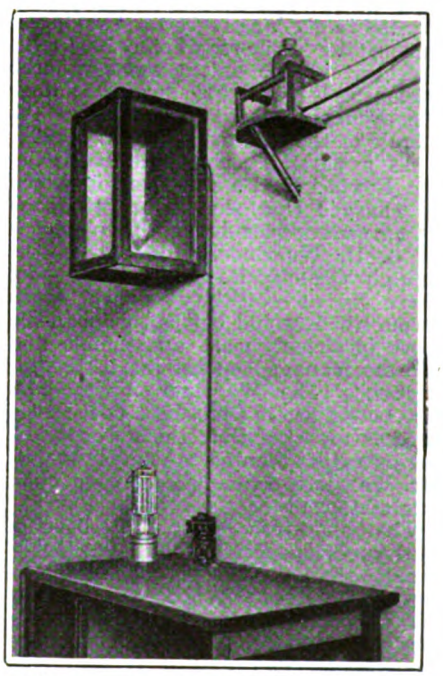
Curves are used to make gradual the changes in direction between straight or tangent tracks, the turnouts for entries, planes, rooms, passing or side tracks, etc. Because of the use of heavy locomotives, with long wheel bases, operated at high speed, curves of a large radius are necessary in order to obtain smooth transportation. Such curves offer less resistance than do those of a smaller radius.

Curves in mines are best designated by their radii in feet. Thus a 200-ft. curve means one wherein the center line of the track is a circle with a 200-ft. radius. A 200-ft. radius curve, on the level, offers the same resistance to movement as $\frac{3}{10}$ per cent grade, while a 100-ft. radius curve offers above the same resistance as a $\frac{6}{10}$ per cent grade. For this reason, where possible, the grades on curves should be lightened to compensate for this resistance. The radius of a curve can be approximately determined with ease and dispatch by the following simple method of calculation.

Using a 10-ft. cord and representing the offset or mid-distance in inches to the gage of the rail at the center by m, the radius of the curve in feet equals $150 \div m$.

Thus when mid-distance is 2 in. we have as the curve radius $150 \div 2 = 75$ ft.; when the mid-distance is 3 in. we have $150 \div 3 = 50$ ft.; when the mid-distance is $1\frac{1}{2}$ in. we have $150 \div 1\frac{1}{2} = 100$ ft.; when the offset is 1 in. the radius of the curve is $150 \div 1 = 150$ ft.

On high-speed motor hauls the outer rail on the curves should be elevated above the inner one, this height varying with the haulage speed and the gage of the track. The distance the rail should be raised may be determined by using a 20 ft. cord and taking the mid-distance from it to the gage line of the rail as the extra height. This will compensate exactly for the following rates of speed on the track gages mentioned: The mid-distance of a 20 ft. cord with a 30 in. gage compensates for a speed of $17\frac{1}{2}$ m.p.h.; with a 36 in. gage for a speed of 16 m.p.h., and with 42 gage the mid-distance for a 20-ft. cord compensates for a speed of 15 m.p.h. Rails should never be elevated more than 6 in., and for smooth action the outer rail should be gradually raised at the rate of about 1 in. in 20 ft. approaching the curve and lowered correspondingly in leaving it.



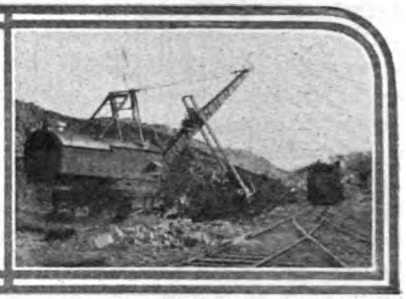
Gas Testing Apparatus Helps Train Firebosses

Training fire bosses and safety men in general, requires care and attention to detail. The detection of gas by means of the safety lamp is comparatively easy to the trained eye but in order to be trained that eye must be experienced. As a means of familiarizing the would-be fireboss with the appearance and behavior of the safety lamp flame when in the presence of gas, means must be provided in the smoke room, laboratory or elsewhere, for artificially creating a gassy atmosphere, one that will readily affect a safety lamp.

Probably the first device of this nature to be employed was the old "umbrella" or "inverted dishpan" apparatus. This consisted of an open ended metal container placed upside down into which gas could be introduced at will. This answered the purpose fairly well except that the lamp could not be viewed from the side. Furthermore in but few mining communities is natural gas available.

The accompanying illustration shows the home-made lamp testing, device in use in the smoke room at one of the largest mines in this country. It consists of an open ended box with the opening down, fastened to the wall of the room. Three sides of this box are of glass. Acetylene gas is introduced into it from an old hand lamp on the desk below by means of a tube leading through a hole in the side frame.

After gas has been turned on for a short time a lighted safety lamp can be raised into the box and the behavior of the flame noted through the glass side. By this means careful training in gas testing can be given under the eye and tutelage of a thoroughly experienced instructor. The management thus has the satisfaction of knowing that the men intrusted with the important work of testing the mines for gas know what to look for and know what it looks like when they see it.



Testing Box in the Smoke Room

Three sides of this inverted open-ended box are made of glass. Gas from the acetylene lamp on the desk below the box can be introduced at will through the side of the box. Into this mixture of gas and air the lighted safety lamp can be raised the behavior of the flame being observed through the glass side of the box. Embryo firebosses thus may be carefully trained in the appearance of the safety lamp flame in the presence of an explosive mixture of gas and air.

News Of the Industry

Hard-Coal Wage Dispute Becomes Propaganda Battle Since Collapse Of Conference at Philadelphia

The anthracite wage controversy, following the collapse of the third joint conference at Philadelphia last week, again has settled down into a battle of propaganda. The operators are carrying the fight direct to the mine workers. A folder, explaining their final offer at the last conference, has been printed in six languages for circulation among the strikers. John L. Lewis, president of the union, went into the region this week to begin another speech-making tour to strengthen the morale of the men out of work.

As a parting shot at Philadelphia, Mr. Lewis issued a statement in which he charged that the failure to reach an agreement was due to the insistence of S. D. Warriner, president of the Lehigh Coal & Navigation Co., that there be no settlement except upon terms which would be "beneficial to the most inefficient, most uneconomic and poorest managed operations in the industry." The Warriner mines, said Mr. Lewis, are in that class. Mr. Lewis further asserted that the majority of the operators wanted to end the strike. Mr. Warriner refused to comment upon this statement.

The operators expressed disbelief that anybody would take Mr. Lewis' charge that the strike had become a lockout seriously. "Why?" asked Major W. W. Inglis, chairman of the operators' negotiating committee. "Because on the very day that it is made the operators proposed that the men go back to work with the assurance of the old wages until next April—fourteen months.

"There is another statement in his latest outgiving about which I have something to say," continued the operators' spokesman. "Mr. Lewis asserts with great fervor that he will never accept compulsory arbitration. We never even suggested that he should. We have proposed arbitration by mutual agreement and within the terms of a contract. Nothing more. He not only rejected this; he would not even agree that Justice Hughes should sit with the board of conciliation—composed of three miners and three operators—and cast the deciding vote in case of a deadlock."

On Feb. 4 Governor Pinchot journeyed to Philadelphia and conferred with the head of the mine workers' union. Neither Mr. Lewis nor the Governor would make any statement as to the nature of their discussion. On Saturday, however, the Governor made another public attack upon the anthracite industry as a "hard-boiled monopoly defiant to public opinion." Governor Pinchot, in the same statement, assailed the Pennsylvania House committee on mines and mining for refusing to favor his legislative coal control program.

Mr. Warriner, in a statement issued Feb. 8, retorted that the "partisan attitude" of the Governor had obstructed the settlement of the strike and that "the responsibility for its continuance must, in a large measure, be charged to him." Mr. Warriner emphasized the fact that the latest outburst of the Governor followed closely upon the star-chamber session between the Pennsylvania executive and the president of the miners' union.

The anthracite operators' leader takes the Governor to task for charges made by the latter that the industry had mulcted the public through the new sizing standards adopted last spring and for using only the most prosperous companies in building up a plea for regulation. Returns per ton after standardization, said Mr. Warriner, were less than before.

"The Governor," he continued, "must have been acquainted with the figures that have been made public recently by the U. S. Treasury Department in answer to S. R. 99, which show that out of 139 anthracite-producing companies, 47 earned net income amounting to approximately $28,000,000 in 1924, while 92 companies suffered losses amounting to approximately $7,000,000, the net results for the industry being a net income of about $21,000,000, or less than 3 per cent on the valuation of the anthracite industry as given by the U. S. Coal Commission."

The detailed figures to which Mr. Warriner refers appear elsewhere in this issue of *Coal Age*.

Creation of a permanent State Anthracite Coal Supply Commission to take over the direction of the operation of anthracite mines in time of strike was provided in a bill introduced in the Pennsylvania Senate Monday night (Feb. 8) by Senator Charles Steel, of Northumberland County.

Publicity on Costs, Profits and Living Conditions Is Best Safeguard Against Strikes, Says Hammond

"The best way to minimize the danger of strikes and to insure the delivery of the right kind of coal, and at the right price to the consumer, is through the adoption by Congress of the U. S. Coal Commission's report of Sept. 23, 1923," declares John Hays Hammond, chairman of the commission, in a communication to the American Bankers Association *Journal* published Feb. 9.

"In its report the Commission expressed the belief that the . . . moral influence exerted through publicity is an important safeguard of the interest of the public.

"Publicity as to the quality of coal in interstate commerce would greatly deter unscrupulous operators and dealers from the sale of fireproof, adulterated and otherwise unsuitable coal. Publicity as to the cost and profits of the operators, transportation charges, the profits of wholesalers and retailers would enable the consumer to judge whether a fair or an exorbitant price is being charged for his coal. Publicity as to earnings, living conditions and living costs of the miners would enable the public to form a judgment as to the equities of disputes between operators and miners over the renewal of wage agreements; and informed public opinion at such times would exert a deterrent influence upon the adoption of an unreasonable attitude by either or by both parties to the controversy and thus tend to prevent a lockout or a strike.

"All these facts change from season to season and vary from district to district and from mine to mine, and the public is entitled to know them since the transportation of coal in interstate commerce is so affected by the public use and coal enters so intimately into all the necessities and conveniences of modern life—indeed being outranked in importance only by food and water—that there is no longer any private right to secrecy as to such matters as costs, profits, wage rates and working and living conditions in the industry."

Clairton Byproduct Plant To Add 300 Ovens

Addition of 300 coke ovens at the Clairton byproduct plant of the Carnegie Steel Co. is contemplated and the plans have progressed so far that the awarding of the contract for the installation impends. The improvement will involve an outlay of more than $3,000,000 and work will probably get under way this spring.

When first constructed, the plant consisted of 768 ovens, and a few years ago an addition of 366 ovens was made. The proposed addition will bring the aggregate to 1,434 ovens—the largest byproduct unit in the world.

At present the blast furnaces in the neighborhood of the Clairton plant are supplied with coke from that source, while outlying furnaces get coke from the H. C. Frick Coke Co.'s beehive ovens in the Connellsville and Westmoreland districts.

Three towing steamers and seventy barges also are to be purchased for use on the Monongahela River in transporting coal from mines to the extension of the Clairton plant.

Roads Install 128,557 Cars In 1925; Orders Decline

Class I railroads of the United States installed in service 128,557 freight cars in 1925, according to the Car Service Division of the American Railway Association. This was a decrease of 27,857 cars from the number installed in 1924 and of 69,318 cars from the 1923 total. Of the equipment placed in service during the last year 48,670 were coal cars, 61,140 box cars and 5,761 refrigerator cars.

Freight cars on order on Jan. 1 last totaled 40,794, including 15,368 coal cars, 21,380 box cars and 1,781 refrigerator cars. On Jan. 1, 1925, Class 1 railroads had 55,684 freight cars on order and on Jan. 1, 1924, they had 25,619 on order.

During 1925 Class I railroads placed in service 1,733 locomotives compared with 2,246 in 1924 and 4,037 in 1923. The same roads on Jan. 1, 1926, had 471 locomotives on order compared with 287 on Jan. 1, 1925, and 510 on the same date in 1924.

These figures include new, rebuilt and leased equipment.

Japan May Erect Coal Piers Like Those at Sewalls Point

Coal piers to be erected by the Japanese Government on the Island of Hokkadio probably will be patterned after the piers of the Virginian Ry. at Sewalls Point. Kenege Nakamura and H. Suzuki, representatives of their government, were in Norfolk recently, inspecting the piers and taking drawings of their operations. They stated that the Sewalls Point piers were the finest they had seen, and they left here to inspect coal-handling facilities at Baltimore. It is desired to increase the dumping capacity of the Japanese piers from 5,000 to 10,000 tons a day. The Japanese representatives visited various European coal ports before coming to America.

The Late Col. D. B. Wentz

Blasts at Pittsburgh Mines; To Open Euclid Plant

State police are investigating two explosions at the Warden Mine, at Scott Haven, Pa., Feb. 2. Bombs are believed to have been responsible for the blasts. Officials of the Pittsburgh Coal Co., which owns the mine, state that though the shock of both explosions was felt for several miles, no one was injured. The Warden Mine is one of the largest operated by the Pittsburgh company, employing about 250 men since operations were resumed about a month ago on the 1917 scale.

On Feb. 1 the fan house was dynamited and considerably damaged at the same company's Montour No. 4 Mine, at Hill Station, Washington County, Pa. This mine also is working under the 1917 scale.

The Pittsburgh Coal Co. is preparing to open Euclid Mine, four miles from West Newton, in Westmoreland County, according to an announcement made last week. The mine will be the eighth of the company in the Pittsburgh district to operate under the November, 1917, scale. Men will go to work in the mine within two weeks, it was stated.

Czechoslovak Coal Output Off 15 per Cent in 1925

Czechoslovakia produced 12,753,000 tons of coal in 1925 as against 14,359,000 tons in 1924, a decrease of 11 per cent, according to a cable to the Department of Commerce from Commercial Attaché J. F. Hodgson, Prague. Output of lignite in 1925 was 18,787,000 tons compared with 20,507,000 tons in 1924, a decrease of 8 per cent. These decreases were almost wholly in the first half of the year. Coke output totaled 1,774,000 tons as compared with 2,219,000 tons in 1924, a drop of 20 per cent in 1925.

Colonel Wentz, Well Known Operator, Dead at 52

Colonel Daniel Bertsch Wentz, one of the best known coal operators in the country, and president of the American Mining Congress, died Feb. 9 at his home in Wyncote, Pa. He was fifty-two years old.

Colonel Wentz, who as president of the Stonega Coke & Coal Co., the General Coal Co. and the Hazle Brook Coal Co., maintained his offices in the Land Title Building, Philadelphia, also was a director of many coal companies and banks, among them the Virginia Coal & Iron Co., the Franklin National Bank and the Fidelity Trust Co. A few years ago the General Coal Co. absorbed the Wentz Coal Co., founded by Colonel Wentz's father, the late John S. Wentz. Colonel Wentz was president of the National Coal Association in 1920-21.

In January, 1918, General Goethals selected Colonel Wentz to take charge of the fuel and forage division of the Quartermaster Department. Previous to this he had been one of the "dollar a year men" in Washington and had been assistant to Francis S. Peabody, chairman of the coal committee of the Council of National Defense. For his services with the Quartermaster Corps Colonel Wentz received the Distinguished Service Cross and also was honored by France with the rank of Chevalier of the Legion of Honor.

On Dec. 12, 1923, Colonel Wentz received one-half of his father's estate, valued at $5,886,204. He was a graduate of Harvard and prominent in the social life of Philadelphia.

Changes Made in Coal Work Of Bureau of Mines

Changes were made in the work of the Coal Division of the Bureau of Foreign and Domestic Commerce, effective Jan. 1, 1926, whereby all questions relating to domestic trade in coal and other matters pertaining to the domestic coal industry are being handled by the Coal Division of the Bureau of Mines, and the personnel of the Coal Division of the Bureau of Foreign and Domestic Commerce which has been engaged in such domestic work has been transferred to the Bureau of Mines.

All questions relating to promotion of the American coal export trade, and in general all matters concerning foreign trade in coal and coke, formerly handled by the Coal Division, will be taken care of until further notice by the Minerals Section of the Bureau of Foreign and Domestic Commerce, under the direction of Homer S. Fox, who also will continue in charge of foreign trade promotion in petroleum and other minerals, the Coal Division as such being discontinued in this Bureau.

The monthly statement on the overseas coal trade, special circulars covering foreign trade in coal, assistance rendered in connection with special inquiries to the Bureau on the exporting of coal, and similar services formerly rendered by the Coal Division, will continue to be available through the Minerals Section of this Bureau.

Explosion Following Fire Kills 19 in Horning Mine; Rock Dust Limits Effects

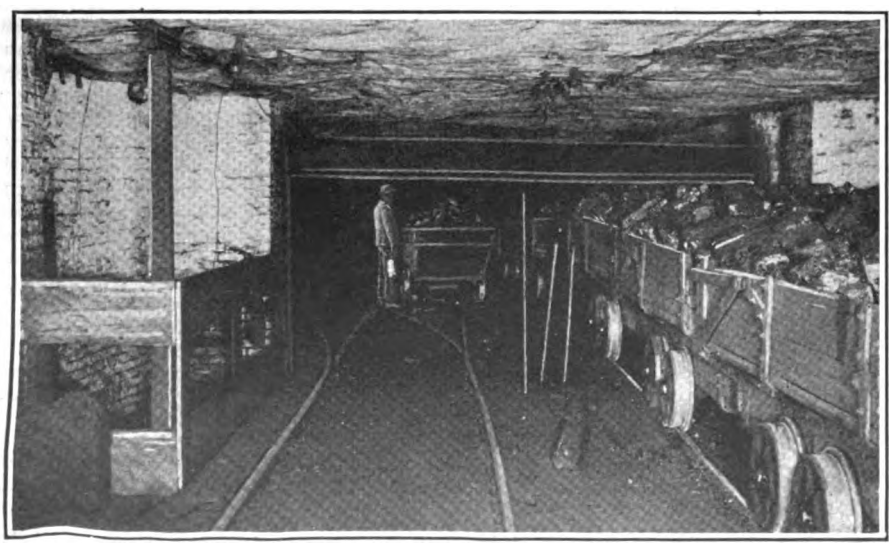
Nineteen men were instantly killed on Feb. 3 by an explosion in No. 4 mine of the Pittsburgh Terminal Coal Corp., at Horning, about 10 miles south of Pittsburgh, Pa. The explosion occurred at about 4 p.m. as the result of a fire which had started at about 10:30 a.m. at the face of Butt 16 in Sec. 4. This entry and Butt 15, which together constitute a pair, were being developed, but no rooms had been turned from them. Headed by General Superintendent H. M. Ernst, the men who lost their lives in the explosion were engaged in sealing off the fire zone.

Sec. 4 is served by Face Entries 7, 8 and 9. Of the room entries in this section Butts 15 and 16 were furthermost inby and had been extended about 450 ft. from the nearest of the face entries and a distance of about 2½ miles from the hoisting shaft and 3,000 ft. from an airshaft.

The fire was started by a shortwall cutting machine which at the time was sumping out of a cut in a clay vein. The cut opened a feeder of gas, which obviously was ignited by arcing or sparking on or within the machine. The flame jumped to oil and dust on and about the machine. Efforts to beat out the flame by the cutters and an assistant foreman who was present during the cutting were futile. The cutter was of the so-called closed, but not of the government-approved, type.

Unable to Reach 16 Victims

Brattice and board stoppings were erected both on the intake and return butts at points about 70 ft. from the respective faces, inclosing also a crosscut between these entries. A mortar-brick wall had been erected behind the temporary stoppings in the intake butt and a similar wall in the return was nearing completion when the explosion occurred.



Prior to the time of this dispatch the rescue teams had not been able to reach 16 victims in the fire area of Butts 15 and 16 which has been sealed off by three walls in the face entries. Three bodies were found on the face entries, outby of these butts.

Officials of the company and rescue men believe that rock-dusting confined the explosion to comparatively narrow limits. The intake entries of the mine were thoroughly rock-dusted to the faces, but the returns were not. Rock dust had not yet been applied to Butts 15 and 16.

The blast displayed its greatest force in the return face entry of Sec. 4, which, of course, was not rock-dusted. The explosion was checked after traveling several thousand feet, meanwhile extending with diminishing force into Butts 13 and 14 off this return, crossing over to Butts 13 and 14 of Sec. 3, adjoining, and demolishing two stoppings which closed the latter buts from Sec. 4. The force in Sec. 3 was not marked as evidenced by the fact that two men at work in that area escaped to the airshaft.

Tipple of Pittsburgh Terminal Coal Corp. No. 4 Mine, Where Nineteen Men Lost Their Lives

Shaft Bottom of Ill-Fated Mine

The man with the flame safety lamp is George Travis, superintendent, who was among those who perished in the fire and explosion.

Coal Men of All Ohio Fields Organize to Save Industry

The first all-Ohio organization of coal operators came into being at a meeting in Cleveland Jan. 29, with the appointment of a committee representing the four major fields. It will lay plans for a bureau to tackle the freight rate situation, which operators say discriminates in favor of the mines of lower West Virginia and Kentucky to such an extent that the latter fields have taken the coal trade away right on the doorsills of the Ohio mines.

All fields in the state had representatives present. These were appointed to arrange for the bureau and report at another meeting within a month:

Percy Sprague, of the M. A. Hanna Co., Cleveland, and Fred Braggins, of the Lorain Coal & Dock Co., Columbus, representing eastern Ohio; H. D. Thomas, of the George M. Jones interests, Toledo, and W. E. Tytus, of the Sunday Creek Coal Co., Columbus, representing the Hocking Valley; J. L. Good, of the National Coal Co., Cleveland, and J. Gaines, of the Cambridge Collieries Co., Cleveland, representing the Cambridge seam, and C. L. Terry, of the Midvale-Goshen Coal Co., Cleveland, and N. E. Thomas, of the Akron oal Co., Akron, representing the middle district.

Ezra Van Horn, president of the Pittsburgh Vein Operators' Association, presided. W. H. Haskins, of Coshocton, advocated dropping "jealousies and differences which have split the coal industry in the past" and forming a state organization and united front on freight rate questions.

Sealed proposals will be opened by the Supt. of Lighthouses, Staten Island, N. Y., at 2 p.m., Feb. 18, 1926, for approximately 1,800 tons bituminous coal, in quantities as required from April 1 to June 30, 1926, delivered and trimmed into bunkers of lighthouse vessels, under coal chute at contractor's pocket, New York.

Federal Non-Intervention in Strike Proves Popular Policy

By Paul Wooton
Washington Correspondent of *Coal Age*

After having shed more darkness than light on retail coal prices the Senate's District of Columbia committee has recessed its "informal" hearings while it tries to persuade the Comptroller's office to undertake some fact-finding in the account books of Washington coal dealers. Rather violent reverberations in the Senate and House keep Congress reminded that there still is a coal situation, but it is apparent that the conflict again has narrowed to the operators and miners themselves. Activities in the other theaters of operation have all but ceased. Evidence continues to pile up that the administration has pursued a very popular course in refusing to intervene. It is certain that executive officials will not allow themselves to be drawn in now that the popularity of their policy is established.

Judging from information reaching Washington, the miners are fighting with their backs to the wall. The desire for peace among the mine workers is becoming so strong that none will be surprised to see a break in their ranks at any time. The leaders still are putting up a bold front but they have surrendered their demands one by one. In accepting the Pinchot proposal they gave up the demand for increased wages, despite the face-saving clause referring to an increase if conditions should warrant. In accepting the Lynett plan they gave up the check-off. It was the mine workers who asked for a resumption of negotiations when the rejection of the Lynett plan was made perfectly plain.

Urge Insistence on Arbitration

Everything has been conceded except the principle of arbitration. The operators are being encouraged to insist on such an understanding by the increasing evidence of public approval and of its willingness to wait until a permanent settlement is reached.

The action of the Pennsylvania Legislature in reporting the Pinchot bills unfavorably, rather than allowing them to die in committee, is regarded in Washington as a sort of grudging courtesy to the Governor—a courtesy that probably would have been withheld had there been any chance of the measures going through.

There seems no chance, however, that Harrisburg can command enough pressure to cause the operators to abandon the firm stand they have taken to insure continuity of production while differences are being threshed out.

The demand of Representative Boylan for the seizure of mines is not regarded seriously. With the end of winter in sight it is increasingly plain that Congress will not attempt to act in the anthracite crisis.

It is expected that the operators will make no new move in the near future. With the coal year so nearly gone the operators have little to gain by a settlement just at this time. So far as their interests are concerned they can wait until May without jeopardizing any of their next winter's business.

There are some who, while admitting that the advantage now rests with the operators, think the ability of the union to hold out is being underestimated. They point out that there have been strikes in which the men, less favorably situated than the anthracite workers, have held out for longer periods. A comparatively recent instance was the fifteen-months strike in eastern Ohio in 1914 and 1915, which finally ended in the mine-run basis of payment.

Largely because of its political possibilities, the Copeland resolution gained sudden and unexpected strength Saturday. It was apparent that the Democrats had decided to make the measure a partisan one. It has vote-getting possibilities and promises to embarass the administration.

Coolidge Not Likely to Intervene

There is no reason to think the President will act on the suggestion that he "invite to the White House the committee of coal operators and miners in order that he may urge upon them the national importance of an immediate settlement of the anthracite coal strike."

The attempt to force the federal executive to intervene in a controversy involving production within a single state, somewhat at variance with Democratic principles did not pass without drawing a warning from Senator King, Utah's Democratic Senator. He pointed out "that the people of Pennsylvania and the Legislature of Pennsylvania should deal with this question."

Senator Reed, of Pennsylvania, presented the following telegram from Whitney & Kemmerer:

> Newspaper reports of this morning state that Senator Copeland, of New York, addressed the Senate yesterday on the coal situation and stated that the people in New England are freezing to death on account of fuel shortage. Investigation does not bear out these facts. The public are responsible for the shortage of coal, if any, in New England, for they had opportunities to secure fuel at any time during the past three months. As operators of union mines in central Pennsylvania, as well as on the Bessemer & Lake Erie Railroad, working under the Jacksonville scale, owing to our inability to receive a price sufficient to cover our costs of production we are working only three days a week. We can offer from 50,000 to 100,000 tons of run-of-mine bituminous coal to any responsible dealer that Senator Copeland may designate at a price of $2.50 free on board mines on Clearfield rate of freight delivery before April 1, 1926.

A bill proposing the creation of a board of industrial adjustment also was made a party bill and was introduced by Senator Robinson, the minority leader. It was referred to the committee on Education and Labor.

The board would be empowered to conciliate differences, encourage arbitration and do general fact-finding so as to recommend means that can be employed to remove the cause of strikes.

The proposed board is to be composed of the Secretary of Labor, the Secretary of Commerce, the Director of the Bureau of Mines and two disinterested citizens. The board will be convened by the President in case of an emergency.

While the coal question was engaging the attention of the Senate on Saturday Representative Watres, Republican, Pennsylvania, introduced a resolution in the House inviting conferences of the miners and operators with the Secretary of Labor sitting in as a mediator.

Rush Coal to Jail Lest Murderers Freeze

Fred Heitzman, of Castner, Curran & Bullitt's branch office in Cincinnati, received the following letter from a large jobbing concern in Toronto, Ont., on Jan. 20:

"We wish you would make an effort to ship the order to Sharon McKay, Cochrane (Ont.) Jail. He is very short of coal, and as he has three or four murderers on hand he is afraid they will freeze to death before he has a chance to hang them."

The coal was speeding on its way within a few hours after the letter was received.

German Coal Industry Has Favorable Balance for 1925

Output of coal in Germany during December, according to Acting Commercial Attaché D. P. Miller, reached 11,367,000 tons; lignite, 12,712,000 tons, and coke, 2,234,000 tons. Totals for the year 1925 were: Coal, 132,729,000 tons; lignite, 139,790,000 tons, and coke, 26,810,000 tons. The figures show a substantial increase over the previous year and also an estimated favorable balance on coal shipments of 225,000,000 marks. Ruhr stocks remain unchanged while imports of British coal have been declining since October.

The U. S. Civil Service Commission announces open competitive examinations for mining engineer, $3,800; associate mining engineer, $3,000; assistant mining engineer, $2,400, to fill vacancies in the Bureau of Mines, for duty in Washington, D. C., or in the field. Receipt of applications will close March 9. Advancement in pay may be made without change in assignment up to $5,000 a year for mining engineer, $3,600 for associate mining engineer, and $3,000 for assistant mining engineer. Applicants must qualify in coal mining engineering, metal mining engineering, non-metallic mining engineering, or some specialized line of mining. Competitors will not be required to report for examination at any place, but will be rated on their education, experience, fitness, and writings to be filed with the application. Full information and application blanks may be obtained from the Civil Service Commission, Washington, D. C., or at the post office or custom house in any city.

November Coal Output in Canada Exceeds Average

Output from Canadian coal mines during November, 1925, was 1,649,686 tons as against 1,570,379 tons in October and an average of 1,642,786 tons for the month during the five preceding years.

Alberta and Saskatchewan were the only provinces which showed gains in output in November over the preceding month, while Nova Scotia and Saskatchewan showed increases over the average for the month in the five preceding years. British Columbia's production was just equal to the average for the month in the five preceding years.

Total importation of coal in November was 1,387,373 tons as compared with 1,658,501 tons in October and the five-year average for November of 1,974,196 tons. Receipts of coal from Great Britain during the month were 34,727 tons. For the first eleven months of 1925 the total imported into Canada was 15,485,211 tons, or 8 per cent below the preceding five-year average for the period.

Exports of Canadian coal in November totaled 82,946 tons; October, 99,846 tons. Comparison of the November exports with the preceding five-year average showed a decrease of 36 per cent. Total exports for the year to date amounted to 669,325 tons, or 59 per cent less than the five-year average.

More Coal and Oil Consumed By Utilities in December

Public utility power plants consumed more coal and fuel oil in December than in November, according to a report of the U. S. Geological Survey. In December utilities consumed 3,764,934 net tons of coal, compared with 3,470,439 tons in November, as shown by revised figures. Fuel oil consumption by utilities for December totaled 817,548 barrels, compared with 793,387 barrels in November.

More electricity was generated for public use by public-utility power plants in the United States in December, 1925, than ever before in any one month. The total amount of electricity generated passed the 6,000,000,000 kw.-hr. mark for the first time, with a total of 6,108,000,000 kw.-hr. for the month—an average daily output of 197,000,000 kw.-hr., an increase of 2 per cent over the average rate for November.

The total output for 1925 was nearly 66,000,000,000 kw.-hr., an increase of more than 11 per cent over the output for 1924.

W. H. Sawyer, Columbus, Ohio, president of the East St. Louis & Suburban Railway Co. and a prominent engineer in the electrical industry of the United States, has been selected to make a survey of electric power resources that give promise of working a radical economic improvement in Australia. He sailed for Australia Feb. 2 as he was officially appointed by the Government of the State of Victoria, Australia. The official notification bears the following: "To investigate and report on the Yallourn brown-coal electricity-generation scheme and connected power undertakings."

Heavy Losses by Many Producers Of Anthracite Are Revealed in Income-Tax Returns for 1924

Profits and losses of anthracite mining companies in 1924 are revealed in a report of federal income tax returns for that year submitted to the Senate Feb. 3 by Secretary Mellon in response to a resolution by Senator La Follette, adopted early in January. The list includes 159 mining companies, embracing over 95 per cent of production in this field. Net losses were reported by the majority. The data are from returns as originally filed by the corporations and prior to audit by the Treasury Department.

The larger companies showed heavy incomes, but also heavy allowances for depletion and depreciation, which resulted in bringing down the amount of tax that had to be paid. The figures for the principal concerns were as follows:

Concerns Engaged Solely in Mining Anthracite Reporting on Calendar-Year Basis

	Capital Stock—Common	Capital Stock—Preferred	Net Income	Net Loss	Federal Income Tax	Depletion	Depreciation
American Coal Exchange, Inc., Childs, Pa.	$20,000	.....	.....	$9,663	....	.....	$2,579
Beaver Valley Coal Co., Wilkes-Barre, Pa.	1,200	.....	.....	11,347	....	.....	.....
Carbondale Anthracite Collieries, Scranton, Pa.	30,000	$400,000	.....	.....	....	.....	.....

C. & O. Asks Permit to Buy Island Creek Ry.

The Interstate Commerce Commission has been asked to approve the purchase of the Island Creek Ry., linking Holden and Logan, in West Virginia, by the Chesapeake & Ohio Ry. It is understood that a consideration of $1,500,000 has been agreed upon between the C. & O. and the Island Creek Coal Co., owners.

The road has been under lease to the C. & O. since 1912, and all equipment used on the line is owned by the railroad company.

The proposed purchase contemplates the selling in fee of the entire Island Creek road, its branch lines and switches. There will be no change in operating policy should the sale be consummated.

All freight carried over the Logan and Southern branch, up Main Island Creek, which is owned by the C. & O., must be hauled over the Island Creek road to find an outlet to the main line of the C. & O.

Big Muddy Project Shelved

Reports received from Washington since the survey recently made by Major John C. Gotwalls, U. S. District Engineer, indicate that the project for dredging the Big Muddy River is not considered practical, as had been hoped by coal interests and industries in general throughout the southern Illinois coal fields. Plans were under way for dredging the river as an additional outlet for the shipment of coal into Northern and Eastern markets, but no doubt the scheme will be pigeonholed, temporarily at least.

There still remains the possibility of shipping from the interior mines by rail to the Mississippi and thence by barge to the Twin Cities. The rates on this combined rail-water service are about 80 per cent of the all-rail charges.

The Upper Mississippi Barge Line Corporation plans to expend $600,000 for equipment for use on the upper Mississippi line. Later this will be replaced by government boats specially designed for this service.

Kentucky Legislature Kills Coal Tax Bill

The Kentucky Legislature killed the Hutcherson coal tax bill on Feb. 5 by an adverse vote in the House of 51 to 42 on a motion of its author to read it into the calendar despite an adverse report by the Committee on Revenue and Taxation.

Rising to a point of order at the opening of the session, Representative Milliken, Simpson County, chairman of the committee, said he had heard rumors that proponents of the coal tax planned an effort to take the bill from the committee. He then reported the bill adversely.

Mr. Hutcherson then put his motion to have it read into the calendar and defended the bill in a ten-minute speech. Representative Jones of Harlan spoke against it for ten minutes, when the roll call was taken.

Representatives Strange, Bowling Green, and Pulliam, Paducah, have similar bills in the hands of the same committee.

A. I. M. E. Enriches Program By Additional Addresses

The final program of the 133d session of the American Institute of Mining & Metallurgical Engineers, just received, shows several changes of interest to coal men. In the morning mine-ventilation session of Monday, Feb. 15, A. S. Richardson, ventilation engineer, Anaconda Copper Mining Co., will discuss "Theoretical Operating Performance of Mine Fans."

At the meeting on Tuesday afternoon Graham Bright will present data on the use of loading machines in bituminous mines; R. H. Sweetser, of the American Rolling Mill Co., Columbus, Ohio, will speak on the evaluation of coal. The article by Thomas Fraser and H. L. Yancey on the air-sand process of cleaning coal will be transferred to this session. S. W. Parr, of the University of Illinois, Urbana, Ill., will discuss the relation of origin and state of carbonization of coal to the problems of low-temperature carbonization.

The Wednesday morning session will have the added attraction of an address on the selection of coal for the manufacture of coke, by H. J. Rose, Koppers Co. Laboratories, Mellon Institute, Pittsburgh, Pa.

C. J. Hicks, of the Standard Oil Co. of New Jersey, and J. M. Shore, editor of *Service Talks* of the Philadelphia Rapid Transit Co., will supplement the remarks of George E. Roberts, vice-president, National City Bank, at the afternoon session held by the Industrial Relations Committee.

The ground movement and subsidence meeting in the afternoon will embrace not only H. N. Eavenson's remarks on coal-mine subsidence but some by C. M. Young, mining engineer, University of Kansas, on subsidence round a salt well, and others by George S. Rice of the U. S. Bureau of Mines, on the Gros Ventre slide near Jackson's Hole, Wyo., and ground movements and rock bursts on the Rand, a discussion of the report of the South African Commission on Rock Bursts.

On the afternoon of Wednesday also the Mining Methods Committee will hold open session, and Theodore Marvine, of the *Explosives Engineer*, will discuss blasting in coal mines of the United States.

C. R. Seem

Newly elected president of the Engineers' Society of Northeastern Pennsylvania, who assumed office Jan. 21. Mr. Seem is electrical engineer of the Glen Alden Coal Co., of Scranton, recognized as one of the most completely electrified anthracite companies.

Orient Blast Due to Match Used to Light Lamp

The explosion in the New Orient Mine, of the Chicago, Wilmington & Franklin Coal Co., near West Frankfort, Ill., Feb. 1, in which five men were killed, is believed to have been due to the attempt of a bratticeman to relight his lamp with a match while gas was escaping. A. D. Lewis, State Director of Mines and Minerals, announced that this conclusion was based on the inquiry of an investigating committee, which found a broken match stem and an open safety lamp belonging to Lige Hindman, a bratticeman.

Director Lewis advised officials of the company that "had it not been for the fine condition of the mine and for the fact that the mine was rock-dusted very thoroughly, undoubtedly you would have had the greatest disaster at your mine in the history of coal mining. The department wishes to congratulate you and the company for going further than the law requires to make your mine safe."

American Methods Used by I. W. W. Exiles To Increase Output of Russian Coal Mines

American coal mining methods are being introduced to Russia by the American industrial colony, composed largely of former I. W. W. members, with William ("Big Bill") Haywood, former head of the Western Federation of Miners, as one of the organizers. The American exiles, according to the Associated Press, are building a town on the American plan at Kamerova, and also are constructing an iron bridge over the Tom River below Tomsk.

The colony is operating in the Kuznetsk basin and is said to have made great strides during the last year in the production of coal, coke, iron and naphthaline. Several new coke furnaces have been installed, increasing the output by 75,000 tons annually and coal production was increased by 60 per cent in 1925, bringing the annual output to about 1,000,000 tons a year.

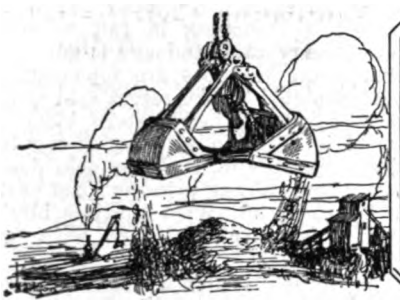
The Americans have erected a new electrical plant and a large chemical works for the manufacture of coal-tar products.

Ventilating Code Rejected By A.E.S.C. Ballot

The mine ventilating code proposed to the American Engineering Standards Committee for adoption has failed of approval on a mail ballot sent out Dec. 19. It has been returned to its sponsors for revision through the sectional committee and may be presented again later. The code was originally signed by the representatives selected by the Mine Correlating Committee, including one from the Bureau of Mines. The Bureau withdrew its sanction and sponsorship at the last minute, and the mail ballot was ordered only after a delay that was much criticised.

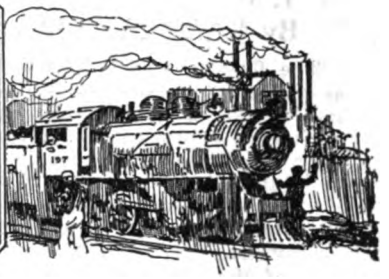
The Bureau lodged objections to the code for several reasons. It believed the code should segregate the mechanical and economic factors from those involving safety and health of miners. It objected because there were no specific standards set up for the quantity of air to be furnished per man underground and no specifications on proportions of firedamp and inflammable gas which may be present in an atmosphere in which it is safe for men to work. The term "booster fan" appeared, to the Bureau, to be confused with auxiliary and small blower fans.

A long explanation of the need for large airways seemed to have no place in such a code. Also, to George S. Rice, chief engineer of the Bureau, the code's provision that crosscuts be not less than 200 ft. apart "seemed unwise" because he believed that spacing is too long for a gaseous mine.



To Continue Mining Research At Carnegie Tech.

C. G. Dunkle, secretary of the Pittsburgh Section of the American Chemical Society, has been appointed to a research fellowship in mining and metallurgy at the Carnegie Institute of Technology. He is a graduate of the University of Pittsburgh in the class of 1922. This appointment fills a vacancy caused by the death of Benjamin E. Hess, of Los Angeles, Cal., and a graduate of California Institute of Technology, who was killed on Dec. 19 in a train wreck.



Mr. Dunkle will continue the investigations in a "study of flame propagation in natural gas and air," that were interrupted by the death of his predecessor. Under a plan in effect for the past several years, the research work will be conducted in co-operation with the Pittsburgh Station of the U. S. Bureau of Mines and an advisory board of Pittsburgh district coal operators and engineers, with H. F. Coward, principal assistant of the Safety in Mines Research Board of England, and G. W. Jones, fuels chemist of the U. S. Bureau of Mines, directly in charge of the study of this problem.

Announcement also is made of the appointment of John W. Greene, of Seattle, Wash., to a newly-created research fellowship to study "reactivity of coke." This fellowship is to be financed for the coming ten months by the American Gas Association.

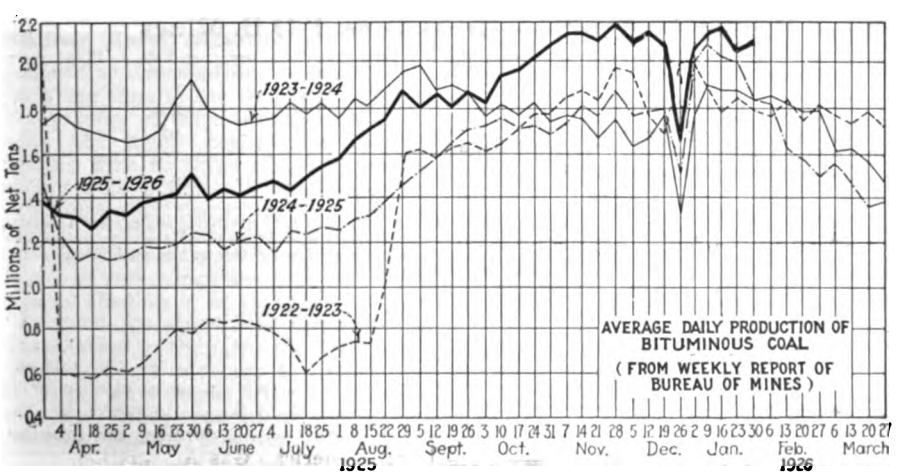
Production And the Market

Light Spot Call for Steam Coals Accentuated By Stronger Domestic Demand

Developments in the coal markets of the country the first week of February intensified the factors which have been dominating the situation since the beginning of the calendar year. The breaking up of the third anthracite wage conference at Philadelphia was immediately reflected in increased demand for prepared bituminous coals and other substitute fuels all along the Atlantic seaboard and indirectly as far inland as the Indiana-Ohio state line. This demand was given a sharper edge by the cold wave that pressed on the heels of the dissolution of the wage negotiations. Weather demand for domestic coals also was felt in the Middle Western fields. There the situation was accentuated slightly by the fact that eastern demand cut down the tonnage of prepared sizes of West Virginia coals normally offered to western buyers.

Steam coals, on the other hand, suffer both from the marked absence of active spot buying by the big industrial consumers and from the fact that the eagerness of the producers to book every possible ton of prepared coal while the domestic trade is ready to pay the price has resulted in a surplus of smaller sizes. Industrial purchasing agents are thoroughly cognizant of this state of affairs and they are using that knowledge to their own advantage. That explains why some high-volatile slack from Kentucky is to be had at 50c. at the mines and why some distress tonnage has sold at half that price. Such quotations, of course, do not represent the average range, but the price list has generally weakened.

The only real cloud on the horizon of the steam coal buyer is the possibility of a breakdown in transportation. Service, on the whole, has been maintained on a remarkable plane of efficiency. Local congestion in Pennsylvania, however, has warned the cautious purchaser that there are limits to all things—even transportation.



In the meantime, the rate of production is unusually high. Preliminary figures for the week ended Jan. 30 show a total output of 12,602,000 net tons. Production for the month was estimated at 53,701,000 tons. This is not the maximum recorded, but it compares favorably with the tonnages of years of extraordinary activity. Even allowing full weight to the added tonnage moving to consumers who normally burn anthracite, these figures evidence a healthy undercurrent to the general business conditions of the nation. The coal man's complaint is that this undercurrent has had little or no effect upon the prices paid for fuel.

Prices Still on Decline

The gravamen of this complaint is reflected in the *Coal Age* Index of prices on bituminous coal for Feb. 8. The index number was 177 and the corresponding price was $2.14. For Feb. 1 the index was 178 and the corresponding price was $2.16.

Dumpings at Hampton Roads the week ended Feb. 4 dropped to 388,265 net tons, as compared with 440,522 tons the preceding week. Heavy seas were in part responsible for the sharp decline: export business was the principal sufferer.

There has been no check to the rising quotations on coke moving to the retail trade. In the case of the Connellsville field, which is the worst offender, ovens have quoted $12@$13 on yard crushed coke for sales direct to the dealer. Where the middleman has intervened, some quotations at New York and Philadelphia have gone to $14 and $15, but little coke has moved at the last-named figures.

Middle West in Doldrums

The Chicago market is again in the doldrums. Operators who gambled on the weather and tried to run full-time are now paying for their temerity.

Steam sizes have been the hardest hit. Western Kentucky 2-in. screenings, shipped to Chicago on consignment, have been seeking buyers at 65@95c. and some spot tonnage also has been available at the lower figure. Fairly good distress strip mine-run from southern Indiana and western Kentucky has been offered as low as 95c.

High-grade southern Illinois screenings are easy at $1.40 and spot Belleville, Springfield and Fifth Vein Indiana fine coal is to be had at $1. Few producers, however, will accept orders for future shipment at those figures.

Trade is dragging in the Carterville field and "no bills" of all sizes clutter up the mine tracks. Under high pressure, mines are working from three to five days a week. Railroad buying from the shaft operations is good. Stripping pits also are receiving a fair share of locomotive fuel orders.

Business has slumped off materially in the Duquoin and Jackson County fields. Working time, with minimum tonnages, ranges from three to five days. Domestic demand in the Mt. Olive district is fair, but steam sizes are hard to move. "No bills" are piling up. Standard district mines are living a hand-to-mouth existence.

Domestic Trade Unexciting

The domestic trade in the Middle West is not exciting. Anthracite is no longer to be had at Chicago and coke is the most popular substitute. Prices on egg and nut coke have advanced sharply. Byproduct plants are sold up and some of the smaller gas companies are finding a ready market for gashouse coke.

Pocahontas egg and nut are scarce at rising prices. Demand for southern Illinois 6x3-in. furnace and 3x2-in. egg is little better than normal because of the anthracite shortage High-volatile coals from eastern Kentucky and West Virginia are moving in fair volume. Quite a respectable tonnage is going to Iowa, where retailers are replenishing stocks depleted by the recent cold snap. Every now and then eastern block is offered in Chicago at bargain-counter prices. Some 4-in. coal has sold down to $2. The average price on good eastern Kentucky and West Virginia block, however, is nearer $2.75@$3, with egg at $2@$2.50.

The return of milder weather has played hob with the St. Louis local market. Coke shows activity, but smokeless demand has receded as prices have advanced. Country domestic trade is slow and steam demand also has declined.

Kentucky Screenings Hit Toboggan

With the exception of a giddy drop in screenings, the Louisville market revealed little change the first week in February. Steam nut suffered somewhat in sympathy with screenings, and some mine-run, principally low grade,

Digitized by Google

also weakened slightly. Heavy consumers are reducing stockpiles and show no buying interest despite the low prices. Most of the movement of block, lump and egg has been on old western orders or for eastern shipment.

Western Kentucky block is $1.85@$2.15; egg and lump, $1.75@$2; mine-run, $1.15@$1.50; nut, $1.25@$1.50; screenings, pea and slack, and nut and slack, 50@80c. Eastern Kentucky block is $2.50@$3; lump, $2.25@$2.50; egg, $2@$2.25; nut, $1.75@$2; mine-run, $1.35@$1.75; screenings, 40@70c. Some distress eastern Kentucky slack has been sold to the trade at 25c.

After a month-end spurt, prompted by sub-zero weather, domestic coal demand at the Head of the Lakes again dropped as the mercury rose. Bookings of a fair volume of industrial orders from Minnesota and northern Wisconsin furnished a pleasing contrast to the domestic decline. Iron and steel interests were the most active factors in this market. Hydro-electric companies, short of water power, also bought.

No Hard Coal on the Docks

For the first time since the 1902 strike, the docks are bare of hard coal. The recent cold spell caused a last rush on the part of consumers which speedily cleaned up the little anthracite left. Consumers are cheerfully buying substitutes. Sales of Pocahontas and other smokeless coals are setting new high records. Domestic coke and briquets also are in good demand. Many householders declare they will use smokeless coals as long as the present wide spread in prices between those coals and anthracite exists.

Smokeless stocks on the docks are liberal. It is estimated that a fair carry-over of that coal will remain on hand at the opening of navigation. The recent cut of 50c. on prepared sizes was prompted by the fact that retailers in the Twin Cities have been buying all-rail.

Bituminous stocks now on the docks approximate 4,500,000 tons.

A week of moderate weather lessened consumption in Milwaukee territory. Despite this general tapering off in domestic demand, it is still difficult to obtain Pocahontas coal, but prices are unchanged. Increasing demand has pushed the retail price on nut coke to $16—the same price to which range was raised the week preceding.

Weather Hurts Southwestern Demand

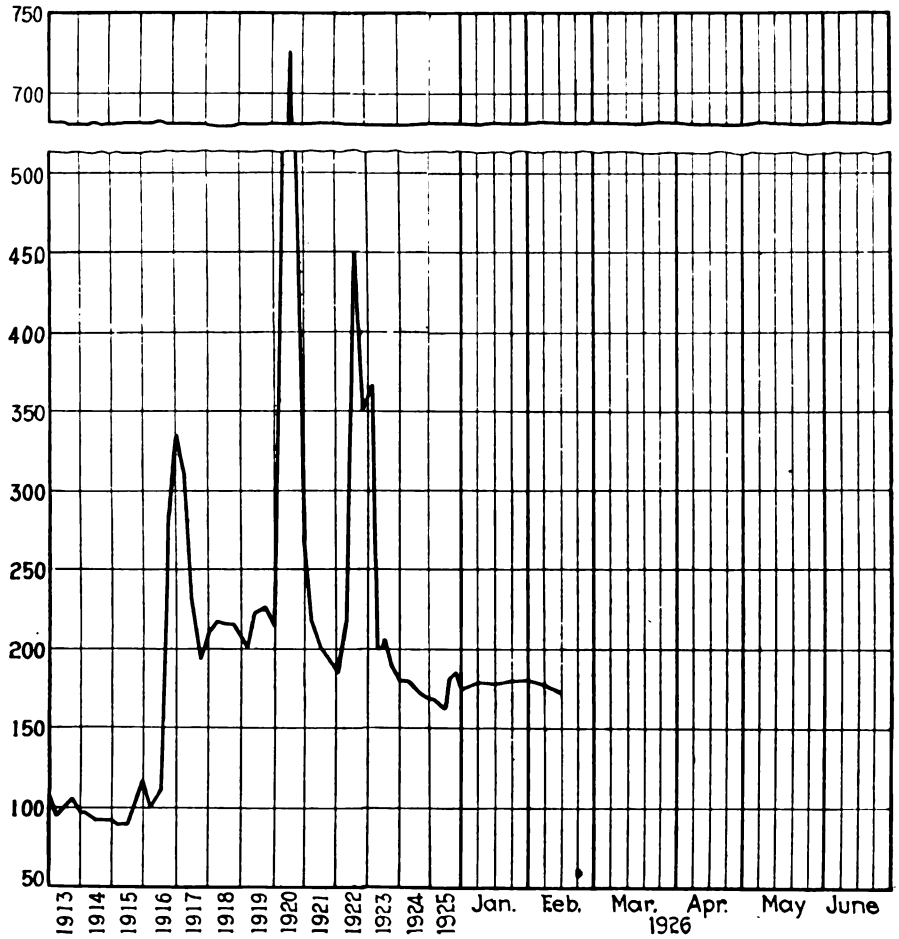
Warm weather has begun to cut down operating time in the Southwest. There is a surplus of all sizes in the Kansas fields and many mines have reduced running time to three and four days a week. This policy will soon clean up screenings accumulations, but how to dispose of surplus prepared sizes without sacrificing all profit is the problem. Prices on screenings are firm, but there is some shading in lump figures.

Demand for sized coal for domestic consumption in the Colorado field holds steady. Mines continue to operate on an 85-per cent basis, with transportation and labor conditions favorable. Domestic demand, however, is unevenly distributed; western Kansas and Nebraska are the heavy buyers. Colorado mines have about 300 "no bills" of various sizes on track. Unless these are moved soon, a cut in production will be inevitable.

Utah operators, due to weather conditions, are finding the domestic market —at no time this winter really brisk— again slow and draggy. Industrial demand is normal. There is no change in prices. Opening of new mines has made competition exceptionally keen.

Upsets in Cincinnati Market

Extremes meet in a review of the Cincinnati market the past week. High-volatile slack is still on the auction block and the situation of mine-run is little better. Block, on the other hand, stands firm at the $2.50@$3 range. Some low-volatile slack has sold at $1, but the general run of prices is $1.25@$1.50. Low-volatile lump commands $4.25 in the spot market; egg, nut and stove bring $5 for western delivery and $1 more when the buyer is located in the East.



Producers are striving to avoid glutting the Cincinnati market. The latest interchange report of the American Railway Association shows a decrease of 1,222 cars in the coal interchanged through the Cincinnati gateways and a much lighter movement of empties to the Chesapeake & Ohio. Counting unbilled loads against the mine allotment on the Louisville & Nashville has forced many operators enjoying a good business in domestic sizes to dump nut and slack on the market at any price.

Another factor in upsetting prices has been the attitude of industrial purchasing agents, who stocked heavily last November to beat down prices during January-March. One Kentucky producer with heavy bookings of domestic orders has been selling slack at 50c., while many other producers in the same field hold to $1@$1.10. New River slack is holding up to $1.25@$1.50. The $1 price mentioned in a preceding paragraph applied to Pocahontas coal; the explanation lies in the refusal of byproduct ovens to take their usual quotas of coal from that field.

Retail business is brisk. The same weather conditions which created that condition, however, have badly hampered river movement.

Central Ohio Trade Drags

Central Ohio domestic trade again succumbed to weather conditions last week. Dealers, who are rather heavily stocked, are devoting their attention to cleaning up as much as possible. Smokeless coals lead in consumer de-

Coal Age Index of Spot Prices of Bituminous Coal F.O.B. Mines

	1926				1925	1924
	Feb. 8	Feb. 1	Jan. 25	Jan. 18	Feb. 9	Feb. 11
Index	177	178	178	181	168	188
Weighted average price	$2.14	$2.16	$2.16	$2.19	$2.03	$2.27

This diagram shows the relative, not the actual, prices on fourteen coals, representative of nearly 90 per cent of the bituminous output of the United States, weighted first with respect to the proportions each of slack, prepared and run-of-mine normally shipped, and second, with respect to the tonnage of each normally produced. The average thus obtained was compared with the average for the twelve months ended June, 1914, as 100, after the manner adopted in the report on "Prices of Coal and Coke: 1913-1918," published by the Geological Survey and the War Industries Board.

Digitized by Google

mand. Splints have weakened considerably and Ohio coals are very dull. There has been little retail price cutting. Smokeless sells at $9.50@$10; splints, $7@$7.50; Kentucky block, $7.25@$7.50; Hocking, $6@$6.50.

The market for industrial coal continues dull and irregular. Spot buying is the rule with many large consumers, including the City of Columbus. Screenings are so weak that many mines in the Hocking Valley and Cambridge fields have closed down. Pomeroy Bend operators paying the 1917 scale still keep going. Some lots of screenings have sold under 50c.

Output in the Hocking Valley, Cambridge, Crooksville and Jackson districts approximates 18 per cent of capacity. Pomeroy Bend is averaging 35 to 40 per cent.

Slack prices in the Cleveland market are touching new low levels. The cheerful side of the situation is that the slump is indicative of heavy and more profitable domestic demand for large coal. The sad angle is the fact that the low prices are in part due to the competition of bargain-counter West Virginia offerings. The surplus of screenings also has diminished inquiry for other steam grades.

Milder weather has slowed down retail activity. Dealers bought heavily during the recent cold wave and now are reluctant to add much to the stocks on hand.

During the week ended Jan. 30 the No. 8 field in eastern Ohio produced approximately 259,000 tons, or 37 per cent of capacity. The output was 17,000 tons less than that of the week preceding and 10,000 tons under the total for a year ago.

No Gain in Pittsburgh District

The Pittsburgh district has undergone no improvement with the new month. Local demand for domestic sizes continues fair, but prices are unsatisfactory. Nut and egg for eastern delivery bring $2.75@$3.25, but the tonnage is limited.

Slack, which recently slumped badly, seems to have found a level at $1@$1.10 for steam coal and $1.15@$1.25 for gas. These prices are 25 to 30c. under the quotations ruling until the break.

The district is operating on a 30-per cent basis.

Developments in the anthracite strike have helped the central Pennsylvania bituminous field. January output is estimated at 5,011,348 tons—the largest since December, 1920, when 5,418,829 tons was loaded. Prices are stronger. Pool 18 is quoted at $1.80@$2; pool 11, $1.90@$2.20; pool 10, $2.25@$2.50; pool 9, $2.40@$2.70; pool 1, $3@$3.50; pool 71, $2.60@$2.90. Prepared sizes are offered at $5.25@$5.50. Run of oven coke brings $7 and sized coke is $10.

The Buffalo bituminous trade is dull and discouraging. Slack has tumbled. Some tonnage has been sold at $1, although standard quotations are $1.25@$1.40 on Fairmont and $1.30@$1.60 on No. 8 coal. Fairmont lump is held at $1.50@$1.75; mine-run, $1.40@$1.50. Youghiogheny gas lump is available at $2.25@$2.50; Pittsburgh steam lump at $2@$2.25 and short-rate Allegheny Valley mine-run at $1.75@$2.

New England Market Sluggish

The New England bituminous market is decidedly sluggish for this season of the year. Industrial demand is intermittent and light and the householder is more indifferent than conservative trade observers had anticipated. Nevertheless, several of the West Virginia smokeless shippers say they are sold up for the fortnight on prepared coal and high-grade Pennsylvania low-volatile screened coal is bringing $5@$6.50, with little offered. There are reports that as high as $8 has been asked by some shippers of Pocahontas and New River egg and stove.

Many consumers, however, show a strong preference for foreign coals. Several cargoes of Welsh anthracite and patent fuel have been badly delayed by the storms. A cargo was landed at New Bedford last week after tossing the waters for nearly a month. A cargo consigned to Boston was abandoned 800 miles off Halifax.

There have been only minor variations in the f.o.b. vessel prices on West Virginia smokeless at Hampton Roads. The range is controlled by accumulations at the piers, but no sales have been reported under $4.75 or above $5 for Navy Standard. On cars, Boston and Providence, this coal brings $6.25@$6.40 gross. There is little retail demand for mine-run.

New York Market Active

The New York bituminous market was active last week. Shippers faced some transportation difficulties, but these were not serious enough to jam shipments, although snow storms in central Pennsylvania closed down some smaller mines. There was, however, much congestion at some of the local piers. The number of cars waiting to be dumped reached 5,000, which is almost double the normal number.

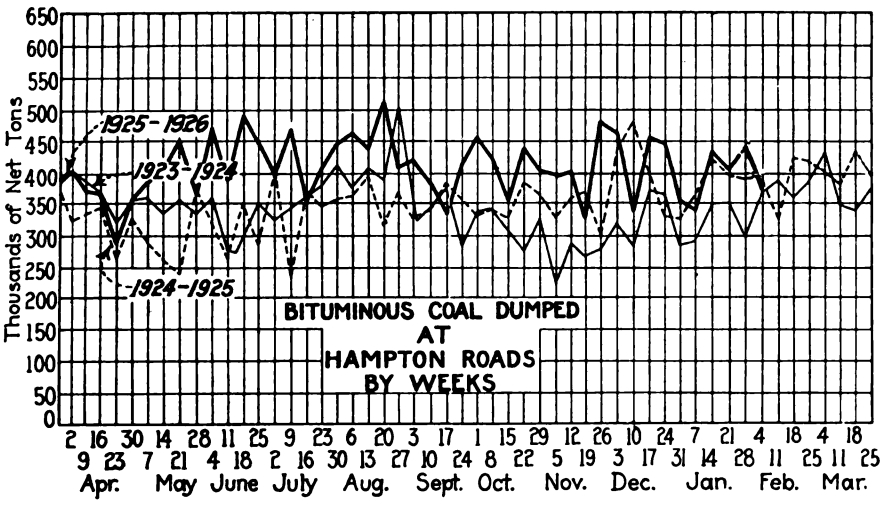
Mine-run was in steady demand. Prepared sizes of New River and Pocahontas were snapped up at $7@$8. High-volatiles were quoted at $3.25@$4.25, but the tonnage was limited. There was a scarcity of sized coals from the Broad Top field. Some shippers demanded up to $9 for Broad Top coal, but the average quotations on 4-in. lump ranged between $5 and $6. Sized low-volatile from central Pennsylvania was held at $6@$7. Some medium-volatile coal was offered at $4@$5.

Congestion Hits Philadelphia

The great drawback to the Philadelphia market last week was delayed transportation. The Pennsylvania R.R. asserts that considerable progress has been made in clearing up the congestion between Altoona and Harrisburg, but coal still comes in slowly. To add to the difficulties, a two-foot snow storm hit the region Feb. 3, cutting down car supply.

Prices on sized bituminous have advanced. Pennsylvania low-volatiles and Pocahontas range from $7.50 to $8, with most shippers sold up. High-volatiles, such as the Fairmont and Westmoreland coals, are in stronger demand as a result, but quotations have not shifted from the $4@$4.25 range. Many householders are now using these coals.

The accumulation of slack is the major problem confronting the operators. The railroad congestion, however, has brought some relief, as industrial consumers are now showing a little more interest in the question of shipments.



No real change is apparent in the Baltimore bituminous situation. All grades are in easy supply and prices have shown little fluctuation.

Prices Up at Hampton Roads

The coal business at Hampton Roads last week was on the up grade. The failure of the anthracite wage negotiations strengthened prices and demand and broadened inquiries for tonnage. Mine quotations on coals sized for household consumption were boosted, but no change in local retail prices was anticipated. The heavy seas had a bad effect upon export shipments, but coastwise and bunker deliveries held up as well as could be expected.

Birmingham market conditions have not changed materially in the past

Digitized by Google

week. Medium and lower quality coals dragged, but the output was moved without serious delay. Washed coals still lead in activity. Railroads are taking large quantities of fuel on contract. The bunker trade is featureless, but the volume is ahead of last year.

Most of the better domestic coals are sold up through February, with a fair amount of new business coming in to augment mine bookings. Medium and lower grades are moving moderately well. Both retailers and consumers, however, are buying on a hand-to-mouth basis.

Prices, except on some of the less desirable steam coals, are steady. High pressure is being maintained in the coke market, egg and nut advancing to $7.50@$8 the past week as the result of the extraordinary demand and shortage in supply. Foundry coke moved up to $7. Gas coke also sold at $7.

New York Cries for Substitutes

Substitutes for anthracite in the New York market were short last week. Demand was increased by the break in the wage negotiations at Philadelphia and was further intensified by the heavy snow storm which swamped retail dealers with new orders. Many of the latter were for less than ton lots.

The scarcity of coke strengthened the market on sized soft coal. Run-of-oven coke was quoted at $11@$12.50, with the average selling price around $11.50. Sized coke sold at $13.50@$14, with a few agents asking up to $15.

There was another rush of Philadelphia retailers for substitute fuels last week, following the breaking up of the third wage conference. The overcautious dealers who had been holding back buying found they were compelled to pay even higher prices. Low-volatile sized coals were around $7.50 and Connellsville sized coke was offered at $13@$14.50.

Coke Prices Still Up

Run of oven coke at Connellsville ovens jumped another dollar early last week under the bidding of eastern buyers demanding car numbers. The region is rife with conflicting claims as to future business; some producers declare they have the situation well in hand and can ship as promised when sales are made; others insist that coke sold a month ago is just being loaded.

Certain sales agents have practically withdrawn from the market. They consider the outlook too uncertain and are unwilling to take the chance of a slump in prices and cancellation of orders. There is much more direct selling by the ovens to eastern buyers than was the case some weeks ago. The prices of $10@$11 on run-of-oven and $12@$13 on yard crushed coke, therefore, represent the actual realizations of the ovens.

The blast furnaces are entirely out of the picture. Those that are operating have contracts averaging $4.

The Connellsville *Courier* reports coke output in the Connellsville and Lower Connellsville regions for the week ended Jan. 30 at 107,700 tons from the furnace ovens and 125,180 tons from the merchant ovens. Furnace oven production decreased 2,900 tons; merchant oven output increased 910 tons over the production for the preceding week.

Coal Produced in the United States in 1924[a]

(Exclusive of Product of Wagon Mines)

a Note that the coal statistics of the Geological Survey for a given year include only the mines that had an output in that year. Many mines that operated in 1923 produced no coal in 1924; moreover, many of the mines that did produce in 1924 worked for a short time only. The number of active bituminous mines of commercial size in the United States was 9,331 in 1923 and 7,586 in 1924.

b Includes also loaders and shotfirers.

Statistics issued by U. S. Bureau of Mines.

Foreign Market And Export News

No Break in Demand On British Collieries; Inquiries Also Growing

The improvement in the British coal market is well maintained. All sections show a broadening of inquiries and substantial bookings to carry the trade well into February have been made. Superior large and smalls are rather scarce for prompt shipment, and prices are strongly held. Ordinary drys and sized products are in keen demand, and prices are very firm.

French inquiries are much better, and good business awaits fulfilment. South America remains fairly active, though effective demand is checked by a sharp rise in the outward freight, which adds two or three shillings to the c.i.f. price.

Best Admiralty large is closely booked over the next two or three weeks, and prices are steady to firm. Ordinary drys are meeting more demand at the lower levels. Monmouthshire collieries are busy, and a steady inquiry is passing. Patent fuel is dull.

There was very little spot coal available for late January delivery in the Newcastle market and the odd lots on offer were taken up at very high prices. All classes of fuel, including cokes, show increased values, but the chief improvements are in best quality gas and steam coals. Contracts and inquiries show much more confidence in the future than one might have expected in view of recent developments. In the coal fields more pits are restarting, and most of those idle are idle from the result of disputes rather than lack of trade.

Output by British collieries during the week ended Jan. 23, according to a special cable to *Coal Age*, totaled 5,540,000 gross tons, compared with 5,460,000 tons in the preceding week.

Better Tone to Belgian Trade

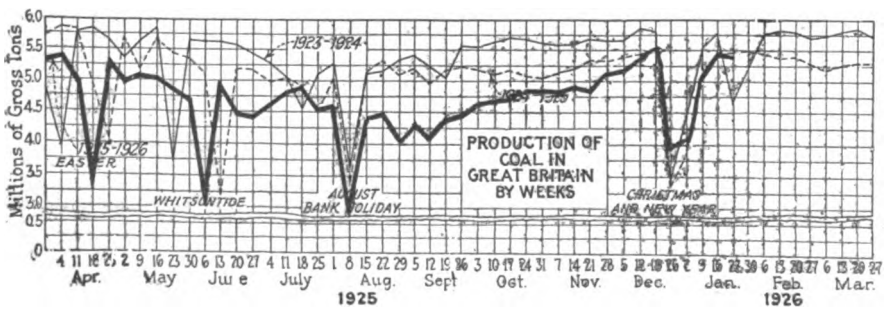
The general feeling in the Belgian market is better than a month ago as far as industrial coals are concerned. Domestic demand continues satisfactory. It is also self-evident that the suppression of import licenses for the free German coals did not fail to improve the situation of the Borinage collieries.

In the Charleroi district stocks are diminishing and the demand is particularly active in 5/10 and 10/20 lean coals. Smalls used in lime production command 69 fr. In the Borinage, stocks are again being drawn from.

Prices at the mine are generally unchanged. Transportation rates on steam coals have been cut 20 per cent, but rates on domestic coals, pitch and pitwood have been increased 30 per cent.

During 1925 Belgium received 2,902,908 tons of reparation coal (of which 1,326,592 tons were coking smalls; 390,137 tons coking, and 260,835 tons coke) as against 4,381,786 tons in 1924 (of which 1,321,374 tons were coking small; 1,024,008, coking coal, and 540,448 tons coke).

Owing to the raising of fiscal charges, the reparation coals bear a slight increase since Jan. 13. The new taxes will be: Cokes, 1.20 fr. instead of 0.12; coking coals, 0.80 instead of 0.08; flaming coals, 71.2 centimes instead of 7.8 centimes.



French Coal Prices Advanced to Meet Wage Demand

Paris, France, Jan. 20.—There is but little change in the French coal market. Demand is steady and collieries are sold up for the month and part of February. Transportation has improved. It is not yet practicable to use all the waterways, but the number again opened to ordinary traffic is increasing every day. Delays in the delivery of the French, as well as of the Belgian coals, however, still compel consumers to use more British coal, in spite of high prices due to the adverse exchange.

The Miners' National Federation has sent the Comité Central des Houillères a request for higher wages, based on a 25 per cent increase in living costs. A meeting held at Douai Jan. 16 between the coal owners' representatives of the Nord and Pas de Calais and those of their men agreed that from Jan. 16 to May 15 the super-indemnity for cost of living (*surprime de vie chère*) should be raised from 40 to 100 per cent. For the underground man, whose wage is the highest, the increase granted will amount to 1.80. Nord and Pas de Calais coal prices have been increased 4 fr.

The Lorraine collieries (La Houve) have raised their prices 5 fr. in order to maintain their prices in the same limits as the Sarre collieries, which have just increased their rates 3 to 7 fr.

Contrary to what has been reported, the French-German negotiations to conclude a coal agreement have not been resumed and they probably will not be resumed for a while.

Egyptian Orders to Wales

Announcement has just been made by the Egyptian State Rys. as to the results of the bidding of Dec. 2, 1925, for the supply of colliery screened Welsh coal. This announcement states that:

Sixteen offers were received and contracts have been placed as follows:

Messrs. Watts, Watts & Co., for the supply of 200,000 metric tons, at £1 8s. 9d. per metric ton. Payment to be made on the delivered weight less two per cent of the freight only or, in the option of the Administration, on the bill of lading quantity less an allowance of two per cent on coal and freight.

Messrs. Beynon & Co., for the supply of 50,000 metric tons at £1 9s. 9d. per metric ton.

Messrs. W. Milburn & Co., for the supply of 50,000 metric tons at £1 9s. 10d. per metric ton.

Each contract is for delivery c.i.f. (Alexandria).

News Items From Field and Trade

ALABAMA

Plans are being formulated for holding the annual state first-aid and mine-rescue meet early next summer. Alabama Mining Institute, Bureau of Mines, Joseph A. Holmes Safety Association and other organizations sponsoring these meets are now giving the matter attention. Officials of the Bureau of Mines and the Safety Association are visiting the different mining fields, giving instructions to the teams and offering all the assistance possible in preparing the men for this important work.

A first mortgage six and one-half per cent gold bond issue of the Porter Coal Co. is being marketed by Ward, Sterne & Co., Birmingham. The company was reorganized in 1922 when W. Carson Adams, E. J. Rowe and J. A. Norman acquired the stock of the Pratt-Southern company, which owned 1,160 acres of mineral rights and 160 acres of surface rights at Porter, adjacent to the Risco holdings of the Republic Iron & Steel Co. The Porter Coal Co. was formed as a holding company and started at once to put the mine property in first-class condition. During this period limited operations were maintained. With the completion of a coal washer in a few weeks, the company expects to resume full-time operation.

ARKANSAS

Mine No. 8 near Bates, owned by W. J. Francis, was flooded recently and workmen were forced to abandon mine No. 2. Considerable equipment was lost but the employees escaped.

COLORADO

R. N. Jones, of Trinidad, formerly master mechanic for the Victor-American Fuel Co., and William Liddle, of Palisade, for three years foreman of the Garfield mine, announce that they have obtained a five-year lease on the Garfield mine and plan to work it on a large scale. They are to take over the property Feb. 15, and expect to have 25 men at work a few days later. The new lessees will erect a new tipple where the old one recently torn down was located. They expect to mine 200 tons daily. The new operators will have the option of buying the mine from its present owner, Albert E. Bayless, of Oklahoma City. No coal has been shipped from the Garfield mine for two or three years.

His property closed up and posted for the second time, Fred Sevcik, owner of the Cottonwood mine, two and a half miles north of Colorado Springs, has filed suit against F. J. Dalrymple, state inspector of coal mines, in district court asking for an injunction to restrain the inspector or his deputies from requiring him to place a certified official in charge and from the installation of a ventilator fan, as provided in the new state mining law. Sevcik does all the underground work in the mine himself, the complaint states, others being employed for the surface jobs. Sevcik won his first action against Dalrymple Jan. 21.

Colorado mines produced 10,412,041 tons of coal in 1925, according to an announcement by State Inspector James Dalrymple. This is 89,047 tons less than was mined in 1924. December output was 1,249,656 tons. The average number of men employed in and about the mines last year was 12,138, and the number of days worked per mine was 156.4.

A. M. Wilson, City Manager, and S. E. Nichols, City Clerk of Colorado Springs, have closed a one-year contract with the Colorado Fuel & Iron Co. for Toller coal for use by the municipal gas plant. The company will supply the plant with approximately 10,000 tons of coal during the year. Its bid was $4.70 per ton.

ILLINOIS

Rice Miller, of Hillsboro, was appointed receiver for the Illinois Coal Corporation on Jan. 28 by Judge W. C. Lindley in U. S. District Court at Danville, the appointment being made on the petition of the American Mine Equipment Co., and with the consent of the coal corporation. The corporation has property valued at $10,000,000, operating six mines in Illinois—at Nason, Springfield, Auburn, Girard, Virden and Nokomis. It has bonds outstanding of approximately $6,000,000. Albert J. Nason is president of the corporation. The Nason mine is one of the largest in the world. It is a twin-tipple operation sunk about a year and a half ago and recently completed.

The Peabody Coal Co., Chicago, is equipping Mine No. 6 with automatic cushioned horn cage stops and table keepers. This is the sixteenth mine of this company to install such equipment.

A large seam of coal was struck late in January at a depth of 246 ft. at the shaft being sunk on the Judge Early Farm, one mile south of Sherman. Sixteen tons of coal were hoisted the first day. The shaft is 7x6 ft. and two cages will be used. Work will be started at once on the outbuildings and the tipple.

William A. Wilson, of Belleville, has resigned as St. Clair County Mine Inspector to accept a position as manager of a coal mine in Freeburg.

The Old Ben Coal Corporation with 14 mines in southern Illinois and offices in St. Louis and Chicago, announces through John E. Jones, safety engineer of the company, a marked decrease in the fatality rate of men employed at its properties during 1925. Last year the rate was 1.17 men for each million tons mined compared with 3.02 in the preceding year.

Initial preparations for two large strip operations are being made west of Duquoin by two different interests. Options on the two tracts have been taken and it is stated that between 25 and 35 drills will be employed in the next 60 days to ascertain the exact position of the coal.

The Peabody Coal Co.'s mine No. 9, Taylorville, produced 1,318,780 tons of coal in the 252 days it operated in 1925. Its payroll for the year amounted to $1,844,538. No. 58, another Taylorville mine, also made a high mark. It hoisted 947,551 tons during 292 working days. Its pay-roll totaled $1,439,371. The total hoists of Peabody mines for the entire district were 5,680,551 tons for 1,724 working days. The district payroll was $8,968,371.

The Randall Mine, one mile north of Freeburg, is expected to be reopened about the middle of February, the property having changed hands recently. William J. Reichert, president of the Freeburg Milling Co., is reported to have purchased the property at a price stated to be over $16,000. The mine, which is one of the smaller operations in the Freeburg district, has been idle for the past two years.

INDIANA

Non-union mines in southern Indiana, closed up several weeks ago when an "army" of 1,500 union miners made a tour of the field, are gradually resuming work under the arrangements that prevailed prior to the visit of the unionists. The return to normal conditions in the region is being made without disturbance or interference, according to mine operators.

The Wasson-Pocahontas Coal Co., of Vincennes, has filed a final certificate of dissolution.

Growth of coal mining activities in and about Petersburgh has forced the enlargement of the New York Central R.R. yards there. Trackage double that now in use is being laid. Most

Digitized by Google

mines in the vicinity are operating full time, and three engines are being used to assemble the outgoing coal trains. All strip mines in Pike County are operating full time.

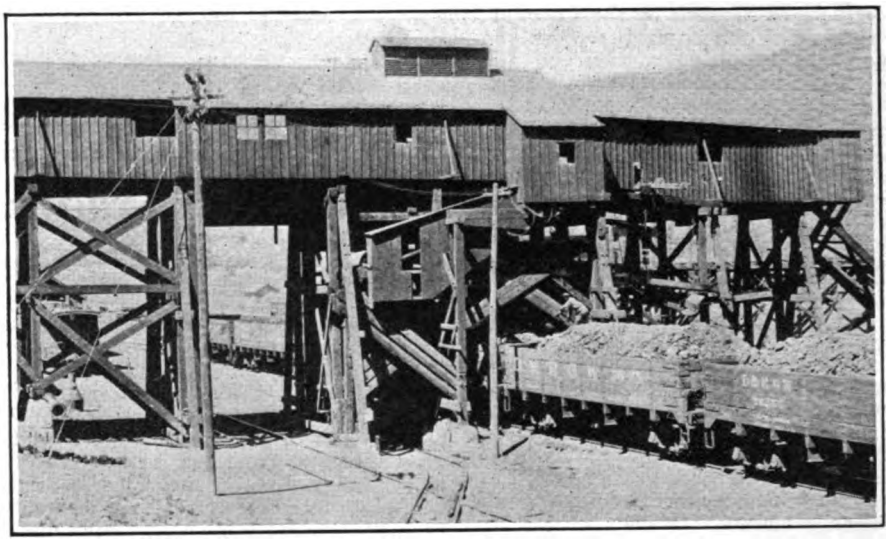
Pleas of union miners for 18 non-union workers to quit work at the Sargeant mine No. 2, near Newburgh, were scorned by the non-union men last Friday. Met by a union delegation at the mine mouth, the non-union men proceeded to work without heeding the delegation's request that they quit and join the union.

The Bardyke mine, north of Terre Haute, which had been idle since early in December due to a fire which burned the tipple, has resumed operations. This mine is one of the large producers in the Terre Haute field. The mine is owned by the Fort Harrison Mining Co. and employs a large number of men.

William L. Williamson, for thirty years associated with the W. W. Ray coal interests at Terre Haute, has sold out his interest to the Ray company and will open a new coal jobbing company. He was a stockholder with the Ray interests in the Neutral Coal Producers Co. He will handle all grades of coal and has taken options on two mining properties which he intends to develop later.

KANSAS

Early returns from the run-off election, Feb. 2, in District 14, United Mine Workers (Kansas), indicated that district headquarters will be moved from Pittsburg to Frontenac, Matt L. Walters, district president, announced the day after the election. Frontenac offered the district free use of Miners' Hall there for offices. Three contestants were voted on at an election in December, at which time Arma, one of the contesting towns, was eliminated.



KENTUCKY

Formation of a coal mining company to be known as the Community Coal Co. is under way by business men of Corydon, Frank Ramsey, prominent merchant, presided at a preliminary meeting of 35 interested persons late in January. It is proposed to sink a new shaft near the city.

Vice-President Garth of the Hazard-Bluegrass Coal Corp. says his company plans the installation of new machinery and the construction of 40 new houses. The capacity of the plant is expected to be enlarged to 40 or more cars daily.

Guy H. Sowards, of the Southwestern Fuel Co., Louisville, who during the war was connected with the office of the Fuel Administrator, has been appointed a first lieutenant in the Quartermaster's Reserve Corps, supply division, to look after coal buying in war times for the Fifth Corps Area.

Establishment of a mine rescue station at Pineville is being urged by the Kentucky Coal Operators' Association. The project would serve 400 tipple mines, employing 50,000 workers, according to data presented by E. R. Clayton, secretary of the Harlan County Coal Operators' Association, and R. E. Howe, Knoxville, Tenn., secretary of the Southern Appalachian Coal Operators' Association. With a car operating out of Pineville, witnesses said, most of the coal district in eastern Kentucky and northern Tennessee could be cared for in case of emergency. Safety campaigns by the government were advocated in conjunction with the actual rescue work.

Bon Carbo Tipple of the American Smelting & Refining Co.

This tipple, located at Bon Carbo, Colo., handles coal for the smelting and refining company's plant about five miles away. The mine from which the coal is taken is equipped with excellent haulage facilities. About 1,200 tons of coal per day is loaded at this tipple.

MINNESOTA

The addition to the Inland Coal & Dock Co.'s plant at Duluth is nearing completion, and it is scheduled to be ready to receive coal at the opening of navigation. With the new addition the Inland dock will be one of the largest coal-handling plants at the Head of the Lakes.

MISSOURI

The Graddy mine, about two miles west of Lexington, was destroyed by fire late in January. All the equipment, the shop and machinery were lost. The mine is owned by E. J. McGrew. It was operated under lease by Ivan Beebe.

George J. L. Wulff, president of the Western Coal & Mining Co., St. Louis, and president of the Southwestern Interstate Coal Operators' Association, headquarters Kansas City, will represent Missouri on the board of directors of the National Coal Association. He will fill the unexpired term of F. W. Lukins, of Kansas City, who died recently.

OHIO

A suit to test the Ohio workmen's compensation law was started in the Jackson County courts recently by Attorney General C. C. Crabbe of Ohio against William McDonald, owner of the mine near Jackson, to compel McDonald to pay to the widow of Charles West the sum of $5,117 as death award. West was killed in the mine Oct. 23, 1924, and since Mr. McDonald was not a subscriber to the state compensation fund, it is held that he is liable for the death award. The result of the suit will be watched with much interest by smaller operators in Ohio.

Secretary H. C. Cain of the Columbus Board of Purchase has rejected all bids received Jan. 27 for coal for the various city departments. He announces that the supply necessary will be purchased on the open market for the time being at least. The bids called for 12,500 tons of Ohio nut, pea and slack for the municipal light plant; 7,000 tons of the same grade and size for the Scioto River pumping station and 2,500 tons for the garbage disposal plant.

A civil action has been brought in the Perry County courts by Allen Ripley, John F. Riley, Alexander Beattie and Joseph Francis against the Primrose Coal Co. to collect $31,000 claimed for the removal of 20,000 tons of mineral stone No. 6 vein from under their land by the defendant company. The plaintiffs also set forth that this operation rendered the coal on their lands inaccessible and ask for damages for that action.

The Maher Collieries Co. (H. F. Pollock, general manager), Bridgeport, is putting in a feeder and a retarder to control the cars on a steep grade.

Clyde S. Palmer has closed the branch offices of the Blue Star Coal Co. and the Three Points Coal Co., which have been maintained in the Union Central Building, Cincinnati, for some time past. Mr. Palmer has gone to Miami, Fla., where he will be in the plumbers' supplies business.

Walter A. Jones, of Columbus, and Fred E. Butcher, of Danville, Ill., receivers for the Wayne Coal Co., of Pittsburgh, are taking steps to liquidate the concern. Inventories of the various properties are being made, preparatory to offering them for sale. The suit which culminated in the re-

Digitized by Google

ceivership was brought by the Colonial Trust Co., of Pittsburgh, to recover on a mortgage of $3,800,300 issued in 1917. The mortgage was given to float an issue of sinking fund bonds amounting to $12,156,000. All of this issue of bonds has been cancelled with the exception of $3,800,300 due in February, 1925. Properties of the company are located in Jefferson County and Athens County, Ohio, and in the Pittsburgh field. All are stripping operations.

OKLAHOMA

A recent report from Henryetta, in District 21, United Mine Workers, where a strike was called Sept. 1, 1925, showed that in that field in the last week of January twenty-four mines were working and nine were idle. Of the twenty-four mines in operation, twelve, operating open shop, under the 1917 wage scale, were producing more than 3,000 tons a day. Four mines, employing union miners under the 1924 scale, were producing 1,300 tons a day, and eight small mines, operated co-operatively, were producing 300 tons a day.

PENNSYLVANIA

Four men were killed at Archbald Jan. 31 when a cave-in occurred in an abandoned stripping operation of the Hudson Coal Co. The men were engaged in "bootleg" mining of coal when a huge rock was jarred loose and enveloped them.

The Wilmore Coal Co., of Philadelphia, announced the appointment on Feb. 1, of R. M. Mullen as general superintendent, and Frank King as superintendent, with offices in Windber, Somerset County. Mr. Mullen is a native of Indiana and a graduate in engineering at Princeton. He has been associated with the development of Windber coal since the beginning of operations. Mr. King is a graduate of Pennsylvania State College and has been located in Windber for three years.

James H. Allport, president of the Rich Hill Coal Co., at Barnesboro, and president of the Barnesboro Bank, is being prominently mentioned as a candidate for the Republican nomination for Congress from the Cambria County congressional district. The present Congressman, Anderson H. Walters, will not be a candidate to succeed himself. Mr. Allport is a member of the board of directors of the Central Pennsylvania Coal Producers' Association and served on the engineering board of Dr. Garfield's Fuel Administration during the World War.

The Bethlehem Mines Corporation is understood to be planning to start two more mines on the 1917 scale, at Ellsworth and Bentleyville. The company now has two mines working on this basis at Marianna and Cokeburg, in the Pittsburgh district.

Ninety-six per cent of the employees of the Orient Coal & Coke Co. (subsidiary of A. M. Byers Co.), Pittsburgh, have subscribed to a plan for employees' insurance arranged with the Metropolitan Life Insurance Co. Under the terms of the plan general employees may obtain $1,000 policies for 75c. per month and foremen and supervisory employees $2,000 policies for $1.50 per month, the company paying the balance of the net cost.

The Lehigh Valley Coal Co. has installed a mine pump at the Stockton end of the Shaft colliery that is said to be a forerunner of the time when the status of the pump runner in event of strikes won't be cause for anxiety. This pump is run by electricity and it needs no attention from a pump runner. Several times a week it is inspected, but that is all. An arrangement throws on the current when the rising waters submerge the end of the tail pipe and the same contrivance throws off the current when the pump lowers the level and leaves the tail pipe free from water.

Hillman Coal & Coke Co., of Pittsburgh, is improving the Edna No. 2 Mine, at Irwin, and will install a set of automatic cagers.

It is reported that negotiations are under way for the construction of a byproduct coke plant which will produce 1,000 tons daily near Morrell, south of Connellsville. Connellsville and New York capital is interested, the former owning 1,500 acres of coal lying 60 ft. under the surface. A 1,000-ton byproduct plant, as figured in the Connellsville district, would be equivalent to a 500-ton beehive plant.

The Harmon Creek Coal Co., one of the concerns in which John A. Bell, bankrupt coal man, owned a chief interest, has filed an answer in court at Pittsburgh, to a suit in equity filed by the Colonial Trust Co. of Pittsburgh, which seeks the inclusion of 500 acres of valuable coal land in Ohio in a mortgage made by the defendant company. The company claims that the property was acquired six months after the signing of the bond agreement.

TEXAS

Dr. J. P. Sparks, of Rockdale, has been appointed to the State Mining Board to succeed E. A. Camp, of Rockdale, whose term expired Jan. 1. W. K. Gordon, of Fort Worth; John Legory, of Crockett; Pete Kramer, of Mingus; D. B. Hollis, of Lovelady; L. R. Stoddard, of Calvin; and Adam R. Johnson, of Austin, compose the board, and their terms expire August 5, 1926. Frank Willis Denison, of Bastrop, is state mining inspector.

WEST VIRGINIA

Walter R. Thurmond, one of the leading operators of the Logan field, announces the consolidation of four coal companies in which he and his associates are interested in that field into one large company, the Thurmond Consolidated Coal Co., capitalized at $1,000,000. The companies merged are the Argyle Coal Co., Thurmond Coal Co., Logan Eagle Coal Co. and the Perry Branch Coal Co. Officers of the old companies as well as directors will continue in the new company, Mr. Thurmond being the general manager and A. E. Wait secretary and treasurer. The Thurmond Consolidated Coal Co. controls approximately 6,500 acres of coal land in Logan County, operating five mines with an annual production of about 750,000 tons. Finishing touches were put on the merger at Charleston.

The Consolidation Coal Co. is opening additional mines in the Fairmount field as rapidly as it can get the labor to man them. Thus far fifteen of its mines have gone into operation. In 1925 the company produced 8,042,280 tons, notwithstanding the long shut down in the early part of the year. Its 1924 output was 7,957,456 tons.

The U. S. Circuit Court of Appeals at Richmond has upheld a decision of the U. S. District Court at Charleston awarding a judgment of $94,437.82 to the Dingress Run Coal Co. against the Steel & Tube Co. of America. The litigation involved a dispute over a 10 per cent sliding scale of royalties on coal mined on land leased from the Dingress Run company by the steel company. The latter company contended that the coal had not been sold but had been shipped to its furnaces in the west and that therefore no royalty was due to the plaintiff company. The court, however, ruled in favor of the coal company. The decision deals with royalties on coal mined during 1920 and 1921.

The Sitnek Coal Mining Co. of Lumberport, recently installed a set of yoked horn feeders.

The W. H. Green Co. has acquired the mine and assets of the Greenmar Coal Co., Elkins, and will operate them.

The United Mine Workers is erecting additional barracks to house evicted miners' families at Watson, Chiefton, Monongah, Ida May, Wendel and Bower.

The Grey Eagle Mining Co., a Delaware corporation, has been granted permission to transact business in West Virginia.

An extensive crushing and screening plant for coke has been constructed by the West Virginia Coal & Coke Co. at its Coalton operation, in Randolph County, and is now in operation. Sizes of coke corresponding to anthracite sizes generally in use will be prepared.

The Guardian Coal Co. has increased its capital stock from $1,000,000 to $2,500,000.

The Morrison Coal & Coke Co., of which John C. Wolf, of Baltimore, is secretary, has been authorized to do business in West Virginia and similar permission has been granted the David Thomas Coal Co., of Ohio, of which David S. Thomas, of Naugatuck, W. Va., is secretary.

The State Compensation Department has started making payments to the orphans and widows of the men who lost their lives in the recent explosion in Jamison mine No. 8, near Farmington. The total awards will approximate $100,000.

S. A. Williams, Wheeling coal operator, has entered suit against C. E. Tuttle, president of the Pittsburgh Ter-

Digitized by Google

minal Coal Corp., and his agent, B. F. Hoffacker, for $200,000, alleged to be due from the sale of 2,600 acres of coal at Potomac, W. Va., near Wheeling. The suit was filed in Wheeling. Williams declared he sold the property to Tuttle through Hoffacker, in December, 1924, and that he had received nothing in payment. He said he understood the property was to be included in the North American Coal Corporation merger, and asks the attachment of the Potomac property to prevent its inclusion in the merger.

WYOMING

Union Pacific Mine No. 4, at Reliance, was shut down during the week ending Jan. 30 as the result of a fire which broke through from old workings into the haulageway in a drift of No. 1 mine. The fire was controlled early in the week by stopping back about 800 ft. of the drift, the stops being placed at each end of the fire. This fire has been burning for slightly over 10 years and has been stopped back at various times. The fire has made it necessary to drive crosscuts from the drift to another entry so that coal could be hauled from No. 4 Mine.

Cumberland mines of the Union Pacific Coal Co. received the safety banner for the last six months of 1925, having had the lowest percentage of accidents to man shifts of any group of mines of that company. Cumberland also won the banner for the first six months of the last year. The company's accident record for 1925 shows only five fatalities during the working of almost 480,000 man shifts. The number of fatal accidents in 1924 was nine. For the second time in 25 years the Rock Springs mines, the largest of the company, were without a death.

The Wyoming Federation of Labor has organized fourteen Workmen's Educational Institutes in Wyoming, nine of which are in the coal districts. These schools, organized through the activities of Dr. R. V. Holwell, of Casper, are at Rock Springs, Superior, Kemmerer, Acme, Monarch, Gebo, Lander, Casper, Cheyenne, Rawlins, Hanna, Crosby and Hudson.

CANADA

Shipments of coal from the Larchwood basin near Shelburn, Ont., have commenced and 45 tons have been received in Toronto to be followed by other shipments within a few days. The coal is taken from an open pit 20 ft. deep. Considerable diamond drilling and some development work have been done since government geologists pronounced the coal to be anthraxoitite and of no commercial value. It is understood that an experimental test to crush and press it in a mixture of fuel or some similar scheme is to be attempted.

Toronto's 1,000-ton Alberta coal order has been awarded by the Board of Control and deliveries are to commence forthwith at the rate of six cars per week. Five hundred tons of Rosedale deep seam in egg or larger sizes will be purchased from the Rosedale Coal Co. at $4 per ton f.o.b. mines, and the other five hundred tons from the Northern Fuel Supply Co., this latter to be mixed lump at $3.75 per ton f.o.b. mines.

At the meeting of the Alberta Coal Operators' Association, held at Calgary on Jan. 23, a coal advisory board was elected to co-operate with the Alberta Government in extending the market for Alberta coal. W. W. McBain, of Edmonton, and Jesse Gouge, of Drumheller, were appointed as representatives to lay the coal operators' case before the federal government. The Premier of Alberta, who was present at the meeting, promised that his government would do its utmost to co-operate with the association in extending the coal trade of the province.

North Toronto rate payers recently held a meeting which developed into a red-hot discussion of Alberta coal. C. Edwards, a member of the Citizens' Association, dilated at length on the advantages of Alberta coal, and passed through the audience samples of a shipment which had just reached Toronto, and which, according to him, could be delivered at the consumer's doorstep for $15 a ton. This coal, he maintained, was semi-hard, smokeless and practically sootless. The audience quickly warmed up to the samples, and decided on the spot to purchase through Mr. Edwards one carload of the shipment.

Traffic

Adjust Hard-Coal Rates To Upper New York

In a supplemental order in Docket 15006, commonly known as the Anthracite Substitute Case, the Interstate Commerce Commission has removed certain existing disparities in the rates on anthracite from Pennsylvania points moving to destinations in upper New York State. These adjustments involve some increases in the single-line rates, and generally reductions in the rates for joint-line hauls. To illustrate: It is proposed to increase the present single-line rate to Albany, N. Y., to $2.75, and to increase or reduce, as the case may be, the rate for joint-line hauls to $2.88, the rates on pea size and generally on smaller sizes to be 25c. less.

Commissioners Eastman, McManamy and Hall dissented.

Reduce Some Alabama Rates Via Birmingham

By formal order issued Jan. 26 the Alabama Public Service Commission approved rates of $1.54 per net ton from Louisville & Nashville R.R. mines north of Birmingham, and $1.64 per net ton from mines of the same railroad south and west of Birmingham on coal in carloads to Florence, Sheffield and Tuscumbia, as proposed by the Louisville & Nashville, Southern, North Alabama, St. Louis & San Francisco railroads.

These new rates have been prescribed by the commission for application via Birmingham. The commission ruled that no present necessity was shown for opening of the proposed route through Decatur for the transportation of coal from Louisville & Nashville mines to Florence Sheffield and Tuscumbia. Proposal of new rates by the carriers and the order of the commission followed filing with the commission by the Florence Chamber of Commerce of a petition against then existing rates between the points named on coal in carloads, the rates in effect representing a combination of the lowest single-line rates, which it is stated, amounted to more than $3 a ton.

Obituary

Thomas F. Downing, of Huntington, W. Va., general manager of the Monitor Coal & Coke Co., died Feb. 4, following an operation in a Philadelphia hospital. Mr. Downing was born in England and came to this country when 22 years old. For a number of years before coming to West Virginia, in 1913, he was associated with the Judge Geo. W. Robertson coal interests of Pennsylvania. Mr. Downing was generally regarded as quite successful in his management of the Monitor company, which operated mines in Logan County. At the time of his death he was a director of the Logan Coal Operators' Association. Besides his widow and two daughters, Mr. Downing is survived by a son, Thos. F. Downing, Jr., of Philadelphia, who is connected with the coal business.

Col. Lloyd G. McCrum, aged 50 years, a veteran of the World War and former Somerset County (Pa.) coal operator, died at the New Haven Hospital, New Haven, Conn., on Feb. 3. He had been a patient in the hospital for a month, suffering with Bright's disease. Mr. McCrum left the Somerset coal field five years ago and went to New York, where he became manager of the Richmond Radiator Co., later becoming president of the concern. He was a native of Uniontown, Fayette County. He is survived by his wife and one daughter.

W. L. Mapother, president of the Louisville & Nashville R.R., dropped dead in the street in Panama City, Feb. 3. He was born in Louisville, Ky., in 1872 and entered the employ of the L. & N. at the age of 16. In 1902 he was appointed chief clerk of the executive department, under Vice-President Milton H. Smith, and at the age of 32 became first vice-president. Nine years later he was elevated to the directorate of the road. William G. McAdoo, war-time Director General of the U. S. Railroad Administration, appointed Mapother federal manager with supervision over the operations of the L. & N. and other roads. After the dissolution of the Railroad Administration, following the war, Mr. Mapother was elected executive vice-president in March, 1920. One year later he was elected president to succeed Mr. Smith, who had died a month before.

Association Activities

At the fourteenth annual meeting and dinner of the **Cincinnati Coal Exchange**, held last week, Burke Keeney, last year's president, formally handed the reins of office to Nolan L. Mahan, recently elected William C. Culkins, executive secretary of the Chamber of Commerce, of which the Coal Exchange is a subsidiary, was the toastmaster. The principal speakers were J. M. Dewberry, coal and coke agent of the Louisville & Nashville Ry.; J. M. Hutton, D. C. VanZandt of the Norfolk & Western lines, and George Neale, president of the East Harlan Coal Co. William Heitzman read the yearly report of the treasurer and reported that all was well with the funds.

Members of the **Montana Coal Operators' Association**, in annual meeting at Billings, Mont., re-elected all the old officers for another year. The officers are W. C. Whyte, Anaconda, president; H. S. Hopka, Roundup, vice-president; and M. F. Purcell, Billings, secretary-treasurer. Members of the board of directors are: C. C. Anderson, Seattle, Wash.; James Needham, Chicago; R. W. Wilson, Great Falls; J. M. Freeman, Red Lodge; R. D. Scott, Red Lodge; H. S. Hopka, Roundup; George Wilson, Sand Coulee, and Thomas Good, Washoe, are alternate members of the board. Outside of the election, the association transacted only routine business at its meeting.

Digitized by Google

Coming Meetings

Pittsburgh Vein Operators' Association. Annual meeting, Feb. 15, Cleveland, Ohio. Secretary, D. F. Hurd, Marion Bldg., Cleveland, Ohio.

American Institute of Mining and Metallurgical Engineers. Annual meeting, Feb. 15-17, 1926, at Engineering Societies' Building, New York City. Secretary, Dr. H. Foster Bain, 29 West 39th St., New York.

The Rocky Mountain Mining Institute. Winter meeting, Feb. 23-25, 1926, at Albany Hotel, Denver, Colo. Secretary, Benedict Shubart, Boston Building, Denver, Colo.

Canadian Institute of Mining and Metallurgy. Twenty-eighth annual and general meeting, March 3-5, at the Windsor Hotel, Montreal, Quebec, Canada. Secretary, G. C. Mackenzie, 603 Drummond Bldg., Montreal, Que., Canada.

New England Coal Dealers' Association. Annual meeting at the State Armory, Worcester, Mass, April 7 and 8. Secretary, E. I. Clark, 141 Milk St., Boston, Mass.

The American Mining Congress. Annual Exposition of Coal Mining Equipment, May 24-28, at Cincinnati, Ohio, in conjunction with the annual meeting of practical operating officials. Assistant secretary, E. R. Coombes, Washington, D. C.

International Geological Congress. The fourteenth congress will be held in Madrid, Spain, commencing May 24, 1926. From May 5 to 22 excursions of interest to the visiting delegates will be arranged. Information concerning the congress can be obtained from the secretary of the organising committee, Enrique Dupuy de Lome, Plaza de los Mostenses, 2, Madrid, Spain.

American Wholesale Coal Association. Annual meeting, June 7-9, at Toledo, Ohio, Treasurer, R. B. Starek, Union Fuel Bldg., Chicago, Ill.

New Companies

The Hackers Creek Coal Mining Co., of Buckhannon, has taken out a state charter, it has been announced. This company operates chiefly in the Hackers Creek district of Lewis County. The capital stock is $10,000. The incorporators are George A. Quertinmont, Ophelia Quertinmont, Eugenia Lambert, Emile Monnoyer and Cecile Monnoyer.

Incorporation papers have been filed in Birmingham, Ala., by the **Thacker Creek Coal Co.** to engage in coal mining, etc. J. D. Glasgow is president, S. H. Smith, vice-president; E. N. Hamill, secretary-treasurer. Capital stock is given at $22,000.

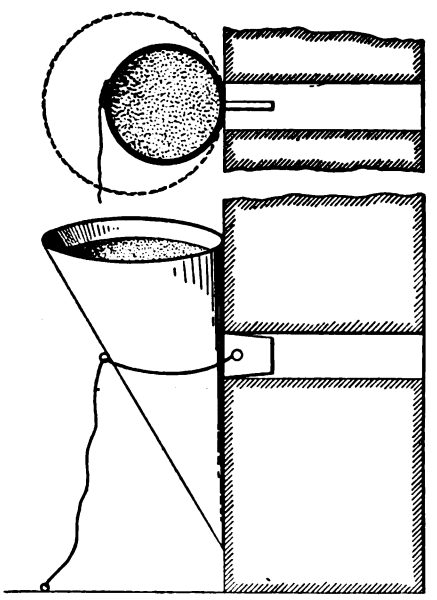
The East Kentucky Coal Sales Co., Inc., has been chartered with a capital of $10,000 to mine and sell coal in the Harlan field. The incorporators are: J. W. Thomas, Herman Dittmar, Phineas Phillips, Helen Pernice and Meyer Albert.

Industrial Notes

The Strom Division of the **Marlin-Rockwell Corp.** has moved its Philadelphia office to 1211 Franklin Trust Bldg., 15th and Chestnut Sts. A. W. Wiese will continue as manager in that territory.

William K. Vanderpoel, formerly general superintendent of distribution of the Public Service Electric & Gas Co., New Jersey, has become vice-president and executive engineer of the **Okonite Co.** and the **Okonite-Callender Cable Co., Inc.**

At the annual meeting of the **Roberts & Schaefer Co.**, Chicago, on Jan. 25, the directors created a new office of chairman of the board, to which Col. Warren R. Roberts was elected. Edward E. Barrett was elected president: John J. Roberts, treasurer; Frank E. Mueller, first vice-president; Clyde P. Ross, second vice-president, and Ray W. Arms, third vice-president.



Fraser & Chalmers of Canada, Ltd., with offices in the Canada Cement Building, Montreal, have been appointed sales representatives for the provinces of Quebec, Nova Scotia, New Brunswick and Ontario by the **Terry Steam Turbine Co.**, Hartford, Conn.

New Equipment

Dust Bag Mounts Guard Over Mouth of Shot Hole

That a bag of incombustible dust be suspended outside a shot hole—in order to provide, in front of a blownout shot should one occur, a dense cloud that would extinguish the flame—has been frequently proposed. There are two difficulties—providing for the suspension and the danger of igniting the bag.

Dr. Kruskopf, of Germany, has devised a method of driving within the mouth of the hole a truncated steel

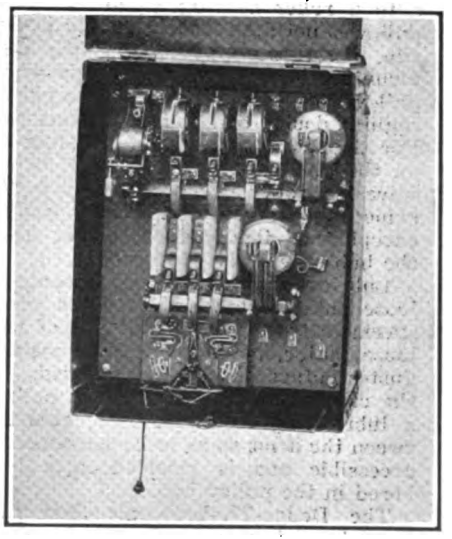
Holds Rock Dust in Place

This arrangement by which a bag of dust is hung in a loop of wire over the mouth of a shothole is intended to insure a flame-quenching cloud with each shot. The wire is attached to a wedge in the hole.

wedge or dowel which can be recovered after each shot. This wedge is perforated, and a wire about 3 ft. long is passed through the hole. As the wire and wedge fall together when the shot is fired, it is easy to find the wedge even when covered with coal. It can, therefore, be used over and over again.

Impregnated and incombustible bags of the correct size and shape are provided, and one is slipped into the loop of the wire. The loop is made of such size that the bag is held with the greater part of the dust above the center line of the hole. The bags are manufactured of such size that from 4½ to 5½ lb. of dust can be used as prescribed.

Tests made at Neunkirchen in the Koenig mine showed that no ignition took place when 17½ oz. of gelatinous dynamite blew out, the shot having been tamped in a 2⅞-in. hole with one tamping cartridge of rock dust and protected by 2.2 lb. of dust in a bag of the kind described. The hole was 2 ft. deep and 8 to 9 per cent of methane was present in the atmosphere. When a shot of 78 grains of the same explosive, without tamping or exterior protection, was fired the gas exploded despite the fact that the loading was only about one-hundredth as large. The Wolf Safety Lamp Co. of America, 220 Taaffe Place, Brooklyn, is prepared to supply this equipment.



Improvements in Starters Increase Reliability

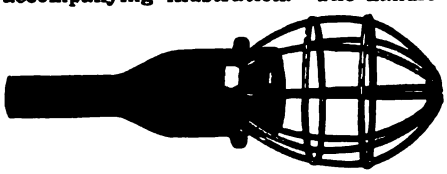
Primary resistance starters for squirrel cage induction motors built by the General Electric Co. and designated as CR-7056-D-1, have been superseded by two new types, the CR-7056-D-3 in sizes up to 25 hp., and the CR-7056-D-4 in capacities from 25 to 50 hp. The D-3 is provided with arc barriers and the D-4 is equipped with magnetic blowouts and arc chutes, permitting the handling of the larger motor currents. Both starters have an improved magnetic time interlock, an important change being that the operating spring is in compression instead of tension. The interlock can thus be adjusted more easily.

These resistors also have been redesigned and enlarged to give greater capacity, and conform to Classification No. 16 of the Electric Power Club, which provides 200 per cent full load current or more on the first point for 15 sec. out of every 4 min.

The inclosing case of the D-3 starter opens from the top, is ventilated, has two 1¼-in. knockouts in the top and has two knockouts of the same size in the bottom. These provide ample space for power and control wires. The cover may be padlocked shut if desired.

The inclosing case of the D-4 starter is larger than that of the D-3, in order to make room for the increased size of

New Starter With Cover Raised



This is a starter of the larger type intended for serving motors from 25 to 50 hp. The smaller sizes, however, or those of less than 25 hp. are similar, differing only in detail.

Digitized by Google

the equipment. This case opens on the side and, like the D-3, can be padlocked shut if desired. It is provided with two, 2-in. knockouts in both top and bottom. Both forms of starter are arranged for wall mounting and have an approximate weight of 122 lb.

Portable Insulated Socket Prevents Short-Circuits

In many places in and about the mine and mine plant, both above and below ground, portable electric lamps on extension bars are necessary for a proper execution of the work in hand. To meet the demand for a safe equipment of this kind, the Daniel Woodhead Co., of 15 North Jefferson St., Chicago, makes the portable socket cover shown in the accompanying illustration. The handle

Strong Insulated Portable Socket Cover

of this device is made of a high-grade rubber compound so proportioned as to withstand the abuses common to the type of service in which it will be used. The wire guard also is insulated to prevent possible shortcircuiting during inspections behind switchboards.

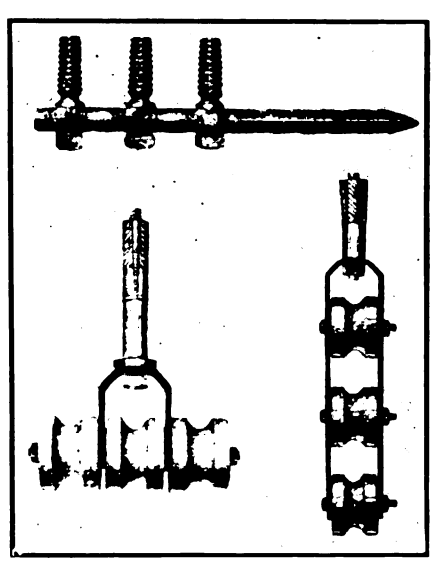
Loose Pulley Is Fitted with Roller Bearing

A new loose pulley that incorporates the advantages claimed for the tapered roller bearing, as well as certain other desirable features, recently has been introduced by the Dodge Mfg. Corp., of Mishawaka, Ind. This pulley includes a Timken roller bearing in its hub and the new pulleys are now available in both iron and steel.

The roller bearing loose pulley consists of an Oneida steel pulley provided with an extra large bore to accommodate a roller bearing mounting. The pulley is not split, but is riveted at the rim, the clamp hub holding the unit mounting in place. The loose cast-iron pulleys are made from the company's regular double-belt solid iron patterns. For diameters up to and including 20 in. the pulleys are counterbored to receive the roller mounting which is the same as that used in the steel pulley except that the housing is not used, the hub serving as the housing.

Lubrication, always important in loose pulley operation, has been given special attention in the design of this loose pulley, and, in addition, positive dust-proofness has been provided. In the case of both steel and iron pulleys a lubricating feed pipe is located between the arms so as to be conveniently accessible and is inserted in a hole bored in the pulley hub.

The Dodge-Timken unit mounting consists of two tapered roller bearings mounted on a ground steel tube and fitted to an accurately machined cast-iron housing. Grease seals and two clamping collars are mounted on the threaded ends of the steel tube. The tube is slotted and threaded at each end and is held to the shaft by the two collars which are used to obtain accurate adjustment of the bearings on the steel tube. In diameters over 20 in. the pulleys are bored straight to receive the unit mounting which is secured by set screws. The special grease seals positively prevent dust from working in or the lubricant working out.



A feature that the manufacturer considers of importance is the availability of both iron and steel loose pulleys from stock. The pulleys are made with standardized bores and the unit mountings have standardized outside diameters to accommodate all ordinary shaft sizes. It is, therefore, possible in certain cases to change the bore of the pulley by merely applying another unit with a housing having an outside diameter conforming to the pulley bore and with a tube to accommodate the desired shaft diameter.

Simplified Suspensions for Three-Wire Feeder Lines

Three schemes for suspending 3-phase feeder lines or combining other circuits onto one bracket are provided by new devices developed by the Ohio Brass Co. Each of these devices has three insulators or spools assembled so as to carry three wires with the use of only one expansion bolt or barbed pin.

In one, the right angle triple-pin type attachment can be made either in the roof or wall by means of the barbed pin. Thus either a horizontal or a vertical position of the insulators is secured. This fitting uses any standard 1-in. threaded insulator and, consequently, can be used where it is desired to take advantage of high tension porcelain insulators. All three are accessible and the device is said to be easy to erect.

The other devices are modifications of the clevis frame used with the O-B Type C single spool assembly, adapted to carry three spools. Attachment to the roof is made with an expansion bolt. In one, the spools are mounted one above another and in the other the three spools are carried side by side on a bolt extended through the clevis. In addition to use for 3-phase power feeder lines these fittings are being employed in combinations of phone lines, signal wires, feeder and other circuits, thus simplifying construction.

Handy Suspensions for Three-Wire Circuits

Standard insulators are used exclusively and in every case all three are held in place from a single attachment. This greatly simplifies circuit suspension.

Galvanizing Does Not Render New Castings Brittle

Hot-dip galvanizing has long been recognized as one of the best known methods for rust-proofing castings. Unfortunately, however, ordinary malleable castings are frequently rendered brittle by this process, although experience has demonstrated the great desirability of this method of zinc coating as a means of preventing rust. In order to overcome the deleterious effects of the process upon malleable castings, The Ohio Brass Co., of Mansfield, Ohio, has developed a new metal, called "Flecto" iron. This is a malleable iron which, by virtue of a heat treating process, is rendered immune from all tendency to become brittle when hot-dip galvanized. In addition also to retaining all the desirable characteristics of malleable iron, this process so improves the quality of the metal that it is considered as being practically a new alloy.

Although announcement of this new process is only now being made, it is understood that all malleable iron castings produced by this manufacturer during the past few years have been treated by this process. Announcement has been purposely withheld until the metallurgy of the new material might be thoroughly proved by practical use in the field. The most valuable characteristic of the new iron is that it will stand galvanizing by the hot-dip method without any tendency to become brittle. It, therefore, always retains its malleable property. In fact, treatment of castings by the new process so improves their physical characteristics that all castings of this company are now being treated by this process, whether they are to be galvanized or not. The process for making the new metal is patented, but is available to other manufacturers under liberal license agreements.

Trade Literature

The Link-Belt Co., Chicago, Ill., has issued **All-Purpose Crawler Crane Book No. 895**, containing 48 pages and illustrating and describing the use of the dragline, dipper and trench shovel, skimmer scoop, hook blocks and piledrivers. Data on lifting capacities are given.

General Electric Co., Schenectady, N. Y., has issued the following bulletins: GEA-255, G-E Arc Welder, Type WD-11; GEA-67, CR-2931, **Float Switches for Automatic Pumping Equipments**, Water Level Control; GEA-9, **Gas Engine-Driven Arc Welding Sets**, consisting of a WD-12 generator and Buda engine. These folders are 8 x 10½ in. and illustrated.

Westinghouse Electric & Mfg. Co., East Pittsburgh, Pa., has issued a 56-page catalog on **Safety Switches**. Included in the catalog is a new type of safety inclosed switch, externally operated and with a quick-break mechanism; a quick-make, quick-break compensator switch made in capacities of from 30 to 400 amperes; a Universal meter trim also is described. At the end of the catalog comparative switch information and wiring data are given.

Belt Conveyors Win Their Way In Room Mining—Page 255

COAL AGE

The World's Accepted Authority on Coal Mining

McGraw-Hill Pub. Co., Inc. **February 18, 1926** Price 20 Cents per Copy

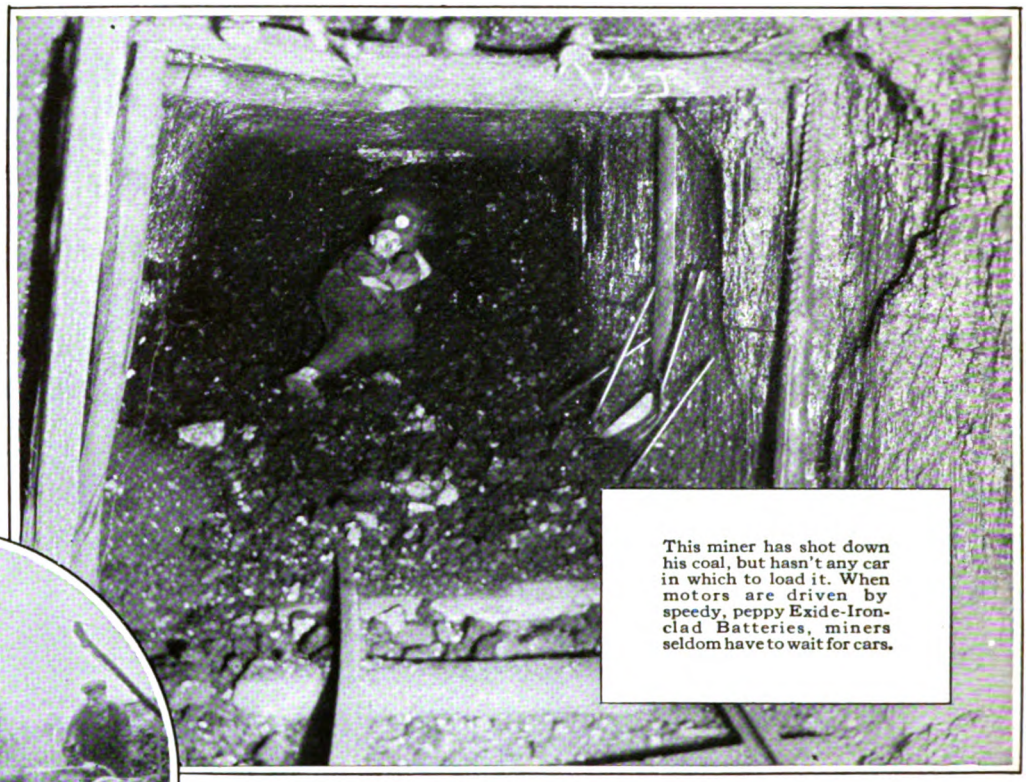
The answer to lower cost of "mining"
271 billion gallons!

The industry "mines" 2½ times as many tons of water as of coal. To lower the cost of operating the 60,000 pumps required to take care of this water "tonnage" the industry is depending upon automatic pumping.

Automatic pumping is now saving thousands of dollars a year for mines in all parts of the anthracite and bituminous regions. No denying its revolutionary economies in labor, maintenance and power costs.

The Hazleton Automatic Pumping System can be applied to ALL centrifugal pumps—old or new—of ANY make. The very simple automatic apparatus has been recently made even simpler. Every mine official should learn the latest news on the development of this automatic system. Write today.

WRITE FOR BOOKLET



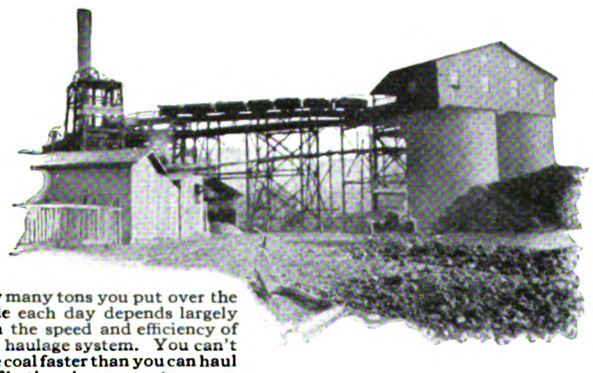
Write for your copy of the Hazleton 24-page Booklet, giving complete details on automatic control and operation of centrifugal pumps.

BARRETT, HAENTJENS & CO., HAZLETON, PA.

HAZLETON PUMPS

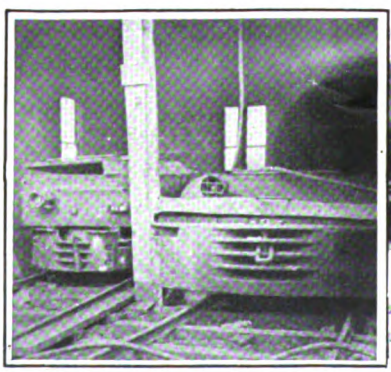
MANUFACTURED IN THE HEART OF A GREAT MINING REGION

Digitized by Google

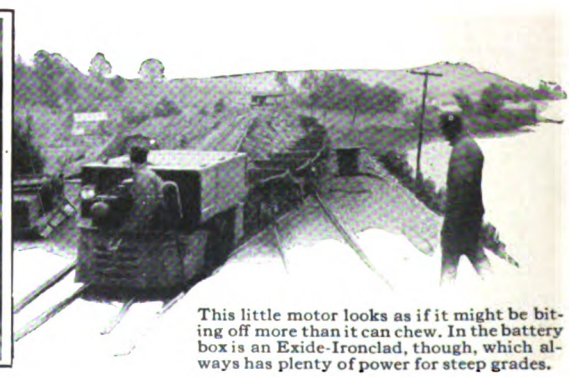


The camera caught this trolley motor at the instant it was taking the rails after jumping the track. (Note the stick snapped in half by the weight of the wheel.) Battery motors often jump the track, too, and then the ruggedness of the battery is severely tested. If the battery is an Exide-Ironclad, however, you need not worry.

This miner has shot down his coal, but hasn't any car in which to load it. When motors are driven by speedy, peppy Exide-Ironclad Batteries, miners seldom have to wait for cars.



More Speed
and less cost in hauling coal



How many tons you put over the tipple each day depends largely upon the speed and efficiency of your haulage system. You can't mine coal faster than you can haul it. That's why more tons are mined daily when Exide-Ironclads drive the haulage motors.

IF you equip your battery motors with Exide-Ironclad Batteries you will not only speed up your entire haulage system but also cut down the cost of moving each ton from the face to the tipple or breaker. The Exide-Ironclad's speed and pep last all day; its power on grades is great; its charging efficiency is high; its repair cost almost nil; its life long; and its first cost reasonable. Send for free booklet, No. 1791—"Facts for Consideration in *Selecting a Battery* for Locomotive Service."

These motors have done their day's work and are on charge. They are taking current quickly, easily, and wasting very little of it, for the batteries are Exide-Ironclads, and this battery is extremely efficient on charge.

This little motor looks as if it might be biting off more than it can chew. In the battery box is an Exide-Ironclad, though, which always has plenty of power for steep grades.

And Now— The "Jigger"

CONVEYORS COMMAND ATTENTION. They simply cannot be held in the coal industry's background. Conveyors, conveyors, everywhere, speeding, shuffling, shaking and jigging. Next week "the original jigging conveyor," the Eickhoff, as it operates at Toms Creek, Va., in Pennsylvania, and in Wyoming will be described by Frank H. Kneeland, associate editor. He is just back from Virginia with first-hand impressions of the performance the German machine is giving in the mines of the Virginia Iron, Coal & Coke Co.

Mr. Kneeland likes a good many things about this "jigging," electrically driven, sectional, trough conveyor. It seems designed particularly for low coal such as that at Toms Creek but is giving a good account of itself in thicker beds. It fits into almost any method of mining and even can be equipped with a stout end section which can dig and load coal into itself in narrow work. It serves in ordinary room work and slabbing and also is readily applied to pillar drawing. When a room is driven up the full distance a break through is turned through the pillar either right or left. A cross feeder chute is installed in this break through and driven from the main conveyor. The pillar is then brought back by successive cuts.

In his article, the author suggests some ideas in mining methods which may prove helpful to those who are now using the Eickhoff machine or who will use it in the future. He suggests, also, an improvement in the driving mechanism, but his general conclusion is that the machine if properly applied, offers great cost-cutting possibilities in coal mining.

Weight Drop Machine for Testing Malleable Iron.

A New Malleable

O-B FLECTO IRON

Insurance against breakage of Hot-dip Galvanized Malleable Fittings

HERE ARE TWO identical test pieces of Hot-dip Galvanized Malleable Cast Iron. Both were made from the same raw materials, in the same furnace, and under the same working conditions.

What is the difference?

Simply this.

The test piece on the left is galvanized O-B FLECTO IRON. It bends. It is ductile. It will not break in service. It is your insurance against broken or brittle malleable fittings.

The other is just regular good hot-dip galvanized malleable iron. Frequently it is brittle.

O-B Flecto Iron

is the material of which the following O-B products have been made for the past two years.

Catenary Hangers
Mine Trolley Harps
Pole Brackets
Pole Hardware, Miscellaneous
Suspension Insulator Caps
Suspension Strain Clamps
Suspension Wire Clamps
Trolley Bases
Trolley Catchers
Trolley Retrievers
Trolley Clamps
Trolley Cross-overs
Trolley Frogs
Trolley Hangers
Trolley Pull-overs
Wood Strain Insulators

Hot-dip Galvanizing of malleable iron has a tendency to cause it to become embrittled. Experience has shown that an average of 20%, or 1 out of every 5 ordinary malleable castings are brittle after galvanizing. Out of the same heat, after hot-dip galvanizing, part of the castings will be brittle—while the remainder will retain their malleable properties.

Many attempts have been made to dodge the real problem by the use of substitute methods of rust-proofing. Yet the fact remains that no commercial protective coating, yet invented, is quite as good as hot-dip galvanizing.

Through long research, the Ohio Brass Company has developed a special heat treatment that causes the iron to retain its ductility after galvanizing. It actually makes brittle iron good and good iron better. It eliminates the faulty 20%. This special process raises the shock resisting qualities to the maximum and makes this maximum permanent. The product of this new patented process has been named "Flecto Iron".

Really, O-B Flecto Iron is not new. For the past two years all O-B Malleable Castings have been made of Flecto Iron. And through the most severe test—the test of service—this iron has proved its worth. Now, with the product thoroughly proved, the process is announced.

Lewis Defeated

THE LARGEST coal strike on record in American industrial annals closed quietly and swiftly, and without the blare of publicity. Shorn of pretense and smoke-screenings, the victory was to the public and to the operators, and defeat to the dogged leader of the union forces. The union "vowing it would ne'er consent, consented" to arbitration, although the forbidden word was kept out of the simple document which recorded renewed co-operation. The check-off, also excluded by name from this document, was circuitously referred to in a paragraph which specifies that it and other inside arrangements between operators and union officials shall be the subject of "negotiation." The demands of the miners for fixed wages for five years—an impossible economic condition—were successfully resisted; and afterward they lessened the demand to a two-year fixed wage. The crumb which the union finally obtained was a fixed wage scale for less than a year and after that a wage subject to arbitration. What private understanding, if any, the opposing sides may have other than the signed agreement, is of course not certain; but it is certain that the operators backed by the public and by the President, have been able to resist arbitrary and ruinous demands which could only have led to economic and social disaster. This conclusion is accentuated by the loud peals of victory given off from the headquarters of the union leaders, while the operators maintain a demure and resigned attitude. If there was any private understanding concerning the terms of settlement, one is inclined to think it was that Mr. Lewis should be allowed to roar to his followers that he had achieved a great victory and be permitted to "get away with it." And there is no doubt that his misguided followers, impoverished and without advantage, will believe that they have won, and experience the joy and contentment that goes with it.

One point of Administration strategy glimmers out now which was not open to detection before. The Administration policy was, wisely, hands off, and resistance to the strategy of Lewis to get the government to intervene. And to cover the situation the President had written Congress asking it to give him the aid and administrative authority recommended in the report of the U. S. Coal Commission. This, then, was his reply, and that of his party, when Democratic politicians demanded the intervention of the President—that Congress should heed his earlier plea and give him the advantage of position asked for. Now that the strike is settled, it appears that those Republican heads of committees in Congress who had in charge the introduction of the special legislation asked for, will take action. "It was not proper," they say, "to embarrass the President by bringing this up during the strike." No cleverer piece of politics could be imagined; and it was sound sense withal.

The present crisis over, the anthracite industry will apply itself to the problem of regaining its lost markets, to problems of how to keep the price of coal down through keeping the cost down. And lower wages do not necessarily mean reduced costs. The American system, amply tested since the war, and only instanced by the methods of Henry Ford and others, is that in many cases high wages mean low costs. Mechanicalization, system, efficiency, cutting out of waste, reduce costs; but frequently low wages go along with high costs, for they are symbolic of a generally slack system of operation. In this general contention the union leaders have been correct. The coal operators beyond doubt have these big problems fully in mind.

Make the Standby Automatic

ONLY SEVEN YEARS AGO the representatives of a large electrical manufacturer discouraged the officials of a certain coal company in their quest for a truly automatic substation and spoke disparagingly of its possibilities. At that time the manufacturer in question had sold several such stations for street railway work but considered the equipment too complicated for installation at the mines. Today automatic electrical control has become standard practice at mine plants and the equipment is believed to be more reliable and dependable than a substation attendant.

Following the same line of thought, why should not automatic starting equipment be provided for the internal combustion standby engines installed for fan drives? There are instances where two or three men are employed at remotely located fans chiefly for the purpose of starting the standby engine in case of failure of the electric power supply. The cost of such attendance usually ranges between $3,000 and $5,400 per year.

Engines that have found greatest favor in fan standby service are now equipped with electric starters. So far as automatically starting the engine itself is concerned, therefore, it would appear that the addition of a few relays would be all that would be necessary. In order to insure prompt starting of the power unit in cold weather, however, an electric fumer or vaporizer might advisably be installed. If the engine is direct connected to the fan it drives, the interposition of a magnetic clutch would facilitate connection of the two machines after the prime mover had been brought up to speed.

As to the reverse operation, stopping the engine and reconnecting the fan to its driving motor upon return of line power, this also could be accomplished automatically but probably this would not be necessary. Instead it might be found advisable to dispatch a mechanic to the fan whenever a suitable signal indicated that the standby unit had been called upon to start. This man could remain at the fan and stop the engine upon restoration of normal conditions.

Digitized by Google

Some expensively operated steam fans are now in use that would have been changed over to electric drive long ago had it not been considered necessary that an attendant be kept at the fan at all times to start the standby engine if line power were utilized. The extensive adoption of automatic starting for gasoline engines employed as fan standbys would effect appreciable total savings in the coal fields as a whole.

Coal Will Serve the Farmer

THOSE WHO FEAR a decline in the gross consumption of coal in this country, because greater and greater boiler and furnace efficiencies are being obtained in the burning of this fuel in the larger steam plants, forget that a limit to the exercising of efficiencies exists and that the gaining of higher efficiencies becomes increasingly difficult. The growth of power consumption is so rapid that fuel saved by improved practices in central stations—and more besides—will be required.

The future power demands of the farmer will contribute to a healthy growth of the coal industry. The agriculturist will establish greater stability in coal as his requirements will be regular; for he is active even when those engaged in other industries are idle. People must eat whatever else they may refrain from doing.

The coal industry should take heart in what was said relating to the future of the farmer, at the annual banquet of the Engineers' Society of Western Pennsylvania, in Pittsburgh on Jan. 25. Gen. Guy Tripp, chairman of the board of directors of the Westinghouse Electric & Manufacturing Co., pointed to the need for a wide application of power to jobs on the farm and conceded to the farmer prosperity by this means.

Later, as a side issue in his address, George E. Roberts, financer and economist of New York City, dealt with the economic side of farming. About one-third of the population of the United States lives on farms. Products from the soil are generally in excess of domestic consumption. This fact is viewed with alarm by many economists who point to it as one of the reasons for the financial embarrassment of the farmer in the past. But Mr. Roberts believes otherwise; he thinks there is no immediate danger of our farmers exceeding an economical limit of production. The surplus of products will be taken gladly in foreign markets. His views coupled with those of Mr. Tripp depict clearly a situation of the future which will affect the coal industry for the better.

The needs of the American farmer will necessitate a gigantic power program in which transmission lines will be extended in every direction to the farms. Being a more or less heavy industry farming will consume much electrical power. The coal industry will expand thereby in about the same degree as the interests which produce power.

Lighter Wheels, Heavier Loads

IN THESE DAYS of low prices and fierce competition no stone is being left unturned to decrease coal costs. One means of furthering this end that is now receiving serious attention in some quarters is the substitution of steel for iron wheels on the mine rolling stock. Several advantages are realized from this change.

Heretofore the chilled-tread, cast-iron wheel has been used almost exclusively on American mine cars. England and Canada, on the other hand, have long been users of the steel wheel. It seems really strange, therefore, that the United States has been so backward in its adoption.

Steel casting is far tougher and more ductile than cast iron. It is however, more difficult to produce. A steel casting is much more liable to be rough, contain blow holes, cold shuts and the like than iron which melts and pours at a far lower temperature. Consequently a good steel casting is harder to manufacture and correspondingly more expensive than is an iron casting of comparable quality.

At the present time several coal companies are trying out steel wheels on their mine cars. Such wheels are much lighter than those made of cast iron and will withstand spragging better, although the practice of using sprags is fast going to the discard. In wrecks or derailments also steel wheels are less vulnerable. Under heavy shock or impact they will bend or distort whereas an iron wheel will break.

It is probably the lessened weight, however, that appeals most strongly to the coal-mining man. A certain company in Kentucky that employs nearly 2,000 mine cars has reduced the weight of the individual wheels from 174 to 100 lb. (both limits being approximate) through the substitution of steel for iron. This is a decrease of roughly 43 per cent in the weight of the wheel itself and means that a steel-wheeled car weighs about 300 lb. less than one fitted with iron wheels.

Assuming that the new wheels will rotate as easily as the older ones any decrease in their weight signifies that a locomotive with a given tractive effort will be able to haul as much more coal as the trip is decreased in weight. In the Kentucky instance the decrease in total car weight resulting from the substitution of steel wheels for iron is about 7 per cent. Thus a locomotive capable of hauling a trip of 14 cars fitted with iron wheels could haul 15 cars equipped with the lighter steel wheels, the weights, capacities and loadings of the car bodies remaining the same.

Mechanical Sparks

A WORKMAN recently repairing a leaky gas main in New York City tried to cut the pipe with a chisel. The resultant spark set fire to the gas causing a violent explosion. The danger of mechanical sparks igniting methane when an atmosphere with an explosive mixture of the gas exists in the mine should not be overlooked. The only safe corrective is to create a ventilating current that will remove the gas, perhaps not from the immediate point where the spark is struck but in the air around it.

It may be impossible to ventilate an under or other cut in the coal—any application of a fan specially to perform that service might add to the hazard and would raise the fine dust—but the working place should always be so ventilated that the gas if ignited will not find in the air of the room sufficient fuel to propagate the flame.

The disaster at the Horning mine, some say, was due to a mechanical spark igniting gas and to the gas igniting coal. In isolating the fire an explosion occurred. The operating company had made every effort to keep the mine safe. Nevertheless, it may be said that if the ignition was from a mechanical spark, had the cutter-bars been sprinkled the gas might not have ignited, and had a box of rock dust been available the fire might have been extinguished.

Flexible System of Belt Conveyors Is Applied To Thin-Seam Room-and-Pillar Mining

Pennsylvania Coal & Coke Corp. Builds and Uses Two Types—20-Ft., 470-Lb. Self-Contained Units at Face Deliver to Main Belt on Rollers Between Posts

By J. H. Edwards
Associate Editor

EXPERIENCE during the past eighteen months in the mines of the Pennsylvania Coal & Coke Corporation with belt conveyors in room-and-pillar mining has proved the practicability of this system. This company, which operates thirty-two mines in central Pennsylvania, was one of the first to develop in a practical way the use of self-contained short-length belt conveyors. The company was also a pioneer in the use of jack-supported main conveyors for rooms.

Belt conveyors are now operating in three of the mines. During the past year 33,100 tons were loaded over belts. Additional conveyors are now being built in the company shop to increase the tonnage mined by this method.

After considerable experimentation the company is using a 20-ft., self-contained belt conveyor unit parallel to each 30-ft. face, arranged so that it discharges onto a belt conveyor of another type laid along the rib to a car loading point at the room neck. Two wide rooms may be worked simultaneously by the short transverse conveyors serving one main conveyor. As the face advances the main conveyor is lengthened by the use of a number of the 20-ft. units working in tandem until the distance is great enough to permit a 50-ft. extension of the main belt.

The main conveyor consists of a head or drive section, one or more 100-ft. lengths of 22-in. composition belt, a number of sets of wooden idlers and light-weight roof jacks. Fig. 2 shows one of these main conveyors in use in the Moss Creek mine of the company, where a good deal of the experimenting was done. The head section, which is the one mounted at the entry, has two drive pulleys and an idler. As shown in Fig. 3, the motor is belted to the head pulley *A*, the shaft of which is connected by a chain to the other driving pulley, *B*.

In the space between the head and tail sections the idlers supporting the belt are wooden rollers, mounted 6 ft. apart. The upper or troughing idler consists of three pieces, one cylindrical and two cone-shaped. The bottom idler is cylindrical and made in one piece. The bottom roller is omitted from alternate idler sets. This means that the lower strand of the belt is supported at 12-ft. intervals.

The rollers and bearings are of simple construction. The wood is bored somewhat larger than the shaft and molten babbitt poured around in a mandrel to form a bearing. Lubricant is applied to the rollers only when the conveyor is moved to a new room. At that time the hole in the roller is stuffed with grease and the shaft is pushed through it.

The main conveyor is extended in 50-ft. lengths—that is, by splicing in 100-ft. sections of belting as the room progresses. To make the extension it is necessary only to open a splice in the belt, move the tail section 50-ft. ahead, set up seven idler sets, and splice in the extra 100-ft. piece of belting.

Temporary extensions to the main conveyor are formed by using one, two, or three of the 20-ft. self-contained conveyors which are interchangeable with that used across the face in a 28- to 30-ft. room. As an extension to the main conveyor, these short conveyors are lapped, one over the other, as shown in Fig. 1. The extension can be varied by changing the length of lap. The 5-in. wooden side boards of the short conveyor are removable in sections in order to provide for this lapping.

In Fig. 1 is shown one of the 20-ft. lateral or face conveyors emptying into a similar conveyor which is serving as an extension to the main. The head end of the face conveyor is elevated by being set on a "horse" made with wooden legs and a pipe cross member.

Construction of the 20-ft. conveyors can best be explained by referring to the shop views, Figs. 4 and 6. The light weight of this device is such as would seem to qualify the mechanics of the company to design and build airplanes. The unit, complete with the 16-in. belt but without the 1-hp. motor, weighs only 470 lb.

The main frame of the unit is made up of two 3-in. light-weight channels, an 18-ft. sheet 16 in. wide by ⅛ in. thick and two 2-in., wood-filled steel angles 20 ft. long. No idlers are provided. The upper strand of the belt slides on the steel sheet, and the bottom strand is supported every 3 ft. by a cross-piece of ½-in. pipe.

IS THIS A PROPHESY FULFILLED?

WHEN the modern surge toward mechanical loading underground got well on its way a few years ago a good many sound mining men declared the industry would shift from one fanciful scheme to another but eventually would come back to old-fashioned room-and-pillar methods of mining no matter what sort of machines they used. These men held that it was wrong to make the system of mining conform to the machine. The machine, they thought, ought to conform to the system of mining. This is exactly what the Pennsylvania Coal & Coke Corporation has done. It has made use of the flexibility of the belt and applied it as fully as possible to old-style mining layout. The performance of the belt units thus far has been good. The future must speak for itself.

Digitized by Google

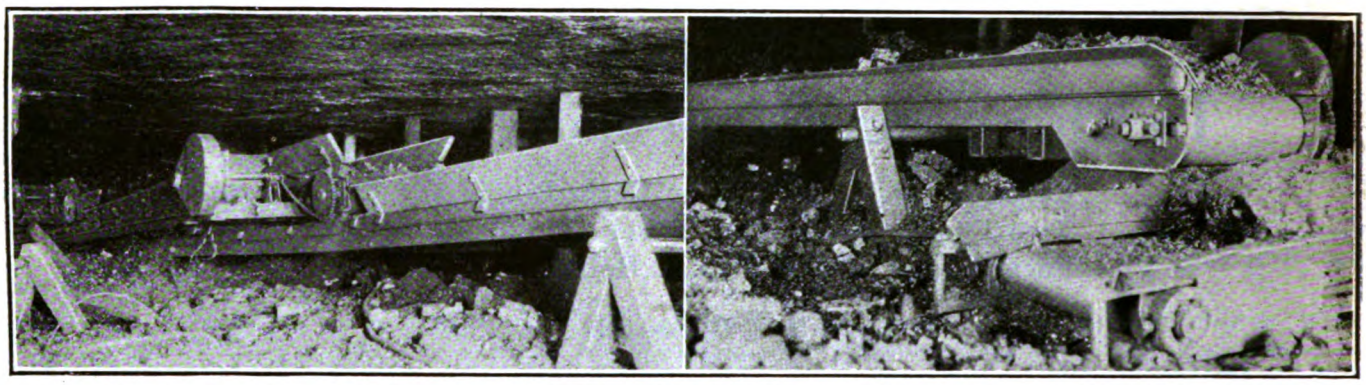

Fig. 1—Overlapping Conveyors Extending Back to the Face Discharge Coal Into Main Belt

The view at the left looking toward the face, shows three 20-ft. unit-conveyors acting in tandem as an extension. These units are used until the face advances far enough to allow a 50-ft. extension on the longer conveyor. The center unit is lapped several feet over the one in front of it, which has a section of the side boards removed to permit this arrangement. The picture at the right in this pair shows the unit conveyor discharging into the main. The room is 30 ft. wide. The use of a 20-ft. lateral conveyor at the face leaves space for stabling the mining machine at one end. After the cut is made the conveyor is advanced to within 2 ft. of the face. Some of the coal falls on the belt when the shot is fired.

The ⅛-in. sheet is kept from sagging through the center by a number of ¾-in. cross angles set 18 in. apart.

In the construction, electric welding takes the place of all riveting. The crowned, squirrel-cage drive pulley, of 6½-in. diameter, is made up by welding twenty ⅛- x ¾-in. strips to five disks which in turn are welded to the shaft. A screw adjustment of 6 in. for belt tightening is provided at the tail pulley.

TAIL PIECE AIDS MACHINE

An important detail of the construction is a tail piece which follows back the tail-pulley bearing filling the gap between the upper and lower strands of the belt and preventing the entrance of fine coal. The white mark near the head of the adjusting screw, Fig. 6, indicates the back end of this tail piece which slides against the web of the channel. Some of the first conveyors which were built without this device gave trouble. The belt stuck because fine coal worked its way between the strands.

The widening portion of the side frames at the drive pulley is formed by splitting the 3-in. channel, expanding it to 7 in. and welding in a filler web to support the bearing. To date, thirty of these 20-ft. conveyors have been built in the company shop at Gallatzin, Pa. All parts are made interchangeable by the use of jigs for forming and drilling. A roller chain is used for the single-reduction drive between the motor and head pulley.

The illustrations which show the conveyors at work were taken in Moss Creek mine, No. 21, at Marstellar, Pa. This mine is in the Lower Freeport seam which has an average thickness of about 40 in. in the section where the conveyors are used. About 6 in. from the bottom of the coal there is a parting consisting of 1 to 2 in. of "mining slate." Above the coal is 2 to 4 in. of draw slate, and over that 8 to 12 in. of what is locally termed "cannelized slate."

Fig. 5, taken from the mine map, indicates the methods employed in a series of eleven rooms, each 275 ft. long. The positions of the main and 20-ft. conveyors, as they were arranged when the photographs were made for the illustrations in this article, are indicated in full lines. The positions of the main conveyor while mining rooms Nos. 1 and 10 inclusive, are shown by the dotted lines.

Rooms 1 and 2 were driven double with the main conveyor in room 2. The coal from room No. 1 was moved through the crosscuts to the main conveyor by means of the 20-ft., self-contained conveyors. Drawing the pillars proved difficult. An unfavorable cave while drawing the third pillar influenced the management to try a different method on the next set up.

DIFFERENT METHODS TRIED

The three-room system was tried on rooms 3, 4 and 5, with the main conveyor in room 4, which was driven only 10 to 12 ft. wide. In this case the pillars were drawn with less trouble but at an unfavorable cost. In the next set up the three-room system was tried again, the main conveyor being installed in the narrow room, No. 7. Here was tried the idea of drawing pillars by starting with a diagonal crosscut. The principal objection to this was the use of too many conveyors.

Rooms 9 and 10 were driven double with 15-ft. pillars between, and no attempt made to recover the pillar

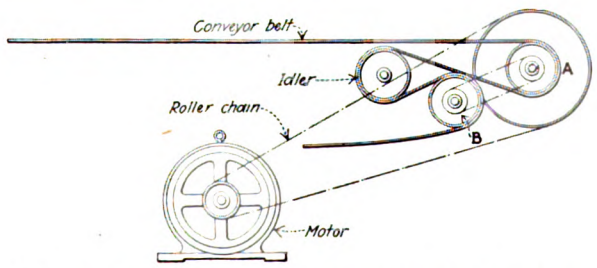

Fig. 3—Drive Scheme at Head of Main Conveyor

The motor is belted directly to a large pulley mounted on the same shaft as the conveyor-belt pulley, *A*. The other belt drive pulley, *B*, is connected to the first by a roller chain.

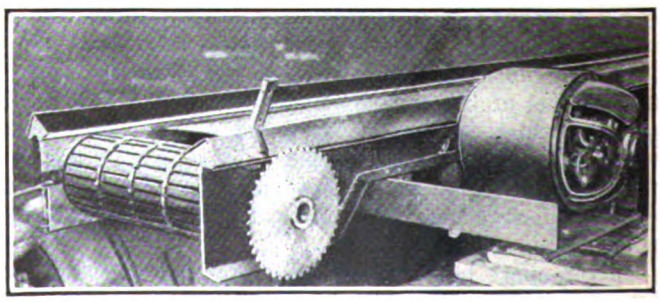

Fig. 4—Drive End of 20-Ft. Conveyor

Without the ¾-hp. motor but with the belt, the conveyor weighs only 470 lb. Electric welds take the place of all rivets in the construction. Instead of the belt rolling over idlers, as on the main conveyor, it slides on the sheet-steel bottom. The drive pulley which has a diameter of 6½ in. at the crown is made light by squirrel-cage construction.

Digitized by Google

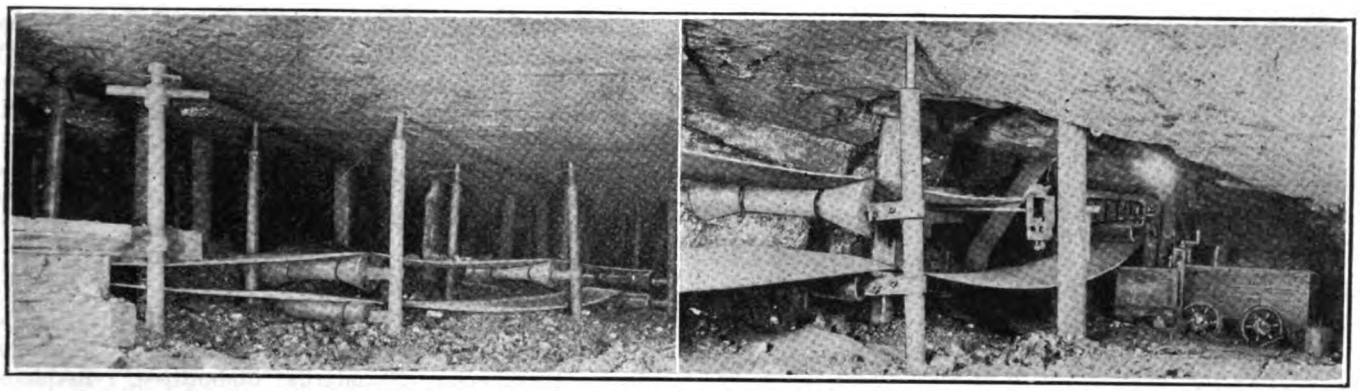

Fig. 2—Belts Supported Thus Transport Coal from Face Conveyors to the Loading Point

The tail end of the main conveyor is shown at the left of this pair of pictures. The conveyor is operating in a room 30 ft. wide. One end of the frame of section equipped with a take-up mechanism can be seen in the left side of the photograph. The belt, which is 22 in. wide is in 100-ft. lengths. The head or discharge end of the main conveyor appears in the photograph at the right. The steel frame of this drive section is only 15 ft. long. The motor is belted to a pulley mounted on the shaft of the end driving-roller. The idlers supporting the belt are of wood with babbitt centers. The upper or troughing idlers are in three sections each turning freely on the shaft. This plan of carrying coal out of rooms by belt has some advantages due to its flexibility.

coal. In this instance the main conveyor was set up in room 9. Of the various methods tried up to this time the latter proved the most attractive from the standpoints of safety and cost.

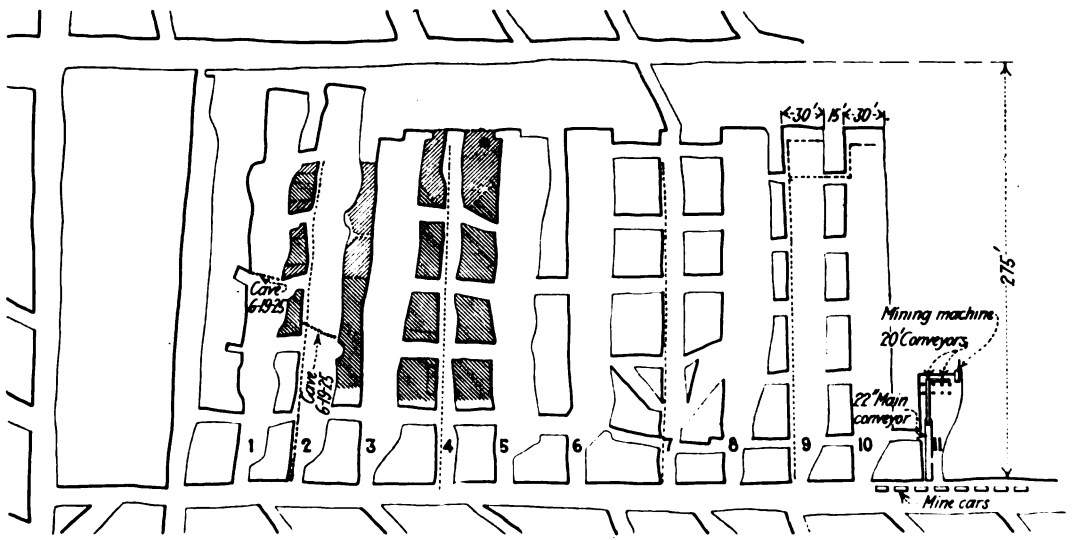
ONE ROOM DRIVEN SINGLE

No. 11 room, the one being worked when the photographs were made, is being driven single in order to obtain a cost comparison between that and the double-room method. In this place four men were employed at the face and one at the entry. From 12 to 18 in. of top is taken down at the loading point on the entry to provide head room for the main conveyor and its drive pulley. The main and the 20-ft. conveyors are all controlled by the entryman. The 30-ft. face is undercut to a depth of 6 ft. with a shortwall machine. After a cut is finished the machine is stabled at the end of the lateral conveyor on the opposite side of the room from the main conveyor.

The cycle of operations at the face is as follows: After the completion of a cut, the lateral conveyor is moved to within 2 ft. of the face, and posts set back of the conveyor on 3- to 4-ft. centers. The coal is then drilled by hand and is shot with permissible explosives set off by a magneto-type firing battery. Some of the coal falls upon the conveyor, which has the side board removed from the side next to the face to prevent damage to the board, and to decrease the shoveling height.

The four face men then start loading the half of the face on the side where the machine is stabled. After this section of the face is loaded, two of the men sump in with the machine and start the next cut. When they have cut as far as the coal is loaded, they leave the machine under the coal and help complete the loading. When the remainder of the face is being cut, the other two men start drilling. The main conveyor is extended by decreasing the lap of the 20-ft. conveyors, by adding another 20-ft. conveyor, or by adding 100 ft. of belt, as the status of the work may dictate.

RESULTS OF TIME STUDY



The rooms are worked by two 8-hr. shifts. A stop-watch time study during eleven cycles on three consecutive days showed that 38 per cent of the time was consumed in preparation, 47 per cent in loading, and 7 per cent in moving and adjusting the conveyors. The rest of the time, or eight per cent, was without productive result. The preparation included cutting, drilling, shooting, and timbering. The men are paid day wages provided for the various occupations by the union scale.

According to C. L. Watkins, vice-president in charge of operations, results so far obtained indicate that the two-room method will prove the most economical for his company's condition. With that system one entry man and one main conveyor serves two rooms, and

FIG. 5

Belts Were Tried Out Here

Coal from these eleven rooms in Moss Creek Mine No. 21, Marstellar, Pa., was brought to the entry by belt conveyors. A system of advancing two wide rooms with a narrow pillar between by the use of one main conveyor seems to be the most economical method. Belt conveyors are used in room-and-pillar work in two other mines of the Pennsylvania Coal & Coke Corporation.

Digitized by Google

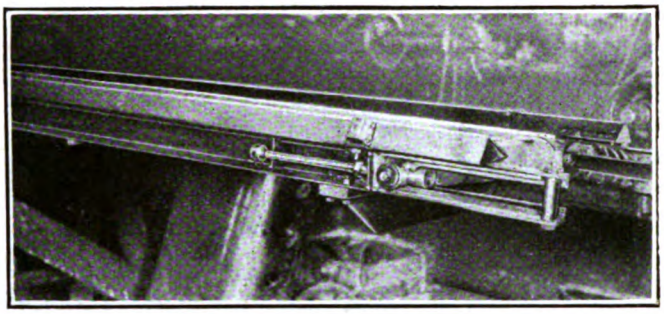


Fig. 6—Take-Up End of 20-Ft. Conveyor

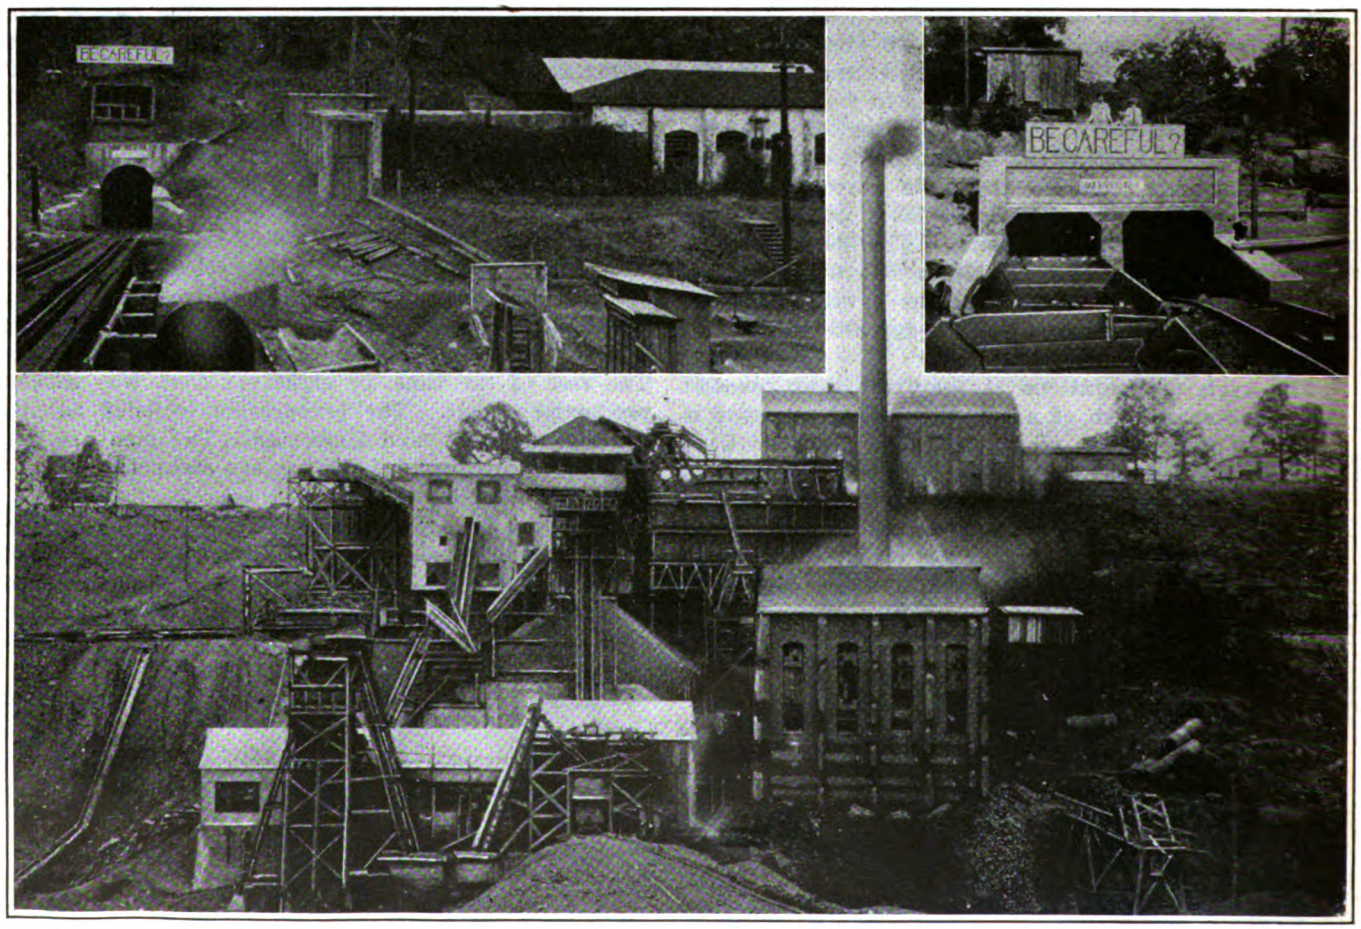
A screw adjustment of 6 in. is provided for the take-up pulley. An important feature of the construction is a tail piece which is fastened to the bearing and keeps the opening between the upper and lower strands of the belt covered thus preventing the entrance of coal.



there is less trouble in keeping the faces advanced equally, than with the three-room method.

In roof where the caves normally break square across the last stump, the usual 25-ft. pillar may be drawn. In roof where the caves frequently pass the stump, as at the Moss Creek mine, a narrow pillar must be left. One of the most successful applications of the belt conveyors has been in drawing heading stumps, chain and barrier pillars.

The accomplishments of the Pennsylvania Coal & Coke Corporation with room conveyors in low coal is but another instance pointing to the final elimination of the mine car from the face in low seams.

A COMPREHENSIVE PROGRAM of standardization of drafting room practice has been launched by the American Engineering Standards Committee. Reducing diversity not only in practice but in the materials, equipment and tools used for making drawings is expected to result in a more ready understanding of drawings by anybody for whom they are intended, in great savings in the draftsman's time and efforts, and in a more efficient use of drafting materials and filing cabinets for the storage of completed drawings.

Alabama Coal Plant Handles Output of Three Slopes

Nearly 2,000 Tons a Day Is Hauled to This Tipple and Washery of the Roden Coal Co., at Marvel, Ala., by Rope and Steam Locomotive

The lower illustration shows the power plant, tipple, and washery of the Roden Coal Co., Marvel, Ala. This operation was started 18 years ago by B. F. Roden, president and general manager of the company. Improvements to the top equipment gives it a capacity of 2,000 tons per day, however the largest day's run was 1,858 tons. The mine openings, consisting of three slopes, are back across a valley from the tipple. Haulage out of slopes Nos. 1 and 2 and over a steel bridge to the tipple is by means of a 1,100-hp. double-drum steam hoist, located in the brick building on the hill. The electric generators, in the same building, have been shut down in favor of purchased power. The boiler-room smoke stack, which is of steel and of the self-supporting type, rises 150 ft. above its foundation on the upper side of the building.

At the upper left are shown slopes Nos. 1 and 2, with fan and first-aid house. The concrete portal of slope No. 2 (left foreground) was damaged by a derailed trip coming out of slope No. 1. The Marvel mine is on pick work with mule gathering and rope haulage. The Clark seam averages about 48 in. at this mine.

At the upper right is slope No. 3 known as Marvel No. 3 mine. This is located several thousand feet from the tipple. The cars are handled on the slope by an electric hoist, but a dinkey steam locomotive pulls the trips from the slope landing to the tipple.

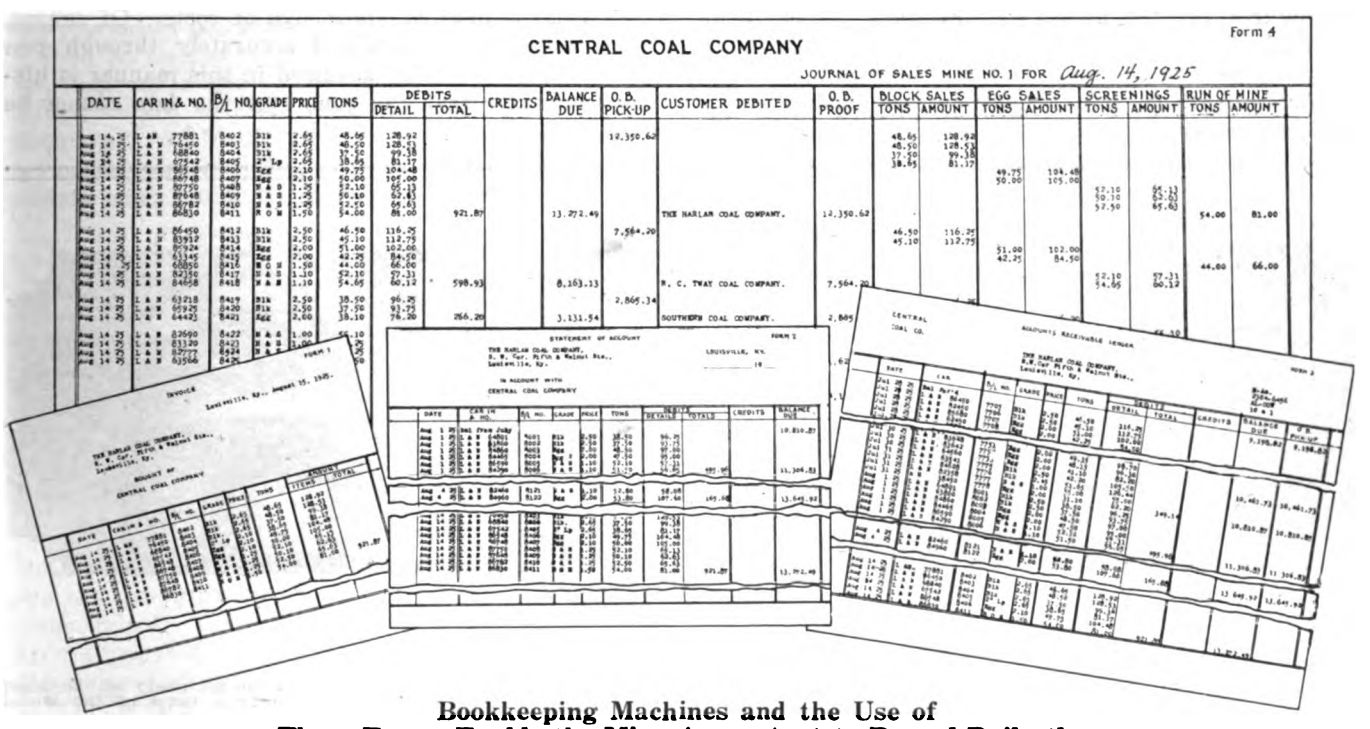
Machines Keep Mine Books Up-to-the-Minute

By John C. McNeil, C. P. A.
Louisville, Ky.

ALL COAL MINE operators like to know their total business down to date, as well as a distribution of the grades of coal produced, but heretofore this data could not be obtained daily, because the bookkeeper did not have sufficient time to prepare it. This article describes a system that yields it daily and without any additional effort on the part of the bookkeeper. Posting the records in the manner to be outlined gives the bookkeeper time to attend to worth-while matters and releases him from the endless detail that is ever present at the mine offices. This kind of a system is calculated to lift him out of the rut and make his services really valuable.

Most railroads require a separate bill of lading for each car and this is as it should be because it places every shipment on its own responsibility, so to speak. After the bills of lading are returned with the weights shown by the railroad and the coal is receipted for by the agent, the short-cuts provided by this system begin.



When the bills of lading are received with the weights, the file copy should be priced and extended in pencil and after these extensions have been made, the billing is ready for invoicing. The plan is to invoice the customer, write his monthly statement, post his ledger account and write and distribute the sales record in one operation. After all extensions have been made on the file copies of the bills of lading, an adding machine list should be made of the weights and amounts as shown by these bills of lading and the totals retained for proof purposes. When these totals have been obtained. Form 4, which is the Journal of Sales, is placed in the bookkeeping machine. A sheet of carbon paper the width of the ledger sheet passes over the top of this sheet and is kept in the machine, so that the operator does not have to handle the paper. The bills of lading are arranged in alphabetical order according to the customers to be charged and are then numbered. It would be preferable to arrange them in this order and number them when the coal is billed so as to determine whether or not the office is short bills of lading for any particular car.

After the sales sheet is placed in the machine, the customer's ledger sheet, Form 3, and the accompanying Statement of Account, Form 2, are taken out of the tray and placed in the machine, with another sheet of carbon passing between the Accounts Receivable Ledger and the Statement of Account. Then an invoice is taken (Form 1) and placed over the carbon which is over the Statement of Account. Since these carbons are permanently fastened to the machine, the operator does not have to handle them. The principal part of the work becomes merely that of writing.

After the forms are in the machine, the operator picks up in the Pick up O. B. column on the ledger, the last balance due by the customer as shown on the Old Balance column of the Statement of Account and then moves across the Invoice to the left side, writing in the date, car initial and number, bill of lading number, grade of coal, price, tons and amount in the item column.

Register Adds Item Column

An adding register is kept over the item column which totals the amounts of items and when all bills of lading for one customer have been entered on the Invoice, all that is necessary is to clear this amount out of the item register and write it in the Total column on the Invoice. Through a cross-totalizing mechanism on the bookkeeping machine, this amount is added to the Old Balance which has been picked up and this amount is copied out of the cross-totalizing mechanism into the New Balance column on the statement. Unless this balance is cleared out correctly, the sign of clearance cannot be made and it is necessary to correct the

Bookkeeping Machines and the Use of
These Forms Enable the Mine Accountant to Record Daily the Total Business Done and the Distribution of Each Grade of Coal Produced

Digitized by Google

error before proceeding further. The items written on the Invoice are copied on the Statement, Ledger and part of the Journal of Sales in this operation.

As it is desirable that the distribution by grades be shown in tonnages and amounts, these items are written in the respective columns on the distribution side of the sales journal.

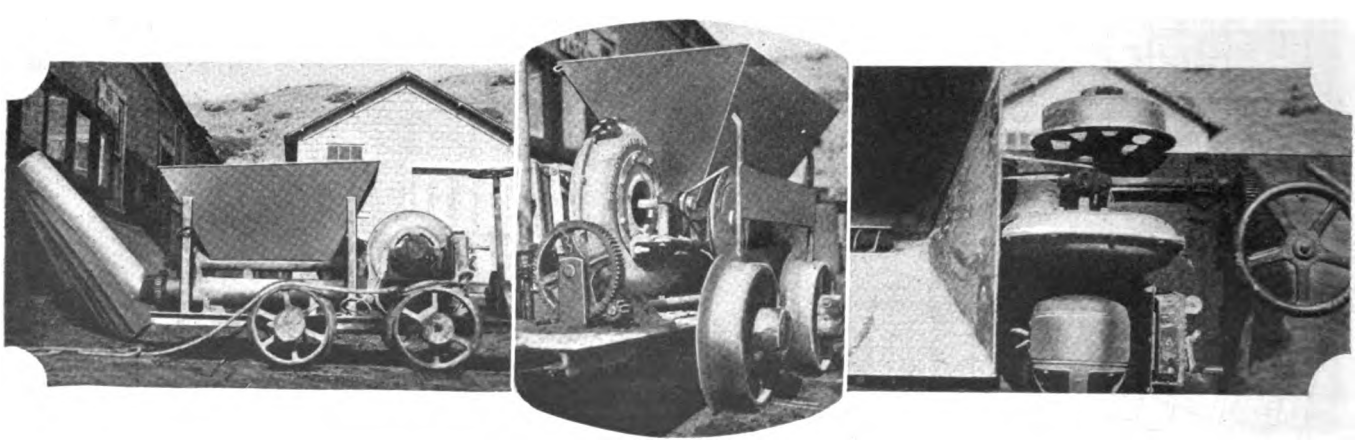
The machine adds vertically as well as horizontally and when the items are written, the figures in the respective columns are being added so that when the last item is written, the vertical totalizers contain the totals for each column. Inspection of Form 4 shows how these vertical totals are taken. It will be observed in the line Totals for Today the total tons and total debits are shown. These items should be in agreement with the predetermined totals as shown by the adding machine list of tonnages and amounts of bill of lading extensions. If the work has been correctly done these totals will be in agreement.

FURTHER ACCURACY ATTAINED

It will also be observed that the Balance Due and Pick-up O. B. columns have totals also. The total of the Pick-up O. B. column added to the total debits for the date should be in agreement with the Total of Balance Due. As a further aid to accuracy, the Pick-up is repeated on the sales journal and this is again picked up from the statement so that if the two Pick-up columns are in agreement, it is a further proof that the account has been correctly handled. If the two totals do not agree a simple line comparison will point out the account having the error and this can be corrected.

Attention is called to the distribution side of the sales journal, containing the distributions by grades and amounts. The totals of these respective distributions agree with the total tonnages and amounts on the debit side of the Journal of Sales.

The lines Previous Totals and Totals to Date This Month show how the figures may be made cumulative so that the line Total to Date This Month contains the figures for the month's operations. These items should be brought forward from day to day. By doing this, the posting at the end of the month of the debit to Accounts Receivable account in the general ledger and the corresponding credits to the four sales accounts.



After the day's billing is over, the ledger is posted, the monthly statements against customers prepared, the sales journal entries made with proper distributions and all of this has been done in one operation with proven balances and totals. Invoices can be mailed out promptly with bills of lading attached. It is not necessary to keep copies of invoices, because the ledger account carries these copies in alphabetical order by customers and the sales journal carries these statements in chronological order. At the end of the month, there is nothing to do but mail out the statement, as everything is posted up.

For a mine loading 1,000 to 1,500 tons per day, which means 25 to 35 cars per day, about an hour per day is all that is required for the bookkeeper to extend the amounts of the invoices, make the invoice, post the ledger, write the customer's statement, write and balance his sales journal and obtain totals for the day and for the month to date.

Control of the accounts receivable is kept by a control card handled in the same manner as an individual ledger account. This is debited with all charges and credited with all credits and the card is balanced each day automatically, so that this card shows the total due by customers down to date. The balances shown by the individual ledger cards should, of course, be in agreement with the balance as shown on this card.

This system is bound to speed collections because the statements against customers, proved and balanced, can be placed in the mails just as soon as the last car is charged. There is no waiting on trial balances, etc.

No good operator desires to go back to the old expensive days of pick mining, solid shooting and mule haulage and there is no reason why the savings made for the mine through the use of modern labor-saving machinery cannot be extended with equal profit to the office. Mechanical devices in the office, properly installed, reduce office overhead, make the office more efficient and, in fact, makes the bookkeeper a producer, instead of a historian. One of the troubles of the coal trade today is lack of knowledge of costs. Of course, these costs can be obtained accurately through pen methods, but knowledge acquired in this manner is history and water that has gone over the dam cannot be saved.

With This Rock-Duster No Nozzleman Is Needed

At Reliance, Wyo., the Union Pacific Coal Co. has a rock-dusting machine with control at the front end. Thus constructed, the man who operates the nozzle is well away from the dust blast and escapes coating his lungs with the flying dust. He is also where he can attend to the operation of the hopper and the manipulation of the switch. A vertical side elevation is shown on the left and vertical quarter elevation in the center. On the right is an almost plan view showing the wheel, reducing gear and the shaft which latter at the rear end of the machine has a gear which meshes with another on the periphery of the blast pipe. Consequently a twist of the wheel changes the direction of the blast at the will of the operative. A short part of the feed screw at the bottom of the bin can be seen in the view at the right in this illustration.

Coal Mining Engineer Is Chosen President of A.I.M.E. at 133d Meeting in New York

A COAL MAN—Samuel A. Taylor, consulting engineer of Pittsburgh, Pa.—was elected president of the American Institute of Mining & Metallurgical Engineers for 1926 and a number of facts interesting to coal men were brought out at the 133d meeting of the Institute in New York City, Monday, Feb. 15 and 16. The sessions ran through to Feb. 18. A good many engineers and operators from bituminous fields were present together with a handful of anthracite representatives.

After Tuesday's meeting the board of directors re-elected Dr. H. Foster Bain, secretary, and T. T. Read, assistant secretary. Mr. Read is now director of the safety service of the Bureau of Mines at Washington. He joins the Institute March 1. The board announced the fall meeting for Pittsburgh, Pa., Oct. 4, 1926, and a regional meeting for the Transmississippi sections in Denver, Sept. 20. The officers elected Tuesday in addition to President Taylor were: Birch O. Mahaffey of St. Louis, Mo., and Carl A. Meissner of New York vice-presidents and L. K. Armstrong of Spokane, Wash., W. Spencer Hutchinson of Boston, H. A. Guess of New York, Seeley W. Mudd of Los Angeles and Reno H. Sales of Butte, Mont., directors.

Secretary Bain, of the Institute, announced in the Tuesday business meeting that regional secretaries would be provided so as to increase the interest of the local organizations. B. F. Tillson proposed that a change be made from the present practice of leaving nominations to the nominating board. The plan he proposed would give the full membership an opportunity to express its will. At present only one name is presented for each office and what that name shall be is decided by a committee of three from the local section, one of the committee being an ex-president of the Institute.

John A. Garcia said the system of nominations was not democratic but advocated its continuance because it had worked well and resulted in the appointment of good men. R. V. Norris advocated that the proposal be voted down and "voted down hard." Mr. Tillson's motion when put to the vote was unanimously rejected.

STATUS OF COAL INDUSTRY

At the Tuesday afternoon coal meeting H. N. Eavenson reported for the coal and coke committee on the status of the coal industry, predicting that the production curve of oil would soon begin to sag and tended already in that direction, that in three or four years the production of coal would progress upward at its old rate of increase. He showed that other industries such as the production of ingots and copper were as hopelessly below capacity as coal if not more so.

Graham Bright gave the result of a questionnaire on the use of loading machines in bituminous mines showing that of 49 replies, 22 were from union and 27 non-union mines. Of 43 replies, 38 reported no opposition from employees. Six union mines reported trouble with the union and one no trouble. Of 34 answers, 15 reported decreases in the production of lump coal, 12 an increase and 7 no change.

Evaluation of coal formed the subject of an address by R. H. Sweetser who said that the relative value of coal should be determined in the same way as the relative values of iron ores. One per cent ash in coal increased the cost of pig iron 30c. per ton. One company was paying 75c. above market price to get a coal 3 to 3½ per cent better than that of the general run of the market. Mr. Sweetser pointed out that 1 per cent of ash represented nearly one shovelful of slate to a ton of coal. Mr. Garcia wanted an evaluation of coal land made on somewhat similar considerations.

Thomas Fraser's description of the air-sand process of cleaning coal was read by J. J. Rutledge.

Prof. S. W. Parr declared that the resins in coal have little or no coherence when carbonized and do not make coke. That was the function of bituminic coal. A. C. Fieldner said that Rheinhardt Theissen had noted that the attritus bands in coal would not coke satisfactorily but anthraxylon, which is made from the woody parts of coal, fuses well and cokes freely.

VENTILATION DISCUSSED

On Monday opening the first meeting of the ventilation committee George S. Rice paid a tribute to the coal industry for having taken the first and most significant steps in the science of ventilation. However, some of the other industries now have ideas and experience to offer of which coal men might with advantage avail themselves.

E. A. Holbrook said that the lack of information about cardinal facts in ventilation was well illustrated by a colloquy between an inspector and a mine manager. "What's your water gage?" queried the former. The prompt reply was "We don't need one. *Our* mine's dry." The need of the coal industry is to obtain and absorb some of the facts that manufacturers, other societies interested in ventilation and the British mining associations have discovered by diligent inquiry and experimentation. Graham Bright reported that a committee on mine fans has been formed of manufacturers and fan users including in the latter A. B. Kiser and G. E. Lyman.

A paper that received much favorable comment was presented by L. W. Huber. In brief he said that as a mine had a variable resistance due to the passage of trips and the opening of doors, a fan which did not work with a reasonably even efficiency, despite these changes in condition, was undesirable. The fan that could meet a change in pressure without an undue change in volume delivered or in horse power required for constant speed was the fan best suited for application.

Mr. Huber said that the forward and radial tip blades did not have the stability of the paddle-wheel or partial-backward curved blades and that the full backward-curved blade was the most stable of any. It appeared to him that the last-mentioned blades which were driven at high velocity had the further advantage that owing to their high speed they could be driven direct-connected. Furthermore he said, the fan with the backward-curved blades was the most efficient. Mr. Bright suggested that the fan could have its speed regulated

Digitized by Google

to suit the resistance of the mine as that resistance changed in the course of the mine's history.

Mr. Tillson advocated a study of the propeller-blade fan that had been used recently in South Africa and had given water gages between 3 and 6 in. It was said that the manufacturer should provide a graph showing the characteristics of the fan as a protection to the client who wanted to know if the fan measured up to what might be expected should the water gage of the mine vary somewhat from what was anticipated. It was said also that it should be provided as a means of making the most economical use of a fan. Mr. Bright proposed that each fan have the characteristics on the name plate graphically portrayed. Another suggested a tabulation that would convey the same story.

PITOT TUBE RELIABLE INDICATOR

F. R. Still, of the American Blower Co., said that the backward-curved blades had to be rotated 50 to 150 per cent faster than the forward-curved blades and that the construction of the former was weaker than that of the latter. To get a 5-in. water gage with such a fan a tip speed of 7,000 ft. per min. would be necessary which would be a great strain on the fan structure. Discussing the measurement of air he said that he had found that by making the holes in pitot tubes of a diameter not larger than 0.02 in. he had been able to get the true static pressure as opposed to that of impact. He had found the pitot tube a much more reliable indication than any anemometer. At speeds of 1,500 ft. per min. the anemometer would be strained and unreliable whereas speeds of 4,000 to 5,000 ft. per min. are not unusual. He said that one reading of a pitot tube is enough to gage the quantity of air passing through a given pipe or passage when it has been properly calibrated but only so long as the speed above is changed. When the water gage is lowered or raised then the reading of the pitot tube will have to be interpreted by complete readings for every part of the section taken at that gage. Mr. Still said that the backward-curved fan of the same capacity as a forward-curved fan might cost 75 or even 100 per cent more than the latter.

G. E. McElroy, ventilating engineer of the Anaconda Copper Mining Co. and former member of the U. S. Bureau of Mines at Vincennes, Ind., read A. S. Richardson's article on the failure of operating performance to agree with the theoretical rating. Only occasionally could Mr. Richardson forecast what a fan will do when erected at any one of the Butte mines, where, it may be said, depths of 3,000 ft. and high temperatures are encountered.

Uncommonly interesting were the remarks of Ole Singstad, chief engineer of the New York-New Jersey Tunnel Commission. The tunnel when completed will be provided with a capacity of 3,761,000 cu.ft. of air per minute. That will be divided among 84 fans, three for each blower duct and three for each exhaust duct. One out of every three will be a standby unit. The air will be blown in by a duct under the roadway and liberated at distances of 10 to 15 ft. dependent on the grade. The air thus released will be sucked up into the return air duct.

The air ducts run half way from air shaft to air shaft, and the shafts are placed to accord with the grade of the tunnel and therefore in accord with the demand for air by which to neutralize the lethal gases delivered as the result of the incomplete combustion of gasoline. Fans of from 81,000 to 227,000 cu.ft. per min. capacity will be used. From experiments at Yale made by Dr. Yandall Henderson it was ascertained that with 4 parts of carbon monoxide in 10,000, the air can be breathed with safety and comfort for one hour. The design of the ventilating equipment is based on that fact. The ventilating speeds and resistances were tested at Urbana in the University of Illinois, a special concrete tunnel being built for that purpose. Further experiments at Bruceton in the experimental mine where an oval track was built and eight automobiles were allowed to circulate confirmed what had been learned at Urbana.

It was found also that a fire in the tunnel would not cause smoke to spread more than 30 ft. Instead of the fire traveling from car to car, the draft being vertical from intake to return duct will remove the flames in a manner that will cause least danger. It is easy to imagine what would happen in a tunnel if a car took fire and the air traveled from the car past the other cars to the exhaust portal and in such prodigious volume as ventilation by a single current would make necessary. The size of the installation can be understood when it is said that the largest fan to be constructed in the world, which has, by the way, radial blades with the tips turned backward, has a capacity of 900,000 cu.ft. per min. One big fan in America has a 5-in. water gage and a capacity of 750,000 cu.ft. per min. The installed horsepower of the tunnel plant in New Jersey and New York will be 6,000 but only two-thirds of that will be put in operation except perhaps in emergencies.

In the afternoon the meeting on mine ventilation was held. George S. Rice presided. The first topic discussed was the ventilation of the Liberty Tunnel in Pittsburgh, Pa.

The first problem in ventilating this thoroughfare was a determination of the content of carbon monoxide (CO) in the tunnel atmosphere produced by motor vehicles. The second was a determination of the composition of the exhaust from automobiles. Several actual tests were made on the air in this tunnel while machines were passing. In the first the calculated content of carbon monoxide was 0.04 per cent and the actual analysis showed 0.041 per cent.

ACTUAL RESULTS OF TESTS

With motor trucks 0.07 per cent was expected and analysis showed 0.05 per cent. In all cases the actual results obtained checked those calculated within fair limits. In most instances the larger discrepancies were realized on the longer tests when the air within the passage had a chance to purify itself somewhat by diffusion as well as by circulation. Air movements induced by the passage of vehicles in the longer tests carried away much of the foul gas generated.

Air drawn from this tunnel is discharged upward from comparatively high stacks at high velocity while that forced in is drawn from points near the ground. There is thus small chance of the bad air short-circuiting and being returned to the tunnel. No special provision has been made for caring for the condensation of humidity which in some tunnels, notably London subways, is at times bothersome.

An apparatus for continuously analyzing small percentages of carbon monoxide has been perfected and is being used as a part of the ventilation equipment of this tunnel. This depends for its operation on the heat generated from the oxidation of carbon monoxide to

Digitized by Google

carbon dioxide in the presence of a catalytic agent. This instrument is sensitive to as low an admixture of CO as ten parts in a million and will easily indicate one part in 100,000. Such an apparatus could easily be connected by relays to the equipment driving the ventilating fans in such a way that the quantity of air forced into the tunnel could be increased whenever the content of carbon monoxide rose above a certain predetermined percentage.

It was then stated that the committee on mine ventilation carefully reviews the results of work done on this subject throughout the world and attempts to

Samuel A. Taylor

select and co-ordinate such material as will prove useful to American mining men. A research fund has been established and some of the revenue from this source might logically be devoted to the work of this committee.

Dr. R. R. Sayers then stated that the carbon dioxide content of mine air could not be regarded as an index of its vitiation by the respiration of men and animals, although it had long been so considered. Air vitiation in mines may arise from other causes and will take place if neither men nor animals are present. Deficiency of oxygen sometimes causes trouble. Many men become unconscious if the atmosphere contains 9 per cent or less of this element, and most men succumb to unconsciousness or coma at 5 per cent of oxygen.

Effects of Increased Oxygen

Percentages of oxygen higher than normal have no particular effect up to about 160 per cent. At a pressure of two atmospheres, making the weight of oxygen taken into the lungs approximately twice normal, animals die from lung irritation in about 48 hr. Divers using oxygen (not air) apparatus are liable to become foolish, or rather foolhardy, when the oxygen breathed becomes 125 per cent above normal.

In the atmosphere of a mine abnormal constituents are important. Methane or marsh gas has no particular physiological effect, however dangerous it may be from the standpoint of explosibility. Sulphur dioxide, although poisonous, is not particularly dangerous because its odor always gives warning of its presence. Oxides of nitrogen and hydrogen sulphide are highly toxic but not particularly dangerous except when the latter in high concentration paralyzes the sense of smell. As small a quantity as $\frac{5}{1000}$ per cent irritates the mucous membrane.

A true index of air vitiation is furnished by its content of carbon monoxide (CO). The index, or quantity that will give trouble under ordinary conditions, after 45 min. exposure, is 0.04 per cent. In 5 to 6 hr. 0.02 per cent will be felt. With 1 hr. of exercise 0.04 per cent may cause collapse. High temperature always increases the ill effects of this gas.

Because of the danger from these various gases it is highly important that every mine be well ventilated. Exposure to concentration of any poisonous gas should be avoided if possible. If necessary the gas mask may be used in poisonous atmospheres or those deficient in oxygen. Should a person be overcome he ought to be hurried into good air as quickly as possible and the prone pressure method of respiration applied. It is also highly important to keep the patient quiet.

Dr. Sayers said that in cases of carbon monoxide poisoning oxygen should be administered. A mixture of carbon dioxide and oxygen stimulates deep breathing, but authorities differ as to the advisability of using this mixture. If it is not ready at hand in case of emergency no time should be lost in procuring it, but pure oxygen should be administered at once.

Prof. A. C. Callen next outlined some of the high points in the contemplated work of the committee on mine ventilation for the ensuing year. These, among other things, include: A basis for determining mine resistance, determining a coefficient of friction along mine passages, a coefficient of friction for air in passing around bends, the effect of the use of guide vanes for conducting air around sharp corners, and the selection of suitable instruments for measuring the velocity of air as well as its static head.

American vs. British Practice

In discussing the report of the British Institution of Mining Engineers on the "Theory of Ventilation," Mr. McElroy asked, "Can a simplified formula for mine ventilation be developed?" The new formula as proposed in the report in question had been simplified only mathematically. The British Institution proposed the units of pounds pressure per square foot and cubic feet of air moving per second, whereas American engineers almost invariably employ inches of water and cubic feet per minute. The majority of mining men in this country believe that the American practice is preferable.

Mr. McElroy brought out another interesting detail concerning mine ventilation. This was to the effect that in metal mines not only are the volumes of air circulated much smaller than those employed in coal mine ventilation but the resistance offered to their flow is higher.

He then showed an interesting chart for determining the flow of air in mines. Although this chart may leave much to be desired, it nevertheless affords an excellent check on more elaborate and exact calculations.

Mr. Tillson then stated that present means of measuring air flow might prove inaccurate and inexact. He favors the use of orifices as a means for determining the flow of air and gases. In reply it was stated that much work of this nature had already been done by the American Society of Mechanical Engineers and that the results obtained by them might prove of interest to mining men.

Frank Haas stated that mine ventilation was receiv-

Digitized by Google

ing intensive study both in this country and abroad. Costs of ventilating mines in the United States were too high, this in many cases being the result of ignorance.

An objection was then raised to the use of the Pitot tube for measuring air velocities on the ground that its manipulation was delicate and that it sometimes gave highly erroneous results. In reply Mr. McElroy stated that it was his belief that best results could be obtained with this instrument only if the volumes of the air spaces between the static and velocity nozzles and the pressure gage were made equal. Unequal volumes in the connecting tubes sometimes led to violent fluctuations in the liquid column and great difficulty in reading it accurately.

"BOOSTER" AND "BLOWER"

A study of booster and auxiliary fans was next suggested as a subject for investigation by the ventilation committee. Such fans are opposed by some engineers. On the other hand new methods of mining make them extremely convenient and almost dictate their use in some cases. In the discussion that followed a sharp line of distinction was drawn between the "booster" and the "blower." The booster was considered as an auxiliary fan of moderate size furnishing air to an entire split or section. The blower is a small fan ventilating a single heading or other passage by means of canvas or other flexible tubing.

Mr. Rice stated that in some cases boosters are used in place of brattices. He recalled an instance where two fans were thus used, both being electrically driven. The return of one became the intake of the other and a dangerous condition was thus created.

Dr. J. J. Rutledge then stated that if we are to have any improvement in present methods of mining we must have single entries. These can only be ventilated by use of a blower. In many cases where such machines are now used the air sweeping the face is purer than where ordinary crosscuts between a pair of headings are used.

Mr. Rice felt that boosters were sometimes justified in extreme cases but believed that for such places air-driven machines were safer than those connected to electric motors. Such machines are not forbidden in England. When a fan of this kind is stopped a splendid opportunity is presented for gas to collect which may be driven back upon the motor when the fan is again started.

WHAT IS A GASSY MINE?

The question was then asked: "Could not this committee define in a quantitative way exactly what is a gassy mine?" It was remarked that some time ago the Bureau of Mines had an opportunity to formulate such a definition but sidestepped the question—perhaps wisely. It was also pointed out that at present no convenient, reliable, accurate means for determining the gas content of mine air is available for use by the ordinary mine man.

It was also asked: "Should the work of the committee be limited or circumscribed by existing state laws? Should not the Institute rather point the way to better standards?" In reply Mr. Haas stated that he would treat existing statutes with all due respect and would hesitate to recommend changes unless such alterations were sorely needed. It was also stated that although there is little uniformity in the statutes of the various states it can hardly be hoped that uniform mining laws will be enacted. The Bureau of Mines once took some tentative steps in this direction but its motive and purpose were misunderstood and the matter accordingly was dropped.

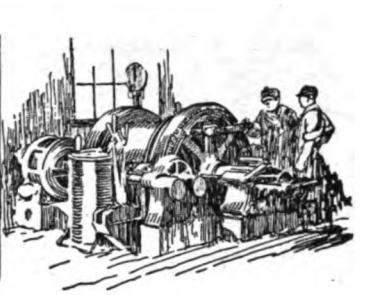
The new president, Mr. Taylor, was born in what is now East McKeesport, Pa. about ten miles east of Pittsburgh, in 1863. He was educated in the public schools, the Polytechnic Institute in Old Allegheny, and at the Western University of Pennsylvania, now the University of Pittsburgh, graduating in the class of 1887 with the degree of civil engineer. He received the honorary degree of doctor of science from the University of Pittsburgh in 1919.

In July, 1887, he began work for the Carnegie Steel Co. at the Homestead plant, then under the management of Julian Kennedy, as draughtsman in the new structural steel department, where he continued until September, 1888, when he resigned to accept the position of assistant engineer of construction of branch lines of the Pennsylvania Railroad, with headquarters in Greensburg, Pa. He continued in that position until October, 1893, when, on account of the business conditions, the department was temporarily disbanded.

He then began the practice of his profession as a civil and mining engineer in Pittsburgh where he has had his offices ever since. For many years he carried on the general practice of engineering, designing and building water works and sewer systems, street and road improvements, railroads and buildings, as well as designing and building a number of coal mines and coke plants. He was for many years the engineer for about ten municipalities in the western part of the state, and was engineer for a number of coal companies. About 1900, he, with associates, became interested in the development of coal properties and opened up a number of coal mines, and from this time to the present he has devoted most of his time to coal mining and its allied industries as consulting engineer and in a managerial capacity.

HELD MANY IMPORTANT POSITIONS

Mr. Taylor has served on several national commissions pertaining to mining matters, as well as on several state commissions of public interest. He has been one of the consulting engineers of the U. S. Bureau of Mines ever since the Bureau was established. He also served as technical adviser to Dr. Harry A. Garfield, U. S. Fuel Administrator during the World War. During 1918, he was loaned to the Canadian government to assist that country in their fuel matters. He served with U. S. Coal Commission in 1919 to adjust the labor scale, also served on the board of engineers which made the valuation of coal lands and properties for the Coal Commission in 1922.



He was president of the Coal Mining Institute of America in 1911, president of the American Mining Congress in 1913, and president of the Engineers Society of Western Pennsylvania in 1914.

He is a member of those societies, and also the American Institute of Mining and Metallurgical Engineers, American Society of Civil Engineers, American Water Works Association, American Society for the Advancement of Science, American Society of Political and Social Science, National Forestry Association, International Navigation Congress, a fellow of the National Geographical Society, and a member of the chamber of commerce of Pittsburgh, Pa.

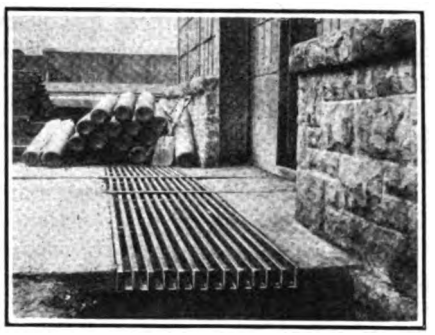
Practical Pointers For Electrical And Mechanical Men

Heavy Grating Keeps Surface Water Out of Mine Building



Many mine buildings are so built that their floors are at approximately the same level as the ground outside. Handy though this arrangement may be it sometimes leads to trouble because surface water may find its way into the building. A flood outside then means also a flood within.

In the accompanying illustration may be seen the heavy grating that guards the entrance to a large mine shop in Kentucky. This shop is built in a community that is generously provided with good roads and the pavement has been carried clear to the shop door, so that trucks and wagons could be driven into the building. Much time and labor is saved by this provision.

In order to prevent water on the pavement entering the building a trench was dug and concreted, immediately in front of the door. As the ground upon which the shop was built is somewhat sloping it was an easy matter to give this trench sufficient slope to carry away all the water that enters it.

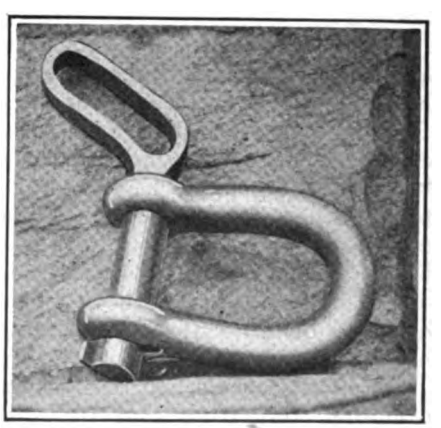
The grating itself is made up of bars of strap iron each 1 x 4 in. in cross-section. These are fastened together by ¾-in. bolts or rods which are passed through ¾-in. pipe spacers about 1½ in. long. The trench is about 30 in. wide and the grating is supported by 80-lb. rails extending across it, one rail under each end of each grating section. There are three of these sections, one between the rails of the mine car track that enters the shop and one upon either side of it. The side or flank sections, which are long compared with the one in the center, are supported by transverse rails in the middle as well as upon either end.

The top of the grating is made flush with the concrete paving and slightly below the top of the track rails. By this arrangement wagons, trucks or cars may enter or leave the shop as may be desired but surface water is effectively trapped and drained off. No matter how hard may be the rain outside the shop floor is always reasonably dry. Furthermore, this grating was inexpensive and was built to suit the local conditions in the shop that it serves.

Grating Protects Shop Floor

This grating spans a drainage trench in front of the shop door. Thus while mine cars, teams or motor trucks may enter or leave this building at will, surface water is effectively trapped and drained off.

It is not intended to convey the idea that the kind of grating here described is in any sense a new scheme. Such gratings have long been used for various purposes. The application described however, is novel and in use is highly effective.

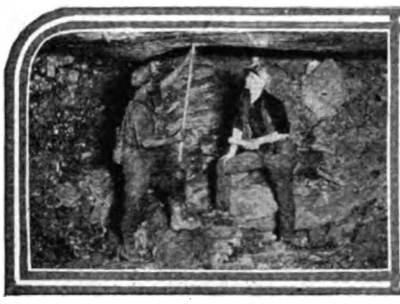


Keeps the Pin in Place

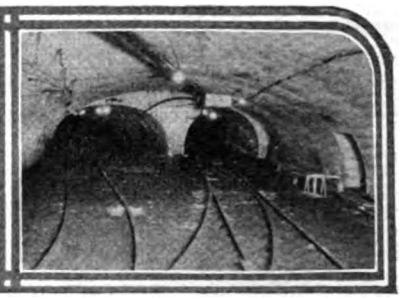
Many have been the devices employed for keeping the pin of a clevis from coming out while the clevis is under stress. Of these the old lynch pin or the later cotter pin is perhaps the most common. Both of these were effective but required some time for their withdrawal, furthermore they were liable to be lost.

An ideal fastening of this kind would be one that would hold the clevis pin in place without failure so long as the clevis is under stress but which can be withdrawn almost instantly when withdrawal is desirable without loss of time and without the use of tools. It is probable that the device here illustrated and described is not new, but it will be new to many of our readers and is here set forth for what it is worth.

The illustration shows a clevis provided with a pin that is fitted with a short tongue or feather welded onto one side of its lower end. The lower opening in the clevis body is a "keyhole," that is, it is a circular opening with a slot or rectangular opening extending from it toward the body of the clevis. This is made big enough to permit the short feather on the end of the pin to pass through it readily, yet does not weaken the clevis. The handhold or ring on the top of the pin is not circular but elliptical or flattened and extends in a direction parallel to that of the feather on the end.



When it is desired to remove the pin from the clevis it is only necessary to turn the pin until the handhold is parallel with the clevis body. In this position the feather will easily pass through the lower hole while in any other position the pin cannot be withdrawn. This device is particularly handy on the end of haulage ropes or on draft chains by which cars are hauled.



Non-Releasing, Yet Easily Released

When the pin of this clevis stands in the position here shown the feather upon its lower end prevents its withdrawal. Turning the pin through an angle of 180 deg., however, allows it to be withdrawn with ease. The handhold on the top of the pin serves as an indication of the position of the feather.

Underground Operation

Arc Believed to Have Fired Gas at Castle Shannon Mine

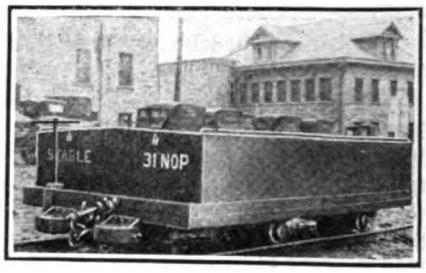
On Jan. 23, at about 10:30 a.m., six men were more or less severely burned in an explosion of gas at the dead end of Tenth Face entry in the No. 3 mine of the Pittsburgh Terminal Coal Corporation at Castle Shannon, near Pittsburgh, Pa. The agent of ignition is believed to have been an arc caused by the unhooking of the cable nip of a cutting machine from the trolley wire which had been extended to the last breakthrough, about 80 ft. from the face. At the time, the machine was backing out of the place after having completed a cut. The machine is of the permissible type. In this mine closed lights and permissible powder are used exclusively and the roadways are rock-dusted.

There was no lack of air in the entry for it is one of the two intakes in a triple-heading projection which has been developed to a point about 2,300 ft. from an intake air shaft. The last two crosscuts were left open except that in the outby crosscut was hung a canvas, and a chute which lay further in was not blocked by a door. It is believed that the air made a clean sweep to the return without going to the last crosscut.

On the day before the explosion, a cut had been made which exposed, but did not penetrate through, a clay vein. The assistant mine foreman, in compliance with the mining law, accompanied the loader to the place, tested for gas and, finding none, bade the latter put in a test hole. He is reported to have admitted finding gas after the test hole had been drilled. However, he must have believed the quantity being given off was insufficient to cause an explosion, forgetting that little or no air found its way to the face. When the cutting machine crew came he is said to have given orders to the men to go ahead with the cutting, which they did. In the meantime he retired to the last crosscut, where he was when the explosion occurred.

By the time the cutting had been finished a large volume of gas must have displaced the stagnant air near the roof and extended from the face to the last crosscut where the ignition apparently occurred.

When that happened only one man, the machine runner, was stationed inby of the last crosscut. He was at a point about 50 ft. from the face, sitting on the cutting machine which was then backing out from the place. Among the four men who were with the assistant foreman were the machine helper and the fireboss of the section who had arrived while the machine was in operation. He is said not to have visited the place because the assistant foreman had assumed responsibility for the operation. One of two loaders stood with the before-mentioned men in the crosscut and the other stayed on the entry at the point where the machine cable was attached to the trolley wire. It is thought that this man tampered with the cable nip causing an arc, the controller on the machine being open; otherwise no arcing would have resulted.



Inasmuch as the entry was being advanced into virgin territory air should have been conducted to the face by a brattice, particularly because a clay vein had been encountered. Lastly, the assistant foreman should have determined approximately the quantity of gas standing in the place by tracing the extent of its occurrence outby.

Following the explosion the following exhortations were made by the general superintendent to the mine superintendents: (1) Under no condition should two open breakthroughs be permitted on any entry; (2) Under no condition should canvas be depended upon for permanent stoppings, and (3) Under no conditions should the trolley wire be carried to within less than 150 ft. from the face or beyond an open crosscut.

Closed Feed Cars Save Grain

Taking mule feed into the mine has heretofore presented its problems. When the feed was transported underground in ordinary grain sacks there was always some spillage and wastage. Furthermore, grain thus transported would absorb moisture, and if left and stored in the sacks it might mold. Again, sacked grain is exposed to attack by mine rats, and the loss sustained from the incursions of these animals may be great.

In the accompanying illustration is shown a covered steel stable or feed car employed at one of the big mines of Kentucky. This car is constructed specially for the purpose of transporting grain and other mule feed into the mine. It amounts practically

Rat, Thief and Moisture-proof

A steel tank with sloping top covered with hinged doors which may be padlocked shut effectively protects its contents from moisture, rats, spillage and theft. This car may be hauled anywhere within the mines, and soon saves its cost in the protection it affords the feed of the mine animals.

to a covered steel tank mounted on a low car. As may be seen the covers are hinged and may be padlocked shut. Not only does a car of this kind protect its contents from moisture, but also from rats or from theft. It cannot be opened by unauthorized persons.

Two interesting details of construction appear in the photograph. One of these is the brake mechanism, which as may be seen, strongly resembles that employed upon the ordinary railroad freight car. The other is the hook on the end of the car, which is used to support the clevis of the coupling, thus preventing it from dragging along the track. Cars of this kind, save their cost.

Book Reviews

Will New Conditions Modify The Miner's Freedom?

As interesting as a novel will the recent publication "The Miner's Freedom" be to operators of coal mines. The author, Carter Goodrich, assistant professor of economics in the University of Michigan and Amherst Memorial Fellow in Economics, 1921-22, 1923-24, knows his subject quite thoroughly having acquired his knowledge at first hand underground as well as by a diligent study of technical literature. He has seen miners working under many conditions in the bituminous regions. He has devoured at least *Coal Age*, not only its editorials and articles but its news, its blurbs on the contents page and even its advertisements also. He writes like a coal technician with a full grasp of his subject and, withal, with a clearness and conciseness which carries the reader through the book without uncertainty as to his meaning and without a moment of weariness.

He opens his book, which has as sub-title "A Study of the Working Life in a Changing Industry," with the statement, "It is often said that modern society has chosen efficiency in production rather than richness in the working life; that it has chosen the possibility of fuller and more varied living outside working hours rather than the possibility of a creative life on the job itself." He then denies that there is any "choice" made and says this is "not only a false rationalization of the past but a real hindrance to intelligent thought about the future. Society makes no choices as such."

JOBS AS DULL AS FORD'S

He adds that "the countless individual decisions out of which have come mass production as efficient as that at Ford's and jobs as dull as those at Ford's have most of them been made without the slightest reference to the quality of the working life that would result." "There's no such thing as discipline in a coal mine; the miner is his own boss," he quotes as recognized slogans. He then denies that this is entirely true and recalls the colored loader in a West Virginia mine who drifted back from the factory to coal mining as saying that in a coal mine, "They don't bother you none."

One is reminded of the story that W. J. German tells so well regarding a West Virginia loader who quit his work disgusted and disgruntled because the driver, the trackman, the shift boss and the foreman in turn cussed him out and one after another made him change the position of a prop until he had moved it from place to place no less than four times. That story doesn't suggest freedom from supervision and instruction. Nevertheless, the author is right in declaring that the miner's customs have made him extraordinarily free as to what he shall do, when he shall do it, when he shall come to work, when he shall quit his place and whether he shall put in his day in the mine or at the country fair.

WON'T HIRE MINERS

The author quotes "Industrial Management" where it says as he briefs it, "Don't hire former miners if you can avoid it. Their work has unfitted them for factory discipline. In the mines the possibility of constant supervision or of surprise tests does not exist. The coal miner is accordingly trained to do as he pleases. . . . Transplant such a man into a factory where production is speeded, and no imagination is required to picture what will happen. His 'personality' is 'so magnified' by the laxness of mine discipline that he chafes under the necessary restrictions of other employment. . . . The ex-miner resents all suggestions as to his working methods, resents all effort to compel continuous application and assumes in general a hostile attitude to all supervision."

Quoting *Coal Age*, Mr. Goodrich says, "Mining is still in a way a 'cottage' industry, only, the cottage is a room in the mines" and he adds "the miner's freedom is largely a byproduct of the very geography of the working places inside a mine." He goes on to elaborate the variety of the miner's daily work, his independent existence and his resentment of direction. As one miner he met said, "If there's anything that gives me the willies, it's a boss standing and looking down my shirt collar."

The first part of the book is on "The Miner's Freedom," the second on "The New Discipline." In the latter Mr. Goodrich shows that machines must introduce elements of factory management, though the Ford ideal can never be attained in the mine. "Surely no one," says the author, "is looking to the mines of today to see how the automobile factories are to be run but many are looking to Ford's for the mines of the future." He shows how coal mining had advanced immensely prior to the introduction of loading machines by quoting an article on the methods pursued before the Civil War, but says that the change is less than is about to take place and shows why this change is almost inevitable.

In the concluding chapter the author says, "Profits and prices, and to a less extent employment and wages and safety—it is chiefly in these terms and the others already suggested that the revolution in the mines is discussed; and certainly all these things should be considered as men weigh the gains and losses of the change and attempt to control its course. But for all these claims there are already spokesmen. . . . The purpose of the present study, on the other hand, is to place alongside these other problems an almost entirely neglected one—that of the effect of the change on the quality of the working life."

FREEDOM TO LOAF

Mr. Goodrich's plea will have few advocates. It is largely a plea for leisurely and inefficient operation and even incorrect and wasteful methods of mining, profitable in the end to none of the trinity of interests in coal mining, the public, the miner or the operator.

The miner's "freedom", as the author would define it, is a thing of no value to him or to anyone and really not worth the labor of writing and publishing a book in its defense, not entitled surely to 189 pages measuring 5 x 7½ in. Yet it is a well-written book, all the better because it has a single purpose and ideal. Too many books wander from subject to subject and do but weary without informing the reader. The publisher is Marshall Jones Co., 212 Summer St., Boston and the price $2. R. DAWSON HALL.

News Of the Industry

Five-Year Agreement Ends Longest Strike In History of Anthracite Industry

The longest strike in the history of the anthracite industry is at an end.

Members of the joint negotiating committee of operators and miners, without advance notice to the public, returned to Philadelphia last Thursday, met secretly that day in separate sessions and the next afternoon affixed their signatures to an agreement to expire Aug. 31, 1930. This agreement had already been approved by the full scale committee of the union and was submitted to a special tri-district convention of the anthracite districts of the United Mine Workers at Scranton on Feb. 16. Ratification of the contract by that convention was accepted as a matter of course.

The principal terms of the agreement, which is printed in full on the opposite page, are:

(1) Extension of contract in effect immediately prior to Sept. 1, 1925, to Aug. 31, 1930, subject to annual readjustment after Jan. 1, 1927.

(2) Upon application of either operators or miners, modifications in the wage scale may be asked. Joint conferences to consider such modifications must start within fifteen days after the receipt of the proposals. If an agreement is not reached within thirty days after joint negotiations have been started, points in issue shall be submitted to a board of two men.

(3) This board will be allowed ninety days in which to reach a decision. In order to avoid a deadlock, it may enlarge its membership to an odd number, in which event a majority vote shall be binding.

(4) The demands of both sides on questions of efficiency and co-operation shall be submitted to the Board of Conciliation, exclusive of the umpire, to work out a reciprocal program of co-operation and efficiency.

Grant Brings Factions Together

Credit for bringing the warring factions together after all attempts to effect an amicable *rapprochement* appeared to have failed is given to Richard F. Grant, vice-president of M. A. Hanna & Co. and president of the Susquehanna Collieries Co. Mr. Grant, who is a past president of the Chamber of Commerce of the United States, did not enter the picture until Feb. 6. As he explained later, he waited until the political atmosphere had been cleared by the refusal of President Coolidge to take any action on the Copeland resolution requesting the President to invite the operators and the miners to resume negotiations.

On the date named, while the operators were pressing their campaign to appeal over the heads of John L. Lewis, international president of the United Mine Workers, and his fellow officers to the rank and file of the anthracite workers, Mr. Grant journeyed from Cleveland, Ohio, to Scranton, Pa., to lay his program before Major William W. Inglis, chairman of the operators' negotiating committee. From Scranton he moved on to Wilkes-Barre, where he talked for hours with Mr. Lewis.

Mr. Grant next went to Philadelphia to see S. D. Warriner, chairman of the Anthracite Operators' Conference, and William J. Richards, president of the Philadelphia & Reading Coal & Iron Corporation. He persuaded the operators to call a conference in Philadelphia on Thursday. He persuaded Mr. Lewis to abandon his speech-making tour of the mining region and return to the temporary headquarters at the Bellevue-Stratford Hotel, to which Mr. Lewis summoned the district presidents and the full scale committee of the miners.

All day Thursday Mr. Grant acted as intermediary between the operators, holding secret conferences at the Ritz-Carlton Hotel, and the union representatives, closeted across the street at the Bellevue-Stratford. Mr. Grant made a suggestion here, argued for a concession there, insisted upon this point, ironed out misunderstanding over that and finally whipped the agreement into a form acceptable to both parties. It

Joint Committee That Signed the Peace Agreement

Seated, left to right: Richard F. Grant, John L. Lewis, Alvan Markle, W. W. Inglis and James A. Gorman. Standing: Andrew Mattey, Philip Murray, Thomas Thomas, A. M. Fine, Rinaldo Cappellini, George B. Hadesty, E. H. Suender, Thomas Kennedy, Jesse B. Warriner and Christ J. Golden.

Digitized by Google

was submitted to the full scale committee of the miners on Friday morning and indorsed without change.

At 1 o'clock that afternoon the operators' delegation crossed the street and went into joint session with the miners. In less than an hour the announcement was made that an agreement had been reached. Word was flashed to the mining region and scenes duplicating the armistice day celebrations of 1918 were repeated from Forest City to Minersville.

Grant Pricks Some Bubbles

It was only after spokesmen for various state and federal officials had begun to claim credit for the settlement that Mr. Grant consented to talk for publication. He then made the following statement:

"When a coal strike develops, many champions of the people with political hopes start to develop ways and means to capitalize the situation for their own benefit. The first thing to do is to convince the people of their general love for humanity.

"There is no publicity value in being a private lover, and so their love is proclaimed loudly. The next thing is to have a plan or to offer their good offices. This is done, so that later, when the strike is settled, they can point with pride to their helpfulness.

"Hundreds of plans have been submitted. Generally they follow the plan of the Ten Commandments, the Episcopal marriage ceremony or Mrs. Rorer's cook book.

Richard F. Grant

"These champions of the people accomplish nothing except to confuse everything and everybody and prolong the strike.

"For three days I have been the sole contact between operators and miners. Right at the start it seemed sure that a formula could be written to end the strike. My only fear was that some great friend of the people would have a heart-break and start loving out loud and spoil the party.

"I call attention to the great common sense and wisdom of President Coolidge. It is my firm conviction that if he had yielded to the great pressure upon him and had tried to intervene, this contract would not be signed today. The American people are entitled to know this solemn conviction of mine and to honor this great President of ours who has shortened the strike by his wisdom.

"I would like to paste across the sky in eternal letters a warning to look out for these great lovers of America who want to do their loving out loud and who would capitalize the distress of our people for personal reasons."

Follows Hanna Tradition

Mr. Grant's successful mediation was in line with the traditions of the House of Hanna. The relations of that institution with labor always have been such that a Hanna man could command a real hearing from the union leaders. The founder of the firm was one of the first bituminous operators to hold out the hand of friendship to struggling organized labor more than a half century ago.

The late Senator Hanna also was a prominent figure in the anthracite controversies between the anthracite operators and the United Mine Workers in the early years of the presidency of John Mitchell. It was largely through his influence that the 1900 basis was continued until the big strike of 1902. And in 1922 Michael Gallagher labored to end the disastrous bituminous suspension of that year.

Major Inglis declined to make any

Complete Text of the Agreement Signed at Philadelphia

This agreement, made this twelfth day of February, 1926, between Districts 1, 7 and 9, United Mine Workers of America, parties of the first part, and the anthracite operators, parties of the second part, covering wages and conditions of employment in the anthracite coal fields of Pennsylvania, witnesseth:

1—Work shall be resumed at once under the terms of the expired contract, which, subject to modification as hereinafter provided shall be in force and effect until Aug. 31, 1930.

2—At any time after Jan. 1, 1927, but not oftener than once in any year, either party may, in writing, propose modifications in the wage scales of said contract. The parties agree within fifteen days after receipt of such written proposals to start conferences in the usual manner in an effort to agree upon such modifications.

3—If within thirty days after starting such negotiations the parties have not agreed, all issues in controversy shall be referred to a board of two men with full power and without reservation or restrictions, and the parties agree to abide by any decision or decisions of such board, either on the merits of the controversy or as to procedure to be followed. Such board shall be appointed as follows:

The operators shall name three men and the miners shall name three men. The operators shall select one man from the miners' list and the miners shall select one man from the operators' list, and the two men so approved shall constitute said board. Unless agreed, the men named by the parties shall not be connected with the United Mine Workers of America or the business of mining coal. The board shall be obligated, within ninety days after appointment, to arrive at a decision on all issues in controversy, and to that end shall formulate their own rules and methods of procedure and may enlarge the board to an odd number, in which event a majority vote shall be binding.

4—The demands of the operators and the mine workers on the question of co-operation and efficiency are referred to the Board of Conciliation, exclusive of the umpire, which shall work out a reciprocal program of co-operation and efficiency.

5—The Board of Conciliation shall proceed to equalize wages, etc., in accordance with Clause 12 of the agreement, dated Sept. 19, 1923.

6—Except as modified herein the terms and provisions of the award of the Anthracite Coal Strike Commission and subsequent agreements made in modification thereof or supplemental thereto, as well as the rulings and decisions of the Board of Conciliation, are hereby ratified, confirmed and continued during the term of this contract, ending Aug. 31, 1930.

In witness whereof, the parties hereto, through their accredited representatives, have caused this agreement to be properly executed, the day and year first above written:

On behalf of the anthracite operators:
W. W. INGLIS,
GEORGE HADESTY,
J. B. WARRINER,
E. H. SUENDER,
THOMAS THOMAS,
ANDREW M. FINE.

On behalf of Districts 1, 7 and 9, United Mine Workers of America:
JOHN L. LEWIS,
PHILIP MURRAY,
THOMAS KENNEDY,
C. J. GOLDEN,
RINALDO CAPPELLINI,
ANDREW MATTEY.

Attest:
JAMES A. GORMAN, Secretary.

ALVAN MARKLE, Chairman.

Digitized by Google

comment upon the settlement before leaving Philadelphia. On his arrival at his home in Scranton, however, he issued the following statement:

"This time I am glad to return home with a contract that means the resumption of mining. The public's disappointment over earlier failures was not nearly so great as mine.

"I am confident that the agreement signed on Lincoln's Birthday will carry with it a long period of peace and prosperity. This prosperity will be shared not alone by the coal companies. If it is as good a peace as I think it is, the mine workers and every one in the region will benefit. No contract, in fact, that was not good for everybody would be worth signing.

"The past has shown that pulling in different directions gets us all into a lot of trouble. In place of that, what I should like to see established is a rule of co-operation and good feeling that includes the public, the mine workers and ourselves, all pulling together for the general good.

"That the industry which means so much to every one here has suffered severely is undeniable. With co-operation all round we can more quickly regain our markets and make this region again prosperous and happy.

"The thing that makes me most glad is that the strike is ended with honor to all concerned—all except the self-seekers who sought to make of it an opportunity to glorify themselves. They, of course, prolonged the strike. But to the earnest men who, without self-advertisement, sought to be really helpful in bringing about a settlement I am sincerely grateful."

Constructive Peace, Says Lewis

Mr. Lewis, in a statement issued soon after the signing of the agreement, said:

"The settlement is satisfactory and constructive. It assures stability and continuous operation for a five-year period, which is the longest agreement ever made in the coal industry.

"It does not contain the principle of arbitration, for which the operators have been contending, but it does provide machinery for the exercise of reason in the industry.

"The wage schedules of the expired contract are continued for five years unless changed by mutual consent of the representatives of both parties; both sides are thus given full protection.

"Under the agreement the Board of Conciliation is given broad powers as a stabilizing agency and is instructed to work out a reciprocal program of co-operation and efficiency which will restore a greater degree of confidence and harmony between the operators and the mine workers, which should result in substantial economies and reduced operating costs.

"Such a result will be a contribution to the industry which has been sadly needed, and if both parties work in good faith toward the attainment of the desired objective it will result in the industry being placed upon a higher plane that will command the respect of the coal-consuming public.

"It is the dawn of a new era in the anthracite industry, and both operators and miners should make the most of the opportunity which is given them.

"The agreement has met with the unanimous approval of the members of the scale committee of Districts 1, 7 and 9, United Mine Workers of America, and I anticipate will be overwhelmingly indorsed when presented for ratification by the mine workers throughout the anthracite region.

"The high courage and unselfish devotion to public interest which has been demonstrated by the Hon. Gifford Pinchot, Governor of Pennsylvania, throughout the course of the strike deserves the commendation of the mine workers and all throughtful citizens who have suffered inconvenience and paid exorbitant prices for substitute fuel.

"From the first Governor Pinchot, acting as a faithful public servant, has utilized the influence of his high office to crystallize public sentiment into an instrumentality that would end the strike.

"The present happy ending is in a large measure due to his untiring efforts to accomplish this result, and I am sure that his earnest spirit will receive ample reward in the gratification that comes from the knowledge that public necessity will now be relieved.

"The Federal Conciliation Service, under the personal direction of the Hon. James J. Davis, Secretary of Labor, has also rendered marked service in the controversy. The Secretary and his personal representatives have at all times exercised tact and wisdom in dealing with the problem and are justly deserving of credit."

Operators Are Gratified

Later in the day, Mr. Warriner said:

"The operators are intensely gratified that the strike is at an end.

"If it has engendered any bitterness we hope it will soon pass away. We shall make the utmost effort to that end. The next step is to rebuild what the stoppage of production for five and a half months has torn down.

"Out of the strife and misunderstanding there has been obtained an assurance of five years of peace. During that time the public is guaranteed a regular, dependable supply of anthracite.

"Production will be resumed at the earliest possible date. With the return of the men this can be done quickly because our properties have been kept up throughout the strike and within a few days coal should be rolling to market.

"In a period of scarcity caused by the loss of some 35,000,000 tons of production it is inevitable that prices soar. The effects of such conditions have been plainly seen in the mounting prices of substitutes.

"So far as the recognized producers of anthracite are concerned, since the strike began they sold the stocks they had at the prices prevailing at the time of the strike. After production is resumed it is expected they will maintain normal Winter prices for domestic sizes. It is also expected that the retail trade will maintain normal margins, so that our customers may not suffer from profiteering."

Strike Establishes Duration Record

The 1925-26 anthracite strike breaks all records for duration. Heretofore first place had been held by the 1902 suspension of 164 days, followed by the 1922 suspension of 163 days. On the day on which the agreement to end the 1925-26 strike was signed, the struggle was in its 165th day. About 150,000 workers (excluding maintenance men) were involved and the average loss in wages was over $1,000,000 per day. The total cost of the strike, including wages, profits and curtailed general business in the anthracite region may reach $1,000,000,000.

The record of preceding strikes in the last twenty-five years follows:

1900: Sept. 12 to Oct. 29.
1902: May 12 to Oct. 23.
1906: April 1 to May 7.
1912: April 1 to May 20.
1920: The vacation strikes of varying length at different mines.
1922: April 1 to Sept. 11.
1923: Sept. 1 to Sept. 19.

Congress Harps on Coal Despite Strike's End

By Paul Wooton
Washington Correspondent of *Coal Age*

Even though the anthracite strike has been settled Congress apparently is determined to devote some time to coal legislation. Chairman Parker, of the Committee of Foreign and Domestic Commerce of the House, has announced his intention to hold hearings on the recommendations of the Coal Commission. As this is written, no date has been fixed.

Senator Borah has announced his intention to urge coal legislation. The Oddie bill has been introduced in the House and active steps on behalf of this bill may be expected in the Senate.

When Secretary Hoover was asked about the charge, made on the floor of the Senate, that he had been delinquent in not having reported on the Oddie bill, he replied naïvely that the department could do little else if he had to write essays on each of the 5,000 bills introduced at each Congress which come within the purview of his department.

The District of Columbia Committee at last has brought about an arrangement whereby an audit of the books of certain retailers will be made by accountants from the office of the Comptroller General.

Advisory Committee Report Made Public; Reynders Out of Range of Protests

The report of the Bureau of Mines Advisory Committee, of which J. V. W. Reynders is chairman, was made public Feb. 18 at the Department of Commerce, in Washington, D. C. Secretary Hoover is withholding comment until he has had an opportunity to study the report in detail.

The report, which was submitted to Secretary Hoover on Jan. 5, contains the following recommendations:

"Transfer to the Bureau of Mines of the Division of Mineral Resources, which as a part of the Geological Survey has long maintained an important statistical service for the mineral industries, and placing the whole in the Department of Commerce, where the economics of industry and trade are under constant review, affords an excellent opportunity for developing the further usefulness of the Bureau of Mines in an important direction. It will not be satisfactory to attempt to segregate economic studies entirely from the technologic and engineering aspects of these industries. Economic policy relating to minerals must be based on a wide knowledge of technical and engineering facts, and, conversely, the direction and intensity of technical studies must be related to the economic situation in the industry.

Recommends New Branch

"Your committee believes that the interests of the several mining industries concerned can be best served by the Department of Commerce by a consolidation of relationships within the Bureau of Mines and therefore recommends the incorporation of a branch of industry or economics within the Bureau of Mines and the transfer to the Bureau of the Coal, Minerals and Petroleum divisions' work of the Bureau of Foreign and Domestic Commerce, with any others involved, to the extent that the officials of the department may deem it wise or necessary for the accomplishment of this purpose.

"Because of the limitations placed upon federal safety service by our dual form of government, the object of the Safety Division should be the development of a public opinion within the various states for the creation of such standards of mine inspection and accident prevention and of such adequate facilities as will enable this Bureau to turn over gradually to the individual states the work which properly belongs to them, in the meantime maintaining a high standard in its personnel and continuing unfalteringly its missionary endeavor toward the prevention of accidents, its encouragement of an increasingly higher standard of safety, and the actual rescue work in cases of emergency.

"It is recommended that the work of the small stations be consolidated into three units, located at Pittsburgh, Salt Lake City, and one at a point where the oil industry could be well served. Three stations so situated could be built up into efficient units where brains and apparatus could be consolidated under more efficient leadership and supervision than is possible with many small struggling units.

"The Bureau of Mines . . . depends on the co-operation and good will of the industries in collecting data. It is most important that this good will be not lost and that the confidential character of individual returns be respected in the fullest degree. Accordingly, it is recommended that neither the Bureau nor the members of its staff be used in connection with prosecutions by the government or the states, for infraction of laws, or in determining damages in civil suits.

"It is recommended that the collection of statistics be transferred to the proposed economic branch of the Bureau and that the method of collection and form of publication of these statistics be carefully revised to make these figures more accurate and in consequence of greater value to the industry.

"We believe that, subject to the limitations imposed by appropriations available for this work, the Bureau should collect current figures showing production, sales, distribution, stocks and consumption, also costs, selling prices, realizations, etc., if desired by the industry concerned, and that such information should be tabulated and promptly distributed to all interested parties.

Seeks Advice and Criticism

"The point of view of the Bureau staff, essentially that of a field engineer, has led to a feeling that the work was not complete until the results had been put into practice. Such a result is greatly facilitated through co-operative agreements at the same time that a proper part of the expense is assessed to those first and more immediately benefited. . . . It is highly desirable that the staff of the Bureau have at all times the advice and criticism of the industry, and the system of advisory committees already in being may, we think, be extended to advantage to cover the initiation of various studies, the methods of their conduct, and the partial and final results."

It is recognized in Washington that the report is certain to arouse many protests. Some are wondering if Chairman Reynders chose this time to make his trip to Soviet Georgia so as to be beyond reach when the report was made public.

Caught in Coal Slide, Turns Up Safe in Tender

A sudden slide of coal in a big bin of the Louisville & Nashville R.R. at Lebanon Junction, Ky., last week came near being disastrous to W. Metcalf. Mr. Metcalf and other employees of the L. & N. were engaged in digging coal down when the slide occurred. Seeing Mr. Metcalf's perilous position, his companions ordered an engine under the slide, and as the coal was released, filled the tender.

Mr. Metcalf was forced through the chute, carrying down with him several tons of coal.

Lawton Guilty of Contempt; Sentence Withheld

Tyler G. Lawton, of Terre Haute, Ind., president of District No. 11, United Mine Workers, was found guilty of contempt of court by Judge Edgar S. Durre, of the Superior Court of Vanderburgh County, as a result of an order issued by Lawton, giving miners working in the Green Mound Coal Co. mine at Washington, Ind., the alternative of quitting work at their present scale or losing their membership in the United Mine Workers. The order was part of a unionization movement under way in the southern part of the Indiana field.

The mine was operating under a receivership by order of Judge Durre's court and it was held that Lawton's order interfered with the discharge of his duties by the receiver. Lawton pled ignorance of the receivership.

Judge Durre withheld sentence until May 1 with the advice that Lawton attempt to get the men to return to work. However, the miners were not working under the Terre Haute agreement and if the district president orders them to return to work, he will be violating his obligations to the union. If he does not order them to return to work, he faces the probability of invoking a sentence from the court. The maximum penalty on this charge is a fine of $100 and 90 days in jail.

1 Dead, 19 Hurt, 600 Escape In Ohio Mine Blast

An explosion at about 8 a.m. Feb. 15 in the Powhatan Mine, 16 miles south of Bellaire, Ohio, caused the death of one miner and injuries to nineteen others, one of whom may die. Six hundred other miners escaped without injury. The men escaped through the main airshaft, located 300 ft. from the scene of the explosion. The airshaft was undamaged, though the interior of the main shaft was wrecked. The cause of the blast is not known. It is believed that the mine will be cleaned up so that operations can be resumed within a few days.

The mine is owned by the Powhatan Mining Co., which recently figured in a merger with the North American Coal Corp., of which Frank E. Taplin is president.

Defers Filling Read's Place

No successor to T. T. Read will be named at this time, it is stated by Director Turner of the Bureau of Mines. Mr. Read, who was in immediate charge of the Bureau's safety work, recently resigned to undertake a membership drive for the American Institute of Mining and Metallurgical Engineers.

As some reorganization of the safety work is in prospect, Director Turner in the meantime expects to give considerable personal attention to that branch of the work. With the assistance of those within the Bureau who are familiar with the Bureau's safety activities, the work will be looked after carefully while the reorganization studies are in progress.

Kernohan Named Manager Of Houston Coal Co.

W. R. Kernohan, of Chicago, is the new general manager of the Houston Coal Co., having taken charge on Feb. 15, with headquarters in Cincinnati, Ohio. Since the death of Kuper Hood, about two years ago, the position was held for short periods by Harry Olmstead, who died suddenly from pneumonia, and by Leo Lewellyn, who returned to a washery manufacturing company with which he had formerly been connected. Mr. Kernohan, who is 46 years old, has spent his entire business life in the coal trade, having been associated at various times with S. P. Kineon, the Kanawha Fuel Co., the Carbon Fuel Co., the Zeigler Coal Co. (in full charge of sales), the Pocahontas Coal Sales Co. and the M. A. Hanna Co. In 1924, with George M. Cain, he organized the Kernohan Coal Co., of Chicago, and this company will continue to do business under its present name, but on an independent basis.

Scale of 1922 for Two Years In Nova Scotia

The convention of District No. 26, United Mine Workers, held at Sydney, N. S., during the week ending Jan. 30, adopted by a vote of 57 to 38 the report of the Royal Commission as a basis for negotiations with the operators for the establishment of a new wage schedule. The report recommends a long-term contract at the wages of 1922, which in some cases are rather below those fixed by the last contract in 1925.

The basis recommended by the report is a minimum wage, and a sliding scale, with the establishment of an accounting system giving the accountants of the union access to the company's books to ascertain what share the men may demand in the profits as wage increase.

It was agreed that the policy of the district shall be directed toward the nationalization of the mines with compensation to the owners to the extent of the value of their operating plants and equipment. A contract running until 1928 is favored.

To Extend Co-operative Study of Explosions

Co-operative research on coal-mine explosions by the governments of Great Britain and of the United States has been so successful that plans are being made for its extension to the field of metallurgy. The coal work also may be enlarged so as to include research on fuels.

Dorsey A. Lyon, assistant director of the Bureau of Mines, in charge of its research branch, and George S. Rice, the Bureau's chief mining engineer, will go to London in the spring to discuss the matter with the British authorities.

The work, if undertaken, will be confined to fundamental research. By working together duplication of effort can be avoided and plans made so that more can be accomplished than would be the case were the work conducted independently.

In addition to the exchange of information as to the progress of work on mine-explosion problems, Dr. H. F. Coward, a British specialist, is working at the Pittsburgh station of the Bureau of Mines with the group engaged in this study. In the same way Dr. Reinhardt Thiessen, of the Bureau of Mines staff, is working in the British laboratory at Eskmeals.

Spurr Nominated Chairman New York Group A.I.M.E.

Ballots are being circulated for the election of the New York Section of the American Institute of Mining and Metallurgical Engineers. The ballots must be received on or before Feb. 25 to be counted in the election. J. E. Spurr, editor, *Engineering & Mining Journal-Press*, is nominated for chairman. Nominees for vice-chairman are Sidney Rolle and A. D. Brokaw, and for committeemen M. F. Chase and Karl Hoffman. M. H. Merriss is nominated for treasurer. Two vice-chairmen and two committeemen are to be elected.

Rocky Mountain Institute Plans Live Meeting

The program for next week's meeting of the Rocky Mountain Coal Mining Institute, in Denver, Colo., includes a paper by Dan Harrington, of Salt Lake City, Utah, on electrical dangers in coal mines. This already has elicited several hot replies from manufacturing companies, all of which will be read at the meetings, which run through Feb. 23, 24 and 25. G. A. Murphy, of Storrs, Utah, will read a paper on spiralizing coal; Edward Bottomley, of Kleenburn, Wyo., will describe the loader operations in his properties; E. C. Horne has a paper on ventilation; Jack King is to display moving pictures telling the story of wire rope, and George B. Pryde, of Rock Springs, Wyo., has the completed report of the safety committee ready to offer.

National Council to Study Spanish Fuel Problem

A national council of combustibles (fuels) recently was authorized in Spain by a royal decree to study and propose to the government the proper procedure for the solution of the national fuel problem—production, distribution and consumption—according to a report by Commercial Attaché Charles H. Cunningham, Madrid, to the Department of Commerce.

The commission is to consist of 25 members, 13 to be appointed from the government departments most concerned with the fuel problem and others representing the department of mines, the Consejo de Economia Nacional, the army and navy and the ministries of commerce, labor, finance and public works. The commission is to have jurisdiction over coal and petroleum problems and in addition to handle questions of the commercial classification of coal, its transportation, distribution, floating and free deposits. It is also to have jurisdiction over taxes, customs, duties, and financial problems concerned with coal production, including subsidies by the state, loans to the coal industry, and labor problems such as the regulation of salaries and the solution of labor disputes.

(a) Note that the coal statistics of the Geological Survey for a given year include only the mines that had an output in that year. Many mines that operated n 1923 produced no coal in 1924; moreover, many of the mines that did produce in 1924 worked for a short time only. The number of active mines of commercial size in Kansas was 222 in 1923 and 228 in 1924; in Maryland, 105 in 1923 and 93 in 1924; in Michigan, 13 in 1923 and 9 in 1924.
(b) Includes also loaders and shotfirers.
Statistics issued by U. S. Bureau of Mines.

Philadelphia Has World's Largest Coal Dumper

An important addition to the facilities of the Reading Company's 3,800-mile railway system at Port Richmond, its Philadelphia Harbor terminal, was made during the past year with the installation of the world's largest coal-car dumper. This piece of machinery is capable of handling 40 100-ton coal cars each hour, is to a great extent electrically operated, and all control apparatus is electrically actuated.

The huge new dumper loads freighters with export coal, barges for coastwise trade, and smaller craft for direct delivery to the industries of the Port of Philadelphia.

Cars to be dumped are pulled up a 12 per cent grade onto the dumper cradle, and are hoisted vertically to the hopper. The main operator, stationed in a cab near the top of the machine, which gives him a clear view of the car as well as the ship into which it is to be emptied, controls the raising of the car as well as the height of the pan into which the coal is to be

Reading Co.'s Coal Dumper at Philadelphia

dumped. The hoisting machinery is operated by steam, while the pan is governed by a 150-hp. Westinghouse electric motor.

At the end of the pan into which the coal is dumped there is a telescopic chute, with an operator to control its movement stationed in a cab directly over the ship's hatch, so that proper direction of the flow of coal can be obtained. The entire operation is controlled electrically and with surprising flexibility, which assures even distribution of the coal. The pan and telescope mechanism is hoisted clear of receiving ships before and after docking by a 275-hp. motor, protected with limit relays and full magnetic dynamic breaking controller.

In connection with the car hoist, a large thawing house for use in winter is maintained on the dock. A temperature of 200 deg. F. is maintained in extreme weather, which quickly thaws the coal for dumping into waiting barges or ships. Four tracks pass through the building, having a total capacity of 48 cars.

© Keystone View Co.

Lord Londonderry

British political and industrial circles were much interested in the statement last week by this eminent operator that "there need be no lowering of wages and no lengthened hours in the pits" and his previous statement at Seahan that the coal owners do not believe that the prosperity of the industry depends upon the reducing of the wages or lengthening of hours.

N. Y. Coal Exports Decline

During the twelve months ended Dec. 31, 1925, shipments of fuel to foreign countries through the Port of New York included 71,533 tons of anthracite, 14,028 tons of bituminous coal and 5,140 tons of coke, as compared with 98,645 tons of anthracite, 29,941 tons of bituminous and 25,334 tons of coke during the preceding year.

Of this tonnage Canada in 1925 received 62,683 tons of anthracite and 5,108 tons of bituminous coal as compared with 84,668 tons of anthracite and 1,409 tons of bituminous in 1924.

The average price per ton for the anthracite exported in 1925 was $11.17, while in 1924 it was $11.45. Bituminous coal brought $7.44 per ton last year as compared with $6.86 in 1924 and coke $17.04 per ton in 1925 as compared with $12.11 the preceding year.

Coal Company to Make Own Liquid Oxygen Explosive

Erection of a plant for the manufacture of liquid oxygen has been started by the Enos Coal Mining Co., which operates the largest stripping mine in the United States, near Oakland City, Ind. The liquid oxygen will be used in the manufacture of an explosive which will be used by the company in its own workings and which will also be placed on the market commercially. Cartridges of cheesecloth filled with lamp black will be soaked in the liquid oxygen and then allowed to dry to form the explosive, it is said. It is fired by the use of the ordinary dynamite cap and electric battery.

Mail Order Coal Company In Financial Straits

The Boylston Co., Chicago's well known mail order coal house, has become insolvent, a recent meeting of the company's creditors revealed. The concern is believed to owe about $185,000, the creditors including approximately 100 country banks and a number of coal companies. The Franklin County Mining Co., it is said, has a claim for $80,000. Plans are being studied whereby creditors may realize on the available assets.

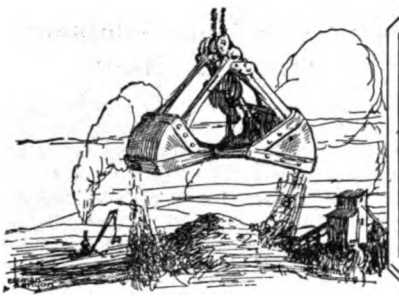
The officers of the Boylston Co. are Simon Levy, president and treasurer; Arthur Levy, vice-president, and Charles B. Levy, secretary and general manager. The Boylston Co. was organized in April, 1922, and owned and operated the Popular Coal Co., the Washington Coal Co., the Faultless Fuel Co. and the Red Seal Coal Co.

C. & O. Plans Connection With Virginian Ry.

Unconfirmed reports are in circulation in southern West Virginia to the effect that the Chesapeake & Ohio Ry. proposes to take over the railroad interests of the Glade Creek Coal & Lumber Co., of Raleigh County, and construct a line through the Richmond, Flat Top and Camp Creek districts, connecting with the Virginian Ry. at Kegley, near Princeton, on condition that the Chesapeake & Ohio be merged with the Virginian.

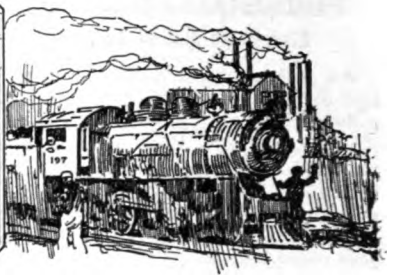
The Glade Creek Coal & Lumber Co. has built a line from the main line of the Chesapeake & Ohio, about ten miles east of Prince, through Raleigh County for a number of miles to its extensive holdings and a large bridge has been built over the New River at one point near the C. & O. Coal companies owning property near the rumored extension include the New River Co., Flat Top Mining Co., the Prince heirs, Raleigh Lumber Co., Rolfe Coal Mining Co. and the Camp Creek Coal & Lumber Co.

Use of Permissibles Gains



A total of 58,380,217 lb. of permissible explosives was consumed in the United States in 1925, an increase of about 6 per cent as compared with 1924, according to a preliminary report by the Bureau of Mines. Ninety per cent of the total amount sold in 1925 was for use in coal mining.

Sales of black blasting powder during 1925 were approximately 6,307,184 kegs of 25 lb. each, a decrease of 6 per cent in comparison with 1924. Of the total reported sales of black powder during 1925 coal mines used 84 per cent.



Sales of other high explosives in 1925 totaled approximately 285,295,097 lb., an increase of 4 per cent. Of the total amount used, 10 per cent was for coal mining.

Plants manufacturing permissibles and other high explosives operated in 1925 at the rate of 62 per cent of capacity, which is the same rate as prevailed in 1924.

Production And the Market

Agreement to End Hard Coal Strike Causes Many Shifts in Market Conditions

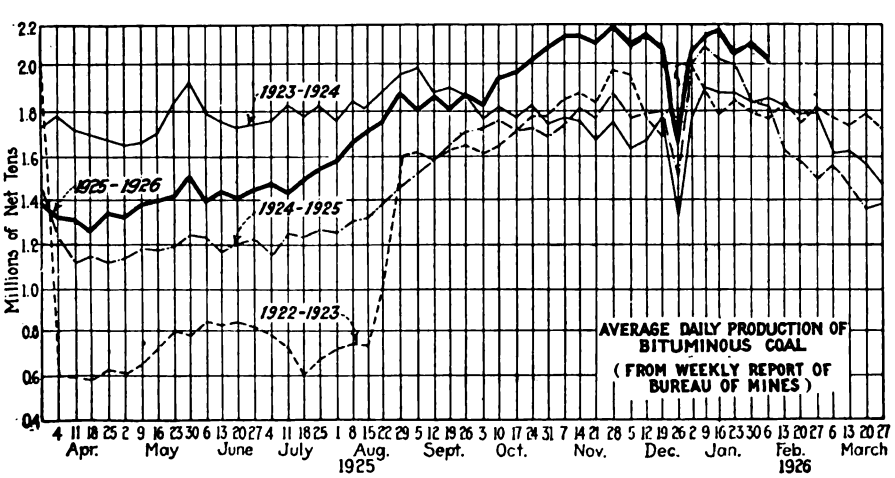
The agreement to end the prolonged anthracite strike was easily the outstanding feature of the market situation last week. Coming practically unheralded and almost at the close of the week, the full effect of the settlement could not be measured. There were enough changes in Atlantic seaboard markets, however, to show that prices on bituminous coal and coke for household consumption will undergo a sharp liquidation. A flood of cancellations has already set in and many shippers find that business booked has vanished.

The effect of the resumption of anthracite mining upon the steam bituminous market promises to be beneficial. The pressure to expand production of soft coal to take advantage of high prices bid for the so-called domestic sizes in recent weeks has resulted in surfeiting the market with an undigestible surplus of fine sizes. Some of this tonnage has been sold at prices which yielded little more than the freight charges. With the restriction in bituminous operations which will naturally follow shipment of hard coal to the anthracite-consuming territory, the accumulation of screenings will diminish. There also will be more interest displayed in the situation by the industrial buyer.

Weather Acts as Depressant

In those markets where the settlement of the anthracite strike did not start prices on prepared bituminous coal on the downward path, milder weather proved an effective depressant of demand. Middle Western, Kentucky and West Virginia coals suffered in this slump. Unfortunately for the shipper, there was, except under unusual circumstances, no offsetting gain in prices realized on the steam sizes.

The general level of spot prices again declined. The *Coal Age* Index for Feb. 15 was 173 and the corresponding price was $2.10. For Feb. 8 the index number was 177 and the price was $2.14.



Dumpings at Hampton Roads during the week ended Feb. 11 totaled 448,634 net tons, as compared with 388,265 tons the week preceding. Increased foreign demand and heavy shipments of slack to New York and Boston helped to swell the total.

Production Still at High Rate

There has been some decline in the rate of production in the bituminous fields since the beginning of the month, but the curtailment has not been drastic enough to clean up "no-bills," which are to be found on mine tracks from Colorado to the eastern seaboard. Output the first week in February approximated 12,134,000 net tons, according to estimates of the Bureau of Mines. Cumulative production for the coal year on Feb. 6 was 460,149,000 tons—an increase of nearly 45,000,000 tons over the corresponding figure for 1924-25.

Nowhere has the settlement of the anthracite strike hit harder than in the Connellsville region. Within a few hours after the word flashed over the wires, cancellations began to pour in and prices began to tumble. New York quotations on beehive coke slid off $3 and further reductions were anticipated. Nevertheless the strike brought undreamed of profits to the ovens in the Connellsville region. It is estimated that since the first of the year the field has been shipping 90,000 to 100,000 tons weekly to eastern consumers for domestic use.

Anthracite production starts this week, but it will be several days before the movement reaches normal proportions. This will give the retail trade some chance to liquidate stocks of substitutes.

Estimates of Production

(Net Tons)

BUTIMINOUS

Middle Western Prices Break

Plans to keep Middle Western prices stabilized came a cropper in the Chicago market last week. Saline County was the first to break with a reduction of 25c. from the $3.50 basis on 6-in. lump. Franklin County met this challenge by cutting to $3. Neither action brought any influx of orders and there was some resentment in the retail trade, which had been assured that the $3.50 price would be maintained throughout the month. Carterville also is weaker.

Southern Illinois, however, feels that the reductions place that field in a better position to withstand the inroads of non-union coal from Kentucky and West Virginia. Some high-grade 4-in. block from the last-named state has been offered as low as $2 and there is 6-in. Kentucky coal which can be bought by wholesalers for $2.25. Even smokeless mine-run is down to $2@$2.25 and good lump from the low-volatile districts is available at $4.25@$4.75. Smokeless nut and egg, on the other hand, are scarce and prices are stiff.

The slump in domestic demand, of course, has curtailed the output of fine coal from the Illinois and Indiana fields. Nevertheless the steam market still drags. Purchasing agents are drawing upon storage piles and ignore solicitation except at bargain-counter prices.

Duquoin and Jackson County have not been behind the southern Illinois field in the matter of price-cutting. Reductions have put quotations 25@35c. under the ruling figures in the Carterville district. Neither the Mt. Olive nor the Standard field is immune from the general monotony. Mines in those districts are averaging three days a week.

Domestic business in the St. Louis local market is only fair, with the cheaper coals moving better than higher priced Illinois tonnage. Steam trade is featureless. Country domestic and steam demand is quiet.

Kentucky Fights Steam Coal Slump

Kentucky operators are trying to check the slump in steam-coal prices, but neither the curtailment in production brought about by an easier domestic demand nor the refusal on the part of some shippers to flood the market with consignment coal has been wholly effective. The better grades of Kentucky screenings, both eastern and western, are selling at 60@95c. Lower grades and distress tonnage have been sold down to 15@20c.

This weakness has been reflected in prices on wagon-mine mine-run. Some coal from those operations has been offered as low as 90c. Steam buyers are taking full advantage of the situation, apparently content to let the future take care of itself.

Although some shippers are asking $3.25 for choice eastern Kentucky block, the general run of prices is $2.50@$3. Lump and egg bring $2@$2.25, and mine-run, $1.35@$1.75. Western Kentucky block is quoted at $1.85@$2.15;

lump and egg, $1.60@$2, and mine-run, $1.25@$1.50, with little desirable tonnage under the lower figure.

Dock Shipments Decline

The weather has taken its toll of the domestic business of the docks at the Head of the Lakes this month. The industrial outlook, however, is encouraging. Iron and steel plants are taking larger tonnages than a year ago. Mining companies on the Minnesota iron ranges also are in the market for more coal. Dock quotations are unchanged.

Coal shipments from the Duluth-Superior docks last month, according to the Western Railway Weighing & Inspection Bureau, totaled 23,990 cars, as compared with 25,735 cars in December and 27,693 cars in January, 1925. Supplies of bituminous coal on the commercial docks on Feb. 1 approximated 3,600,000 tons. Operators hope that the carry-over can be materially reduced before the opening of navigation.

Outside of a slight decrease in business due to milder weather conditions, the Milwaukee situation is unchanged. Domestic demand has been well taken care of with coke, smokeless coal and high-grade bituminous so that former anthracite consumers have had no cause for complaint. During January, Milwaukee received 10,327 tons of anthracite and 36,741 tons of bituminous coal via car ferry and 4,450 tons of anthracite and 46,163 tons of bituminous via all-rail routes.

Southwestern Outlook Drab

The "no-bill" report of Feb. 10 showed 399 unbilled loads at the Kansas mines. Of this number, 190 cars were lump, 40 were nut and 169 were screenings. The accumulation of fine coal, however, is causing little worry, as operators feel that the falling off in domestic demand will soon correct that situation. In an effort to clean up lump tonnage, many producers have cut their price to $4.50 and some will take orders at $4.25.

The Arkansas outlook is even more depressing. The late winter demand was below normal. All mines have been checking up idle time and some have closed down completely.

Mild weather throughout Nebraska and Kansas has cut down shipments of domestic coal from the Colorado mines. Production is slowing up, but prices are unchanged. Last week there were approximately 500 unbilled loads in the southern Colorado field.

The bottom has dropped out of the market for domestic coal in Salt Lake City territory. Steam demand, however, continues normal for the season of the year. No new contracts have been signed, but early activity in that direction is expected. The weak domestic demand threatens to create a shortage of slack in Utah.

Cancellations Burn Cincinnati Wires

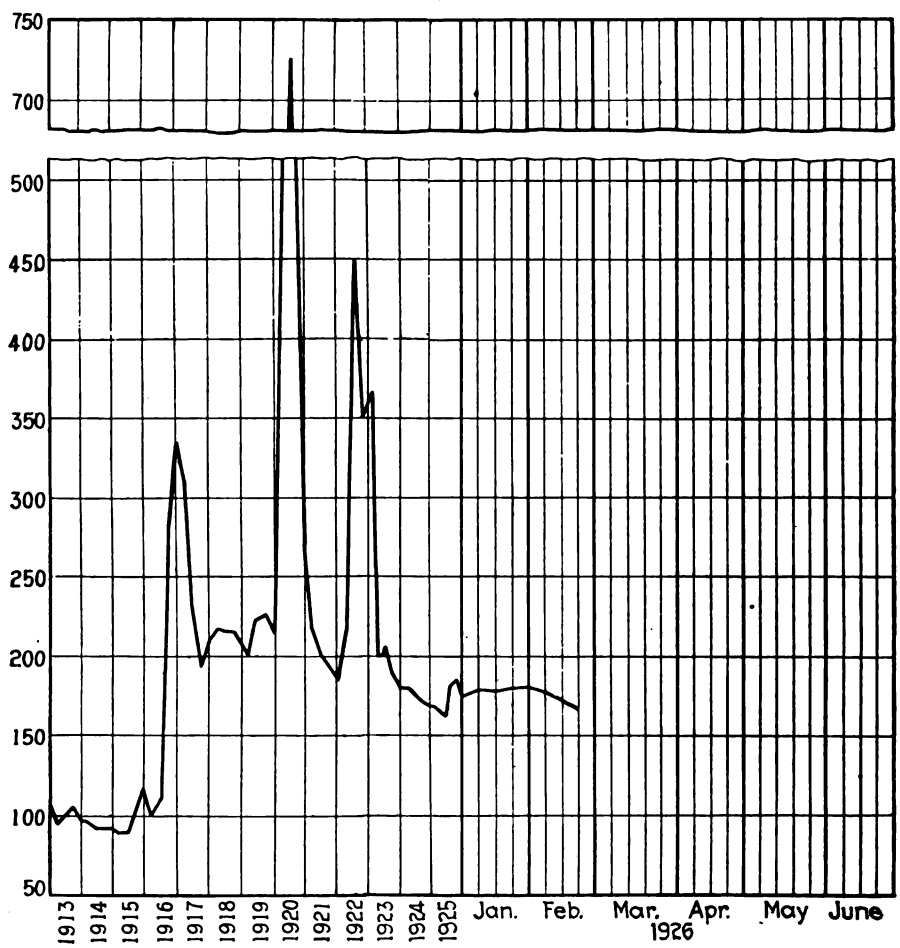
The Cincinnati market was not left long in doubt as to the effect the settlement of the anthracite strike was to have. Friday afternoon (Feb. 12) messenger boys wore a steady path to low-volatile offices with telegrams canceling or suspending orders. Coming on top of a weaker market for high-volatile coals, smokeless producers immediately decided that the better part of merchandising was discretion. Plans already are in the making for a renewed drive on western trade. What further steps will be taken in the eastern sales campaign is a question of the future.

At the present time the market is glutted with low-priced fuel. Slack at 40@60c. is common. Some Hazard shippers are offering block at reductions which have not been approached in months—and other districts threaten to meet these price cutters on their own ground. Harlan prices, too, are slipping. Logan County quotations also are on a low basis.

The principal worry is what to do with coal already on wheels. The latest interchange report of the American Railway Association shows 13,353 cars passing through the Cincinnati gateways—an increase of 1,873 cars over the preceding week. Louisville & Nashville loads were 1,174 cars heavier and Chesapeake & Ohio movement increased 677 cars.

Retail business in the Cincinnati district has been helped by wintry weather. Prices to the consumer are unchanged, but an early revision is in prospect.

Cold Wave Helps Central Ohio



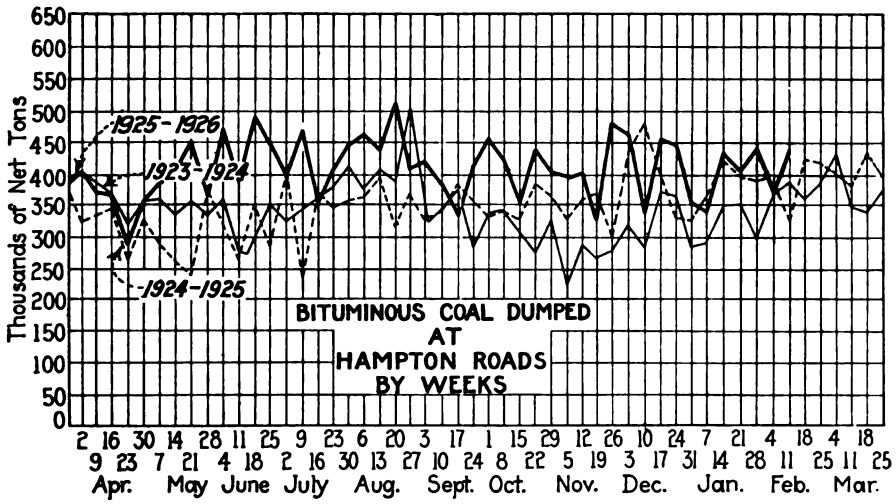
A cold wave last week quickened domestic demand in central Ohio and somewhat toned up a flabby market. The fact that many retailers are still carrying liberal stocks, however, robbed the situation of real intensity. Demand favors the smokeless coals; splints and Kentucky block are a close second, but Ohio coals make a poor third. Consumer buying is in small lots.

There is no animation in steam-coal trading. Shipments of West Virginia slack at 50@75c. keep prices on Ohio screenings close to the dollar mark. Many large industries are stocked up for 60 to 90 days. The steadiest buyers are the utilities and the steel plants. Railroad consumption has tapered off since the close of navigation. There is some distress tonnage, but not enough to embarrass the market.

Output from the southern Ohio field as a whole does not exceed 20 per cent of capacity. Pomeroy Bend is doing much better than Hocking Valley and other southern districts.

Distress Coal Crowds Cleveland

Distress coal depressed the Cleveland market last week. Slack and nut-and-slack were quoted down to $1 and con-



Coal Age Index of Spot Prices of Bituminous Coal F.O.B. Mines

	1926				1925	1924
	Feb. 15	Feb. 8	Feb. 1	Jan. 25	Feb. 16	Feb. 18
Index	173	177	178	178	168	186
Weighted average price	$2.10	$2.14	$2.16	$2.16	$2.04	$2.25

This diagram shows the relative, not the actual, prices on fourteen coals, representative of nearly 90 per cent of the bituminous output of the United States, weighted first with respect to the proportions each of slack, prepared and run-of-mine normally shipped, and second, with respect to the tonnage of each normally produced. The average thus obtained was compared with the average for the twelve months ended June, 1914, as 100, after the manner adopted in the report on "Prices of Coal and Coke: 1913-1918," published by the Geological Survey and the War Industries Board.

Digitized by Google

cessions were offered from list prices also on other grades of eastern Ohio coals for steam consumption. The retail trade, on the other hand, has been reasonably active because of cold weather, but this demand has been centered upon West Virginia smokeless, not Ohio coals.

During the week ended Feb. 6 the No. 8 field produced 296,000 tons, or approximately 42 per cent of potential capacity. This was an increase of 37,000 tons over the preceding week and 1,000 tons more than a year ago.

Gloom Still Shrouds Pittsburgh

Aside from the steady eastern demand for nut and egg coal at $2.75@$3.25, there is no life to the Pittsburgh market. The outlook for the future is dark. Presumably the demand from the East will disappear as soon as the anthracite mines go into operation and the competition of non-union coals in Pittsburgh's normal markets will increase. Moreover, at the present time there seems little disposition to follow the lead of the Pittsburgh Coal Co. in reverting to the 1917 wage scale.

Central Pennsylvania also foresees dark days ahead with the end of the anthracite strike. Output the past week was hampered by the heavy snows and resultant railroad congestion. Pool 1 coal is quoted at $3.35@$3.80; pool 71, $3.10@$3.55; pool 9, $2.85@$3; pool 10, $2.60@$2.65; pool 11, $2.25@$2.35. Lump is offered at $5; egg and nut, $5.50; slack, $2.20. Run of oven coke was held at $8.50 and sized coke at $10 last week.

The Buffalo bituminous trade wallows in a slough of despond. Slack is going begging, with good coal seeking a market at $1@$1.05. Prepared sizes are doing only a little better, relatively. Fairmont lump is nominally $1.60@$1.75; mine-run, $1.40@$1.50; slack, $1.25@$1.40. Youghiogheny gas lump is held at $2.25@$2.50; No. 8 steam lump, $2@$2.25. Allegheny mine-run is $1.75@$2.

New England Feels Reaction

The reaction following the settlement of the anthracite strike has set in in the New England market. While buyers realize that it will be several weeks before shipments of hard coal are moving in normal volume, life has gone out of the demand for substitute fuels. Middle houses already have received cancellations of orders for prepared sizes of bituminous coal and more cancellations are expected despite the efforts the soft-coal trade will make to hold part of the tonnage won during the suspension of anthracite production. Trade interests not directly concerned with the sale of bituminous are inclined to discount the success of such efforts.

F.o.b. vessel at Hampton Roads, the spot market on pool 1 coal was somewhat firmer last week, although this week probably will see a mild reaction. Owing to heavy weather along the coast, an extra demand to clear ships developed, but accumulations were still the rule. Less frequent arrivals boosted prices on cars at Boston and Providence to a $7 basis.

All-rail bituminous egg, stove and nut last week commanded $6.50@$8.25. Lump was offered at 50c.@75c. less or in combination with egg and stove orders. High-grade central Pennsylvania low-volatile brought prices which compared favorably with the New River-Pocahontas range.

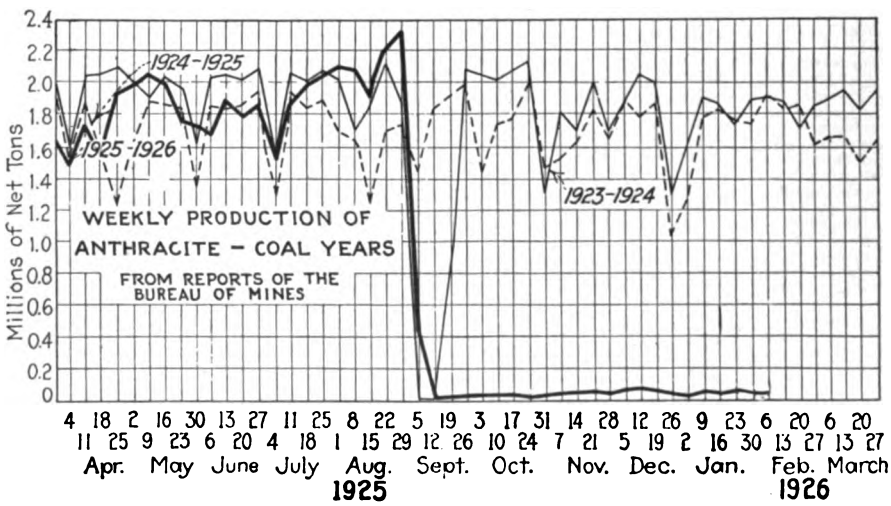
Strike Settlement Hits New York

The end of the anthracite strike comes as a sad blow to the New York bituminous market. Cancellations of orders for prepared sizes of coal and coke began to flow in as soon as the report of an anthracite agreement was confirmed. Prices, which early last week were on the upgrade, began to slip back and this week probably will see further declines.

West Virginia smokeless coals withstood the shock the best. Prepared sizes of Pocahontas and New River were snapped up at $7.50@$8.25. Central Pennsylvania low- and medium-volatiles were quoted at $5@$7, and high-volatile prepared at $3.50@$4. West Virginia splints ranged $4.25@$5.75.

As was the case in New York, bituminous demand at Philadelphia was active the early part of the past week, but went to pieces when the news was flashed that the hard-coal struggle was over. Until cancellations began to appear, prepared West Virginia and central Pennsylvania low-volatiles commanded in the neighborhood of $8.50 for prepared sizes. Prices on high-volatiles—Fairmont and Westmoreland—advanced to $4.50 under increased buying demand and a slowing up in movement.

Transportation congestion was a factor in maintaining prices, which had not broken up to the Lincoln holiday. The only exception was slack, which has been very weak. Stocks of coal in retail yards are dangerously low.



Baltimore on Hand-to-Mouth Basis

The Baltimore bituminous trade has been living on a hand-to-mouth basis. Retail stocks of low-volatile coals, which have come into favor as substitutes for anthracite, have been so depleted that many dealers have been making their deliveries to the householder direct from the cars. The steam trade is featureless. Accumulations of slack at the mines have impeded prompt shipment of the prepared sizes to the retail distributors.

Activity marked business at Hampton Roads the second week of the month. There was an increase in foreign demand and heavy shipments of slack to New York and Boston. This latter movement was at the expense of the Pennsylvania producers.

The Shipping Board paid $4.81 for a cargo of pool 2 coal. Coastwise business generally has been hampered by bad weather, but inland trade has been brisk. Retail prices were unchanged.

There has been no improvement in demand for medium grade coals in the

Birmingham steam market. The better grades, however, are moving freely and Cahaba and Warrior field operators experience little difficulty in keeping production sold ahead. Coke ovens are taking liberal quantities of washed coals, pushing demand ahead of supply. The domestic market has settled down to a weather proposition.

Coke from the Birmingham district ovens is still in active demand. Egg and nut are quoted at $6.50@$7 and foundry and gas coke bring $7.

The settlement of the anthracite strike took the wind out of the sails of the coke interests shipping to the New York market. Quotations on sized coke, which went to $15 the beginning of last week, dropped to $12@$12.50; reclaimed coke fell from $13@$13.50 to $10@$10.50 Cancellations probably will force further radical cuts.

High prices for coke have increased the demand for low-volatile coal in the Philadelphia domestic market. The scarcity of prepared sizes has swung considerable business to mine-run, which has been retailing at $9.50@$14. Culm, sold at $1.50 f.o.b. banks, also has been in good demand from steam consumers, who mix it with the rice and barley they still have on hand.

Cancellations Crowd Coke

Connellsville's brief reign in the high-dollar domestic-fuel market is over. Within two hours after the anthracite strike settlement was announced on Feb. 12, cancellations began to pour in on the ovens and their Pittsburgh representatives. Prior to that time run-of-oven coke was held at $11@$11.50 and yard crushed coke at $13@$13.50. Optimists still expect to receive more business from eastern retailers, but they are resigned to the fact that buying will be on a lower price basis.

The greater part of the production blown in when eastern buyers began to turn to coke for domestic consumption will be discontinued. Most of this tonnage would not be acceptable to the blast furnaces and the regular sources of supply for that trade undoubtedly will be able to hold the industrial business they now have. Contracts for the current quarter, averaging about $4, will not be disturbed.

The Connellsville *Courier* reports coke output in the Connellsville and Lower Connellsville regions for the week ended Feb. 6 at 124,200 tons from the furnace ovens and 126,640 tons from the merchant ovens. Compared with the preceding week, furnace oven production increased 16,500 tons; merchant oven, 1,460 tons.

Kitchen on Wheels Carries Cause of Smokeless Coal

The New England soft-coal campaign was placed upon wheels recently when Eugene C. Hultman, Massachusetts Fuel Administrator, gave the official send-off to the traveling kitchen of the Smokeless Coal Operators' Association of West Virginia. The unique outfit will tour cities in Massachusetts and New England. Experienced demonstrators will explain to householders how to burn the coal to get the best results. Samples of coal in various sizes from the New River and Pocahontas fields in West Virginia will be used in the demonstrations.

Freight Loadings in 1925 Break All Records

The greatest freight traffic on record, measured by the number of cars loaded with revenue freight, was handled by the railroads of this country during the year 1925, according to the American Railway Association. Loading of revenue freight for the year totaled 51,177,962 cars. This was an increase of 2,643,529 cars, or 5.4 per cent, over 1924; 1,365,849 cars, or 2.7 per cent, over 1923, and 6,059,490 cars, or 13.4 per cent, over 1920.

The record traffic of 1925 was handled without transportation difficulties by the railroads and with practically no car shortage. Instead, the rail carriers have had at all times during the year no less than 103,000 surplus freight cars in serviceable condition, while they have also had at all times not less than 4,200 surplus serviceable locomotives.

In 20 separate weeks in 1925, beginning about the middle of July, loading of revenue freight has exceeded one million cars, the peak week being that ended on Aug. 29, when 1,124,436 cars were loaded, the greatest number for any one week on record. This exceeded by 12,091 cars, or 1.1 per cent, the previous high record made during the week of Oct. 24, 1924.

U. S. Gets More British Coal

Lieut. Col. G. R. Lane-Fox, British Secretary for Mines, replying to a question in the House of Commons Feb. 9, said that 424,474 tons of coal had been exported from Great Britain to the United States during the four months which ended Jan. 31 at an average price of £1.17.7½ ($9.09) a ton, f.o.b. In the corresponding period a year ago, he said, Great Britain exported to America 44,002 tons at an average price of £1.12.1½ ($7.75) a ton, f.o.b.

Foreign Market And Export News

British Demand Shows No Signs of Weakening; Prices on the Upgrade

A good tone prevails on the British steam coal market, and February prospects are bright. Demand proceeds steadily from all directions, and order books are in a healthy condition for the next two or three weeks. Consumers are not inquiring too far ahead, but up to the end of the new month there is a ready disposition to enter into business.

France is buying better than for months past, due to the comparative shortage of native coal and decline in reparation deliveries. Admiralty large coals are firm. Graded sized coals are a scarce and firm feature. Smalls are strongly held. Patent fuel inquiry is a little more active.

The first week of February opened on a very strong basis in the Newcastle market and the increased prices of the preceding week were easily maintained, with, in the case of best quality steams, a tendency to still further improvement. The contract and inquiry work has been on a good scale, 30,000 tons of gas coal and 30,000 tons of steam coal having been sold at current f.o.b. prices over the next three months in two contracts alone. There is a forward inquiry for February and March, which indicates that trade will be steady for the next two months.

Output by British collieries during the week ended Jan. 30, according to a special cable to *Coal Age*, totaled 5,495,000 gross tons, compared with 5,450,000 tons in the preceding week.

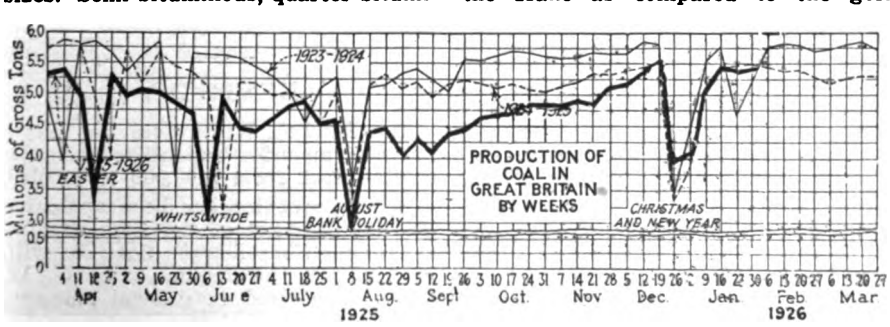
Belgian Market Stronger

The Belgian market is strengthening very slowly, but surely. Domestic coals are still firm. In industrial sorts, there is a general improvement. Foreign competition is less effective from the Nord and Pas de Calais mines, because of the increase in French prices at the collieries. Scandinavian demands are clearing Dutch fuel out of the Belgian selling zone and British shipments are steadily declining.

In the Borinage district, stocks are drawn from and prices are strengthening. Screened coals are almost unprocurable, the more so as the French producers are no longer supplying those sizes. Semi-bituminous, quarter-bituminous and lean coals enjoy a good demand. Charleroi stocks are rapidly decreasing. The rubbly culms used for lime and brick making hold at 66 fr.

There are coke contracts frequently made at 120 fr. per ton.

The briquet market seems to have recovered from the dullness which weighed upon it so long. An arrangement has been made between the producers and the State Railways fixing a price of 100 fr. on all first quarter consumption this year. For the last quarter the producers are asking for 97 fr., which is less than prices on the open market during the last quarter of 1925.



French Coal Market in Strong Position; Coke Prices Up

Paris, France, Jan. 27—There is a satisfactory demand for French industrial coals. The production of domestic fuels is not sufficient to cover requirements, compelling merchants in the Parisian districts to buy from Great Britain in order to make up the deficiency in flaming screened from Marles and Bruay, at delivered prices 10@15 fr. higher than on the French coal.

There is some improvement as far as transports are concerned.

At the present time there are 37,000 tons of Russian anthracite stored at Rouen. Of this only 10,000 tons have been sold. The commercial representatives of the Soviets in France indicate the following prices per ton for that anthracie, c.i.f. Rouen; 1 to 2 (French nuts). 52s. 9d. (343 French fr.) 2 to 3 (cobbles) 50s. (325 fr.); 2 to 5 (cobbles) 48s. 9d. (318 fr.); large and lumps 37s. (240 fr.). To the above prices must be added 20 fr. per ton for delivery on quay or loading into river barges, and 20 fr. per ton for the river freight to Paris. Russian nuts and cobbles from crusher are quoted by the French sellers 360 to 370 francs per ton at Rouen. That Russian anthracite contains about 4 per cent volatile matters, 3 to 4 per cent ash and 4 per cent moisture.

During the first twenty-six days of January, 217,310 tons of reparation coke have been received from the Ruhr. As a result of the two successive increases applied upon the Nord and Pas de Calais coke prices, and the fall of the franc as compared to the gold mark, the O.H.S. has informed the O.R.C.A. that the reparation coke price will be increased 7.15 for the first fortnight of January, and 6 francs from Jan. 16. Reparation coke priced at 144 fr. in December, is now 157.15 fr. However, the 2.50 fr. return allowed for big tonnages is to be deducted from the above price. On the other hand, the O.R.C.A. surcharges on the reparation coke price, makes the rate 158.30 fr. (the 2.50 return not included).

Figures obtained by Assistant Commercial Attaché Evans from the Geological Survey of China, which are reported to be accurate, show that China's production of coal amounted to 23,711,103 tons in 1924. This is an increase over production for the previous year of slightly over 150,000 tons. In obtaining these figures the output of the small mines from which no returns are received is estimated as being the same for both years or 6,000,000 tons.

News Items From Field and Trade

ALABAMA

The Birmingham Coal & Iron Co. has to clear the ground and repair tenant houses and mine structures at the old Inland No. 1 mine, near Inland, Blount County, which has been idle since 1920, when it was operated by the Inland Coal & Iron Co. This is a drift opening on the Jagger seam of coal and is served by the Birmingham Mineral branch of the Louisville & Nashville R.R. It is understood that the mines will be developed up to a daily output of 1,000 tons as soon as practicable. I. E. Boyette is president of the company, the operating office being located at Inland, near Oneonta.

The first work of organizing in convict operations chapters of the Joseph A. Holmes Safety Association was inaugurated recently at the Aldrich mines of the Montevallo Coal Mining Co., when four chapters were instituted from the membership of the mine workers, one each for colored and white convicts and one each for the colored and white free employees.

The Pratt Fuel Corporation is reported to be making preparations for greatly increasing its output at Cedron No. 1 mine, near Carbon Hill, which was purchased from the Kershaw Mining Co. last year. This is a stripping operation on the Jagger seam and a large steam shovel recently was authorized to be purchased for this mine. It is understood that consideration also is being given to the building of a large washery.

ARKANSAS

Representative Hearstill Ragon of Arkansas introduced a bill in the House at Washington to authorize the Secretary of the Interior to establish a mine-rescue station at Spadra, Johnson County, in the heart of the Arkansas coal district. The measure also directs that suitable equipment and suitable quarters be provided for the proposed station. It was referred to the Committee on Mines and Mining, where favorable action is expected. A similar bill will be introduced in the Senate by Senator Robinson. The House committee will begin hearings on Ragon's and other measures of similar purport Feb. 19.

COLORADO

The explosion in the mine No. 3 of the Bear Canon Coal Co., at Bear Canon, on Jan. 29, which resulted in the death of four coal miners, was caused by a set-off of gas in some old abandoned workings where men were engaged in drawing rails, according to the findings of the coroner's inquest held at Bear Canon Feb. 6. The verdict of the coroner's jury further found that the company was at fault in not making examinations for gas on the morning the men entered the mine, the last inspection prior to the explosion having taken place two days earlier, on Jan. 27. It was not determined what set off the gas. The mine itself was a non-gaseous mine and miners worked with open lights.

The Radiant mine of the Victor-American Fuel Co. was closed down at the end of January. The Chandler mine of the same company, however, has been working every day. Several mines in this district have cut down their work to two or three days a week, because of a lack of orders. Wagon mines, however, as a rule are working steadily.

ILLINOIS

Frank W. Collins, of East St. Louis, has been appointed county mine inspector of St. Clair County by the Board of Supervisors. There were 11 applicants for the vacancy created by the resignation of W. A. Wilson who has accepted a position as manager of the Randall mine at Freeburg.

Saline County coal mine No. 4, about four miles west of Carrier Mills, has closed down, making the third mine that has closed recently in the vicinity of Carrier Mills.

Posting of suspension notices in mines No. 9, at West Frankfort, and No. 12, at Christopher, operated by the Old Ben Coal Corp. is regarded as marking the first step in a general slowing down of production in the southern Illinois fields. An indefinite suspension is contemplated. The West Frankfort shaft employs about 800 men and No. 12 about 600. The Old Ben corporation has four other mines in that section which are working.

INDIANA

A report from Evansville states that the Korff mines, Possum Ridge Mine and Sargeant mine in the Evansville district have resumed on a non-union basis, and others out toward Rockport will start soon. While these mines are working short forces, the report indicates that more men are reporting, and in view of smaller demand for coal, indications are that they will soon have a waiting list.

Articles of incorporation for the A. D. Spears Coal Co., which will take over the business and property of the Vermillion Coal Co., have been filed in Terre Haute. The incorporators and directors of the new company are: Archibald D. Spears and Ira J. Church, of Clinton, and Thomas H. Cochran, of Chicago. The property to be taken over by the company is located in the Terre Haute field and is valued at approximately $550,000, exclusive of the good will.

The East Chicago Coal Co., East Chicago, has filed a final certificate of dissolution.

William L. Williamson, Indiana coal operator, has disposed of his interest in the Neutral Coal Producing Co. and the Sanford Mining Co. and has opened offices in the Rea Building, Terre Haute, under the name of W. L. Williamson & Co. He will do a jobbing business in all grades of Indiana coal and expects to organize a coal mining company of his own.

The Parke County Coal Co. of Terre Haute, has filed a final certificate of dissolution.

KANSAS

Authorization by the receiver of the Joplin & Pittsburg Railroad Co. for the construction of a track from Pittsburg one and one-half miles west to the site of the Lone Star Coal Co.'s mine, was announced Feb. 8. J. J. Nesch and R. G. Nesch, owners of the Lone Star company, recently purchased 135 acres of coal land, on which they expect to have a shovel in operation soon. Bruce Cameron, general manager for the J. & P., says easements for the track have been obtained and construction will start soon.

Plans are being discussed for the eighth annual state first-aid and mine-rescue meet, which, James Sherwood, state mine inspector, and Harry W. Burr, secretary-treasurer of District 14, United Mine Workers, recently announced, will be held either late in May or early in June. Eighteen teams competed in the contest last year, but because of the greater interest in first-aid and mine-rescue work displayed this year by the organization of many classes in the southeastern Kansas field, Mr. Sherwood expects a greater enrolment for the 1926 meet.

KENTUCKY

The Mitchell Willis Coal Co., Typo, has filed amended articles reducing its capital stock from $100,000 to $10,000.

H. S. Carpenter has been appointed general manager of the Elkhorn division of the Consolidation Coal Co., with headquarters at Jenkins, vice G. W. Hay, transferred to general manager

Digitized by Google

of operations, Fairmont, W. Va.; J. F. Daniel has been appointed general superintendent of the Elkhorn division with headquarters at McRoberts, vice H. S. Carpenter, promoted; M. H. Foerster has been appointed assistant general superintendent of the Elkhorn division with office at Jenkins, vice J. F. Daniel, promoted.

The Black Diamond Mining Co., Drakesboro, recently donated a day's run of coal and the miners donated a day's pay to the four churches at Drakesboro, two of which have colored congregations, to aid their finances, which got behind during the strike of 1924.

NEW YORK

Maurice Bloch, Democrat, minority leader, on Feb. 11 introduced in the Assembly a bill amending the Public Service Commission law empowering public service commission to investigate concerning coal supply, source, storage and price of coal and other facts relating thereto.

OHIO

The United Mine Workers was made defendant in two damage suits totaling $600,000 in Common Pleas Court at St. Clairsville Feb. 10. The suits were brought by Scott Story and Mrs. Clyde Majors as the result of a strike riot at New Lafferty, Belmont County, June 27, 1922. The New Lafferty riot was the result of a demonstration by union men against Majors and Scott, who had gone to work in a non-union stripping mine near the village. John Majors was shot and killed and two other men were shot and badly beaten.

Erection of a pier on the Kentucky side of the Ohio river, opposite Cincinnati, to cost approximately $110,000, to provide a harbor for steamers and coal barges was favored by a number of officials of coal companies and steamship lines at a public hearing held in the office of Major A. K. B. Lyman, U. S. District Engineer at Cincinnati, Feb. 10. Among those who spoke were: R. P. Gilham, F. E. Hall, James P. Reilly, F. J. Bramlage, F. P. Nowell and A. L. Kirchner.

Major E. S. Helburn was appointed and has qualified as receiver for the Kentucky Fuel Co., of Cincinnati, Ohio, which asked for receivership in the U. S. Court in Covington, Ky., on Feb. 9. This is a selling corporation but also is financially interested in Clay County Coal Co.'s Nos. 1 and 2, the Willis Harlan Coal Co. and the Turner Jellico Coal Co., of Kentucky, and the Coaldale Products Co., of Ohio. According to John Hoffman, principal stockholder, it is hoped through this method to clear up the financial entanglements of all five companies.

OKLAHOMA

A report from the Henryetta field, District 21, United Mine Workers, where a strike was called Sept. 1, 1925, showed that in the week ending Feb. 6 more than 13,000 tons of coal was mined. Of this, nine open-shop mines, paying the 1917 scale, produced 10,265 tons; eight co-operative mines produced 1,460 tons and three union mines, paying the 1924 scale, produced 1,470 tons. Three mines, nominally open, one in each class, were idle through the week. Those working are experiencing difficulty marketing their product. And the Crowe Coal Co. has announced it soon will close down one of the two mines it has in the field operating on the 1917 scale.

PENNSYLVANIA

Hearings are to be resumed in Scranton, Feb. 28 in a $5,000,000 suit against the Glen Alden Coal Co. for alleged breaches of contracts, involving leases of 800 acres of coal land. Both actions are based on leases entered into in 1864 and 1868 by relatives of the plaintiffs and agents for the defendants. In addition to money damages, the plaintiffs ask for complete termination of the coal company's operations on their property. Hearings are expected to continue through the spring before former Judge Frank C. McLaughlin, who was appointed referee by the Supreme Court of Broome County, New York. Complaints by the lessors of what are known as the Central and Luzerne leases were first made by Helen B. Millard and Charles P. Bennett, owners and lessors of the property in 1921, and amended complaints were filed in September, 1922, both drawn against the Delaware, Lackawanna & Western R.R., whose liability in the action is admitted to have passed to the Glen Alden Coal Co. upon segregation of the anthracite mining company.

Dynamite enough to blow Rush township clear out of Centre County was found under the tipple of the DuShan mine, near Osceola Mills, on the night of Feb. 11. The dynamiters bungled the job and the charge failed to go off. The DuShan mine is owned and operated by James Dugan, of Osceola Mills, and John F. Short, of Clearfield, and has been working for some time. State, railroad and county detectives are working on clews.

Output at the Pittsburgh Coal Co.'s seven mines now working at the 1917 scale in the Pittsburgh district set a new high record in the week ended Feb. 6, when 32,387 tons was produced. The company reports that the number of miners working in the Pittsburgh district under the 1917 wage scale reached a new high record on Feb. 11 with 1,717 men at work in seven mines, distributed as follows: Banning No. 1, near West Newton, 295; Banning No. 2, 276; Midland, near Canonsburg, in Washington county, 374; Montour No. 10, 333; Warden, 284; Mansfield, 67, and Dickson, near Imperial, 88.

UTAH

H. F. Fernstrom, manager of the Western Fuel Co. and well known in Salt Lake City retail coal circles for several years past, has been elected president of the Associated Retail Credit Men.

Fire caused about $10,000 damage recently to the material house of the Independent Coal & Coke Co. near the tipple at Kenilworth. The fire brigade saved the slack conveyor from destruction. Work is about finished on the new material shops of the company, and for this reason the old building may not be repaired.

WEST VIRGINIA

Because of the absence of Robert M. Lambie, chief of the State Department of Mines, the inquest to determine the cause of an explosion in Jamison mine No. 8 of the Jamison Coal & Coke Co., at Farmington, was again postponed, this time until Feb. 26. The inquiry will be held in Fairmont.

Announcement has been made here that 45.62 acres of Sewickley or Mapletown coal and 32.94 acres of surface, besides a leasehold on three acres of surface, and all mining machinery and equipment now upon the property owned by the Stone & Scott Coal Co., known as Betty mine, will be sold at public auction at a special commissioners' sale at the Marion County Court House Feb. 20. Besides the above-named property, which is located in Grant District, Marion County, on the Baltimore & Ohio R.R., the sale also will include all of the real and personal property of E. B. Stone and T. M. Scott, conveyed to them by the Hudson Coal Co. in 1920, situated in Harrison County.

Work of rock-dusting Mine No. 86 of the Consolidation Coal Co., at Carolina, has been started, and will be completed in a week or 10 days, it is said. This is the first of the Consolidation mines in this region to receive the rock-dust treatment. Work probably will be started soon on rock-dusting Federal mine No. 3 of the New England Fuel & Transportation Co., at Everettsville.

G. A. Richardson, manager of the technical publicity department of the Bethlehem Steel Corporation, with headquarters in Bethlehem, Pa., was the principal speaker at a safety meeting recently held by the Bethlehem Mines Corporation at its Barrackville mine No. 41.

The U. S. Court of Appeals has set aside the motion of the West Virginia-Pittsburgh Coal Co. for a writ of error in its case against Van A. Bittner, chief international representative of the United Mine Workers, and others, according to information received at the Fairmont office of the Mine Workers from Thomas C. Townsend, chief counsel of the organization. By this action Mr. Bittner is purged of the contempt charges that have been pending in federal court. The remarks made by Mr. Bittner in an address at Farmington, Marion County, early last year resulted in the charges of infringing upon an injunction granted to the coal company in the Panhandle section. Federal Judge W. G. Baker dismissed the proceeding which was later appealed by the coal company.

William Anderson Staab has been appointed assistant professor of mining engineering at West Virginia University to fill the vacancy caused by the

Digitized by Google

resignation of Thomas Fraser. Mr. Staab is a graduate of Lehigh University, class of 1910. Since graduating he has spent ten years in mining engineering work at Morenci, Ariz., one year teaching at Lehigh University, and for the past four years has been a mining engineer for the Lehigh Coal & Navigation Co. at Lansford, Pa.

A total of approximately $100,000 will be paid by the State Compensation Department to the widows and orphans of the men who lost their lives in the recent mine explosion at Farmington. Within less than 24 hours after the explosion at Farmington, representatives of the compensation department had set the machinery in motion for making payments.

One hundred coke ovens of the Houston Collieries Co. at Maitland, will be fired as soon as they can be put in condition. Men have been put to work repairing them.

The Crozer Coal & Coke Co. recently completed the installation of a preparation plant having a capacity of about 3,000 tons a day. The new plant, which is at Elkhorn, is similar in design to the one completed about five years ago at Pageton, but a number of improvements have been made. A similar but larger plant is to be built at the Upland mine of the Crozer company.

The Blue Ridge Coal Corporation, operating at Brush Creek, on Coal River, is building two large tipples which will be completed within a comparatively short time.

Plans are being drawn for a large tipple for the Guyan Eagle Coal Co. at Amherstdale, in Logan County, to handle coal from the company's Chilton mine. This tipple will replace one destroyed by fire about two weeks ago. Long leaf pine is being used for the reconstruction.

In the interest of the bondholders of the Sullivan Pocahontas Coal Co., having a number of operations in West Virginia, Howard N. Eavenson, consulting mining engineer, Union Trust Building, Pittsburgh, Pa., who has been acting in the above capacity for the company, has been made president and general manager, and H. W. Frey, of New York, has been made vice-president and treasurer; succeeding J. C. Sullivan, of Tralee, who had been president, treasurer and general manager.

Rock-dusting at the No. 9 mine of the Jamison Coal & Coke Co. will be completed within a few days, according to W. Clark Dobbie, superintendent, who also reports that the work has speeded up in the last few days.

WYOMING

The Union Pacific Coal Co. produced 2,779,061 tons of coal in its 17 mines in 1925. In an effort to further reduce all classes of accidents, the company has instituted a new system of daily inspection of all mines for gas and loose top before each shift goes on duty. In addition to this, a joint committee representing the United Mine Workers locals and the company makes an inspection of general committees each quarter. Among the safety moves instituted during the past year were continuous rock-dusting of all mines, improved ventilation, Edison safety lamps for all miners, prohibition of smoking tobacco or matches in the mines, electric shotfiring by specialized shotfirers after all men have left the mines.

P. J. Quealy, president of the Kemmerer Coal Co. and of the Gunn-Quealy Coal Co., has been named as one of the Wyoming members of the advisory council for the sesquicentennial celebration to be held in Philadelphia this year.

The Union Pacific Coal Co. recently formed a safety association among its employees. Men of all occupations connected with the company's mines are eligible for membership. This company regularly sends out bulletins of all serious accidents showing how the accident occurred and how it could have been avoided.

CANADA

Premier E. N. Rhodes, of Nova Scotia, has promised District 26, United Mine Workers, that the provincial government will advance a loan of $13,000 to be devoted to relief purposes in the colliery district of Cape Breton. The British Empire Steel Corporation has promised to make a similar donation provided the union will supply funds for the relief of distress.

G. H. Kirkpatrick, chairman of the Vancouver Harbor Board, announced on Feb. 8 that options had been taken on sites on the harbor front at North Vancouver for the erection of a coal pier of about 10,000 tons capacity for bunkering steamships, which now have to cross over to Vancouver Island to bunker. Recently the Blue Funnel Line, which had been in the habit of bunkering its ships at Vancouver Island coal ports, let a contract for the bunkering of its ships to the Pacific Coast Coal Co., of Seattle, in order to avoid crossing the strait. It is proposed that the bunkers be operated under a system whereby ships will purchase coal directly from the mine operators in various parts of British Columbia and Alberta, and the Harbor Commission will collect a commission from the operators for handling the business.

Traffic

Proposed Midwest Rate Cuts Cancelled by I. C. C.

The Interstate Commerce Commission, in I. & S. Docket 2483, finds certain proposed reduced rates on coal over the Missouri Pacific, Burlington, Illinois Central, Chicago & Eastern Illinois and Mobile & Ohio railroads from points in the southern Illinois, Murphysboro, Centralia and Duquoin districts to St. Louis, Mo., and nearby points not justified, cancels the suspended schedules and discontinues the proceeding.

The respondents sought to reduce the present rate of $1.385 (applying from southern Illinois group to St. Louis) to $1.35. The reductions to St. Louis proposed from the Duquoin, Centralia and Murphysboro groups were 0.5c., 1c. and 3c. respectively.

Voluntary attempt of three Western railroads to reduce coal haulage rates from Illinois mines to points further west has been halted by the Commerce Commission.

The new schedules, which were to have become effective Feb. 7, were suspended until June 7, to await the result of an investigation. The commission did not explain the action.

The Wabash, Big Four and Chicago & Alton published schedules to apply on shipments from the mines along their lines. The commission said that from Springfield, Ill., the rate to Keokuk, Iowa, on lump coal is $1.89 per ton, and that it would have become $1.75 under the new schedule. To Hannibal, Mo., the rate on slack, which is now $1.60, would have become $1.50. On run-of-mine coal the changes were less noticeable and the rates were not changed in many cases.

Protest Illinois-Indiana Rates To Chicago and Wisconsin

Six petitions relative to coal freight rates from the Indiana and Illinois fields to Chicago territory and points in Wisconsin have been filed by Indiana and Illinois operators with the Interstate Commerce Commission, the Indiana Public Service Commission and the Illinois Commerce Commission.

The traffic departments of the two state operators' organizations each filed two interstate complaints, asking a hearing on the reasonableness of the rates from their respective fields to Chicago territory and consuming points in Wisconsin and also on the relation of such rates to those in effect between the same points of destination and the Kentucky-West Virginia fields. The two intrastate complaints involve the reasonableness of the rates from the two producing fields to points in the Chicago territory within their respective states.

A joint hearing on all of the complaints will be held Tuesday, March 23, in Chicago, before the three commissions with which the petitions were filed.

Obituary

Death removed one of the well known figures in the coal industry of southern West Virginia on Feb. 6, when **James Clark**, who for more than twenty years had been identified with the industry, passed away at the Chesapeake & Ohio Hospital in Huntington. Death was due to pneumonia. Mr. Clark was born in Renfrew, Scotland, in 1850, and came to this country in 1903. At that time he became superintendent of the White Oak Coal Co., a position he held until appointed a member of the Chesapeake & Ohio Car Allotment Commission. After serving for five years on that commission Mr. Clark organized a company of his own in the Coal River and Elk River mining fields and continued to give his attention to the management of his properties until about three years ago, when he retired from business owing to failing health.

Coming Meetings

The Rocky Mountain Mining Institute. Winter meeting, Feb. 23-25, 1926, at Albany Hotel, Denver, Colo. Secretary, Benedict Shubart, Boston Building, Denver, Colo.

Canadian Institute of Mining and Metallurgy. Twenty-eighth annual and general meeting, March 3-5, at the Windsor Hotel, Montreal, Quebec, Canada. Secretary, G. C. Mackenzie, 603 Drummond Bldg., Montreal, Que., Canada.

New England Coal Dealers' Association. Annual meeting at the State Armory, Worcester, Mass, April 7 and 8. Secretary, E. I. Clark, 141 Milk St., Boston, Mass.

The American Mining Congress. Annual Exposition of Coal Mining Equipment, May 24-28, at Cincinnati, Ohio, in conjunction with the annual meeting of practical operating officials. Assistant secretary, E. R. Coombes, Washington, D. C.

International Geological Congress. The fourteenth congress will be held in Madrid, Spain, commencing May 24, 1926. From May 5 to 22 excursions of interest to the visiting delegates will be arranged. Information concerning the congress can be obtained from the secretary of the organizing committee, Enrique Dupuy de Lome, Plaza de los Mostenses, 2, Madrid, Spain.

Western Canada Fuel Association. Annual meeting at Winnipeg, Manitoba, Can., May 27 and 28. Secretary, W. H. Morrison, Winnipeg.

American Wholesale Coal Association. Annual meeting, June 7-9, at Toledo, Ohio, Treasurer, R. B. Starek, Union Fuel Bldg., Chicago, Ill.

Association of Iron & Steel Electrical Engineers. Exposition and convention at Hotel Sherman, Chicago, Ill., June 7-10. Secretary, J. F. Kelly, 1007 Empire Bldg., Pittsburgh, Pa.

American Society of Mechanical Engineers. Spring convention at San Francisco, Calif., June 28-30. Secretary, Calvin W. Rice, 29 West 39th St., New York City.

New Companies

The Etter Coal Co., Cleveland, Ohio, has been incorporated with a capital of 500 shares of stock, no par value, to operate coal mines and do a jobbing business in coal and coke. Incorporators are: George S. Etter, Dorothy Dean, J. W. Gooch, M. A. Moran and A. W. Young.

The Garland Coal & Mining Co. was recently incorporated in McAlester, Okla., with a capital stock of $200,000, by J. G. Puterbaugh, E. P. Joyner and others.

New Equipment

Electric Chain Hoist Is Strong and Efficient

A new ball-bearing electric chain hoist known as Model 20B recently has been developed and placed on the market by the Yale & Towne Mfg. Co., of Stamford, Conn. This hoist is the result of many years' experience in developing and building electric machines of this variety ranging from ½- to 2-ton capacity. It embodies such features as close headroom, long lift, high speed, automatic top and bottom limit stops,

Part Sectional View of New Hoist

Low head room and high lifts as well as careful construction and efficiency are distinguishing characteristics of this hoist. Ball bearings and alloy steel together with careful design do much toward attaining the desired results.

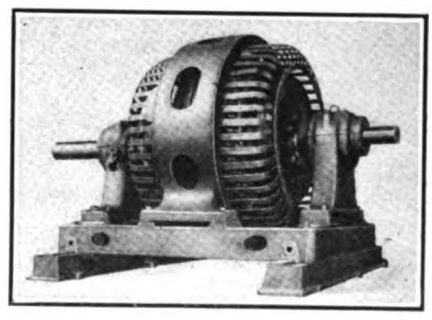
and greater over-all strength. This hoist has been built with unusual factors of safety in the load-supporting members and is designed to withstand the shocks common to this class of equipment. All suspension members are made of the highest quality steel.

The model 20B can be quickly adapted to any overhead system. The side plates of the trolley carriage can be spaced to fit any desired beam flange. Electrically welded steel chain can be furnished for varying lengths of lift. The centralized steel suspension means a constantly balanced load on the trolley wheels and hoisting unit irrespective of load position.

The mechanism is fully inclosed in oil-tight chambers. It is compact yet easily accessible for inspection without expert service. The ball-bearing load sheave, which is a late development, adds a big factor for low current consumption and general all-around hoisting efficiency.

Large chrome vanadium steel ball bearings surrounding the substantial steel load sheave reduce friction and make this hoist highly efficient, requiring minimum power and assuring increased life. The heavy one-piece steel load sheave, ground on an arbor to give perfect concentricity for the ball races, is bronze-bushed for the driving pinion. Splash lubrication provides a continuous flow of oil over all gears, pinions and bearings.

The driving pinion, the shaft of which passes through the load sheave, is machined from a single drop forging, after which it is heat-treated. The bearing surfaces on the shaft are accurately ground.



Steel chain containers can be furnished to hold any length of slack chain up to 60 ft. for ½-, ¾- and 1-ton, and 30 ft. for the 2-ton hoists. These containers are secured to the under frame of the hoist and do not affect the headroom.

Magnetic Clutch Built Into Standard Synchronous Motor

A new type of synchronous motor recently has been developed to meet the need for a machine having extra high starting torque, a low starting current, and the recognized high efficiency and unity power-factor characteristics of the synchronous type. The new motor, available in standard ratings from 60 to 600 hp., with larger ratings as special machines, is being manufactured by the Westinghouse Electric & Manufacturing Co., of East Pittsburgh, Pa. It consists of a combination of two pieces of apparatus each of which has established its utility in the electrical power field.

This combination embodies a standard synchronous motor combined with a magnetic clutch. It forms a compact unit, the over-all dimensions being practically the same as those of the hitherto standard synchronous motors of the same ratings, with the exception of the length, which is from 4 to 10 in. greater. It combines in the one machine the high starting torque of the wound-rotor induction motor with the desirable operating characteristics peculiar to the synchronous machine.

This synchronous motor is started in the same manner and with the same equipment that is employed with the standard synchronous type brought into action under light load conditions. It is particularly adapted for driving loads requiring high starting effort. The starting torque of this clutch-type motor is the same as its maximum run-

Synchronous Motor with Built-in Clutch

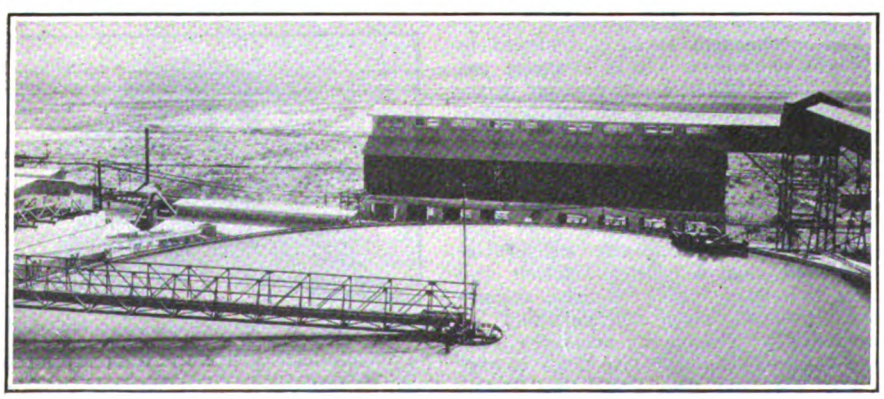
Heretofore despite its manifold advantages the synchronous motor has suffered the handicap of low starting torque. Building in a magnetic clutch obviates this difficulty and renders this type of machine available for uses to which, in the past, it has been but ill adapted.

Digitized by Google

ning torque, since the machine is brought to synchronous speed and fully excited before the load is applied. Thus it can exert any required turning effort up to its pullout torque during starting periods. This is accomplished without shock and at an acceleration rate that may be varied by adjusting the clutch excitation current by means of a rheostat control. The clutch cannot be excited during the starting period, and as a result the rotor quickly reaches full speed.

The rotor section of the clutch is faced with asbestos lining, riveted to a steel ring and made in halves to facilitate easy removal. The armature member of the clutch has a smooth surface where it comes in contact with the brake lining. Steel shims may be inserted between the asbestos lining and the ring to compensate for wear.

Ample clearance between the clutch faces is provided by spring-plate construction. The armature member is mounted on a steel disc which has sufficient flexibility to allow the clutch faces to come into contact when the clutch coil is excited. When excitation is removed, the flexible member springs back into its normal position which provides sufficient clearance between the friction surfaces to prevent contact.



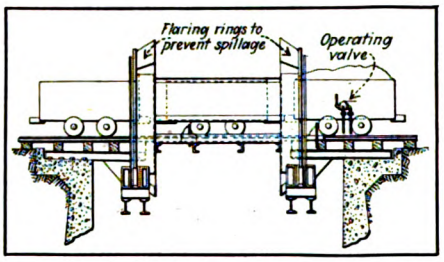
The motor shown in the illustration, rated at 575 hp. at 180 r.p.m. and with 100 per cent power-factor, occupies but 2½ in. more space than would a standard machine of the same rating. The new single unit motor is 49 in. shorter than a standard machine fitted with separate magnetic clutch and outboard bearing. A corresponding reduction in floor space may be realized with other sizes of this type of machine.

Small Diameter Traction Thickener Saves Space

Recovery of sludge or fine material from the wash water is becoming an important process at many coal preparation plants. In the past, traction thickeners of large diameter have thoroughly demonstrated their utility, but during the past year the Dorr Co., of New York, has developed a machine of this kind which is now available in as small a diameter as 20-ft.

This traction type of thickener is of the peripheral drive type, and embodies several advantages over the older machines of the central drive variety. Chief among these is the saving effected in the height or headroom necessary.

A machine of this variety may be seen in the accompanying illustration.



Small Thickeners of This Type Are Now Available

Thickeners of this type possess several advantages over those of the center drive variety. Chief among them, however, is the lessened headroom required by this machine.

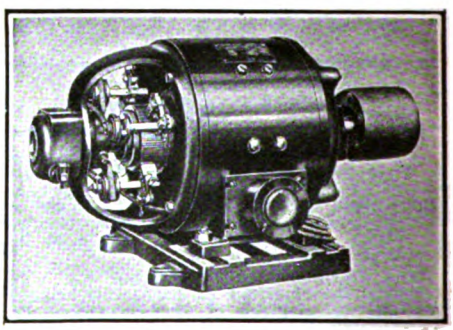
Improvements in Rotary Dump Save Spillage

Rotary car dumps possess many advantages over those of the ordinary crossover or kick-back varieties. In general these are well known to mining men and need no further comment here. In fact most mines nowadays, aiming to attain high capacity, use this type of dump.

As heretofore constructed dumps of this kind possess the drawback that more or less coal has been spilled through the end rings; although this could be caught and guided into the coal hopper it was subject to decided degradation. The improved rotary car dump, shown in the accompanying illustration and manufactured by the Car Dumper Equipment Co., of Chicago, Ill., and Pittsburgh, Pa., is designed to overcome this difficulty.

Coal Cannot Spill

Improvements in this dump are embodied in two important details. The end rings and rollers are cast of an extremely hard metal which affords a perfect rolling surface. Furthermore, the end rings are flared inward greatly decreasing the spillage.



In this improved dump the end rings are really frustums of hollow cones with flaring ends facing each other. This construction of end rings not only obviates spillage but makes a much more rigid cage or dumper frame. The end rings are cast from alloy steel which is so hard that it cannot be machined, and must be ground to shape. The treads of these end rings are, therefore, ground on a specially designed machine giving an extremely smooth running surface, harder than has been obtained heretofore upon any equipment of this kind. This not only assures long wear but also reduces appreciably the power required to operate the dump. The supporting wheels are also made of the same alloy steel and ground to practically a perfect tread.

Sturdy, All-Purpose Motor Can Handle Overloads

A new direct current motor, known as the type N.A. and intended to carry heavy overloads has been developed and placed on the market by the Louis Allis Co., of Milwaukee, Wis. This is a 40 deg., general purpose machine and coincides in essential dimensions, rating for rating, with the polyphase motors built by this manufacturer.

Improved design and ventilation insures uniform cooling throughout the windings and makes an unusually cool motor under operation. The bearing chamber is designed to hold an extra large quantity of oil, making frequent renewals or replenishments of lubricant unnecessary. The bearing inspection opening is closed by a removable cover. This, while permitting easy access, gives, in effect, a dust tight bearing chamber.

An entire elimination of oil trouble is claimed by virtue of the new design incorporated in the bearing. Difficulty experienced in the past, arising from oil soaked windings as the result of oil throwing, creepage, and the like, is made impossible in the present design.

General View of Sturdy New Motor

Details of construction have been given careful attention in the design of this machine. Note the staggered position of the brushes on the commutator. Oil slinging and creepage have been eliminated thus obviating all possibility of trouble from this source.

Industrial Note

A. F. Case has been appointed manager of the coal and ore division of the **Welman-Seaver-Morgan Co.**, Cleveland, Ohio; **P. H. Douglas**, manager, general equipment division; **J. F. Rogers**, manager, gas producer division; **J. B. Shaub**, manager, engineering production; **J. H. Stratton** and **Miss J. L. Krotz**, assistant purchasing agents.

Association Activities

The twelfth annual business session of the **Logan Coal Operators Association** was held Feb. 4 at the offices of the association in Logan County, West Virginia. Matters discussed and acted upon were not made public. New officers were not elected and the officers elected last year will continue their duties temporarily. These are: M. E. Kent, president; C. W. Jones, vice-president; H. A. McCallister, treasurer. J. W. Colley is the secretary of the association. Members of the executive committee are: A. R. Beisel, J. H. Ford, C. H. Jenkins, H. E. Jones, A. J. King, J. A. Kelley, J. R. Thurmond, T. F. Downing and R. R. Smith.

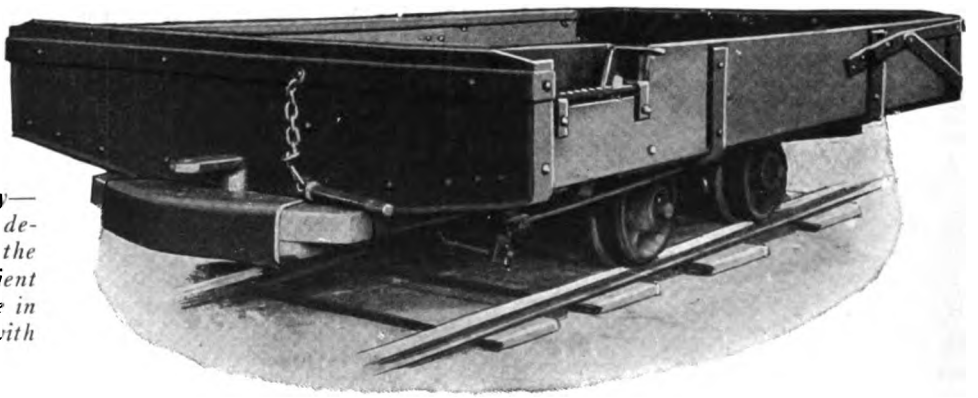
BY INVITATION MEMBER OF

The Secret of Popularity

Hockensmith Cars save time; their low height makes them easier and quicker to load, either manually or by machine.

Hockensmith Cars save power; the maximum capacity feature gives the greatest possible ratio between coal and dead weight.



Hockensmith Cars save unproductive labor; roof and bottom work is reduced to the smallest possible amount, due to the minimum height feature.

Hockensmith Cars save expense; their durability eliminates frequent repairs—costly upkeep.

Hockensmith Cars save trouble; designed for each specific job, they stay on the job, year in, year out.

Hockensmith Cars save equipment costs; they can be used with present equipment without changes.

These things explain why many mines have found Hockensmith Cars a profitable investment—and indicate why all other mines will find them the same. One of our representatives will be glad to talk the problem over with you.

A maximum capacity—minimum height car designed in line with the newest practice. Efficient and economical for use in thin seams, and with mechanical loaders.

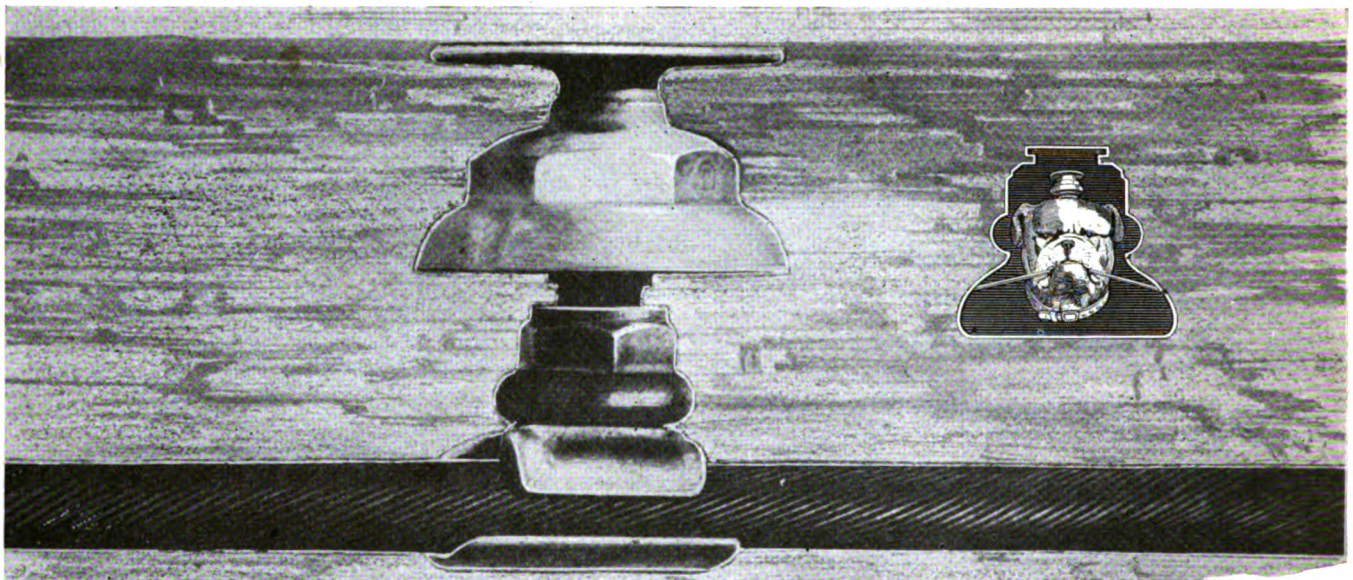
The New Idea in Pumping

PUMPING IN MINES is so important a factor in coal production, especially of anthracite, that small economies have large significance. It costs money to keep pumps running 24 hours a day. Power costs, maintenance costs and attendance charges for pumping are always high, primarily because they are continuous, or nearly so. A few years ago automatic pumping apparatus effected considerable savings by cutting down attendance charges. Other improvements followed.

Today electrical control is further revolutionizing pumping. When the automatic features were developed and applied to pumps the apparatus was so nearly perfect in its operation that there wasn't much room for improvement; however some advances have been made in the co-ordination of electrical control. These will be discussed in next week's issue of *Coal Age* by R. S. Sage.

* * *



ROCKY MOUNTAIN coal mining will be at the fore in next week's issue also. The engineering institute of that region is in session Feb. 23, 24 and 25 in Denver. Even though the sessions take place 1,700 miles from the publishing offices of the magazine, the air mail and the telegraph will be counted on to put a full report of the meeting before the readers of *Coal Age* while the discussion is still hot.

* * *

AIR-SAND CLEANING of coal will be further treated in these pages next week. This scheme of separating rock and dirt from good coal by passing the output of a mine through sand "boiled" by air will grasp the interest of mining men everywhere.

The Bulldog on a New Job

The Daddy of the Bulldog Family, with the alining feature

The New Bulldog Clamp —popular as pay-day in the mines

Of course you are acquainted with the good old standard Bulldog Trolley Clamp. You know its famous grip. You have experienced its satisfying simplicity and have profited by its ease of application.

Now meet another member of the Bulldog family ready to become your friend and protector in cable hanging. Here is a cable sling with clamping jaw, adapted to the same old reliable Bulldog clamping principle. The cable is gripped tightly and will not slip or pull along as is the case with the ordinary sling. A quick, easy, permanent and workmanlike way of hanging cable.

It costs less in the long run to do the job right at the outset.

Engineering Editor

Volume 29 | NEW YORK, FEBRUARY 25, 1926 | Number 8

Support Your Association

JUDGING by appearances, the National Coal Association is strongest when the industry is flourishing and weakest when it is suffering. It is beginning to grow again with the advent of better times. But surely when the industry is in trouble the need for active co-operation to avoid unfair practices and to improve business is greatest. In prosperous times taxes can be shouldered even if with a shrug, but in perilous years taxes that might be borne without great hardship become an increased burden. When, moreover, open consignment of coal is most rampant and harmful, activity to lessen it is nothing less than a vital necessity. Furthermore, when industry uses less and less coal, the need for a more active extension of uses of coal is of paramount importance.

Haslam and Russel in their recently published book "Fuels and Their Combustion" say that "an increase in efficiency [in the use of coal] of 1 per cent (from 10 to 11 per cent) would mean a yearly saving of approximately $1,000,000,000." Is this a matter the industry can afford to pass over without notice? If that billion dollars is saved to the public, it is by the same sign lost to the coal industry. One would be disposed to expect that the industry would be hustling to see if that billion dollars saved could be replaced by a billion dollars expended. Instead only the National Coal Association seems to sense the danger and is making efforts to meet it. To this end there is refrigeration and the increase in the use of furnaces instead of stoves which give only local heating; there is the use of heat for removing snow from the streets and sidewalks; there is the increased use of heat for garages; there are possibilities in farming such as greater use of electric power for services now performed by hand and the introduction of dry season irrigation and sprinkling where now crops are allowed to wither and die. There are chemical uses for coal that will materially aid in swelling the production.

The National Coal Association also can foster in the public a better sentiment to coal mining and create in the industry itself a better understanding of the public and a clearer knowledge of recognized and tested public relations.

The work of the association in the collection of trade data, in standardizing them so that they will be comparable, one with another, and in fighting assigned cars, if that prove to be necessary, are all parts of a program in which all should assist. Other industries have learned that though there are competitive matters in which their associations cannot partake, there are also matters that are only competitive with rival industries, and these conditions can be greatly bettered by combined action. After all, a common feeling of general need will make for a final result favorable to all in the industry.

The individual operators tend to pull against one another, and the boat in which they are all embarked drifts helplessly. Let them organize, let their oars dip as one and all move in the same direction, and then as a result they will find that they will all arrive at the haven they are seeking. Alas, when the waves are highest and winds strongest they leave the boat uncaptained; each determines to follow his own behests, and the result is that there is no progress, nothing but clamor and bewailing. An association is necessary or the boat will founder in the depths of the rage for economy in the use of coal that still threatens the industry.

A co-operation with the wholesale and retail associations which distribute the product and can influence the consumer to use more coal for his greater profit and comfort is greatly to be desired. The men in these associations still seem to think that business is best promoted by energy in competition rather than by selling new ideas to the public, which, by the way, shows no inventiveness in applying the marvelous possibilities of coal to the many uses to which that fuel can be put. Every village and city wholesaler and retailer should be busy popularizing the possibilities of coal. Today the best minds in the advertising field are seeking ways to widen the market rather than to steal the business of a competitor. Let the coal men thrive together rather than at one another's expense.

Pigs Is Pigs

THE famous story of Ellis Parker Butler throws some doubts as to whether pigs is necessarily pigs; and something of the same doubt comes up as to whether coal is coal, without such finer distinctions as modern taste demands.

At the Coal and Coke Committee session in connection with the recent annual meeting of the American Institute of Mining and Metallurgical Engineers R. H. Sweetser protested that to say coal was not sufficient—any more than to say iron ore was sufficient—that as iron ore was sold on its contents of iron, phosphorus and the rest, so the value of coal varied enormously according to its content of fixed carbon, ash, volatile matter and so forth. He believed that some of these things at least should be determined in marketing coal, and that the consumer should know what he was buying. How important is a low-ash content for metallurgical coke he demonstrated, and as to domestic anthracite, he remarked that the New Englanders were objecting strenuously to buying an indeterminate mixture of ash and combustible matter for their domestic fuel consumption. Considerable interest was taken in this matter, both from progressive and stand-pat sides; but a motion to request the Coal and Coke Committee to consider this subject was ruled out of order by the chairman.

Digitized by Google

There is no question, however, that the objection to buying a pig in a poke, in the shape of a ton of coal containing no one knows how much waste, is a growing one. There is no question but from time to time some coal has been unloaded into the consumer's cellar at the standard price which has refused to ignite at all, and that a widespread objection to this crudity has gradually grown up. The majority of companies who are shipping carefully prepared and good quality coal could protect themselves against these occasional buccaneers, who discredit the industry, and whom the public is given no means to differentiate, by advertising the quality of their product—of the output of their respective mines. Whether a general statement of the average quantity of ash is practicable is another problem—but it would seem to be one which should be attentively considered. Mines producing a low-ash anthracite, to take a specific example, should be able to command a premium for their product. In these days no one will submit to buying a ready-made suit of clothes without trying it on, and no merchant will decline to discuss material and fit. Indeed in the mineral world it is doubtful if anything except coal is ever marketed without analytical specifications.

Mark Danger Line

PROBABLY nine-tenths of all the loss of life sustained at the working face in coal mines is due to falls of roof and coal. Records show also that the first three feet of height above the top of the rail to all intents and purposes, is absolutely safe. That is, in order to be dangerous a fall must start at a point on face or rib that is more than 3 ft. above the top of the rail. Thus those working at the face of a room, heading, breakthrough, crosscut, tunnel or other mine passage need pay no attention to that portion of the face or rib which lies below this 3-ft. line but should concentrate all of their safety efforts on the upper, not the lower portion of the working place.

In order to impress the importance of watching the top and higher areas of face and ribs upon all those engaged in underground work, one large company has painted a white line along both ribs of all workings with the words "Safety Zone" stenciled in bold letters at intervals below it. These lines are carried forward with the workings and each foreman and assistant foreman is instructed to see to it that this detail is not neglected. Inasmuch as this company awards bonuses to its foremen and assistants on a merit and demerit system and he who does not have his "safety line" up to the required point is given an appropriate number of demerits it is easy to enforce this ruling.

Safety within the mines has passed the guesswork stage. In order to keep a mine safe today it is necessary to know facts and act accordingly. Marking the "Safety Zone" is merely another way of impressing upon the underground worker the importance of taking no chances whatever that human knowledge and foresight can discern as possibilities. The course taken by this company is one that may well be carefully considered and adopted by others engaged in the same or a like business. It is a perfectly logical, albeit an indirect, means of strengthening and stiffening safety morale. It is a sort of "faith cure" in that it tends to focus the workers thoughts. And in mining he who thinks safety is safe.

The Coal Industry as a Battle Ground

THAT active economic belligerency has recently been exhibited by the coal miners toward the owners and operators of mines, both in Great Britain and in the United States, can hardly be fortuitous; it must be the result of common underlying causes. To be sure, conditions are not similar. In Great Britain the pre-war export coal trade was the foundation of her commercial expansion—she shipped coal and imported raw materials for her factories. The economic upheavals which succeeded the war, in part due to increased living costs, in part to the demand of British coal miners for a higher standard of living and less labor, have led to far more effective competition of continental European coal, from the Rhenish and Westphalian fields; and the consequent lack of work in the English fields. Now the miners' unions demand that the government take over the mines, manufacture cheap electric power, encourage the development of industries using power, and the rest of a beautiful but visionary plan of state socialism; always, however, retaining the right to strike.

One point where the case of the American miners seems to resemble that of their less fortunate British brethren is that there appears to be an element among the miners, and elsewhere in America, that demands government operation—a government operation, to be sure, which the labor element will control; and this government operation will fix the prices at which the public is to buy coal, fix the profits of the operators, and similar economic nonsense; in fact it will fix everything but the miners' pay. To be sure, the published utterances of the leader of the miners, Mr. Lewis, are definitely against government operation; but at least the strategy of the recent coal strike would appear to have been pressing in that general direction.

This idea of government control, in Great Britain or the United States, represents an impracticability of vision, a demand of labor to rule and not to co-operate, a more than socialistic aim, a suggestion of the doctrine of the rule of the so-called proletariat which has ruined Russia. Why the organized labor of coal mines should take an extreme stand is not clear, but it is probable that it is due to the fact that the coal industry is a key industry, capable of being used to bludgeon the public and the government, and that therefore it has been selected in former years by the propagandists of the doctrines mentioned above as a strategic ground whereupon to give battle. And it has been found to be a good vantage ground, because many of the miners, formerly underpaid and recruited from the impoverished peasantry of Europe, are still not so far advanced and educated as to recognize all the fundamental flaws in the conception. The coal barons of a generation ago, then, are responsible for the militant miners' unions of today. If there be any baronial temper left among the operators—and that accusation is often heard—now is the time to forswear it for all future time.

The struggle of the exponents of mine-labor domination without regard to the rights of others has been, in the present instance, in the United States, a losing battle. That American capital and labor are far more enlightened and advanced than the leaders of mine labor realize is evident since both have abandoned their former contempt for and exploitation of the public and are striving to render service to the public in order that each may profit by the resultant prosperity.

Jigging Conveyor Reduces Coal-Mining Costs

Eickhoff Machine Built in Sections That Are Easily Moved—It Follows Faces Closely and Continuously—Miners Have Low Lift and Short Shoveling Distance

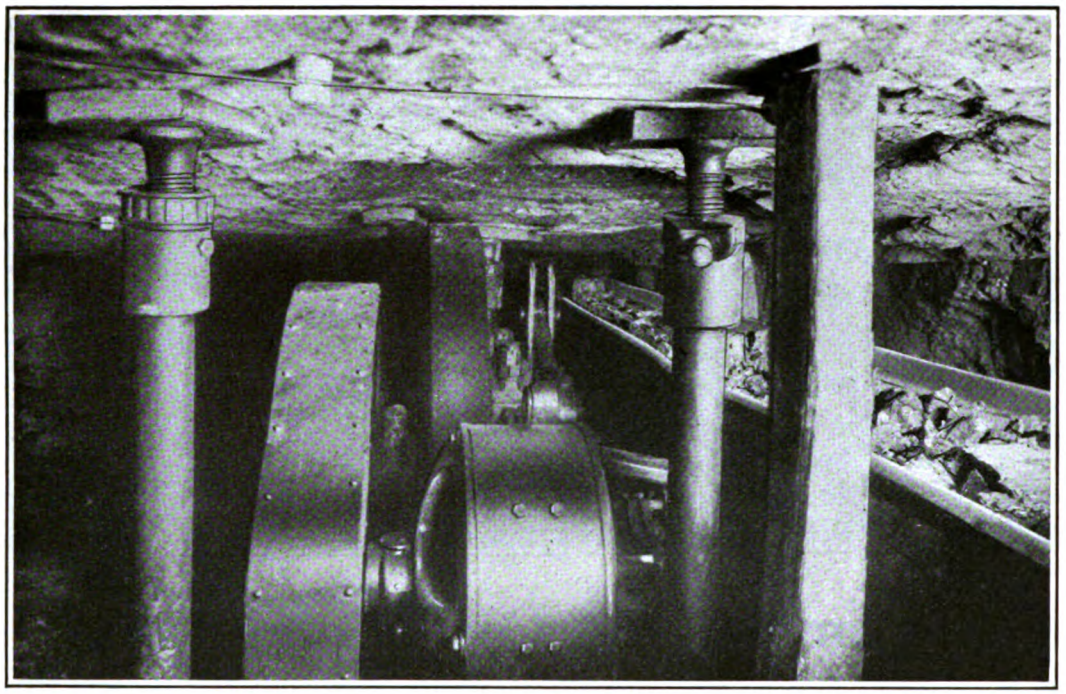
By Frank H. Kneeland
Associate Editor

IN THE CONTINUOUS quest of lower production costs American operators in large numbers are trying conveyors. Many different types and makes of these machines have been and are being experimented with. Probably the simplest and lightest of the varieties thus far tested is the oscillating or swinging trough type. Several kinds of these machines are being tried out in the various coal fields of the country from Alabama to Wyoming on pitches ranging all the way from just below the critical angle for coal on sheet iron to 7 or 8 deg. adverse inclination—that is, up hill.

One of the simplest oscillating or jigging conveyors so far tried is known as the Eickhoff. As may be readily suspected from the name, this is an importation from Germany, built to metric dimensions, but this fact does not deter it from successfully moving American coal. It is at present in daily operation in mines located in several states, including Virginia, Pennsylvania and Wyoming. Although it is especially adapted to use in low beds, it may be employed in measures of fair thickness if desired.

This conveyor is built in sections of varying widths and lengths to suit local conditions. An installation of this machine which might in many respects be considered as typical is in daily operation in the Kentucky No. 2 mine of the Virginia Iron, Coal & Coke Co. at Toms Creek, Va.

Some of the details of this machine as here installed may be seen in the accompanying illustrations. Although it is now being used in drawing pillars, it may be employed with equal facility for driving rooms. About 600 ft. of conveyor trough can be driven from one shaker engine, but only approximately 300 ft. is in use at this mine. This length will enable rooms 260 ft. long on, say, 50-ft. centers to be driven and the room pillar to be robbed back immediately.



In this mine the coal bed is approximately 40 in. thick and the total headroom is about 4 ft. A considerable amount of waste material is separated from the coal at the face. This is thrown into the gob and largely fills it. The roof here encountered is more or less uncertain in quality and requires the use of a fair amount of timber in its support. Inasmuch as the total length of props is only about 4 ft., however, this timbering is not heavy. It consists almost entirely of simple posts with cogs employed only infrequently.

Operation of the conveyor and its application to room driving and pillar extraction are extremely simple. A loading point is first established on the heading. In order to secure sufficient headroom for the conveyor discharge the roof must here be brushed. The room proper is driven narrow, 10 to 12 ft. being sufficient. After the first few cuts have been made in this room the shaking engine may be set up, temporarily if desired, and thereafter the conveyor be employed for loading out all the coal.

Two sections of chute is about the least that can be used successfully. In starting a room, therefore, only the drive and discharge sections would at first be employed. The drive section carries a double fin or keel on its lower side which furnishes a means of attachment to the shaking engine. The discharge section differs from the standard pan in that it is supported at or near either end instead of at one end only. As the room advances section after section of chute is added until full room depth has been attained. Under the conditions here assumed this would be at a depth of 260 ft.

The headpiece accompanying this article is a view looking along the cross or transverse conveyor toward the main conveyor. As may be seen, the headroom is low and the miners for the most part shovel on their knees. It is in low mines that conveyors are particularly useful.

Moving Along

This shows a rear view of the shaker engine with the loaded conveyor beside it in the Kentucky No. 2 mine at Toms Creek, Va. The quantity of coal that this conveyor is called upon to transport is not equal to the full capacity of the machine, so the connecting rod joining the crank to the triangular rocker is shown in this picture pinned into the second or intermediate set of holes.

After the room has attained its full depth a passage or breakthrough is turned from its end and driven through the pillar either right or left as may be desired. The cross or feeder chute serving this breakthrough is driven from the main conveyor in the manner shown in Fig. 1. When this breakthrough has been completed the pillar is brought back by successive cuts taken across the face served by the cross conveyor. During this process section after section is removed from the main conveyor as the pillar face retreats.

This conveyor transports the coal by a combination of a differential oscillation and a vertical movement. The sectional pan carries upon its bottom a vertically curved track made of angle iron within which the supporting rollers travel. On the floor or mounted on blocking depending upon the desired height similar but reversed tracks are placed. The rollers which operate between these two trackways or raceways are wheels about 8 in. in diameter with ¾-in. faces. These are fastened together and held to gage by a 1-in. shaft or axle extending between them. Each pair of wheels therefore constitutes a single rigid roller of light weight that allows the conveyor trough to move back and forth with only a small amount of friction and effort.

As may be seen in the drawing, Fig. 4, the shaking engine is an ingenious mechanical device that imparts a differential oscillation to the conveyor by a combination of an eccentric crank and a toggle joint. This gives a strong mechanism that is positive in its action. The trough moves forward, slowly carrying the coal with it, but is jerked backward quickly. The tracks in which the supporting rollers operate are so curved as both to assist in the movement of the coal and to take advantage of gravity, thus aiding the shaking engine and decreasing its consumption of power. Thus the entire conveyor trough rises as either extremity of the stroke is approached. Upon recession from either end of the stroke the conveyor falls.

Coal upon a conveyor of this kind moves forward in a series of steps or shuffles. The length of oscillation of the chute as well as its speed may be varied by changing the position of the connecting rod in the triangular rocker on the shaking engine, three pairs

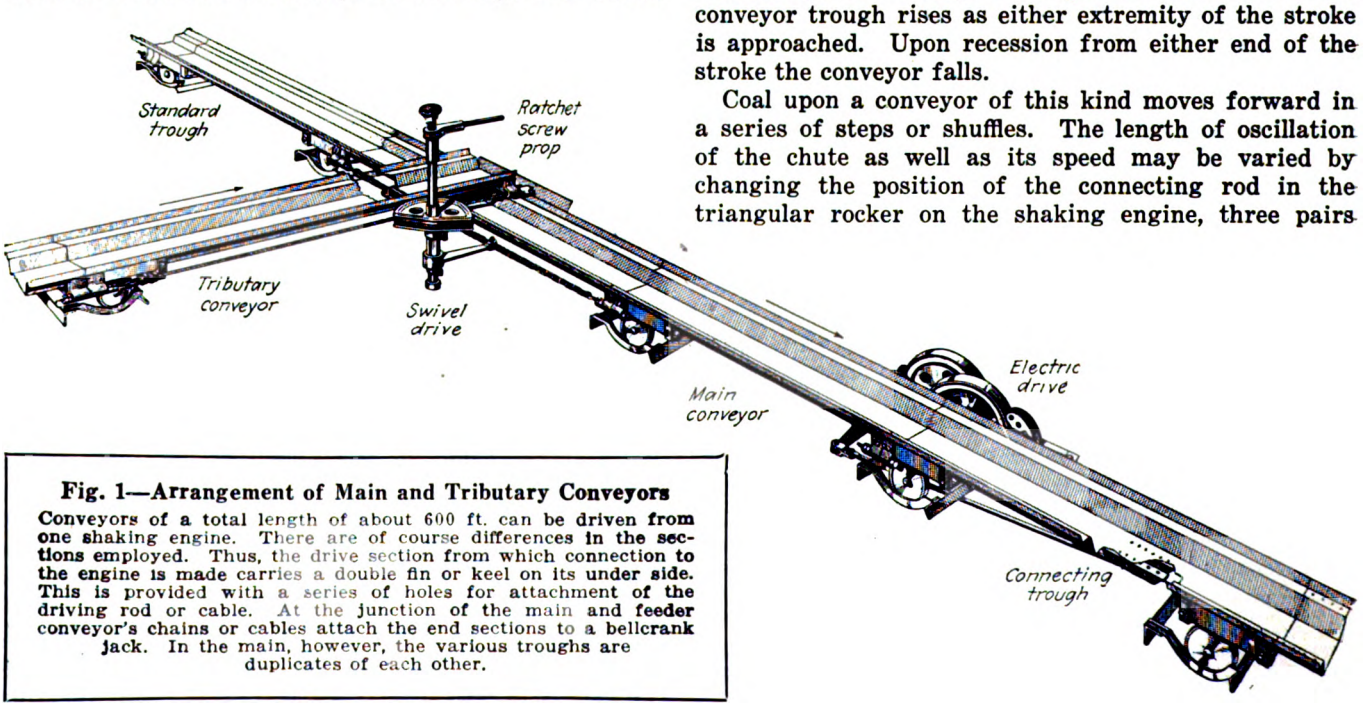

Fig. 1—Arrangement of Main and Tributary Conveyors

Conveyors of a total length of about 600 ft. can be driven from one shaking engine. There are of course differences in the sections employed. Thus, the drive section from which connection to the engine is made carries a double fin or keel on its under side. This is provided with a series of holes for attachment of the driving rod or cable. At the junction of the main and feeder conveyor's chains or cables attach the end sections to a bellcrank jack. In the main, however, the various troughs are duplicates of each other.

Digitized by Google

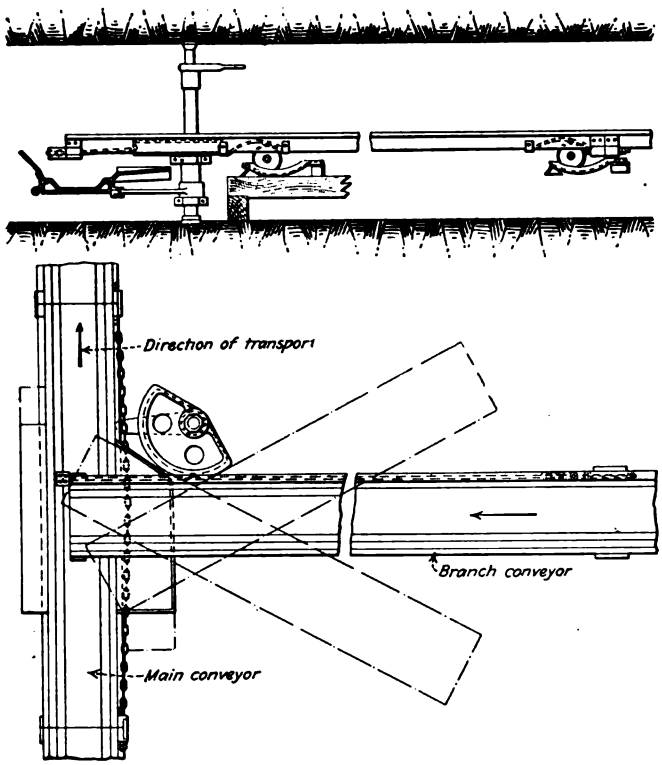

Fig. 2—Cross Conveyor Drive

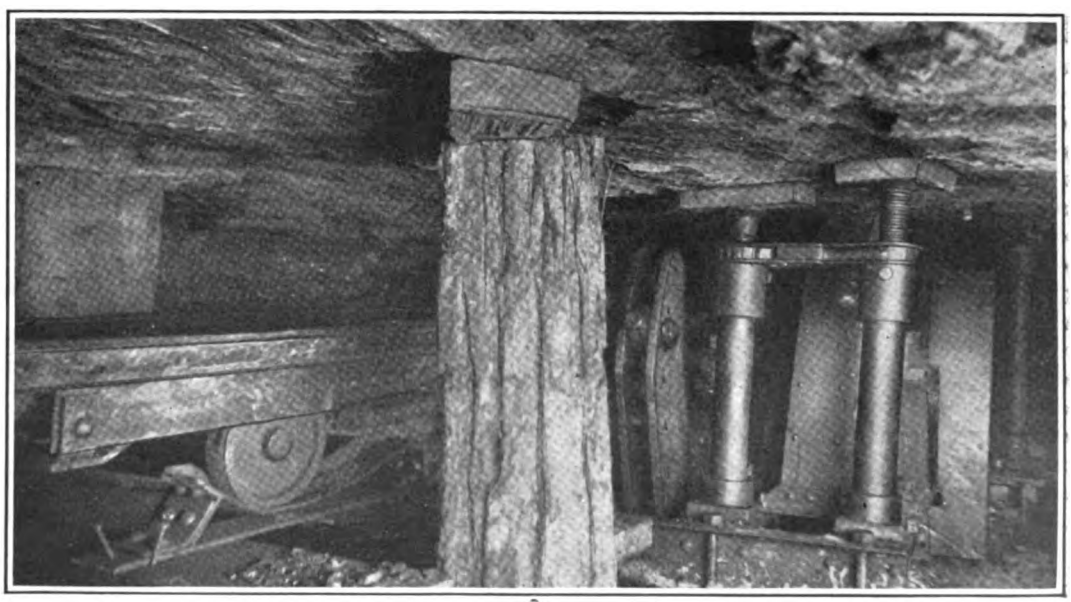
This shows a quadrant drive which is particularly useful if either conveyor must be slewed from a right angle position. Practically the same result can be accomplished, however, by substituting a second lever for the quadrant here shown, making a true bellcrank. This also reduces the weight somewhat.

of holes being provided for this purpose. When the connecting rod pin is placed in the lower set of holes the operation of the chute is most violent and the steps or movements of the coal are longest. Power consumption likewise is greatest. When set in the opposite extreme position the movement of the coal per stroke is the least, as is also the consumption of power. Accordingly the rod will be connected to the set of holes that will give the desired capacity with the least power consumption. In any case the conveyor makes about one complete oscillation, forward and backward movement per second, or 60 "shakes" per minute.

As shown in Fig. 1, the feeder chute is driven from the main conveyor by means of a lever and quadrant. This device is mounted on a post jack that may be readily taken down and moved as the conveyor is lengthened or shortened. On the last section of the main conveyor a chain is stretched between the deadeyes at either end that serve to join adjacent sections together. This chain passes through and is bolted fast to the end of a slotted lever attached to the quadrant. A cable is stretched tight around the quadrant and is fastened securely to the deadeyes at either end of the delivery section of the feeder chute. Lever and quadrant are free to revolve and slide up or down on the tube of the post jack placed in the angle between the two conveyors.

By this means practically the same motion that is given the main conveyor by the shaker engine is imparted to the feeder chute. At Toms Creek the cable quadrant, as shown in Fig. 1, has been supplanted by a second lever and chain, transforming the motion-transmitting device into a true bellcrank. This both simplifies and lightens the equipment somewhat.

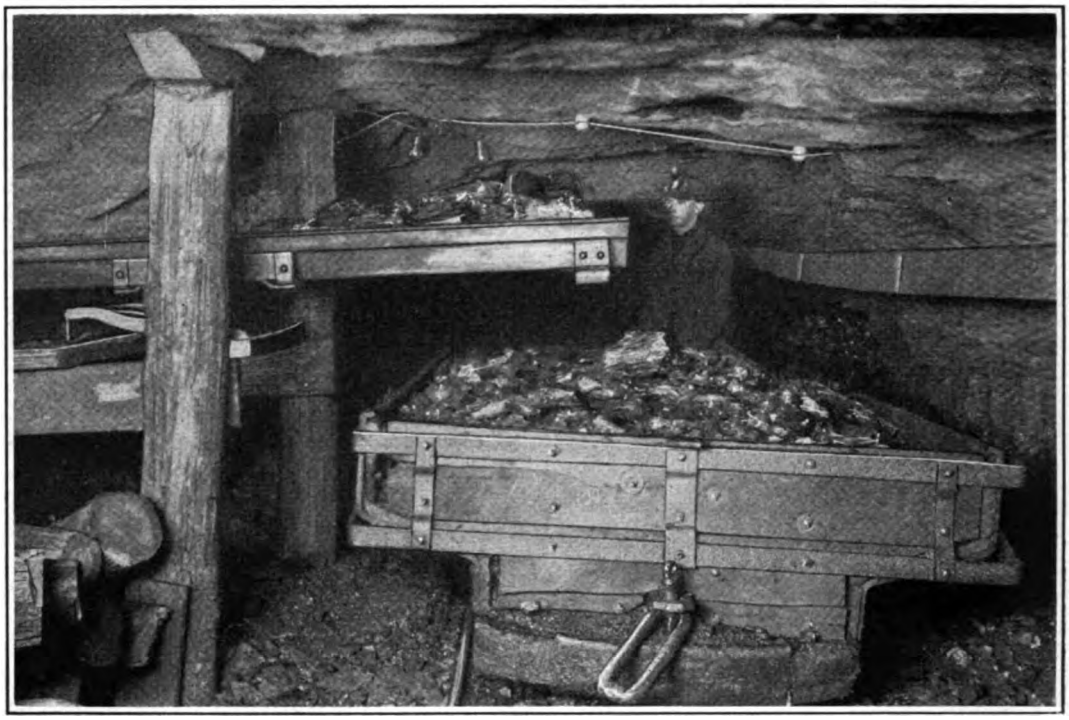


The pans of this conveyor are approximately 10 ft. 2 in. long and overlap 2 in. at the joints, making the net length of each section 10 ft. The metal from which they are rolled is 3 mm. or approximately ⅛ in. in thickness. The cross-section, shown in one of the accompanying illustrations, is such as to afford large capacity and great stiffness. A roller runway or track is provided on one end of each section only. The sections are joined together by means of bolts passed through adjacent deadeyes. It requires only a few minutes to add or remove a section, the only tool necessary for this operation being an ordinary wrench. A ratchet box wrench might reduce this time somewhat.

No mine of any size can be worked successfully with a single conveyor. On the other hand, coal companies wisely hesitate about making the investment necessary to equip an entire operation with machines of this kind until they have demonstrated their possibilities in use.

It will be readily perceived by mining men that a conveyor of this kind lends itself readily to a variety of applications. With 600 ft. of conveyor trough and two bellcranks it would be entirely possible to drive rooms 10 ft. wide and 400 ft. long on 210-ft. centers, bringing back 100 ft. of pillar upon either side of the conveyor. With a series of such rooms in operation the faces could be either stepped or maintained at an angle

Shaker Engine



This is a front view of the electric shaker engine. Lowering the connecting rod to the next set of holes in the rocker arm would increase the amplitude of the conveyor's oscillation and correspondingly increase the machine's capacity. Raising this connection would have an exactly opposite effect. The power consumed would also be affected in a similar manner and in approximately direct proportion.

Digitized by Google

Loading Point

In order to give sufficient headroom at the loading point the roof of the heading has been brushed. The conveyor is blocked up until its discharge end has ample clearance above the car. The trimmer makes no attempt to top the cars, the material being merely piled up to its angle of repose. If too much coal is loaded on a car, some of it will be shaken off on the journey to the tipple. This should be avoided if possible.

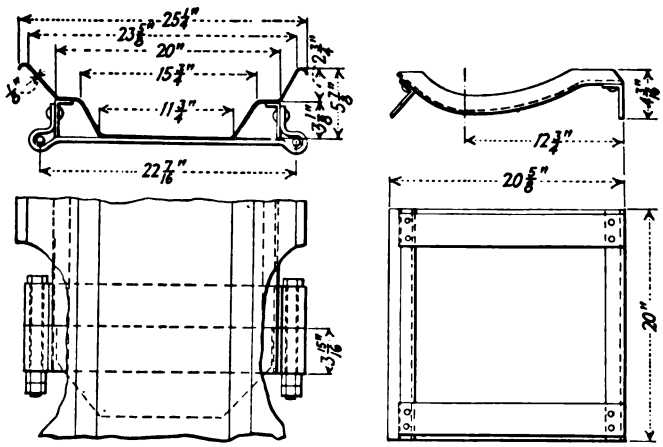


Fig. 3—Details of Trough and Cradles

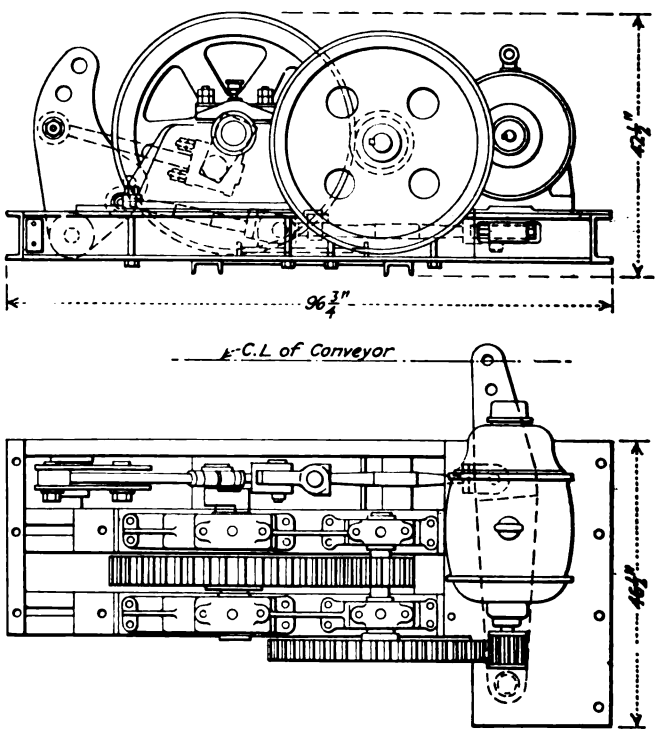
Several sections of trough can be made each of which is stiff enough to take the thrust of the shaking engine. The contour of the cradles is such as to assist the engine both in stopping and in starting the conveyor at each end of the stroke. They thus aid in decreasing the power consumption

so as to give an oblique breakline for the roof. Room headings in such a case could be driven 800 ft. apart.

Another improvement would appear to be entirely possible if a whole mine were worked by means of these conveyors. The electrically operated shaker engine weighs 4,800 lb. Hence it is heavy and difficult to move especially in the close quarters imposed by thin coal beds. A shaking engine driven by compressed air has been developed that weighs only 1,170 lb. and that takes up far less space than does the electric machine. Although it might at first glance appear to be a backward step to substitute compressed air for electric power, yet where reciprocating motion is desired, air has many advantages—witness the rock drill. If several rooms are to be worked in fairly close proximity to one another, all the conveyor engines could be driven from one centrally located portable compressor installer at some convenient point on the heading.

In capacity, conveyors of this kind approximate one ton per minute. This capacity, however, varies with the size of the pan and the rapidity or violence of its oscillation. In driving rooms or crosscuts a telescoping or extensible section may be placed at the forward extremity of the conveyor chute. The end of this section practically slides back and forth on the floor. This chute will dig under any loose material that may be present, but its action may be much aided by men with picks who can pull down much of the loose material and roll it into the conveyor trough. Arrangements can also be made to slew this section sidewise so that much of



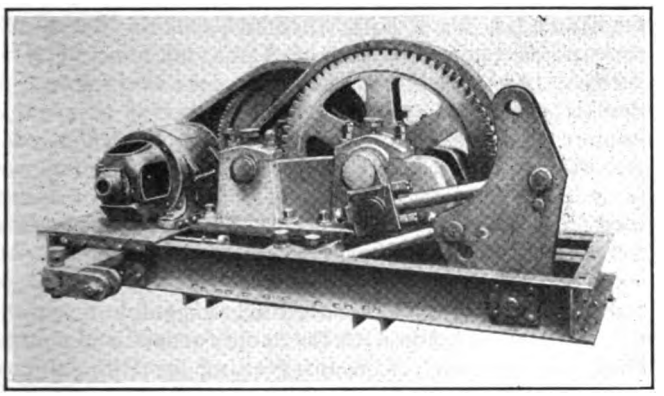


Fig. 4—Electric Shaking Engine

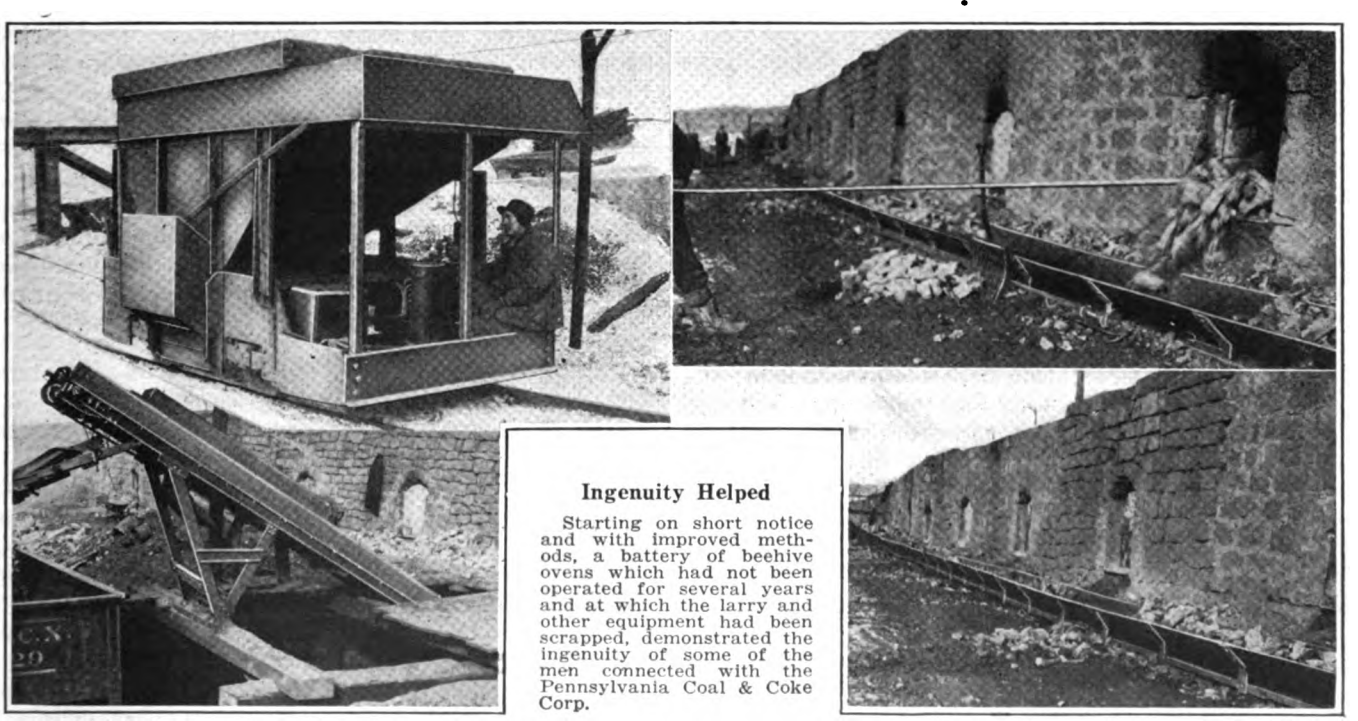
This machine contains two walking beams or levers, one vertical and the other horizontal, the vertical beam transmitting motion to the horizontal lever. By a suitable arrangement of cranks and connecting rods an unequal reciprocation is imparted to the conveyor. The amplitude of this vibration may be adjusted to suit local requirements

Digitized by Google

the face can be cleaned up in this way. Usually about four-fifths of the coal resulting from any one fall may be loaded out in this manner by the machine itself without any necessity for hand shoveling. From Wyoming comes the report that an undercut in the face of a room has been cleaned up in 20 minutes by the aid of this extension chute. This gives a hint of the possibilities of this machine in "narrow work."

Side View of Engine

This machine as used at Toms Creek weighs approximately 2½ tons. It is equipped with a 20-hp. direct-current motor and draws its energy supply from the trolley or feeder line.



Many of the advantages claimed for the use of the conveyor in coal production are self-evident, but their relative importance will depend largely upon local conditions. Thus the conveyor is low in height compared with a mine car, and the distance through which the coal must be raised in order to be deposited upon it is relatively small. For a given expenditure of muscular energy, therefore, a man can load many times as much coal over the side of a conveyor as he can over the side of a car of even moderate height. In the case of the car much energy is wasted in lifting and lowering the body, whereas with the conveyor muscular effort is confined largely to the arms.

Use of the conveyor obviates the necessity of laying track from the heading to the face. This in turn makes it unnecessary to brush top or lift bottom in these passages. There is no carrying or long-distance shoveling of the coal for the reason that the conveyor is always near the face and consequently close behind or beside the shoveler. This short shoveling distance also entails less fatigue.

With a conveyor the consumption of power is of secondary importance. Inasmuch as mechanical energy costs only a small fraction of the price paid for muscular effort, the mine operator may economically be prodigal in its use wherever it can be made to supplant human brawn in mining operations.

The combined result of all these effects is an increase in the tonnage produced from the employment of a given number of men; or, what is the same thing, the cost per ton f.o.b. railroad car is decreased. This is the ultimate desideratum toward which all operators are striving. It will not be accomplished by the installation of one or two conveyors. Experimentation with a few such units, however, will tend to show the possibilities inherent to complete mechanization and thus point the way to cheaper coal.

Old Beehive Ovens Are Again Pressed Into Service

Ingenuity Helped

Starting on short notice and with improved methods, a battery of beehive ovens which had not been operated for several years and at which the larry and other equipment had been scrapped, demonstrated the ingenuity of some of the men connected with the Pennsylvania Coal & Coke Corp.

The coal larry (upper left) and the combination coke screener and loader (lower left) were built hurriedly in the company shop at Gallitzin. It is here, at the No. 10 mine, that the ovens are located. The larry, which holds approximately 5 tons, was built from an old 4½-ton combination battery-and-trolley locomotive, and from parts of a scrap tipple. No sheets of sufficient size were available for constructing the bin of the larry, so material was "made." Scrap sheets of odd size were cut, fitted, and electrically welded to form large sheets for the sides of the bin.

Acetylene cutting and electric welding, also played an important part in the construction of the coke screener and loader. The screening is accomplished by slots in the bottom plate of the flight conveyor. These miniature bar screens were made by cutting rectangular holes in the plate and welding strips of steel across the openings, forming slots parallel to the direction in which the coke moves.

The upper half of the loader is mounted on a pivoted support in order to facilitate repairs, and cleaning of the pit. When either becomes necessary, the loader is disconnected in the center, the upper section is than tipped to a horizontal position, and the lower portion, which is on wheels, moved out below the upper section.

The two pictures at the right show how an old conveyor is installed in front of the ovens for moving the coke to the loader. This conveyor is one which a few years ago was tried in the mines and found unsuited to underground conditions. The snapshot at the upper right shows the coke dropping directly into the conveyor.

Surface Damage and Coal Betterment Waken Much Interest at A. I. M. E.

COAL OPERATING PROBLEMS were at the forefront during some of the closing sessions of the American Institute of Mining and Metallurgical Engineers' 133d meeting in New York City on Feb. 17, following the two days' proceedings reported in *Coal Age* last week. In the final coal conferences a notable report on subsidence was made by the Institute's coal and coke committee. Discussions in which coal men took part covered such subjects as coal cleaning, the difficulty of removing organic sulphur from coal, the use of X-rays for differentiating pyrite, shooting as a cause of mine squeezes, the mining of oil sand, and various recent developments in industrial relations.

Evaluation of coal, advocated by R. H. Sweetser in Tuesday's meeting, seemed to be the animating spirit of the paper by A. C. Fieldner and W. A. Selvig, which formed the opening feature of Wednesday morning's coal session. Unfortunately, we have had specifications which assumed a differential value for coals of varying quality, but we have had no scientific and carefully prepared data on which to base those differentials accurately.

It was suggested in Tuesday's meeting that this was a problem that the consumers of coal, the metallurgists, and gas men for instance, could best attack each for his own interest. Mr. Sweetser calls not for general principles so much as for actual figures that will evaluate differentials truly and not arbitrarily, and these Messrs. Fieldner and Selvig did not attempt to give in their article on the "Relation of Ash Composition to the Uses of Coal."

X-Ray Reveals Sulphur

Ansell St. John said that he had made experiments in the use of X-rays to determine the occurrence of ash. The fractures in the coal show much inert matter, and the X-rays confirm the fact that most of it has found lodgment there. Later Mr. St. John said that, in coking, organic sulphur became inorganic, as could be determined by X-ray methods. X-rays passing through truly colloidal matter give a different impression to that given when crystalline material is interposed. The organic sulphur is a chemical part of the colloid; the pyrite or marcasite is a crystal mixed in the mass. The X-ray differentiation is quite sensitive. When 0.2 per cent of crystals were intimately mixed in a mass of colloids, the presence of the crystals was made clearly evident in an X-ray examination of the mixture.

T. M. Chance said that unfortunately the washing of coal sometimes increased sulphur rather than decreased it. Thus, a piece of coal containing 2.2 per cent of organic sulphur and no inorganic might in washing be purified of non-pyritic ash to such a degree that the percentage of sulphur instead of falling to 1.8 per cent might actually rise to 2.8. The coal in the No. 6 bed of Illinois had a high organic-sulphur percentage and in places this fact made it utterly unsuited for coking. H. M. Chance, father of the previous speaker, declared that the presence of organic sulphur was, forty years ago, recognized by A. S. McCreath, of the Second Geological Survey of Pennsylvania. He found sulphur for which he could find a mate neither in iron nor in calcium. The Hay Creek coal field, some 50 miles north of Deadwood and the Black Hills, in South Dakota, has a sulphur percentage in places of 9.31, and none of it is pyritic. In examinations of coal for coke every attention should be paid to the presence in the coal of organic sulphur that could not be removed mechanically. He pressed for a statement whether organic sulphur was as undesirable as inorganic, and got all kinds of assurance from A. R. Campbell and Mr. Sweetser, but he said their statements were largely dogmatic. He would await certainty until a blast furnace in a trial of several days had been run with coke of high organic-sulphur content and comparison made with the same furnace and charge using a coke with a countervailing pyritic sulphur percentage.

Too Low in Sulphur for Washing

Thomas De Venney said that in the coal of the Portsmouth Byproduct Coal Co. there was more organic than pyritic coal, and the coke had the same characteristic. He said that 0.40 is about the lowest level of organic sulphur in coal and that any coal like that of his company that ran as low as 0.50 to 0.60 per cent sulphur was almost beyond beneficiation as far as sulphur was concerned. Mr. Fieldner agreed that 0.40 was about the correct low limit for organic sulphur.

"The Selection of Coals for the Manufacture of Coke" was presented by Harold J. Rose. Mr. Rose declared that experience in the construction of byproduct ovens had made it possible to coke coal having 21.1 per cent of volatile matter, as in Pierce County, Wash. Coal having 34 per cent of volatile matter, and coming from the Pittsburgh seam, had also been successfully coked. The coking time in the first case was 11 hr. 47 min. and in the second case 11 hr. and 40 min.

Mr. Rose showed that the carbon-oxygen ratios gave the best division for the separation of coking from non-coking coals, but said that the oxygen percentage lines would be equally suggestive, as they paralleled the lines drawn to exhibit the carbon-oxygen percentage. The surest way to test cokability was to coke the coal.

The Cost of Coal Washing

T. M. Chance then addressed the institute on the "Mount Union Sand Flotation Plant for the Preparation of Bituminous Coal." *Coal Age* readers can find a description of this plant in the issue of Dec. 3, 1925, pp. 769-773. Mr. Chance showed by a cost sheet that the coal was washed for 9.64c. per ton, including charges for power at 0.9c. per kilowatt-hour, maintenance at $1,200 per month, and fixed charges, taxes, etc., at 12 per cent on $140,000. He added that of the total labor cost of 4.8c. per hour, 75 per cent, or 3.6c., was tipple labor that would be required whether the coal was washed or was passed through the tipple without washing. At least 50 per cent of the rest of the cost would likewise be necessary for a non-cleaning, screening tipple. The total operating cost of such a tipple would, therefore, be about 6.02c. per ton. If hand picking were employed to the extent shown as necessary in the former operation of the Mount Union tipple, an added labor cost, resulting from the need of employing not

Digitized by Google

fewer than twenty-five men, would be incurred, or 5c. per ton, making the cost 11.02c. per ton.

At the mining methods session George S. Rice described "Oil Sand Mining in France and Germany." The interest in this for coal men rests in the fact that whereas with exhaustive drilling 20 per cent of the oil can be taken out, with the driving of headings through the oil sand another 40 per cent can be obtained. Perhaps all the sand may be removed in some cases, but at Pechelbronn, in Alsace, and Wietze, to the north of Hanover, Germany, the sand is so loose and the pressure so great that complete extraction is unlikely by any method now in general use. In Wietze all the roadways are driven with forepoling and breast lagging.

The interesting feature of the situation is that oil has been extracted in Texas by Leo Ranney's method of undermining the sand with galleries and drilling upward from these headings to the oil above. Pipes are provided to bring the oil to the shaft.

The intention is to develop this method of mining extensively, as it is said it will be more efficacious, especially when compressed air or live steam is forced into the sand. The purpose is to divide the field by driving galleries so as to cut up the oil area into squares of forty acres each, providing 132 "wells" spaced 10 ft. apart on each side of the square. The mines may be quite deep, but one shaft is less expensive than a multiplicity of deep wells. It is stated that the Standard Oil Co. of New Jersey proposes to give the system a careful trial.

VALUABLE REPORT PRESENTED

In the afternoon the committee on ground movement and subsidence received the notable report of H. N. Eavenson on the surficial effects of coal mining. Its sixty-five pages constitute a book rather than an address, and the mining public owes the committee quite a debt for this elaborate and valuable report. John A. Garcia said that he believed the committee should consider the effect of impact in shooting. Two companies in Illinois worked two seams one above the other, the upper being a drift mine with a 5-ft. seam and lower a shaft mine with a 7-ft. seam. A squeeze in the lower mine was followed by a falling-in of the upper mine, and a suit was brought against the operator of the lower working. A counter suit was brought by the latter, alleging that the squeeze in the lower mine was the result of heavy shots in the upper. In fact, these shots were so heavy that they extinguished lights in the bed below. Mr. Garcia thought shooting an important element in roof movement and pressure.

J. B. Porter declared that the pressure of plastic material increased the effect of concussions such as earthquakes. Plastic material has a different wave period from sandstone, and a concussion is apt to cause side movement. Perhaps there was a plastic bed, he said, between the two mines which had the disastrous experiences narrated by Mr. Garcia.

C. M. Young declared that the roof often tended to choke when falling, and so yielded support. R. D. Hall declared that the roof could not fall far if it choked, and so could not choke except perhaps by an infinite series of falls. Mr. Rice declared that the material could fall at the top of the arch of failure and roll down so as to protect the haunches.

S. A. Taylor said that a certain Englishman in earlier years had definitely stated that subsidence did not occur if the bed mined were ten times as deep as the bed is thick. This erratic statement showed how time modified opinion. Mr. Eavenson said that, in one instance, the extraction of a bed 4 ft. thick and 2,970 ft. deep had caused a marked subsidence—1.44 ft., or 36 per cent of the seam thickness. Mr. Young delivered an interesting address on the ground movement due to a salt well in Hutchinson, Kan. Effort is being made to get information as to subsidences that occur as the result of the removal of oil, sulphur, and salt, but unfortunately the information as to the area and degree of extraction makes any conclusions somewhat nebulous.

INSTITUTE AWARDS MEDALS

At the banquet on Wednesday evening Wilbur Nelson, state geologist of Virginia was toastmaster. The speakers were J. V. W. Reynders, C. L. Kinney, Jr., J. M. Callow, T. C. Denis, G. S. Davidson, Scott Turner, and S. A. Taylor. Award of the Robert W. Hunt medal was made to C. L. Kinney, Jr., for his paper on the "Economic Significance of Metalloids in Basic Pig Iron in Basic Open-Hearth Practice." J. M. Callow was awarded the James Douglas Medal for distinguished services in the concentration of ores, particularly in flotation methods.

W. L. Saunders, it was announced, has provided an award for those contributing in the course of the year the most notable advance in the art of mining. On Thursday morning ninety members of the institute drove to Bear Mountain to see the new suspension bridge across the Hudson, which has the longest suspended span in the world. They lunched at the Bear Mountain Inn and later returned to New York.

A symposium on explosives the afternoon of Feb. 17 began as a hangover from the morning session on mining methods, with R. M. Raymond presiding. Lantern slides were shown illustrating the construction details and method of operating an automatic drill tempering machine. This device will handle and temper one drill steel every 30 sec.

GOOD SHOOTING PRACTICE ILLUSTRATED

It was stated that good practice with hand methods was represented by the sharpening and tempering of drill bits at the rate of 12 pieces per man per hour. The shop cost was about 7c. per piece, making the cost of sharpened steel at the face approximately 10c. An excellent gage of the quality of such steel is the amount of work the user is able to accomplish with each sharpened bit.

Most trouble with drill steel is caused by overheating of the metal. Mr. Stewart stated that he once conducted a test on the tempering of steel and found that his blacksmith was tempering at approximately the critical temperature on a rising heat. Checking this man's work with a magnet showed that it was practically correct. An average of 18 in. of hole in the hardest kind of quartzite was drilled with steels thus treated while in rare instances 36 in. was attained.

Consideration of explosives was then taken up, with B. F. Tillson as chairman. The first paper presented was one by Theodore Marvin, managing editor of *The Explosives Engineer*. This dealt with the blasting of coal in the mines of the United States. Mr. Marvin exhibited thirty-six lantern slides showing good coal-shooting practice under varying conditions. He explained that the arrangement and loading of shotholes must necessarily vary from point to point even in the same mine if the largest reliable percentage of lump coal is to be obtained. Most operators have made no

Digitized by Google

consistent effort to better their coal so far as its blasting is concerned.

Mr. Marvin then showed a few slides illustrating somewhat imaginatively the result, on the quality of the product, of using a high explosive and a permissible. He also displayed a second short series showing the effect of cushioned and non-cushioned blasting.

The question was then asked, "What is a high explosive?" The answer was that a 60 per cent gelatine dynamite might be considered typical. Ammonium nitrate is now used as a base for mine explosives. Practically none has a nitro-glycerine base.

Someone then asked what was the maximum percentage of lump produced in American coal mines. The reply was that this depended much on the nature of the bed worked. In most mines, under present conditions, from 33 to 40 per cent of lump is attainable, while some operations realized as much as 67 per cent.

It was then asked "What is the effect, from a safety standpoint, of using delay exploders? Do they cause windy shots?" In reply it was stated that such an effect was not markedly apparent. Practically all the anthracite mined is shot with fuse, the shots necessarily occurring in sequence. Few, if any, explosions in bituminous mines have resulted from the use of delays. In Utah, where the coals worked produce extremely inflammable dusts, the action of these exploders is feared, yet nevertheless some delay caps are being used with good results.

THE POSSIBILITIES OF L. O. X.

The next paper, on "Liquid Oxygen as an Explosive," by Frederick W. O'Neil and Herman Van Fleet, was presented by Mr. O'Neil. An abstract of this paper will appear in a forthcoming issue. There has been much misconception, rumor and conjecture concerning this new explosive, its possibilities and limitations. This authoritative treatise therefore, comes at an opportune moment.

At the conclusion of this presentation someone asked what is the smallest plant to be had for the manufacture of liquid oxygen. It was stated that a plant with a capacity of 16 liters, or approximately 40 lb., per hour is the smallest commercial outfit now procurable.

Several other questions were asked and answered, this discussion bringing out the following salient information: The temperature of exploding L.O.X. is unknown. It is believed to have a long hot flame similar in characteristics to that of black powder. In action it is closely equivalent to 40 per cent dynamite although its speed of explosion propagation or its quickness is the same as that of 60 per cent dynamite. Water forms an excellent stemming, but when used freezes. Cartridges of the new explosive can be made by anyone. About 1⅛ in. is the smallest diameter of cartridge that has been found practicable and this must be fired within 10 min. after being introduced into the shothole. Six-inch cartridges may remain unfired in a rock drill hole for as much as 2½ hr. and still give excellent results.

In closing the meeting Mr. Tillson remarked that it had been an extremely interesting session, highly profitable from an educational standpoint to all who attended it. If the mining industry could have as comprehensive and as authoritative information upon other explosives as quickly after they have been developed as is now available concerning L.O.X. much more rapid progress in blasting methods and practice would be possible.

The group meeting on industrial relations, held Feb. 17, drew only a few members of the Institute, who listened to a paper by George E. Roberts, vice-president, National City Bank, on "Employee Stock Ownership" and an extended recital of what Mitten management has done to promote better industrial relations on the Philadelphia Rapid Transit Co., by J. M. Shore, editor of the street railroad company's employees' magazine. C. J. Hicks, Standard Oil Co., who also was scheduled to address the meeting, did not appear.

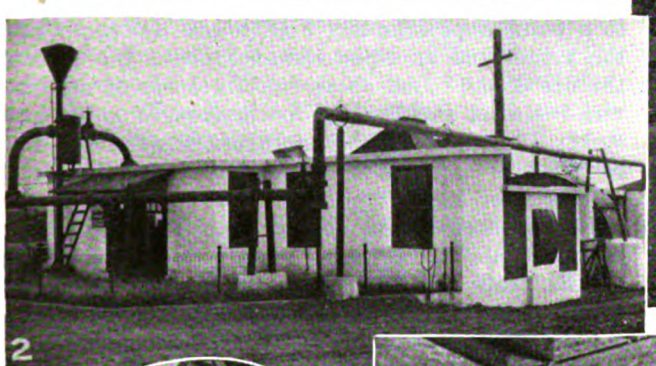
PROBLEMS OF THE BIG UNIT

With the growth of society from the primitive system in which human wants were simple and contacts few as compared to the complex, highly specialized social systems of today, the trend away from the small business unit to the big corporation was inevitable, said Mr. Roberts. It requires no stretch of imagination, he declared, to foresee the day when these large units, owned by the employees and the public they serve, will supersede the old system of ownership of a multitude of small industries by many individuals.

Most of the troubles which the bigger unit faces, continued the paper, read in Mr. Shore's absence by his son, are due to the development of the industrial organization beyond the comprehension of the ordinary worker. Nevertheless, fundamentally the complex organization is the same as the simple type. The modern industrial system, however, will break down unless the spirit of co-operation between management and worker exists. The engineer, the author pointed out, is the natural mediator between capital and labor because he understands the problems of both sides. Stock ownership offers the best method of sharing the profits of industry with the worker. It is superior to ordinary profit-sharing schemes in that it adds responsibility.

MITTEN FINDS LIBERALITY PAYS

Mr. Shore's paper explained that Mitten management, by convincing the worker it was fair and ready to share the benefits of improved operation with those who made such betterment possible, had lifted a company facing bankruptcy to a dividend-paying level and had developed an employee ownership scheme which now takes in one-third of the common stock of the company. Under the latest scheme, recently adopted, wages are based on the purchasing power of the dollar, plus a bonus for increased efficiency. The stock owned by the employees, he said, had been purchased out of wage bonuses accruing to the men. These bonuses had been based upon increased gross earnings.



A suggestion thrown out by the speaker that the mine worker was not as intelligent as the street-car employee drew a sharp defense of the mine worker by Sidney Jennings, past president of the Institute, and Clarence T. Starr, Chamber of Commerce of the United States. Doubt was voiced whether conditions in the mining industry were such that a stock-selling scheme would be successful. The position of the mine, beaten to and fro by competition, and of the public utility, enjoying government protection of earnings, was contrasted.

The ladies are taking more and more an active interest in the meetings of the Institute. For them a full program was provided having no relation to mines or metals.

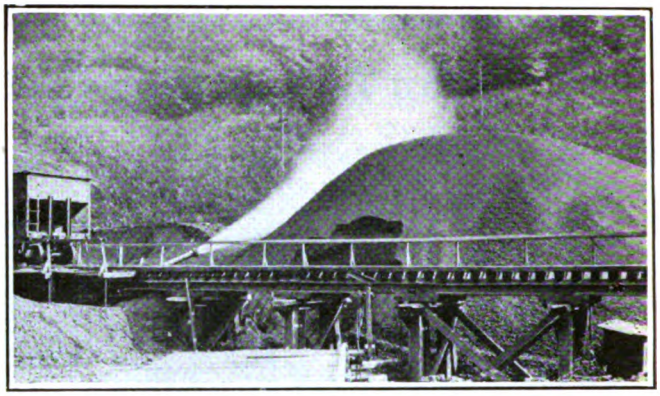
Modified Hand Firing Cuts Mine Fuel Consumption

Boilers that Formerly Used 1,600 Tons of Mine Run per Month Were Raised and Feeders Added—Now 700 Tons of Slack Suffices

By J. H. Edwards
Associate Editor



A 56-PER CENT SAVING in fuel consumed at the mine has been effected by the Gatliff Coal Co., of Gatliff, Ky., by a change in firing method and by the investment of a relatively small amount of money in boiler-room improvements. Formerly this company burned mine run coal in its plant while paying the cost of hauling a certain quantity of fine, practically unsalable coal from the tipple to a refuse dump. Today it consumes the fine stuff and markets the run-of-mine.

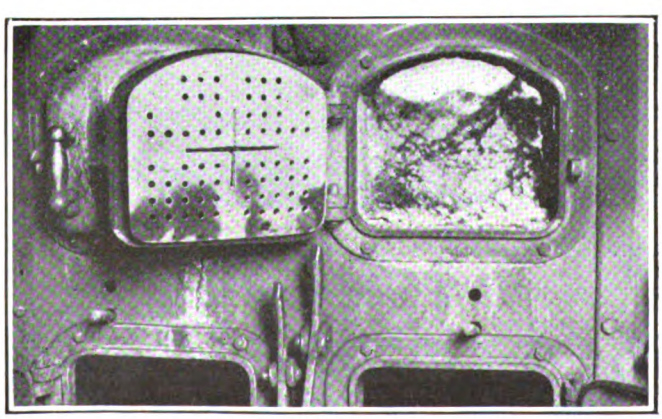
This plant supplies compressed air and electricity for three mines which produce a high grade of bituminous coal for the domestic market. It is located close to a twin tipple which in addition to the usual shaking screens is equipped with a vibrating screen for removing all coal under ⅜ in. This slack runs so high in ash that it is difficult to market, and much of it was formerly dumped as refuse. It had to be loaded into railroad cars, and hauled several miles.

The power plant equipment consists of seven, 72-in. x 18-ft., 150-hp., horizontal-return-tubular boilers, a steam-driven air compressor, and two generators, one engine- and the other turbine-driven. The boilers are equipped only with natural draft, which is supplied by individual steel stacks. A barometric condenser and spray pond complete the plant layout.

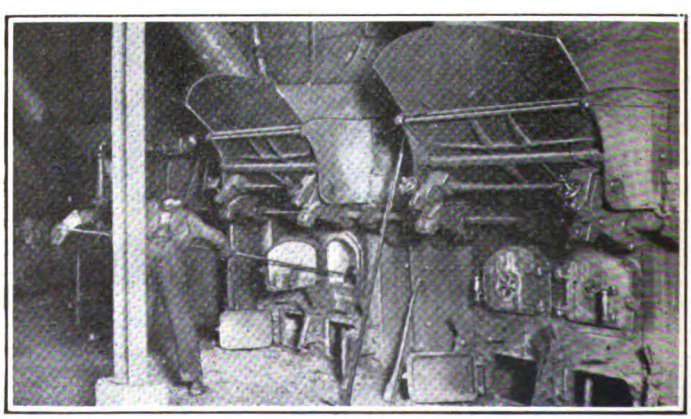
As originally installed, the furnaces were fired by ordinary hand methods, and judging from what the plant engineer and company officials say, it was one continuous fight to carry the load with six boilers. Now the same load is carried easily with but four boilers, burning 700 tons of the slack per month as compared to 1,600 tons per month of mine-run—the former fuel consumption.

This decided saving in quantity, and the change to a lower grade fuel was the result of rebuilding the boiler settings and installing inclined shaking grates and overhead bunkers in combination with furnace feeders. Now only one fireman per shift is needed as compared to a minimum of three under the old system.

The Ash Conveyor in Action



Except for one 30-deg. bend this steam-jet conveyor is a straight pipe. Although this type of conveyor uses about 150 boiler-hp., it need be operated but a few minutes each day. The platform in the foreground is a driveway for a truck which hauls cinders for road making.

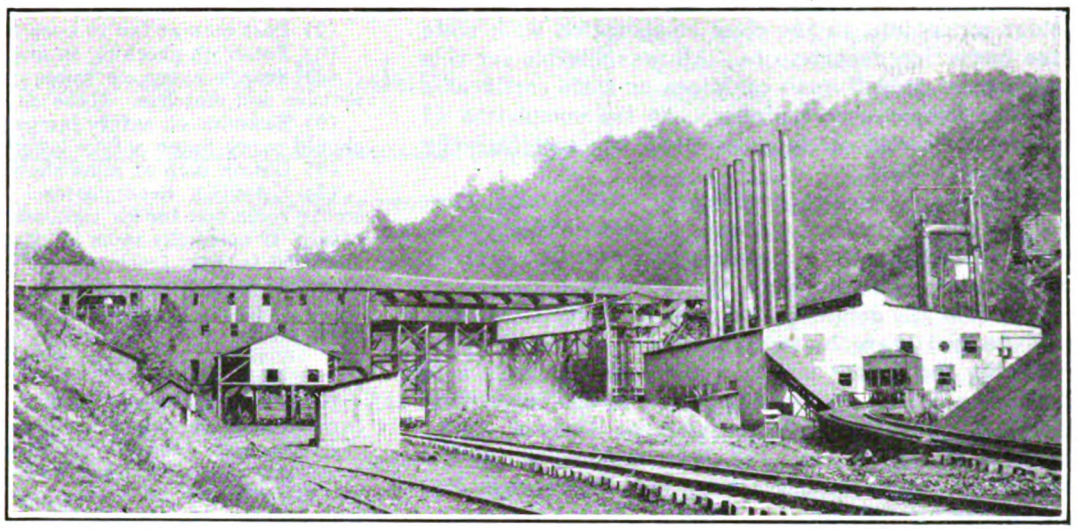


The boilers were raised about 2 ft., bringing them to a point approximately 5 ft. above the upper end of the grate, and an equal distance above the bottom of the fire doors. Just above the fire doors of each boiler was installed the feeding mechanism of a mechanical stoker. The inclined shaking grate, was set on an angle of about 20 deg. and is provided with dumping sections at the lower end.

Fuel is fired by the coking method the feeder being operated intermittently. The coal is dropped in a heap on the grate in front of the fire doors. After a pile about 18 in. high has accumulated the feeder is stopped for a few minutes or until the volatiles have been distilled off. The fireman then opens the door and with two or three strokes of a hoe pushes and distributes the coked fuel down over the grate.

Each fire is cleaned twice a day by the ordinary hand method. Half of the grate is cleaned at a time and the clinker, after being broken up, is dumped at the rear end of the grate. The ash is disposed of by a steam-jet conveyor, the intake openings of which are on the floor in front of the ash pit doors. The ashes are raked up the sloping bottom of the pit and out on the boiler room floor where they are fed into the conveyor openings. There is but one bend in the conveyor pipe, a 30-deg. elbow which gives the discharge the desired elevation.

Inasmuch as the coal is spread by hand and the fires must be cleaned periodically, the method employed at Gatliff differs from hand firing only in that fuel is



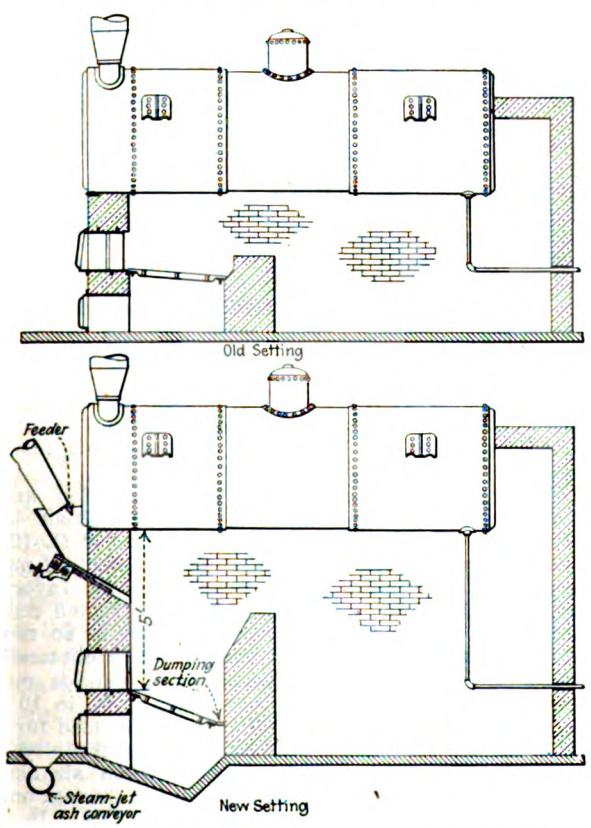
New Method Combines Automatic Feed and Hand Firing of These Boilers at a Kentucky Mine

The photograph at the left shows where the mechanical feeder drops the fuel and where it is left to bake for a few minutes before the fireman pushes it down over the grate. This differs from hand firing by the coking method only in that the coal is deposited mechanically instead of by scoop. In the other picture the fireman is spreading the coked fuel. Only two or three strokes of the hoe are necessary. Mechanical feeding minimizes the time that the fire doors must be kept open.

Digitized by Google

Twin Tipple and Power House

Recent improvements to the tipple included the addition of a conveyor for delivering screenings to the boiler room. At the time the photograph was made the conveyor was not completed, hence the car of fine coal standing at the right ready to be dumped for plant fuel. The boiler room contains seven 150-hp. return-tubular boilers.



introduced into the furnaces by mechanical means instead of by the use of a hand scoop. The gain creditable to the use of feeders lies in the labor saved and in the better combustion efficiency obtained through a reduction in the quantity of excess air admitted.

A definite volume of air is required for complete combustion of a certain quantity of fuel. Assuming that the correct volume of air is being admitted, then, if the fire doors are opened without first closing the stack damper, there will be an inrush of cold air which will lower the furnace temperature. The waste from this cause is much reduced by mechanical feeding.

No doubt the increased volume of the combustion chamber in the new setting also had a material effect in increasing the efficiency. Still another reason for the better results obtained lies in the fact that there is now but one fireman per shift and therefore no divided responsibility.

Although a large proportion of the hand-fired mine plants have been displaced by purchased power, there still exist a goodly number, at which economies similar to those enjoyed at Gatliff could be realized through additions and alterations to the present equipment. In many instances the mere fact that a mine plant is equipped with horizontal return-tubular boilers is a good indication that it is exceedingly inefficient and therefore a place that visitors are not urged to see. This, however, does not hold true at Gatliff. At this plant the officials point with pride to the boiler room and recount the savings resulting from the improved method employed and the equipment installed.

New Setting Gives Big Combustion Chamber

The principal reason for raising the boiler was to make room for the feeder between the fire doors and boiler doors. This feeder drops the fuel in a heap on the grate, just in front of the fire doors.

Bureau Offers "Graduate" Course In Mine Rescue[1]

By J. J. Forbes[2] and G. W. Grove[3]

A NEW SUB-DIVISION of safety service, called the Safety Extension Service was formed in the Bureau of Mines on July 1, 1925. Soon after the organization of this section one of the important things done was the outlining of a course for coal mining men known as "Advanced Instructions in Mine Rescue and Recovery Operations." This course outlines the duties of all the men at the time of a mine disaster, from the general manager down to the men who do the actual recovery work. A total of 128 mine superintendents, foremen and others who would be in charge of safety and recovery work at mines have finished the course.

The need for instruction of this kind has been recognized for a long time as the local mine organization after a disaster is usually disorganized and has little or no idea of what procedure to follow, thereby losing valuable time, retarding the recovery work, and possibly sacrificing what little chance there may be of saving life.

An effort is made in this course to obtain men who are a permanent part of the mining organization, such as underground officials and superintendents with par-

[1]Published with the permission of the Director of the Bureau of Mines.

[2]Chief engineer, Safety Extension Service, Bureau of Mines.

[3]Assistant mining engineer.

Digitized by Google

ticular stress laid on the close co-operation with state mine inspection departments. All men eligible for this course must hold Bureau of Mines or state certificates covering mine rescue training. At the completion of the course a certificate is issued to all who satisfactorily complete the work.

The initial classes were conducted at the Orient Central Rescue Station at Orient, Fayette County, Pa., where the officials of the station and the contributory companies co-operated with the Bureau engineers in working out the details of the course. Fifty-seven men were trained there in four classes of one week each. Following the Orient training, three classes were held at Thomas, W. Va., where 51 officials of the Davis Coal & Coke Co. and representatives of the departments of mines of West Virginia and Maryland completed the course. In addition classes were held at Boswell, Pa., and Glen White, W. Va.

Briefly, this course of instruction starts with a lecture on the properties of mine gases, with particular stress on sources, explosive limits of methane and air, physiological effects, etc. Then follow demonstrations in a small lamp gallery with instruments used in the detection of mine gases, such as approved types of flame safety lamps and the Burrell Methane Indicator.

The course next covers methods for the detection of carbon monoxide or the abnormal conditions found in mines after explosions and during mine fires, using the iodine pentoxide (Hoolamite) and the pyrotannic acid methods, for the quantitative determination of carbon monoxide in blood and air.

After classes have been given a thorough drilling on the instruments used in the detection of mine gases, protective measures against these gases such as are approved and recommended by the Bureau are considered. These include the value of erection of barricades during mine fires and explosions; the use of the self-rescuer and the All-Service gas mask, and finally, all types of self-contained oxygen breathing apparatus. Much time is devoted in classroom work to the proper method of constructing stoppings used in restoring ventilation after explosions and the types of stoppings used for fire seals.

In addition to the lectures and demonstrations for the detection of mine gases and the protection against these gases, classes are taught the different methods of mine air sampling, such as the vacuum tube, water displacement, and aspirating bulb methods; how to take samples from behind seals in fire areas, and, finally, the analysis of mine air.

About one full day is devoted to instructions on the surface organization plan for explosions and fires and methods of procedure for mine rescue crews. It takes approximately five full days or 35 to 40 hr. to complete the course as outlined, three days being devoted to classroom work, and the remaining two days to underground maneuvers. In the underground work the men are given a thorough drilling on how to proceed in case of fire or explosion, and the problems encountered during the progress of recovery operations.

In the outline for the course the following procedure during recovery operations after an explosion is taught:

(A) Signaling (Life Line)—Advance, 2 jerks; Retreat, 3 jerks, and Distress, 4 jerks.

(B) Instructions to apparatus crews before entering mine.

(1) Cut off electric power underground, including telephone and signal wires.

(2) Post man at fan to keep fan in operation.

(3) Establish checking in and out system.

(4) Search everyone going underground for smoking articles and matches. Make no exceptions.

(5) Examine all safety lamps going underground—Who should carry flame safety lamps.

(6) Obtain map of mine showing ventilation.

(7) Establish headquarters for rescue crews. Make smoke room test for air tightness and functioning of apparatus. If no smoke room is available crew should proceed about 50 ft. past fresh air and stop for a few minutes to ascertain safety of apparatus.

(8) Captains of rescue crews take orders only from one in authority as to work and distance of travel. Competent man should be in charge who is familiar with recovery operations.

(9) Examination and checking up of equipment to be carried, such as safety lamp, canary bird, CO detectors, "self-rescuers," chalk, writing pad and pencil, life line, wrenches, nails and screw drivers.

(C) Instructions to rescue crews after entering mine—(Exploration trips should not be undertaken under the following conditions.)

(1) In dense smoke, except with life line and then only to save life, to turn valves, or to open or shut doors essential to recovery operations.

(2) When an explosion from dangerous gas is probable.

(3) When crawling on hands and knees is necessary because of low roof, slate falls or other obstructions.

(4) When necessary to wade in water more than knee deep.

(5) In dangerously high temperature with high humidity.

(6) With less than a full crew of five men.

(7) With apparatus inadequately charged or in unsafe condition.

(8) Unless there is a reserve crew fully equipped at fresh air base except for very short trips.

(D) As soon as the fan has been placed in operation (if out of commission) a fresh air base should be established and telephone communication established to the outside.

(1) Before leaving fresh air base captain of advance crew should be sure that reserve crew is at fresh air base.

(2) Before starting exploration the captain should make sure that each member of the crew has an adequate supply of oxygen for the work which is to be done.

(3) After leaving fresh-air base, crew should proceed carefully in single file with a 6-ft. interval between members of the crew. They should examine roof and roadway, mark with chalk the direction of travel with arrows pointing to fresh-air base, mark the farthest extent of the exploration trip, carefully observe conditions and report to the man in charge upon return to the fresh-air base. All doors should be left as found and not opened any longer than necessary until trip and observations have been made.

(4) Where possible, it is always advisable to make short trips ahead of fresh air—the distance of one or two break-throughs—rather than long and dangerous explorations. Experience has shown that more can be accomplished and the work carried on safer by this method, than by trips far in advance of fresh air.

(5) With crew in proper physical condition and a reserve crew wearing apparatus at the fresh-air base, explorations in flat seams, not to exceed 1,000 ft. (2,000 ft. round trip) in irrespirable gases may be made if necessary, provided conditions are favorable. By favorable conditions are meant a nearly level, unobstructed course, height 5 ft. or more, good roof, air clear, or so nearly clear that vision of the crew is not materially obscured.

(6) For pitching seams (by pitching seam is meant any seam that dips or rises more than 1 ft. in 10 ft.) The maximum distance of 1,000 ft. recommended for flat seams should be reduced proportionally as the pitch increases. Explorations in advance of fresh air should never be undertaken on pitches in excess of 30 deg. unless there is reasonable assurance of saving life. In any event apparatus wearers should take into consideration the difficulties encountered on steep and comparatively steep pitches, such as insecure footing, falls and other obstructions, and be reasonably certain of their ability to return to fresh air unaided.

Viewpoints of Our Readers

Mr. Reynders Didn't Say Coal Mining Is Safe

On page 200 of the issue of Feb. 4, 1926, Robert Emery criticizes the remarks of J. V. W. Reynders, president of the American Institute of Mining and Metallurgical Engineers, quoted in the issue of Dec. 10, on the ground that Mr. Reynders did not prove the point that he was trying to make. Perhaps this criticism would be valid if Mr. Reynders had been attempting to make the point which Mr. Emery ascribes to him. I listened carefully to Mr. Reynders' address and also read carefully the official version of it printed in "Mining and Metallurgy," and I am sure that Mr. Emery is mistaken in supposing that Mr. Reynders was trying to prove that coal mining is a safe occupation.

Those who heard Mr. Reynders' address realized quite clearly that Mr. Reynders was referring to the extraordinary emphasis that is attached to the number of deaths that occur in coal mining from coal mine explosions. Mr. Reynders made a comparison between coal mine fatalities and traffic fatalities, but he might equally well have used the number of people who were overcome by carbon monoxide poisoning resulting from the use of illuminating gas. In a city of half a million population there were twenty-six deaths from accidental poisoning due to illuminating gas in the past year.

Another way of putting it would be that the general public gives the coal mining industry no credit for the large amount of intelligent and well directed work it has done towards trying to decrease the loss of life in connection with the mining of coal. As a matter of fact, coal is produced in this country not only with the least human suffering per million tons produced of any country in the world, but also with the least amount of human effort.

The inaccurate thinking that most people do in this regard is illustrated by Mr. Emery's use of the fatality rate for the men engaged in coal mining, applying it against the total population of one hundred and ten million. It must be evident that a considerable percentage of the whole one hundred and ten million are small children and old people who are relatively free from exposure to accident hazards. The last census of occupations indicates that only about 40 per cent of the total population of the United States are "gainfully employed."

Even if comparisons are restricted to persons engaged in industry, it it rather absurd to attempt to prove that coal mining is as safe as any other form of occupation, because a moment's reflection will reveal that it is not. A good example is the difference between the occupations of picking strawberries and picking cherries. It is perfectly obvious that a strawberry picker can not possibly fall and hurt himself, whereas a cherry picker (who has to climb a tree) has a good deal of hazard of such an accident. The relative safety of strawberry picking and the relative danger of cherry picking has nothing whatever to do with the persons engaged in those industries, because the hazards are not of their making but are inherent in the occupation itself.

About half of the deaths in coal mining result from falls of roof and coal. Coal can not be broken down and brought to the surface without its falling. The workers engaged in taking it out try not to be under it when it falls but they do not always succeed and accidents result. To attempt to prove that coal mining, where the worker is always dealing with falling material, has as little inherent hazard to the worker as occupations where no falling material is dealt with is an absurdity which I am sure Mr. Reynders would not attempt.

I am glad, however, to be able to agree with Mr. Emery as to the utterly unnecessary hazard incurred by the use of open lights in coal mines. Every effort should be made to prevent gas and explosive dust from accumulating in coal mines, but when accidental accumulations occur they are still powerless to do harm unless a flame or a spark sets them off. If there were any real necessity for the continued use of open lights in coal mines there might be some excuse, however slight, for incurring the hazard of an explosion, but under modern conditions there is no valid reason for the continued use of open light, and any operator who permits an open flame to be used in a bituminous coal mine is incurring a hazard not only to the life of his workers but also of property damage that is entirely unwarranted.

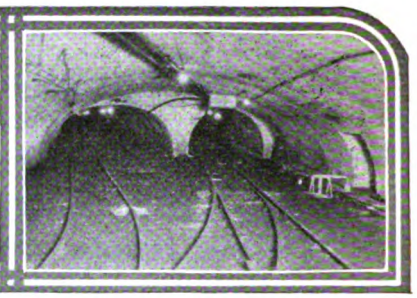
Even when great care is taken to operate a coal mine safely accidents will sometimes occur, as in the case of the Orient No. 2, where a man who knew he was in the presence of explosive gas, and presumably knew the chance he was taking took his safety lamp apart and tried to light it with a match. If all bituminous coal mines were rock dusted, as this one was, large numbers of lives would be saved, as in that instance. It is to be hoped that some time in the near future someone will invent a reliable methane indicator that is convenient to use and will permit the keeping of all flames of every character out of bituminous mines, through doing away with the "safety" lamp.

THOMAS T. READ,
Director of Safety Service,
U. S. Bureau of Mines
Washington, D. C.

Bad Light Causes Loss of 108,000 Years

I have just noted on page 724 of the Nov. 26 issue of *Coal Age* an editorial referring to light and safety. In this editorial I am quoted as being responsible for the statement that 108,000 serious accidents yearly are the result of inadequate illumination.

I am afraid the writer of the editorial has confused some of my statements. You will recall the so-called heatless Mondays during the war, and how every effort was made to conserve our coal supply. Among other things was a demand for the curtailment of illumination generally.



I made an investigation at the time and found that inadequate illumination caused about 18 per cent of our industrial accidents, and the time lost due to these accidents was equivalent to an army of 108,000 men remaining idle for a whole year. The actual number of accidents, however, greatly exceeds 108,000.

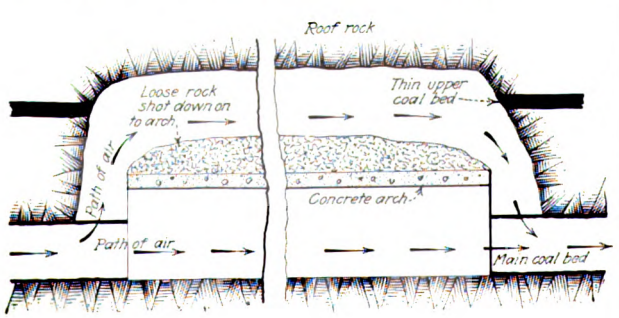
Underground Operation



Builds Arch to Ventilate High Roof Fall

In many mines the roof has an extremely inconvenient way of caving, sometimes to great heights. This tendency is aggravated greatly if any slips or horsebacks are present in the roof strata. Whenever such caves reach upward to any overlying coal beds, there is the additional danger of outbursts of gas in the caved area. These must be guarded against, if possible.

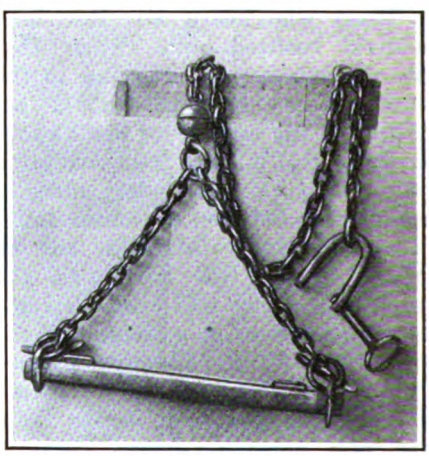
In the coalfields of eastern Kentucky such conditions as have been outlined are frequently encountered, and it becomes necessary to forestall by all means possible the accumulation of dangerous quantities of gas near the roof. In one mine in that region roof falls were so heavy locally and the quality of the roof strata was so uncertain that it became necessary to build a heavy concrete arch over one of the main headings for a distance of several hundred feet. This was put in section by section each segment being about 20 ft. long. After each section was completed and had time to set the roof was shot down in small pieces to form a kind of cushion above the arch to receive the impact of future falls should any occur.

Natural caving together with the shooting of the roof as just mentioned carries the fall up through a small coal bed located several feet above the main seam. In order to guard effectively against the possibility of the emission of gas from this upper bed to form a dangerous mixture with the mine air it has been decided that the passage above the arch must be ventilated as well as that below it. To this end a split of air will be taken off the current carried in the haulway. This will be circulated above the arch and returned to the main current after sweeping the roof above the fall and the material overlying the arch which in effect is really a gob area.

How this is to be accomplished may be seen in the accompanying sketch. If sufficient air will not traverse the fall as a simple shunt from the main current, it will be an easy matter to install, in the roadway below the concrete arch, a light curtain or half curtain near the forward end of the fall and thus force the air to take this course. In any case ventilating the top of the fall will sweep out any gas that might otherwise accumulate there and thus render it harmless.

Air Has Full Sweep

Leaving an opening between the end of the arch and the roof permits the air current to clear the space above which is practically a gob area. Any gas coming from the roof or upper coal bed is thus effectively diluted and carried away.

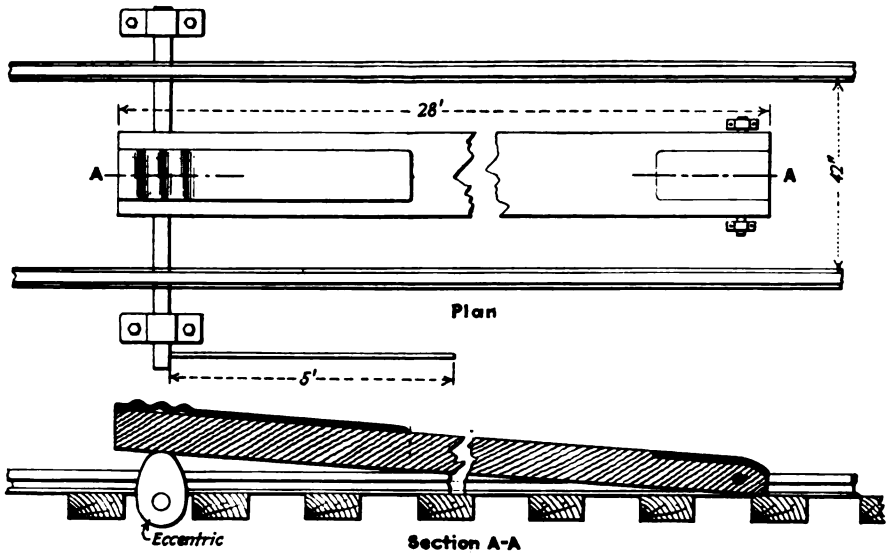


Insulated Draft Chain Protects Mules

Although gathering locomotives have been widely adopted during recent years there are places in almost every mine that can be more economically served by mules than by these machines. It is probable, therefore, that mechanical or electrical haulage will never entirely supplant the "Missouri straw burner" in American coal operations.

Using mules in electrified mines should entail protecting them from shock that they may receive by way of the draft chain. The accompanying illustration shows a spreader and insulated draft chain or a tail chain and butt stick. In this outfit the mule is protected from shock reaching him from the cars by a strain insulator that is welded into and forms a part of the draft chain.

The draft chain proper is made of ⅜-in. iron and is 5 ft. long from clevis pin to insulator. Into the opposite eye of the insulator is welded a ring of ½-in. iron 2¾ in. in diameter. From this ring extend two ⅜-in. chains 21 in. long that terminate in toggles or tees 5½ in. long made of ⅜-in. iron which hitch to the butt stick or spreader.



The butt stick is of hickory 26 in. long. Upon either end are 2-in. ferrules made from 1½-in. pipe. Embracing each of these ferrules and riveted to them is a link into which the tugs or trace chains are hooked. On their opposite ends these links each carry a ½-in. iron ring 2¾ in. in diameter for the reception of the toggles already mentioned. A short distance from the end ferrules the spreader is provided at each end with a brass staple ⅜ in. high and 2¼ in. long in the clear through which suspension straps from the rump spider pass. This device performs a double safety function of much importance. It provides a wooden buttstick that

Hickory Spreader and Insulated Chain

A wooden spreader will not gall a mule as will one made of steel. Furthermore the strain insulator that is welded into and forms a part of the draft chain effectively protects the mule from shock coming from the car or cars hauled.

Digitized by Google

This Device Stops Cars at Head of Slope

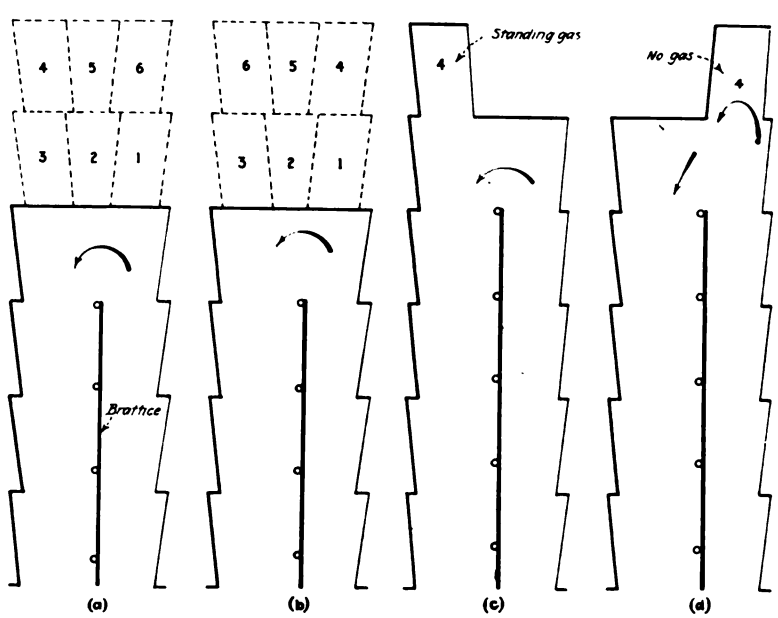
At the Frontier, or No. 1 Mine, of the Kemmerer Coal Co., in Wyoming, the cars, after being raised up a slope, have to be dropped back to the tipple, the seam of coal inconveniently outcropping in the hillside and dipping at a steeper angle than the slope of the hill. In order to prevent the cars from running loose before being coupled to the rope, an axle scrubber or rubber is placed between the tracks which can be raised or lowered at one end by the action of an eccentric. As the scrubber sometimes failed to achieve its purpose and let the cars go by, the steel rubbing surface was corrugated at the high end and this was found absolutely efficacious in all cases.

will not gall or irritate the mule's legs, and as the chain is insulated it obviates all danger of shock from the cars.

Curtains Versus Doors in Mine Ventilation

The mine door is an ancient institution. It has been employed in the control of mine ventilation for many generations and consequently has behind it as justification for its use the experience of centuries. Nevertheless, this time-honored device has, and always has had, the shortcoming that it may sometimes be left open. Under such circumstances it becomes inoperative and the air that it is supposed to control may be short circuited with disastrous results. Much trouble, danger and even loss of life has been traced to this cause.

Another device for controlling air currents within the mine, one which cannot be left open but which is usually considered as being too light to be depended upon implicitly, is the curtain. An added objection to the curtain as ordinarily constructed is the fact that it may leak air especially along its lower edge. Furthermore, it is subject to rapid wear inasmuch as it comes in contact with and drags over trips as they pass through it.



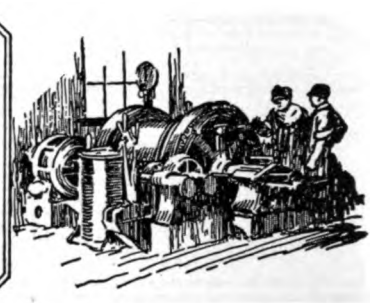
Obviously wear upon a curtain cannot be eliminated. Leakage of air either along the bottom or sides may be stopped by making the curtain large enough to somewhat more than fill the opening in which it is hung. Lightness such as would let it yield to the force of the current and thus leak air can be overcome by adding thickness on thickness until the weight necessary to hold it in place against the air pressure is attained.

Building up curtains in this manner thus surmounts all of the objections that have heretofore retarded their adoption except one. And while this one difficulty—rapid wear—is rather increased than decreased by the additional weight, the advantage obtained may far outweigh it. Thus wear on a laminated curtain is confined almost exclusively to the outer thickness of canvas upon either side. Only these outer sheets require frequent renewal.

On the other hand as it is impossible to leave curtains open, their use assures that the air will at all times be properly coursed and that there is no possibility of the ventilation current being short circuited. Dangerous accumulations of gas are thus obviated.

Ventilation with Mechanical Entry Drivers

With entry drivers that remove the coal at the face in a series of lifts such as are shown in the drawing as 1, 2 and 3, also 4, 5 and 6, the order of operation of the machine has great importance. The natural tendency is to cut section 1, follow by section 2 and 3 and then, without moving the machine sideways, to cut a section 4, as in (a). However, if the entry generates gas it is better to move the machine over and cut section 4 back of section 1 as shown in (b) and the reason for this can be seen in (c) and (d). In (c) sections 1-4 have been cut but section 4 is a pocket into which the air cannot be directed. In (d), sections of the same numbers have been cut, but as section 4 is close to the ventilating brattice cloth the air can be directed into it thus driving out the gas. When sections 5 and 6 are started in turn the same draft of air keeps them free of gas and ready for safe operation.



Way to Ventilate for Machines that Cut Entries by Sections

(a) Sequence that reduces machine moves; (b) Sequence that gives best ventilation conditions; (c) Condition when mining section 4 in sequence (a), and (d) Condition when mining same section in sequence (b).

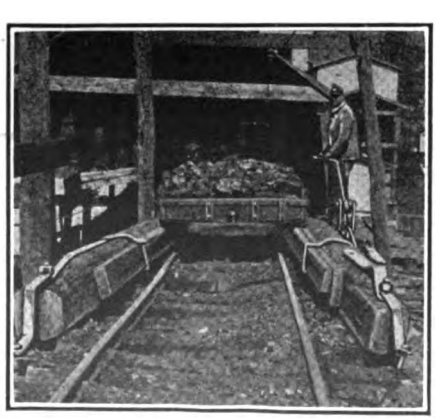
Practical Pointers For Electrical And Mechanical Men



"Squeezer" Made of Planks Does Sprag Duty Reducing Wear and Danger

Of the various ways of retarding mine cars as they approach the dump, the "squeezer" method is one that is little used yet has certain marked advantages over spragging, which is so common at mines not equipped with positive car hauls or retarders. Spragging is not a safe practice. It requires considerable physical labor, and does not afford the certainty and nicety of control that is desirable.

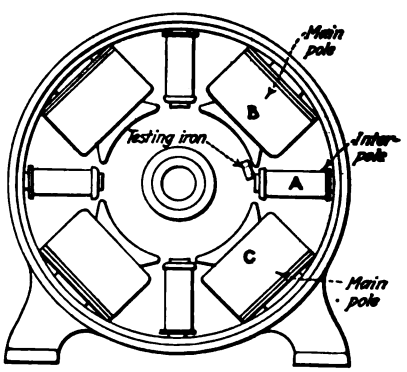
The car squeezer used by the Gatliff Coal Co., at Gatliff, Ky., is shown in the accompanying illustration. Essentially, the device consists of two heavy timbers which parallel the track and rub against the hub caps of the car wheels. At the end where the cars enter, the timbers are spaced a distance slightly more than the car width, and are pivoted so that the opposite ends can be moved in and out to squeeze or release the car.

The timbers are lined with renewable wearing strips of 2x6-in. oak. Movement of the timbers for squeezing the cars is effected by pushing down on a long lever mounted beside the track. Control of the cars is positive, is accomplished with little physical effort, and with no danger to the operative.

Car Squeezer at Gatliff

Forward movement of the loaded trip, which descends by gravity from the mine yard to the tipple, is controlled by the squeezer. The man at the right is holding the operating lever. Braking is effected by pinching the renewable wearing strips of the two heavy timbers against the wheel hubs.

Possible objections to the method are wear on the hub caps and strain on the axle and its mountings. Experience at Gatliff, however, is that the wear on hubs is very slight and that only a very weak car can be damaged by the squeezer.



Safe Practice in Connecting Interpoles of Motors

Interpole motors have been in use for a number of years and most maintenance men understand what the interpole is for but some are very much puzzled about the polarity of the interpole in relation to the direction in which the armature rotates. The proper polarity of the interpole and the rotation of the armature in relation to the interpole can be found in the following manner:

In assembling a compound interpole motor, put the field coils in place and connect them in the proper manner so that adjacent poles have opposite polarity, then connect the interpole coils in like manner. After this has been done, connect two adjacent brush holders or brush holder supports together. This is to complete the series and interpole circuit. Next make the connections outside the frame, as for series operation.

Now connect, in series with this circuit, a resistance that will give a fairly strong field in the interpoles and also in the main poles. Next take a short piece of soft steel and try for polarity of interpoles in relation to the main poles and the rotation of the armature, as shown in the accompanying sketch.

Hold the piece of soft steel in front of *A* and *B*, then in front of *A* and *C*. If there is more attraction between *A* and *B* than there is between *A* and *C* then the armature must rotate from *A* to *B*. Mark this on the field frame and put the armature in place and try out as a series motor. If the armature revolves in the opposite direction from that indicated by the test, interchange the lead on the brush holder studs or

Determining Proper Polarity

The direction of rotation will become evident by the use of the piece of soft steel. If there is greater attraction between *A* and *B* than between *A* and *C*, the armature must rotate from *A* to *B*.

supports from the outside of the field frame to the brush holder and the one from the interpole to the brush holder. This will give the proper rotation in relation to the interpole. Next connect the shunt field to correspond to this rotation.

Rimersburg, Pa. J. A. SHAW.

Tractor Dewaters Strip Pit

Stripping coal frequently involves problems in drainage. The accompanying illustration shows how the Hawley-McIssac Coal Co., operating mines at Nebo and Centertown, Ky., dewaters its surface pits. This company some time ago purchased a tractor for each of these mines. Both were fitted with caterpillars.

Above the gas tank of each machine was mounted a centrifugal pump, weighing 450 lb. and capable of handling 500 gal. of water per minute. These pumps are chain driven from the main power shaft. The tractors are driven into the strip pit proceeding out into the water sometimes to hub depth. The pump is here connected and the machine started in operation.

In this condition these machines operate over long periods of time,

Digitized by Google

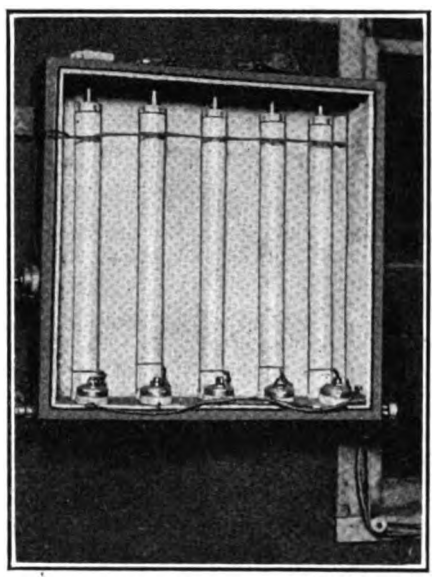
practically without any attention except periodic inspection, refueling, and replenishment of lubricant. Although this type of work is hard on the machines they have withstood it well. The unit at the Centertown mine is now over 18 months old, and

On the Job in a Strip Mine

This shows one of the tractors in the strip pit and gives a good idea of the conditions under which the machine must operate. In this instance, however, the tractor is merely standing idle, neither the suction nor discharge lines being connected. The photograph, nevertheless, gives a good idea of the exacting service to which this machine is put.

has required no replacement of parts. The one at Nebo is only about 8 months old, but has withstood successfully severe daily service.

Starting Batteries Need Special Attention



Quick and certain starting of most gasoline engines which are used for mine fan standby service depends upon a small storage battery. This battery in turn depends upon operation of the engine for charging current, as does the battery of an automobile.

As a rule, however, a standby unit is not operated enough to keep the battery charged. It may be the practice to start the engine once a day or once a week in order to make certain that it is in working condition, but it would be an expensive proposition to operate it long enough each time to maintain a proper state of charge in the battery.

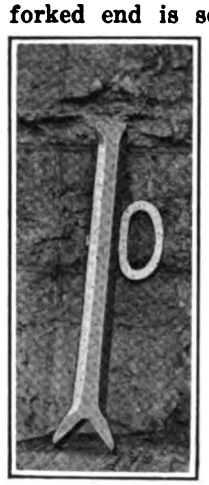
It is important, therefore, to provide a convenient means of charging the battery from an outside power source. Where low-voltage alternating current is available, a rectifier will suffice. Where the direct-current mine circuit is available, charging may be done through suitable resistance units.

An example of the latter method is illustrated in the accompanying photograph of the resistance units which are used to charge the battery of the standby fan engine at the Dehue (W. Va.) mine of the Youngstown Sheet & Tube Co. Five 275-ohm resistors in parallel are connected in series with the battery across the 275-volt line. This allows a maximum charging current of approximately 5 amp.

Referring again to generalities, it is not enough to arrange for convenient charging. In addition, some regular schedule of testing the gravity and of charging when necessary should be followed. Only in this way will there be a certainty that the battery will always be charged ready for use.

Starting Assurance for Fan Engine

This group of resistors is mounted on the wall beside a 127-hp. 1,200-r.p.m. gasoline engine which is a standby for fan drive. The engine-starting battery can be placed on charge from the direct-current mine circuit by closing a snap switch.



Rerailing Jack Saves Fingers of Its Users

Derailments are all too common accidents in most coal mines. In fact there is scarcely a mine of any size but what has one or more cars off the track every day. Getting such cars back on the rails is sometimes a hard job, especially if the headroom is scant.

One favorite method of rerailing a car is by the use of a fishplate or splice bar. This is used as a prop or slanting jack onto which the car is pushed by the locomotive. One end of the fishplate is placed against the bumper or drawbar and the other against a tie in such a way that the force of the motor will lift and slew the car into place. When so used, splice bars have an unfortunate way of slipping with the result that the fingers of the hand holding the bar are liable to suffer. In fact many fingers have been entirely lost to their rightful owners in this manner.

In order to overcome this difficulty and render the replacement of cars on the track a fairly safe operation the rerailing jack shown in the accompanying illustration has been devised and is being used at the Lynch (Ky.) mines of the U. S. Coal & Coke Co. This consists of a 1¼-in. steel bar, 18½ in. long over all, provided on the side with a suitable handhold. At one end this bar is split, the two halves being flared out to form a crotch that will fit over and firmly grip a tie. The other end is slightly upset, two grooves being forged into it at right angles to each other so as to make it easy to grip the bumper or drawbar of a car, without danger of slippage. The surface of this end is also nicked transversely with a chisel to give the effect of knurling, and assure a firmer grip.

In use this jack is handled exactly the same as the splice bar. The forked end is set firmly astride a track tie and the opposite end against the bumper or drawbar of the derailed car. The jack is given an inclination sidewise that will slew the car toward the track. When the locomotive pushes the car against it when so set the car is lifted and at the same time pushed sidewise against and upon the rails. Only one hand is required to place and hold the jack and even it is protected largely by the handhold. As soon as the jack is held between the car and tie the hand is withdrawn.

Finger-Saver

This little forging is carried on every locomotive in the Lynch mines of the U. S. Coal & Coke Co. It is vastly more efficient and safer in use than a fishplate or splicebar when used as a rerailer. A car slipping on a splicebar while being pushed to place by a locomotive had a great way of snipping off fingers. This jack gets a good hold on both car and tie and no fingers have been lost since its adoption.

News Of the Industry

Victory of Public in Coal Strike Causes Chagrin to Some Senators Who Voted for Copeland Resolution

By Paul Wooton
Washington Correspondent of *Coal Age*

The prevailing impression in congressional and administration circles is that the public won the coal strike. It is a matter of no little chagrin to some of the Senators who voted for the Copeland resolution that they should have aided in an act calculated to snatch victory away from the public just three days before settlement was reached within the industry itself.

It is apparent to the legislators that the public has learned what to do in the event of a future strike. It has had a practical demonstration that self-protection is a much more effective defense than is political intervention. It has learned a lesson in self-reliance and, as a result, is imbued with a new-born confidence. The net result probably will be that this is the last great anthracite strike in which the present generation of miners will participate.

As to the belligerents themselves, the victory lies clearly with the operators, in that they stopped every offensive launched by the mine workers. The miners had become so accustomed to the squeezing of some concession out of every new wage contract that they are surprised and dazed that they did not get some substantial advantage out of this one. After expending all their strength throughout a five and one-half months' strike and after having brought to bear all of the political influence they possess they got nothing.

The old scale is continued provisionally for five years but the machinery for making the changes provided in the agreement is nothing more than an elaboration of the present method of negotiating by consent. Only on paper is it arbitration.

This conclusion is borne out by an analysis of the steps to be taken if the wage scale is to be changed. Every year either party is free to propose a change, to be considered at a joint conference in the familiar way. If the joint conference deadlocks, both sides promise that the differences are to be referred to a board. Both sides are pledged to abide by the decision. This sounds like arbitration, but the method of appointing the board is the joker in the agreement. One of the members is to be selected from a panel of three named by the miners. The other member is to be selected from a panel of three named by the operators.

The two members may select a third, but, in effect, only with the consent of their respective principals. If, therefore, the board of two deadlocks, neither representative is likely to consent to the election of a third member, who would cast the deciding vote. This probably means that no agreement will be reached during the life of the contract that would either lower or raise wages. The chances all are that the existing wage scale is pegged for five years.

As to the check-off feature mentioned by the Secretary of Labor in his announcement of the settlement, one fails to find it in the text of the agreement. The agreement does say that the question of co-operation and efficiency, which, of course, might include the check-off, is to be referred to the Board of Conciliation. This is another polite way of providing for no action. The board can function only by unanimous consent. An important feature of the agreement is its face-saving element. Concessions of a phraseological character are made to both operators and miners without change in fact.

Strike Costly to Both Sides

While there may be no change in the actual relationships of the two sides, there certainly has been a change of attitude. Each party to this dispute apparently realizes that the strike has established the precedent that the participants themselves must settle their own quarrels. Each side has been reminded again of the hopelessness of bringing about changes by force. Each side has been penalized heavily. As in wars between nations, the cost has proved to be the most forceful deterrent. It will require the sweat of years, figuratively and literally, to meet the financial aftermath.

Three figures stand out with particular prominence in having made it possible to prevent a political settlement of this economic dispute. It was Secretary Hoover who determined the administration's policy. It was the President who took the political responsibility and who adhered courageously to the hands-off policy, even in the face of a Senate resolution. It was John Hays Hammond who suggested and launched the highly successful campaign for the use of substitutes.

Kentucky Power and Mining Companies in Merger

Merger of seven large mining operations at Nortonville, Ky., with Monro B. Lanier, of the Monro-Warrior Coal & Coke Co., Birmingham, Ala., as president of the new corporation, the Norton Coal Mining Co., was announced late last week. The companies included in the merger, all of which are located near Nortonville, are the Norton Coal Co., Sunlight Collieries Co., Illsley Mining Co., Sunlight Mining Co., Magic Collieries Co., Empire Coal Mining Co. and Western Collieries Co.

It is stated that the combined companies have 10,065 acres of land, 6,200 acres of which is owned outright and the balance controlled under leases, with developed mines having a capacity of 1,000,000 tons annually, about one-half of which is obtained from stripping operations. The Norton Coal Mining Co. is expending some $700,000 in major improvements at its properties, including among other things a large electrically operated shovel for its stripping operations at Illsley.

The Kentucky Electric Power Corporation has been organized by the same interests and has taken over the power plant of the Norton Coal Co. and contract has been made with the J. G. White Engineering Corporation, of New York for major additions to the plant, which will supply power for all the mining operations and for general industrial and domestic use in the section where located. A holding company has been formed for both the mining and power properties known as the Kentucky Consolidated Power & Utilities Co., the controlling interest in which is held by the Monro-Warrior Coal & Coke Co., Birmingham, which will act as general sales agent for the output of the mines, with branch offices in Nortonville, Ky., and Chicago, Ill. The Norton Coal Mining Co. has issued $1,000,000 in bonds and the power company $1,500,000, funding all indebtedness.

Officers of the Norton Coal Mining Co. are Monro B. Lanier, president; Sterling S. Lanier, Jr., Nortonville, Ky., first vice-president and general manager; R. L. Schlotman, Nortonville, secretary; John T. Edmunds, Hopkinsville, treasurer; H. B. Robinson, Birmingham, assistant treasurer; T. F. Ellard, Birmingham, assistant secretary; R. D. Lanier, Birmingham, vice-president in charge of sales; J. G. Gaither, Hopkinsville, vice-president. Monro B. Lanier also is chairman of the board of the Kentucky Electric Power Corporation. The Monro-Warrior Coal & Coke Co. has extensive mining operations at Nauvoo, Walker County, Ala.

Committee Votes Against Confirming Woodlock

Efforts of President Coolidge to have the Senate confirm his recess appointment of Thomas F. Woodlock, of New York, as a member of the Interstate Commerce Commission, received another and unexpected setback Feb. 19 when the Senate Interstate Commerce Committee voted unfavorably, 7 to 6. An unofficial poll some time ago had shown a margin of one for a favorable report. The nomination now goes back to the Senate, which failed to act upon it when it was first presented at the last session of Congress.

When Mr. Woodlock's nomination first was presented to the Senate a year ago there was sharp opposition from Senators from the South who wanted their section represented on the commission. When the nomination was returned to the Senate at this session it was accompanied by that of Richard V. Taylor, of Alabama, who was appointed to succeed C. C. McChord, resigned. Hearings were held on both nominations and that of Mr. Taylor was promptly confirmed.

Mr. Woodlock was called before the committee and questioned during parts of several days, with Senator Wheeler, Democrat, of Montana, leading the cross-examination largely on the basis of Mr. Woodlock's writings on economic and railroad subjects.

Commonwealth Fuel Co. Sold For $3,000,000

With the purchase of the stock of the Commonwealth Fuel Co., of Brooklyn, by Gardiner Pattison, of Pattison & Bowns, of New York, as agent, representatives of well-known families who have been in the coal business in Brooklyn for more than half a century pass out of the retail trade.

Announcement of the purchase of the stock was made last week by Baldwin, Hutchins & Todd, attorneys, of New York, representing the Commonwealth Fuel Co., who stated that the Board of Directors had accepted the offer of Mr. Pattison and that the Brooklyn Trust Co. as transfer agent will soon begin the distribution of the purchase price, said to be in the neighborhood of $3,000,000, to stockholders of record.

It was reported that the purchase of the Commonwealth company was made in the interests of Rubel Brothers, who control 28 coal and ice plants in Brooklyn and Queens. With the acquisition of the Commonwealth Fuel Co.'s 11 plants, the new concern will control and operate 39 plants in the two boroughs.

Richard Wulff, president of the Commonwealth Fuel Co., will continue to occupy that position under the new concern, the Commonwealth company retaining its old name, at least for the present.

Those who will retire as directors of the Commonwealth Fuel Co. are Frank Day Tuttle, Winthrop M. Tuttle, Rudolph Reimer, Richard Wulff, Walter H. Nelson, J. J. Rathjen, W. R. Taylor, W. T. Benedict and Hiram Todd.

The Tuttle family previous to forming of the Commonwealth Fuel Co. were retail coal dealers for many years. The family name of Reimer has been identified with the retail coal business since 1875 and the Taylor family since 1850. Mr. Rathjen also has been in the coal business for many years.

Reject Glace Bay Pact Without Check-Off

Caledonia local of district 26, United Mine Workers, one of the strongest in the Glace Bay (N. S.) sub-district, at a largely attended meeting Feb. 16, unanimously rejected the two-year wage agreement with the British Empire Steel Corporation. The resolution of rejection was in line with the recommendation of the district officers, saying in part: "That the local union goes on record as being unanimous against any contract which does not carry with it the union check-off."

Caledonia local is the first of the score or more locals of the district to consider the proposed agreement, and, according to District President J. W. McLeod, it received short shrift. Mr. McLeod stated that the executives are preparing a statement for immediate issuance to the locals, in which the officers will advise the membership not to accept the agreement unless the check-off is granted.

Resume Work at Euclid Mine

The Pittsburgh Coal Co. started work Feb. 23 at Euclid Mine, four miles from West Newton, Pa., this being the eighth mine of the company in the Pittsburgh district to resume operations on the 1917 scale. Fifty-seven men went to work at Euclid mine, making a total of more than 1,700 men working for the company in the district at the 1917 scale.

Wrecked Tipple at Powhatan Mine

One miner was killed and nineteen were injured—one perhaps fatally—in an explosion Feb. 15 at the Powhatan Mine of the Powhatan Mining Co., 16 miles south of Bellaire, Ohio. Six hundred other miners escaped from the mine without injury.

John A. Bell Properties Sold at Auction

John A. Bell, bankrupt coal operator and banker of Carnegie, Pa., who is under sentence for embezzlement, was shorn of his coal property and realty in the lobby of the City-County Building, Pittsburgh, on Feb. 17, as the auctioneer's gavel banged down on bids for heavily-mortgaged lands.

The sale brought forth bids involving land valued at auction at approximately $275,000, but only about $16,000 changed hands. Mortgages on the properties amounting to $241,500 were assumed by the purchasers.

Outstanding in the sale was the auction of the "Potato Garden Run" tract in Findley township, near Imperial, consisting of 562 acres of Pittsburgh coal and 1,114 acres of surface land. Laden with mortgages of $238,000, the land was knocked down for $150 and taxes to A. D. Robb, representing the Colonial Trust Co., which already holds a $175,000 mortgage on the land.

A bid of $50 and taxes took 45 acres of coal land in West Deer township, which is burdened with a $3,500 mortgage. The successful bidder was C. C. McDermott, of McKees Rocks.

A tract of 197,434 acres in Smith township, Washington County, was purchased by the Hanover Coal Co. for $2,700. Coal and surface was included at this low price. John A. Bell bought this land in 1917.

A tract of 167 acres of coal land in Mt. Pleasant township, Washington County, was purchased by Finkel Brothers, of Washington, for $100. They also bought another tract, which contained about 137 acres, for $2,000.

Other tracts involving small acreages were sold for a few hundred dollars each.

The Carnegie Coal Co., which was one of John A. Bell's holdings, is worth $15,348,240, according to the report of the appraisers, John M. Rayburn and James Donaldson, filed in federal court in Pittsburgh. The appraisers were named after suit had been filed to recover on a $10,000 note by the Harrison National Bank. W. N. Wilshire and C. C. McGregor, receivers, asked for the appointments.

Active and unassigned land is valued at $13,553,250 and railroads, office equipment and docks are valued at $1,794,990, the report shows. The company has a capacity of 2,900,000 tons a year, with a recoverable tonnage of 48,000,000 from the remaining active land, the appraisers reported. There is a recoverable tonnage of 142,000,000 from the unassigned lands, the appraisers stated.

Kills Alberta Union Organizer

Jack Nolan, 35, organizer for the United Mine Workers at Drumheller, Alta., and former boxer, was shot to death Feb. 20 by Constable McKeen, who had arrested him on an assault warrant. Constable McKeen, who is held pending an inquest, said that after he had warned Nolan to desist the latter had made threatening remarks in an argument over bail. The shooting followed.

D. L. Wing Dead; Was Noted As an Economist

David L. Wing, widely known as an economist, who had specialized in coal for many years, died in Washington Feb. 16, a victim of pneumonia.

Most of Mr. Wing's career had been spent in the government service. Since 1923 he had been engaged in consulting practice, an ambition which he long was prevented from realizing due to the fact that he was drafted by the government to perform first one task and then another.

His first service with the government was in the Census Bureau. Later he was a member of the staff of the Bureau of Corporations. He served with the economic staff of the Federal Trade Commission from 1915 to 1920. He was retained by the Calder commission during its probe of coal. In 1921 he served as a coal specialist with the President's Unemployment Conference. In 1923 he was retained by the Harding Coal Commission to conduct an important part of its work.

During the early days of the Lever act Mr. Wing had to take the real responsibility for fixing coal prices. This was a great responsibility and one which was particularly distasteful to him. He was careful and methodical and never lost an opportunity to point out the inadequacy of the data on which to base conclusions as to coal prices and of the impossibility prescribing a scale of prices that would do justice to all fields.

It is no secret that some of the members of the war-time Federal Trade Commission played politics. Through this period Mr. Wing stood like a rock, insisting that the price determination be made on a basis of fact with adequate margins above cost.

The coal producers probably never have known how much Mr. Wing's courage and integrity saved them by frustrating irresponsible members of the Commission who sought to make political capital out of the disordered market.

Throughout his career Mr. Wing insisted on the necessity for actual data as a basis for opinion or administrative policy. He was a stickler for accuracy, for honest attention to detail and never sacrificed accuracy for interest. If his passion for accuracy at some times led him into a mass of detail it was because of his unwillingness to act without an adequate basis of knowledge.

The seven-volume report on costs which Mr. Wing prepared for the Federal Trade Commission and his equally elaborate studies of cost, investment and profit for the Harding Coal Commission are conceded to be monumental pieces of work. They are the industry's best answer to charges of profiteering. From a scientific standpoint these are the most comprehensive studies of production costs that ever have been made in any American industry.

Mr. Wing was born in Valparaiso, Chile, Dec. 20, 1874. He was graduated from the Massachusetts Institute of Technology in 1898 and later took post-graduate work at Columbia University.

Mr. Wing is survived by his widow, a son and a daughter.

The Late David L. Wing

Big Muddy Dredging Project To Get Further Study

The U. S. Government has not closed the books on the proposed canalization of the Big Muddy River as a coal transportation outlet for that section of southern Illinois to the Mississippi River. In a letter to Congressman E. E. Denison, of Marion, Ill., Maj. Gen. H. Taylor, chief of the engineers for the War Department, has assured a more extended consideration of the project.

"The board considered certain aspects had not been fully covered, and at its recommendation the report was returned to the district engineer for further study."

In a communication to the board of engineers Congressman Denison suggested that Illinois might pay part of the canal project's cost. Major General Taylor expresses keen interest in this suggestion.

The district engineer's report was unfavorable to the project principally on the basis that the government should first develop the main water arteries before undertaking work on streams entirely within the confines of one state.

Motion Picture to Portray Rock-Dusting

A two-reel moving picture captioned "The Story of Rock-Dusting," which is to be made and distributed by the U. S. Bureau of Mines, will graphically portray the manner in which this safety method saved 1,055 miners in an explosion Jan. 29 in the New Orient mine of the Chicago, Wilmington & Franklin Coal Co., at West Frankfort, Ill. The film will be financed by the Illinois company, according to word received by Scott Turner, Director of the U. S. Mines Bureau, from George B. Harrington, president of the company.

Dust Code Wins A. E. S. C. Vote; Other Plans Afoot

Standard practice for rock-dusting mines has been recommended to the industry by the American Engineering Standards Committee. The safety code for rock-dusting sponsored by the American Institute of Mining and Metallurgical Engineers has been adopted by a mail vote of 42 affirmative, 1 negative and 1 not voting. The vote by which the proposed mine ventilating code was rejected, as reported previously in *Coal Age*, was 19 to 9. As only 15 votes were necessary to prevent approval, the code was referred to the sponsors for reconsideration by the sectional committee.

The American Mining Congress and the National Safety Council were voted, in the Nov. 11, 1925, conference of the Mine Correlating Committee, joint sponsors for the code, "Fire Fighting Equipment in Metal Mines." Later it developed that the National Fire Protection Association wished a joint sponsorship in this code, and on Jan. 4 the National Safety Council agreed to withdraw in its favor. A letter ballot will be circulated on the advisability of this change.

In regard to the sectional committee on underground transportation, the American Mining Congress has submitted the following recommendation: That the Congress be given 4 votes; manufacturers of special trackwork material, 3 votes; the American Institute of Mining and Metallurgical Engineers, the Electric Power Club, the U. S. Bureau of Mines, consulting engineers, manufacturers of cars and wheels be each given 2 votes, and the American Railway Engineers Association, the American Society of Civil Engineers and the American Electric Railway Association, 1 vote each.

Consideration Deferred

It has been suggested that the standardization of metal-mine projects be submitted to a separate correlating committee to consist of metal-mine societies and groups. This suggestion will be considered later.

Dr. Lucian W. Chaney, of the Bureau of Labor Statistics, has been appointed the second member of that bureau on the Mine Correlating Committee. G. H. Clevinger will submit a report on standardization of screen sizing tests to his committee and advise the Correlating Committee. The Coal Mining Institute of America will submit a "Classification of Coal Standards" proposed by G. H. Ashley to the Correlating Committee.

O. P. Hood, of the U. S. Bureau of Mines, is preparing a standard code for coal-mine illumination. One on electrical equipment in coal mines which has been prepared is being circulated to the committee to consider this subject.

Secretary Hoover has reached no conclusion as to the merits or demerits of retail price fixing. He points out that business men and economists differ widely on the subject, as do the specialists in his own department.

Local Strikes Reflect Return to Normalcy in Hard-Coal Fields; See Trouble in Interpreting Pact

Anthracite mining was officially resumed on Feb. 18.

The preliminary formalities to the termination of the longest strike in the history of the hard-coal industry were disposed of without a hitch. The terms of the agreement signed at Philadelphia on Lincoln's birthday were approved by the tri-district convention of the mine workers at Scranton on Feb. 16 by a vote of 698 to 2. The following afternoon the same men who had affixed their signatures to the Philadelphia contract assembled in the office of Major W. W. Inglis, chairman of the anthracite operators' negotiating committee, and signed the formal peace pact.

On the surface all is again serene. Men are trooping back to work, general business in the region is recovering from its long slump and coal once more is moving to the anthracite coal-consuming territory. Normal volume, however, has not yet been reached. Although there were many men who were called back to put the mines into shape prior to last Thursday, there still remains considerable work to be done in some operations. Moreover, many men who deserted the region in the early weeks of the strike have not returned. As if to give patent to the return to "normal conditions," local strikes already have made their reappearance.

The element of danger underlying the surface harmony, as some observers see it, lies in the possibilities of conflict. in the interpretation of the contract. From the viewpoint of the average reader of the agreement—a viewpoint shared by the operators—the new agreement provides for arbitration in unmistakable terms. Nevertheless, leaders of the United Mine Workers, in addressing the tri-district convention last week, denied emphatically that the labor organization had been compelled to accept arbitration.

But the union officials went still further and assured their followers that the new contract was broad enough to cover the check-off and intimated that failure upon the part of the operators to agree to act as the collection agency of the United Mine Workers in the anthracite region would be a breach of contract. "Section 4 of the contract," asserted John L. Lewis, president of the union in his address to the convention, "provides for a plan of co-operation in the industry. We have ofttimes pointed out to the anthracite operators that their industry could be improved in many ways and production costs could be lowered through the application of greater efficiency not alone on the part of the men but on the part of the management, and we have made the suggestions from time to time and we have said to them that if they were applied in a genuine way there would not be any necessity for the least profitable of the anthracite collieries to ask a wage reduction, and Heaven above knows there is no necessity for the greater portion of them, and to that end we presented them upon several occasions with a joint plan of co-operation calling not only for the co-operation of the mine workers but the co-operation of the operators, but they did not like the word 'check-off' as it appeared in the co-operating plan, so we wrote up a plan that did not contain the word 'check-off,' but it is here in Sec. 4, word for word, as we wrote it, but whether it reads 'check-off' or not that is precisely what Sec. 4 means.

"The operators fully understand that what we mean by reciprocal co-operation is co-operation on our part to reduce cost and co-operation on their part by granting the check-off. And they accept and will sign tomorrow this document, which says that the Board of Conciliation, exclusive of the umpire, shall work out a reciprocal program of co-operation efficiency. They shall work it out. It does not say they may work it out. That is a mandatory clause in that contract. That is a mandate just as strong as the English language can state it, and if they do not agree to that clause and work it out, then they are in violation of the contract and they are doing less than their contractual duty—that is the meaning of Sec. 4."

Although it is known that the operators are as firmly opposed to granting the check-off as they were when the strike began, no official reply has been made to Mr. Lewis' contention. This silence, it is understood, is not to be construed as acquiescence in Mr. Lewis' interpretation.

That the union may bring up the check-off before the Board of Concillation under the terms of the new agreement is freely admitted. But that there has been any understanding, express or implied, that the operator-members of the Board would give such a proposal favorable consideration, however, is an assumption vigorously denied by observers who have been following the situation closely. In view of the importance which both sides attach to the question, it seems hardly tenable, in the opinion of these observers, that the union members of the scale committee were in any doubt as to the operators' attitude before signing the agreement.

Wage Board Gets to Work On Kansas Machine Scale

A joint wage board, composed of representatives of the Kansas Coal Operators' Association and members of District 14, United Mine Workers, organized Feb. 5, began negotiations Feb. 11 for the establishment of a machine scale in the Kansas field. The move was necessitated by the increase in the number of machines in the Kansas field in the last year.

Seven Die as Result of Kentucky Mine Blast

An explosion occurred at about 3:30 p.m., Feb. 16, as the day shift was leaving the Nelson Creek Coal Co. mine, six miles from Central City, in the western Kentucky field, caused the instant death of three workers, while four others died from gas, in a rescue effort. Seven others were overcome, of whom three were in a dangerous condition, but all are now expected to recover.

It is thought that the accident was caused by a windy shot a half mile from the shaft.

Rescue work was hampered by impassable roads, doctors with pulmotors who came from Central City having to be transferred from motors to wagons. When they reached the mine, the gas supply for the pulmotors wasn't sufficient to revive all of those overcome.

By evening gas had been fanned out, and every one accounted for. Cecil Fulkerson, assistant mine manager, was one of the first to go in after the explosion, and was carried out unconscious. J. W. Bastin is general manager of the mine and R. S. Lytle, of Danville, Ky., is president of the company.

New Anthracite Prices Out
